To Determine Pricing For
Unbundled Network Elements
February 11, 1998

PRICING AND COSTING STUDIES

TABLE OF CONTENTS

EXECUTIVE SUMMARY

EXECUTIVE SUMMARY

I. The Telecommunications Act of 1996 requires ILECS to wholesale their infrastructure to competitors, and requires state commissions to determine the prices for these wholesale "products".

The Telecommunications Act of 1996 ("the Act") dramatically changed the nature of the business of incumbent local telephone companies ("ILECs"). Prior to passage of the Act, ILECs focused primarily on providing services to retail customers. Providing access services to interexchange carriers constituted the one major exception to this strong retail focus.

The Act requires ILECs to make a number of significant changes in their businesses. ILECs must disaggregate many of the elements of their infrastructure and make these elements available to their competitors who in turn will use them to compete for the same retail customers.

ILECs must provide reciprocal interconnection with their competitors and discounted wholesale prices for telecommunications services, which the competitors will market in competition with the ILECs.

The Act sets forth the framework that ILECs must apply in pricing unbundled elements, local interconnection, and wholesale telecommunications services other telecommunications companies. The Act further requires state regulatory to approve negotiated interconnection, unbundling and resale agreements and to conduct arbitration proceedings when petitioned to do so.

The Act requires ILEC prices for unbundled network elements and interconnection to be based on forward looking costs. In addition, the Act states that prices should be non-discriminatory and that they may include a reasonable profit.

II. Sprint's Costing Proposal.

In this filing, Sprint is responding to the Commission's order to file TSLRIC for those services the Commission established interim rates for in the initial proceeding in this docket. These include cost studies and methodologies for:

- Local Loops
- Transport(Dedicated and Common)
- Tandem Switching
- Local Switching/Features
- SS7
- Line Information Database and Toll Free Code Access Service
- Directory Assistance, Operator Services, and E911
- Annual Charge Factors
- Other Direct and Common Costs

A. COST STUDIES FOR UNBUNDLED ELEMENTS AND NETWORK INTERCONNECTION

The cost studies for unbundled elements and network interconnection are based on forward-looking costs. The Act specified use of a Total Service Long Run Element Long Run Incremental Cost ("TSLRIC") methodology, which determines the forward-looking long run incremental cost of network elements.

To distinguish between the costing of retail services versus the costing of unbundled network elements, the FCC created the term "Total Element Long Run Incremental Cost ("TELRIC). Sprint's cost were developed using a TSLRIC approach. It is important to note that Sprint does not make a distinction between TSLRIC and TELRIC: Essentially, TSLRIC and TELRIC costing methodologies are the same. Their differences are related to the items being costed, not the method of developing the costs. The FCC Order, paragraph 678, states,

> While we are adopting a version of the methodology commonly referred to as TSLRIC as the basis for pricing interconnection and unbundled elements, we are coining the term "total element long run incremental cost" (TELRIC) to describe our vision of this methodology. The incumbent LEC offerings to be priced using this methodology generally will be "network elements," rather than "telecommunications services," as defined by the 1996 Act.

Thus, TSLRIC studies determine the forward-looking, long run incremental cost of services while TELRIC studies determine the forward-looking, long run incremental cost of network elements. Neither TSLRIC nor TELRIC include common costs. Both methodologies have the following major characteristics:

1. Determine the economic cost of a network to encourage facilities-based competition;
2. Utilize "total" direct incremental costs based on:
   - "Total" network demand,
   - The most efficient technology available,

- Costs which are viewed over the long run such that all costs are "variable or avoidable",
- Cost causative pricing principles.

3. Utilize risk-adjusted cost of capital and economic depreciation lives; and,
4. Will be used to create prices for unbundled elements and network interconnection which include a reasonable allocation of joint and common costs.

Essentially TSLRIC looks at the forward-looking, long run incremental cost of services, where TELRIC looks at costs from a network element perspective. From this point forward, the TSLRIC costs will be used interchangeably with TELRIC costs in this filing. TSLRIC does not include common costs which are incurred to benefit all services offered by the company, and which do not change or go away unless the company goes out of business. However, the proposed prices are based upon TSLRIC cost plus a reasonable allocation of forward-looking common costs. Sprint has provided a forward looking common cost study in this filing.

Sprint's cost studies geographically deaverage the loop, switching and transport costs. Deaveraged costs reflect more closely the actual costs of providing network elements because these costs can vary widely across the service territory. Averaged costing would distort telecommunications carriers' decisions regarding whether to build or lease unbundled network elements. Deaveraging provides accurate market signals, which will encourage efficient utilization of resources and discourage uneconomic investment.

The unbundled loop element will be one of the most significant elements considered in this proceeding. Sprint's undbundled loop cost study deaverages loop costs into six cost bands.

Setting the unbundled loop cost too high would incent uneconomic investment in unbundled loop facilities. Setting the unbundled loop cost too low would create a situation in which the ILEC's competitors would receive below-cost price breaks which will discourage facilities based competition. Sprint as a corporation which has both CLEC and ILEC interests has attempted in this proceeding to develop the closest possible estimate of the true forward-looking cost of the loop and other unbundled network elements.

I. B. Conclusion

Sprint's cost studies submitted herein represent Sprint's best thinking to date on how to develop cost data which will enable this Commission to comply with the Act by setting true forward-looking costs, so that competition, using unbundled network elements, can develop.

LOCAL LOOPS

LOCAL LOOP COST STUDY

The purpose of the local loop cost study is to calculate the TSLRIC Monthly Cost for unbundled loops located within Sprint's local exchanges. The Benchmark Cost Proxy Model, Version 3.1, (BCPM3.1), populated with Florida-specific inputs, was used to develop these costs.

