BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

PREPARED DIRECT TESTIMONY

OF

CHARLES R. BLACK

Q. Please state your name, business address, occupation and employer.

A. My name is Charles R. Black. My business address is 702 N. Franklin Street, Tampa, Florida 33602. I am employed by Tampa Electric Company ("Tampa Electric" or "company") as President.

Q. Please provide a brief outline of your educational background and business experience.

A. I am President of Tampa Electric and I am responsible for the overall management of the company. I received a Bachelor of Chemical Engineering degree in 1973 from the University of South Florida and I am a registered Professional Engineer in the State of Florida. I joined Tampa Electric in 1973 and have held various engineering and management positions at Tampa Electric and TECO Power Services, TECO Energy's independent power production operations. In December 1991, I was named

DOCUMENT NUMBER-DATE

06169 JUL 20 5

FPSC-COMMISSION CLERK

1 Vice President, Project Management for Tampa Electric.
2 In that capacity I was responsible for the engineering
3 and construction of Tampa Electric's Polk Station, a
4 first-of-its-kind 255 MW integrated gasification
5 combined cycle ("IGCC") unit. From December 1996
6 through October 2004, I held leadership positions of
7 progressively greater responsibility within the
8 organization. In October 2004, I became President of
9 Tampa Electric.

10

11 **Q.** What is the purpose of your testimony?

12

13 **A.** The purpose of my testimony is to introduce and support
14 Tampa Electric's request for an affirmative
15 determination of need for Polk Unit 6, an IGCC unit with
16 610 MW and 647 MW summer and winter net capacity,
17 respectively. If approved, the new advanced clean coal
18 generating unit will be constructed at Polk Station, the
19 site of Tampa Electric's existing IGCC unit. Polk
20 Station occupies over 2,800 acres on State Road 37 in
21 Polk County, Florida, approximately 40 miles southeast
22 of Tampa and about 60 miles southwest of Orlando.

23

24 **Q.** Please describe how the Polk Station site was originally
25 selected.

1 **A.** The Polk Station site was selected as the result of
2 Tampa Electric's extensive Power Plant Site Selection
3 Assessment Program, which set out in 1989 to select the
4 most suitable location for meeting the company's future
5 power supply requirements. An integral part of the Polk
6 site selection process was the formation and
7 participation of a Siting Task Force composed of 17
8 private citizens from environmental groups, businesses
9 and universities in Tampa Electric's service area