The results for Sprint-Florida by wire center are shown on Schedule 1. The values in Columns A through E are directly from the BCPM3.1. The Central Office Termination Investment is calculated by multiplying the Total Lines Served by wire center by the per-line CO Termination cost (see Schedule 2). The Circuit, Cable & Wire Facilities, and Central Office Termination investments are then multiplied by the appropriate Total TSLRIC Annual Charge Factor (as described in the Other Direct and Common Cost Study section) to develop the total cost by wire center. The TSLRIC Monthly Cost per Loop is simply this total cost divided by the Total Lines Served and then by 12 to convert the cost to a monthly value.

Schedule 2 contains a detailed breakdown of the additional cost required to connect unbundled loops to Central Office Switching equipment. As shown, these costs include material and installation of the Main Distribution Frame and Protection.

Schedule 3 contains a complete set of the Florida company-specific inputs used in BCPM3.1 to calculate the loop investment required to serve the loops located in Sprint's Florida wire centers.

The TSLRIC Monthly Loop Cost by Wire Center results are shown aggregated into cost bands on Schedule 4. The wire center results were grouped into these 6 bands based on the natural break points of the data, for ease of administration. Schedule 5 shows the application of the Common Cost factor to the banded results.

TRANSPORT

Transport Cost Model

Sprint – Florida, Inc.

February 11, 1998

Sprint.

TABLE OF CONTENTS

Sprint. **Transport Cost Model**

I. STUDY SUMMARY

A. Purpose

The purpose of the study is to develop the Total Service Long Run Incremental Cost (TSLRIC) of interoffice transport .

B. Scope

The cost results were developed specific for the Sprint – Florida, Inc. (Sprint) serving area and are only applicable for intraLATA company operations.

C. Introduction

The Telecommunications Act of 1996 (Act) states:

Provide to any requesting carrier non-discriminatory access to network elements

- On an unbundled basis
- At any technically feasible point
- At rates and terms that are just, reasonable and non-discriminatory
- In accordance with the interconnection agreement
- In a manner that allows the requesting carrier to combine network elements to provide its telecommunications service
  (251(c)(3))

The Federal Communications Commission states in FCC 96 - 325 Paragraph 440

"We require incumbent LECs to provide unbundled access to shared transmission facilities between end offices and the tandem switch. Further, incumbent LECs must provide unbundled access to dedicated transmission facilities between LEC central offices or between such offices and those of competing carriers. This includes, at a minimum, interoffice facilities between end offices and serving wire centers (SWCs), SWCs and IXC POPs, tandem switches and SWCs, end offices or tandems of the incumbent LEC, and the wire centers of incumbent LECs and requesting carriers. The incumbent LEC must also provide, to the extent discussed below, all technically feasible transmission capabilities, such as DS1, DS3, and Optical Carrier levels (e.g. OC-3/12/48/96) that the competing provider could use to provide telecommunications services. We conclude that an incumbent LEC may not

limit the facilities to which such interoffice facilities are connected, provided such interconnection is technically feasible, or the use of such facilities. In general, this means that incumbent LECs must provide interoffice facilities between wire centers owned by incumbent LECs or requesting carriers, or between switches owned by incumbent LECs or requesting carriers. For example, an interoffice facility could be used by a competitor to connect to the incumbent LEC's switch or to the competitor's collocated equipment."

The Transport Cost Model (TCM) was developed to meet the requirements of the Florida Public Service Commission's Docket utilizing the Act and FCC 96-325 as a methodology guideline. The Transport Cost Model determines the TSLRIC of interoffice transport in support of unbundled elements.

Sprint believes that the development of transport cost should be based on the following key items, all of which are incorporated into the TCM:

- Utilize Forward Looking Technology
- Optical Based Transmission Equipment Costs Only
- Capable of Costing OC3, OC12 and OC48 Transport Rings
- Reflect the Use of Existing LEC's Wire Centers
- Include the Cost Associated With Survivability

D. Assumptions

1. The material costs used in the model are based either on recent purchase costs or on manufacturers' quotes. The installation costs are based on recent installations and include engineering and placement costs.

2. The terminal utilization factors used within the cost model are based on current utilized bandwidth adjusted for expected growth.

3. The Annual Charge Factors included in the model are described in the Annual Charge Factor Narrative.

4. The miscellaneous factors (Pole, Conduit, Power) included in the model are based on the Sprint study area, and have been reviewed for appropriateness for forward-looking applications. Pole and conduit factors represent the dollar investment in poles or conduit relative to the dollar investment in the cable which uses it. For example, a pole factor of 0.20 implies that for every dollar of investment in aerial cable, there is $0.20 investment in poles. The

miscellaneous equipment and power factor represents the dollar investment in this equipment relative to dollar investment in circuit equipment.

5. The fiber mix ratio (Aerial, Buried, Underground) included in the model are based on the Sprint's actual mix of strand mileage and has been reviewed for appropriateness for forward-looking applications.

6. The ring configurations are based on the currently provisioned and planned configurations and are consistent with forward-looking applications.

7. The Transport Cost Model (TCM) is considered appropriate for developing the transport cost on a ring by ring basis. TCM is an interactive PC model which determines the TSLRIC of interoffice transport.

E. Methodology - TCM - Work Sheets

1. Introduction

   The Introduction worksheet is simply a title page, including the study name and the state.

2. Summary

   The Summary worksheet is a one-page summary of the TCM study results. The worksheet provides the Single Termination Cost Per Month and the Transit Cost Per Month on a flat rate basis.

3. Material Costs

   The Material Costs worksheet provides the user with input fields that can be specific for their local jurisdiction. The following is a list of the items on the Material Costs worksheet.

   Current Material Cost
   - Fiber Optic Cable
   - Fiber Tip Cable
   - Fiber Patch Panel
   - Fiber Optic Terminals (OC-3, OC-12, and OC-48)
   - OC-3 Cards
   - DS-3 Cards
   - DS-1 Cards

- Installation Costs
- Utilization Factors
- Pole and Conduit Factors
- Annual Charge Factors
- Aerial, Buried, Underground Mix

4. Route Information

The Route Information worksheet of TCM allows the user to input each transport ring, redesigned where appropriate using state-of-the-art, forward looking technology. The data input on this page are the unique characteristics of the ring which include the following:

- Route Name
- Segment Names (Wire Centers that the ring will pass through)
- Ring Type (Self Healing Ring/Folded Ring)
- Segment Termination (DS1, DS3)
- Segment Actual Miles
- Number of Repeaters
- Terminal Size (OC3, OC12, OC48)

5. Worksheet A (Assumption Table)

The Assumption Table worksheet provides the number of units required and the DS1 capacity for each of the following pieces of Termination Equipment:

- Fiber Tip Cable
- Fiber Patch Panel
- Fiber Optic Terminals (OC3,OC12,OC48)
- OC3 Card
- DS3 Card
- DS1 Card
- DSX3 Cross Connect Shelf
- DSX3 Cross Connect Card
- DSX1 Cross Connect Jack Field
- Channel Bank Shelf
- Aerial Fiber
- Buried Fiber
- Underground Fiber
- Maximum Utilization Level

6. Worksheet B (Termination Equipment)

   Worksheet B (Termination Equipment) converts total utilized investment of each type of transmission equipment into a cost per DS1. The following equipment components are shown on this worksheet. (Fiber Tip Cable, Fiber Patch Panel, Fiber Optic Terminal, DS3 Card, DS1 Card, OC3 Card, DSX3 Cross Connect, DSX1 Cross Connect Jack Field, Channel Bank, and Channel Bank Card)

   The following is an illustration of the calculation:

   Equipment Component Investment * Units Required / DS1 Capacity / Utilization Factor * (1 + Power Factor) * Annual Charge Factor = Annual Cost Per DS1 by Equipment Component

7. Worksheet C (Segment Termination Costs)

   Worksheet C (Segment Termination Costs) groups the equipment components annual costs from Worksheet B to develop five types of interconnections. These interconnection types include fiber interconnection, SONET interconnection, DS3 interconnection, DS1 interconnection, and a DS0 interconnection. It should be noted that even at these interconnection levels each of these items are shown at their DS1 equivalent.

8. Worksheet D (Mileage Equipment)

   Worksheet D (Mileage Equipment) converts total utilized investment of each type of mileage equipment into a cost per DS1. The following equipment components are shown on this worksheet. (Aerial Fiber, Underground Fiber, Buried Fiber, Pole Lines, and Conduit)

   The following is an illustration of the calculation:

   Unit Investment Per Mile * Units Required / Fiber Utilization Factor / Terminal Utilization Factor * Annual Charge Factor = Annual Cost Per DS1 by Equipment Component Per Mile

   Annual Cost per DS1 by Equipment Component Per Mile * Fiber Mix Ratio = Weighted Annual Cost Per Mile by Equipment Component.

   Sum all components by ring size and the result is a weighted annual cost per mile.

9. Worksheet E Route Specific Cost Determination

   Worksheet E determines the termination and transit costs of each fiber ring using the information in Worksheets B, C, and D. The end result is the termination and transit cost of dedicated DS1 transport.

F. Results

The results for dedicated are provided on the Summary Sheet of each individual TCM study. Results are provided on an individual ring basis, recognizing the use of existing LEC wire centers, mileage characteristics and each ring's specific utilization. Please note that the TCM model does not include the common cost factor.

TANDEM SWITCHING

TANDEM SWITCHING

The methodology in developing Tandem Switching is the same as for local switching (see the following section titled Local Switching/Features). It is assumed that the cost of tandem switching is equal to local trunk to trunk switching. The cost stated is a weighted average minute of use that can be applied to all tandem switching minutes within the Company's serving area.

LOCAL SWITCHING/FEATURES

LOCAL SWITCHING

In referencing local switching, the FCC Order states:

> We believe that a combination of a flat-rated charge for line ports, which are dedicated to a single new entrant, and either a flat-rate or per-minute usage charge for the switching matrix and for trunk ports, which constitute shared facilities, best reflects the way costs for unbundled switching are incurred and is therefore reasonable. (Paragraph 810)

Sprint has segmented switching costs as three separate components; usage sensitive switching, a flat-rated port and flat-rated features.

USAGE SENSITIVE SWITCHING

The TSLRIC methodology for local switching consists of an Excel worksheet model, SWIM (Switching Model). SWIM takes total investment derived from the Bellcore SCIS (Switching Cost Information System) model, and combines it with actual usage information to derive TSLRIC results for each host office complex.

The SCIS model is a widely used industry model for determining switching investment. Arthur Andersen conducted a review of SCIS on behalf of the FCC in 1992. Their report concluded,

> After conducting an extensive review, Arthur Andersen has concluded that the SCIS model is fundamentally sound and provides reasonable estimates of the switching system investment attributable to service and feature usage of the switch.

The TSLRIC switching results are deaveraged for two distinct cost zones:

1. Host offices, and remote switches within the host office's exchange.

2. Remote offices outside of the host office's exchange.

The TSLRIC methodology for switching consists of six basic steps. The "Local Switching Calculations" example reflects the calculations for one particular switch, West Kissimmee. This process is repeated for each switch studied and the results are located in the workpapers contained in this section.

The first step is to determine the total forward-looking switching investment using the SCIS model. Individual Nortel DMS-100 switches in Florida were modeled, assuming a minimum Supernode-60 processor capability. Supernode-60 is the minimum processor size currently supported by Nortel. Although earlier vintage processors may be currently in use, they represent obsolete technology and do not represent forward-looking technology as required by TSLRIC standards. The DMS-100 switch represents the predominate technology deployed by Sprint in Florida.

This investment is segregated into six investment categories. These are,

1. Getting Started Cost - the minimum investment required to provide switching, regardless of usage. It is composed primarily of the central processor and memory.

2. Line Termination Cost - the investment required to terminate the local loop in the central office. It is composed primarily of a line card, the main distribution frame, and protector.

3. Line Usage - the investment associated with usage sensitive line-side switching. It is composed primarily of the line concentrating module, DS-30A links, line group controller, DS-30 links, and the network module. (CCS is an acronym for 100 call seconds.)

4. Trunk Usage - the investment with usage sensitive trunk-side switching. It is composed primarily of digital trunk controllers, DS1 links, and the network module.

5. Umbilical Usage - the usage sensitive investment in host-remote links.

6. SS7 - investment associated with the SSP (Service Signaling Point) located in the central office.

This investment information for the sample office is summarized on Page 1 of "Common Switching Calculations" .

The SCIS model considers only the hardware investment in the central office. One-time software investment required to provide basic switching must also be included. This proprietary information was provided to Sprint by Nortel.

The second step is to accumulate the demand data needed to complete the study. Traffic studies are used to gather MOU and call set-ups by call type. This information is shown on Page 1 of "Common Switching Calculations."

The third step is to determine the number of processor milliseconds required to process each type of call. This information, shown on Page 2 of "Common Switching Calculations", is proprietary to Nortel.

The fourth step is to derive monthly expense per investment category by multiplying the investment by the appropriate forward-looking annual charge factor. This is shown on Page 3 of "Common Switching Calculations."

The fifth step is to calculate the cost per call set-up per call type. This is done by determining the total processor cost per call type, and dividing by the appropriate MOU. This calculation is shown on Page 4 of "Common Switching Calculations."

The sixth step is to calculate the cost per MOU per call type. This is done by determining the total CCS investment by call type, and dividing by the appropriate MOU. This calculation is shown on Page 5 of "Common Switching Calculations." SWIM cost results for all central office complexes in Florida are reflected in "Local Switching Results."

Translations of the switching cost detail into the FCC ordered switching elements are completed on a disaggregated basis through the following 3 steps.

1. Results from the SWIM model, for each exchange studied, are used to determine average MOU call costs for in-exchange or out-of-exchange calls on the "Cost Development" exhibit. Average MOU call costs are calculated based on the demand for the following call types.

   a) Intraoffice within host

   b) Intraoffice within remote

   c) Interoffice to/from host

   d) Interoffice to/from remote

2. Both usage and fixed costs are included in the banded local switching costs. The usage component recovers the usage sensitive portion of the switch

investment. The fixed cost component is the port or line card cost as provided by SWIM

The cost per band is developed on the "Local Switching Rate Bands" exhibit as follows:

a) The exchange local switching MOU costs, as calculated in (1) above, are sorted ascending from lowest cost exchange to highest.

b) Next, the exchanges are placed within a band where the bands lowest to highest local switching cost is within +/- 10% ** deviation from the average band MOU cost (average band MOU cost is total band cost/total band MOU).

c) The total band cost is then divided by total band MOU generating band MOU cost. The band MOU cost is multiplied by the common cost factor resulting in the total band MOU economic cost.

d) The lines multiplied by port cost per exchange is totaled by band and divided by total exchange lines by band resulting in average band port cost. This cost is multiplied by the common cost to result in the loaded band port economic cost.

Sprint has established six natural rate bands for Florida to reflect switching rates. Sprint's goal in deaveraging is to price in close proximity to cost, in order to supply an economically efficient price to new competitors who will decide whether to use Sprint or an alternative switching arrangement. Sprint established a cost design of grouping wire centers such that the variance in

usage costs was approximately 10% or less. The cost classifications of Sprint's Florida exchanges are provided in the "Local Switching Rate Bands" exhibit.

SWITCHING PORT

The methodology for deriving the switching port is to take the total line termination investment for each office and multiply by the annual charge factor, divide by twelve, and divide by the number of lines per office. This is reflected on Page 5 of "Local Switching Calculations." The banded port price is reflected in "Local Switching Rate Bands."

FEATURES

The TSLRIC methodology for feature costing consists of five steps:

First, the SCIS model is used to determine the cost of the most prevalent features. In total, nineteen Centrex features, nine CLASS features, and eleven Custom Calling Features were studied.

Second, since the SCIS model only considers hardware costs, software costs must be added.

Third, the annual charge factor is applied to derive an annual cost.

Fourth, the annual cost is divided by twelve to derive a monthly cost.

Fifth, and finally, the common cost factor is applied.

Sprint has developed feature packages that CLECs may purchase with a switching port. CLECs may select the individual features they wish to provision on individual access lines from these feature packages. CLECs must purchase an unbundled port in order to purchase unbundled feature capability. As supported by the FCC, feature capability is an integral part of the switch. Sprint's approach is to allow the CLEC to customize the switching ports it purchases from Sprint. However, the CLEC cannot purchase feature capability without first purchasing the switching port.

Company: **Sprint - Florida, Inc.**

Services: **Common Channel Signalling Interconnection Service**
- **STP Port**
- **STP Switching**
- **STP Transport Links**
- **STP Global Title Translations**
- **STP Originating Point Code (OPC) Service**

Service Cost Type: **Network Elements**

Service Description: Common Channel Signalling / Signaling System 7 (CCS/SS7) Interconnection Service provides a signaling path between a customer designated point of signalling premises and an Sprint LTD Signal Transfer Point (STP). This two-way signaling path provides the customer interconnection to the out-of-band Signaling network in order to transmit and receive signaling information related to call completion.

The link facilities for CCS/SS7 Interconnection Service will consist of a 56.0 kbps circuit, or an optional DS-1 (1.544 Mbps) channel at the customer designated premises multiplexed by the OTC to a 56.0 kbps circuit for interconnection to the STP Port. The STP Port is the interface equipment, contained in the STP, to which the interconnecting link terminates.

The STP switching service is for the routing of the ISDN Users Part (ISUP) message through the STP. The rate for switching is applied on the basis of equivalent 56.0 kbps trunks per month. The T-1 rate would be equal to 24 times the STP switching rate per 56.0 kbps trunk per month.

CCS/SS7 Interconnection Service must be purchased by the customer to interconnect to both STPs of a mated pair. Also the interconnecting links should be provisioned with diversity as established in generally accepted industry technical standards for out of band signaling networks.

Application

CCS/SS7 Interconnection Service is used by the customer to interconnect to an OTC's out-of-band signaling network to support Feature Group D call setup using the SS7 protocol rather than the in-band MF signaling typically used. The SS7 signalling protocol also allows for the transmission of additional data between networks for use by interexchange carriers and LECs to provide services to end users such as calling number

and calling name delivery. Interconnection for these purposes can occur to each mated pair of STPs deployed n the Sprint LTD network..

CCS/SS7 Interconnection Service also provides for interconnection by the customer to data base services such a LIDB. However, since the LIDB resides on Service Control Points located in Johnson City and Bristol, Tennessee, for LIDB Access Service the CCS/ SS7 Interconnection Service must be ordered to the mated pair of STPs in those two locations.

Company: **Sprint - Florida, Inc.**

Service: **Originating Point Code (OPC) Service**

Service Cost Type: **Network Element**

Service Description

Originating Point Codes (OPC) are generated to allow Sprint's SS7 network to identify the originating point of a call, and is a manual process that requires routing information to be input into a terminal as a part of the Table Maintenance Process. Sprint's SS7 network, as well as the tables to be updated, are located in Johnson City, Tennessee. Carrier Management, located in Westwood, Kansas, will act as the single point of contact (SPOC) in expediting the add or change request process. This process will be provisioned similarly to the Access Service Request (ASR) process.

The rates identified herein are based on the Sprint Local Telephone Companies Interstate Access Tariff F.C.C. No. 1.

Tariffed Rate per OPC, per Service, Added or Changed, per STP Pair

Company: **Sprint - Florida, Inc.**

Service: **Global Title Translation (GTT) Service**

Service Cost Type: **Network Element**

Service Description

Global Title Translations (GTT) charges apply for each service or application (excluding LIDB access service and TFC data base service) that utilizes Transaction Capabilities Application Part (TCAP) messages. These charges also apply for each service (exluding LIDB access service and TFC data base service) added or changed subsequent to the initial establishment of STP access. The service provides translations to the network for routing purposes, and is a part of the manual process that requires information to be input into a terminal as a part of the Table Maintenance Process. Sprint's SS7 network, as well as the tables to be updated, are located in Johnson City, Tennessee. Carrier Management, located in Westwood, Kansas, will act as the single point of contact (SPOC) in expediting the add or change request process. This process will be provisioned similarly to the Access Service Request (ASR) process.

The rates identified herein are based on the Sprint Local Telephone Companies Interstate Access Tariff F.C.C. No. 1.

LINE INFORMATION DATABASE AND TOLL FREE CALLING

Company: **Sprint - Florida, Inc.**

Service: **Line Information Database (LIDB) Access Service**

Service Cost Type: **Network Element**

Service Description

LIDB Access Service provides the customer the ability to access billing validation data contained on the Telephone Company's LIDB located in Johnson City, Tennessee and Bristol, Tennessee. The LIDB is accessed through the Telephone Company SS7 network utilizing the American National Standards Institute (ANSI) signalling protocol. Access to the Telephone Company's LIDB provides customers the ability to provide toll fraud protection by validating calling card and toll billing exception data and performing public telephone checks.

CLEC LIDB data placed in the telephone company LIDB is administered for initial inclusion and subsequent updates for Personal Identification number, and Alternate Billing Service (ABS) restrictions via the **Line Information Database Administration Service** Network Element described in a separate service description.

LIDB Query Transport and LIDB Query Services are described partially below and in full in the Common Channel Signalling / Signaling System 7 (CCS/SS7) Data Base Services section of the Sprint Local Telephone Companies Interstate Access Tariff F.C.C. No. 1..

Query Transport

The Query Transport rate element is charged per query for use of the transmission facilities between the Telephone company's STPs located in Johnson City, Tennessee and Bristol, Tennessee and The Telephone Company SCP where the LIDB resides.

LIDB Query

The LIDB Query rate element provides for the validation of calling card and toll billing exception data and performance of public telephone checks. For these validation purposes, LIDB Access Service customers will query the LIDB located in the Telephone Company SCP via the Telephone Company CCS/SS7 network. The LIDB will respond with a verification signal message back to the LIDB Access Service customer via the Telephone Company CCS/SS7 network.

Rate Categories:

See Current Tariff Rates For Query Transport per query

See Current Tariff Rates For per database query

Company: **Sprint - Florida, Inc.**

Service: **Toll Free Code (TFC) Access Service**

Service Cost Type: **Network Element**

Service Description

TFC Access Service is an originating service that is provided via TFC Access Service switched trunk groups, or may be provided in conjunction with FGB, FGC, or FGD. The service provides for the forwarding of end user dialed TFC calls to a Telephone Company Service Switching Point (SSP) which will initiate a query to the Telephone Company's TFC data base to perform the customer identification function. The call is forwarded to the appropriate customer based on the dialed TFC number. The customer has the option of having the TFC dialed number (e.g., 800-NXX-XXXX) or, if the TFC to Local Exchange Number Translation optional feature is specified, a translated ten digit local exchange number (i.e., NPA-NXX-XXXX) delivered to the customer premises.

The provision of TFC Access Service requires access to the TFC Service Management System (TFC SMS) by a Responsible Organization on behalf of the customer or through direct access by the customer to the TFC SMS.

TFC Access Services are described partially below and in full in Toll Free Code (TFC) Access Service section of the Sprint Local Telephone Companies Interstate Access Tariff F.C.C. No. 1..

Data Base Optional Service Features

In addition to the TFC call routing (e.g., 1+800-NXX-XXXX) described in (A) preceding, at the customer's option, the Telephone Company will perform additional call routing service options as follows:

(1) TFC to Local Exchange Number Translation

This option allows a TFC Access Service customer to specify standard local exchange telephone numbers for TFC call completion at the terminating end. When a TFC call is to be routed to a local exchange telephone number, the TFC Access Service customer must provide to its Responsible Organization or to the TFC SMS, the full ten digit local exchange number (NPA-NXX-XXXX) to be associated with the TFC number and indicate to which carrier the local exchange telephone number is to be delivered. If the TFC to Local Exchange Number Translation

optional feature is used, the customer will be unable to determine that such calls originated as TFC dialed calls (e.g., 1+800-NXX-XXXX) unless the customer also orders the Flexible Automatic Number Identification (Flex ANI) optional feature.

(2) Customized TFC Call Routing

This option allows for routing to multiple carriers, except as specified in Section 6.2.5(A), or variable terminating locations for TFC call completion based on the following criteria:

- time of day
- day of week
- specific days of the year (e.g., December 25)
- percentage of traffic (in one percent increments)
- calling telephone number (unless technical limitations exist which do not provide for originating number identification.

With this option, TFC calls can be delivered to the carrier in either the direct dialed TFC number format or in the local exchange telephone number translated format. The customer must enter the desired format and the necessary ten digit local exchange telephone number, if any, into the TFC SMS or provide such information to its Responsible Organization for handling.

DA, OPERATOR SERVICES AND E911

Company: Sprint - Florida, Inc.

Service: Directory Assistance Operator Service (Live)

Cost Methodology: TSLRIC

Service Cost Type: *Network Element*

Service Description

The Directory Assistance Operator Service (Live) provides live assistance to a customer to obtain directory listing information and / or to complete a telephone call. The functionality includes a live operator, a data base of directory listing information, and the associated facilities and equipment necessary to access the data base and / or to complete the call. The service does not include customized branding. The calls must be delivered to an existing operator center consolidation network location.

Major Cost Areas and Sources

The major costs included the development of TSLRIC for Directory Assistance Operator Service (Live) are:

- Operator labor, supervision and benefits
- Position equipment and local area networking
- Inter-operator work center networking
- Directory Assistance data base and associated maintenance

The sources for the TSLRIC costs are Sprint - Florida, Inc.'s general ledger, and vendor quotes and Sprint engineering estimates.

The operator work force expenses are those directory assistance related expenses found in Sprint - Florida, Inc.'s general ledger. The position equipment and local area networking, inter-operator work center networking, and directory assistance data base costs are those contained in vendor quotes.

Cost Development Methodology (Attachment A)

The TSLRIC cost development for Directory Assistance Operator Service (live) is comprised of seven (7) steps:

1. Determine the Direct costs. These include the 1997 operator work force labor and payroll costs averaged over 5 years, and the hardware and software one-time and recurring costs associated with the new directory assistance system. The one-time costs are depreciated/amortized over a five (5) year economic life. These Direct Costs do not include the Additional Direct Investment for Network Upgrades to the DA/Toll system, and Switch Upgrades.

2. Determine Other Direct Operating Expenses. These include the fixture/furniture and building and network support costs. These costs are determined by a carry factor multiplied times Direct Identified Costs in 1. above. The factor was determined in the Summary of Indirect Investment Related and Common Expense Factors study for Florida Work Center for the 12 months ending December 1997. The factor is [redacted]. Additional Direct Investment costs are not applied against the Other Direct factor.

3. Determine the Additional Investment Amounts The Additional Investment Amounts are those capital expenditures that were not included in the original investment study for 1997. Associated costs include annual depreciation, an after tax return of [redacted]%, property taxes and income tax.

4. Determine Common Cost. The sum of direct cost, and other direct cost is multiplied by the common cost factor of [redacted]% to determine the allowed common cost. The common cost factor is identified in the Summary of TSLRIC, Other Direct Operating and Common Expense Factors study for Florida. All costs are applied against the Common Cost factor.

5. Determine the Demand. The demand is based on the actual volumes of Directory Assistance position seizures in 1997.

6. Determine the live DA operator cost per initial seizure. The sum of direct identified, other direct, additional direct and common costs are divided by the demand to determine the live operator cost per initial position seizure.

7. Determine the Directory Assistance Operator Service (Live) Cost Per Initial Position Seizure. The live operator function cost per initial seizure determined in l (step 6) is added to the cost per initial position seizure for Directory Assistance Data Base Query Service to get the Directory Assistance Service (Live) price per initial position seizure. The result is:

- Live operator function cost per Initial Position Seizure $.3431
+ Directory Assistance Data Base Query per Initial Position Seizure $.0100

= **Directory Assistance Service (Live) Per Initial Position Seizure $.353**

Company: **Sprint - Florida, Inc.**

Service: **Directory Assistance Data Base Query Service**

Cost Methodology: **TSLRIC**

Service Cost Type: **Network Element**

Service Description

Directory Assistance (DA) Data Base Query service makes Sprint - Florida, Inc.'s electronic directory listing information database, (The same database used by Sprint - Florida, Inc. Directory Assistance Operators) available for access by CLECs. The functions of this service include access to the directory listing information, use of the data base equipment and software for the purpose of searching the database, and the local area network providing access to the data base from the CLEC's directory assistance positions and network routers.. The CLEC desiring access to the data base is required to provide all of the necessary routers connecting the Sprint - Florida, Inc. DA Local Area Network and the connecting links and other routers to interconnect to their own DA center. CLEC systems must be compatible with ILEC systems.

Rate Application

The rate for directory assistance database query service is based on per database position seizure measurements. Every initiated search of the database is a position seizure.

Major Cost Areas and Sources

The major cost areas include: the maintenance of the directory listing information and the hardware and software costs associated with the data base equipment and local area network. The sources for these costs are the subscriber listing costs for Sprint - Florida, Inc., the vendor quotes and the Sprint/Central Telephone Company engineering estimates, project to implement a new baseline directory assistance system in Florida.

Cost Development Methodology (Attachment A)

The TSLRIC cost development methodology for Directory Assistance Data Base Query Service is comprised of five (5) steps:

1. Determine the Direct Costs. These include the hardware and software one-time and recurring costs associated with the directory assistance database portion of the directory assistance system. The subscriber listing direct cost that is used to determine TSLRIC for subscriber listing information is included to reflect the cost of information contained in the data base. The one-time costs were depreciated/ amortized over a five (5) year economic life.

2. Determine Other Direct Costs Other Direct Costs are those costs associated with providing the buildings, maintenance, and network support as identified in a factor by the Summary of Indirect Investment Related and Common Expense Factors Study for Sprint - Florida, Inc. for the twelve months ending December 1997. Other Direct Costs for Directory Assistance Services are [redacted]% of direct identified costs.

3. Determine Common Cost. The sum of direct identified and other direct cost was multiplied by Sprint - Florida, Inc.'s common cost factor of [redacted]% to determine the allowed common cost as identified in the Summary of Indirect Investment Related and Common Expense Factors Study for Sprint - Florida, Inc. for the twelve months ending December 1997.

4. Determine the Demand. The demand is based on the actual volumes of Directory Assistance position seizures in 1997.

5. Determine the cost per initial position seizure. The sum of direct identified costs, other direct costs and common costs is divided by demand to get cost per database seizure. The resulting price per call is:

$.0100 per database seizure

Service: Directory Assistance Database Listing and Update

Service Cost Type: Network Element

Service Description: Directory Assistance Database Listing and Update service is the provision of Subscriber Listing Information for the purpose of providing carriers information so that they can provision their own directory assistance databases supporting their provision of directory assistance service to end users. The basis of this service is the underlying end user subscriber listing that consists of customer telephone number, published/ non-published, or non listed status, primary directory classification for businesses, and customer address. In addition, each provision of add. delete and change activity updates constitutes an initial or update listing. Listings and Updates are provided each business day of the year. The media (e.g., tape or data communications) by which the listings are provided and the transport cost of that media is in addition to the cost per listing or update.

Major Cost Areas and Sources: These listings and updates occur as a result of business office service activity for initial, change of service, or termination of service activity. The major source of cost is the labor, wages and benefits of personnel directly validating the data and correcting any erroneous information, and the shared costs for service order activity and computer processing of information and common costs of business overhead.

The direct cost of producing a subscriber listing involves costs for :

- personnel and payroll costs for validating and correcting information entered into the data repository,
- managing the repository of data ,
- Other direct costs of buildings, and other supporting facilities supporting the personnel performing these functions

Common Costs are the costs to recover Executive and General and Administrative Expenses.

Pricing of Subscriber List Data Methodology

1. Determine Direct cost Identify the direct cost of subscriber list information (SLI)

- Number Services Groups Wages and Benefits (Accounts 6622.211 and 6622.212)

2. Determine the Other Direct Operating Expenses / TSLRIC Investment - This cost represents buildings, and general support expenses. This is determined by multiplying the cost in 1 above by a factor determined by the Summary of Indirect Investment Related and Common Expense Factor Study for the Florida Work Center Study for the 12 months ending December 1997. The Factor is .070579 of Direct Cost.

3.Determine Demand - Determine total number of demand transactions involving SLI supported by these expense accounts.

- Directory Assistance Listings and Updates
- White Page Listing Updates

4. Determine Common Cost - Multiply the sum of identified direct cost, and other direct cost by a carrying charge of 15% for common costs.

5. Determine the Price Per Initial and Updated Listing - Divide the sum of direct, other direct, and Common Cost by the demand identified in (3) above. This is the cost per initial or update listing of subscriber list information (directory assistance listings).

The resulting cost for Directory Assistance Listings and Updates is:

$.05 per initial listing or subsequent update record

Sprint- Florida, Inc.

Company: **Sprint - Florida, Inc.**

Service: **Toll and Local Assistance Service (Live)**

Cost Methodology: **TSLRIC**

Service Cost Type: **Network Element**

Service Description

The Toll and Local Assistance Service (Live) provides live assistance to a customer to complete a telephone call. The functionality includes a live operator, and the associated facilities and equipment necessary to record for billing and / or completion of the call.

Major Cost Areas and Sources

The major costs included the development of TSLRIC for Toll and Local Assistance Service (Live) are:

- Operator labor, supervision and benefits
- Position equipment and networking

The sources for the TSLRIC costs are Sprint - Florida, Inc.'s general ledger and Sprint engineers/vendor quotes.

The operator workforce expenses are those number completion services related expenses found in Sprint - Florida, Inc.'s general ledger. The position equipment are from vendor quotes. The local area networking costs are those contained in the project to implement a new directory assistance system in Sprint - Florida, Inc..

Cost Development Methodology (Attachment A)

The TSLRIC cost development for Toll and Local Assistance Service (live) is comprised of six (6) steps:

1. Determine the Direct Costs. These include the operator workforce expenses which are the annual average of operator wages and benefits grown at a 3 percent annual rate over 5 years using 1997 as a base year, and the depreciation of hardware and software one-time and costs associated with toll and local assistance tandem switch upgrades, and toll and local assistance service's use of the local area network for the directory assistance system and access to rate tables. The one-time costs are depreciated/amortized over a five (5) year economic life. These Direct Costs do not include the Additional Investment for Network Upgrades to the DA/Toll system, and Switch Upgrades.

2. Determine Other Direct Costs Other Direct Costs, were determined via a factor resulting from the Indirect Investment Related and Common Expense Factor study for Sprint - Florida, Inc. for the twelve month period ending December 1997. This factor for Operator Services is [redacted]% of directly identified expenses. Additional Investments are not included in the amount this factor is applied against.

3. Determine the Additional Investment Amounts The Additional Investment Amounts are those capital expenditures that were not included in the original investment study for 1997. Associated costs include annual depreciation, an after tax return of [redacted]%, property taxes and income tax.

4. Determine the Common Cost. The common cost is determined by multiplying Sprint - Florida, Inc. common cost factor of [redacted] by the sum of direct, other direct, and additional costs.

5. Determine the Demand. The demand is based on the actual volumes of Directory Assistance position seizures in 1997.

6. Determine the Toll and Local Assistance Service (Live) TSLRIC per call. The sum of direct costs, other direct costs, additional investment costs, and common costs are divided by the demand (step 5) to determine the Toll and Local Assistance Service (Live) cost per initial position seizure. The result is:

Cost for Toll and Local Assistance : $.414 per initial position seizure

Company: Sprint - Florida, Inc.

Service: 911 Tandem Ports and Trunks

Service Cost Type: Network Element
Ports, TSLRIC
Trunks

Service Description

Sprint, as the ILEC, may be the lead company providing 911 selective routing service to an emergency response agency. Where this is the case, the CLEC will need to provision, based on Florida Law, adequate trunks from the CLEC switch to the Sprint - Florida, Inc. selective routing tandem. The ports portion of this cost study is the cost for 911 tandem ports per DS0 or equivalent.

The Trunking from the CLEC switch to the Sprint - Florida, Inc. 911 tandem is provided based on transport pricing from the Interstate Access Tariff for Sprint - Florida, Inc..

Major Cost Areas and Sources for Port Costs

The cost for the ports is predominately the installed cost of Subscriber Module Urban (SMU)Units on the DMS 911 Tandem. Because 911 is an emergency service these are redundant to accommodate a minimum of two diverse routes to the CLEC or other LEC end offices.

Cost Development Methodology

1. Identify Direct Costs The direct cost for NORTEL Subscriber Modules plus the cost of Engineering and installation was identified. The SMUs were depreciated over a 7 year life.

2. Identify Other Direct Costs Other Direct Costs were determined by multiplying the costs identified in step 1 above by the Indirect Investment Related and Common Cost Factors Study carry factor for Local Switching of [redacted].

3. Identify Common Costs Common Costs were determined by multiplying the sum of the costs identified in step 1 and step 2 above by the Indirect Investment Related and Common Cost Factors Study Common Cost carry factor for Local Switching of [redacted].

4. Determine Demand - Demand was determined based on the utilization of the capacity of 480 DS0 equivalents for the two SMUs times a utilization factor of [redacted] percent. The current fill is 100 of the 480 circuits for all central offices.

5. Determine the Cost per Port The Cost per DS0 equivalent 911 Tandem port was determined by multiplying the utilization factor times the capacity of the ports, then dividing the result into the Total Annual Costs for the port and diving the result by 12.

The result is:

$15.81 per DS0 equivalent

CLEC Cost Per 911 Tandem Port or DS0 Equivalent Sprint - Florida, Inc.

ANNUAL CHARGE FACTORS

ANNUAL CHARGE FACTORS

The purpose of an annual charge factor is to convert an investment amount into an annual recurring cost that includes capital recovery, cost of capital, ad valorem taxes, and direct maintenance expenses. The annual recurring cost is then divided by twelve to derive the monthly recurring cost. Factors were developed for each type of plant included in the TSLRIC studies e.g. digital switching, circuit equipment, underground metallic cable etc. (see Exhibit 1 pg. 1).

The capital element of the annual charge factor includes components such as cost of capital, depreciation, income taxes (including any deferred tax effects) and ad valorem tax(see Exhibit 1 pg. 2).

In order to calculate a single annual charge factor that is applicable throughout the life of the investment, it is necessary to smooth out the year-to-year differences due to capital costs on a declining net investment. This factor, when applied to investment, represents the cash flows (when discounted by the cost of capital) necessary to recover investment and related maintenance expense over the economic life of the plant. An example of the spreadsheet calculations is found in Exhibit 1 pgs. 3-6.

The following assumptions were utilized;

Cost of Capital - The weighted cost of capital utilized is 11.25%, which is the prescribed interstate cost of capital. This cost includes a profit consistent with Section 252(d)(1)(B)of the Act which states that rates for network elements "may include a reasonable profit.

Depreciation - Forward looking economic depreciation lives are used as shown on Exhibit 1 pg. 1.

Taxes - The income tax rate utilized is a blended rate of 38.53% which consists of a federal tax rate of 35% and state tax rate of 5.5%. The Ad Valorem and PUC tax is .92%. All deferred tax amounts were developed using MACRS Class of Plant lives (see Exhibit 1 pg. 2).

Direct Maintenance Expense - A ratio was developed for each investment category by dividing the associated 1997 maintenance expense by the associated 1997 year end plant balance (see Exhibit 1 pg. 1) Other direct (excluding maintenance which is included in ACFP) and common cost attributable to unbundled network elements are not reflected in the ACFP results, but rather are addressed in the Other Direct and Common Cost study.
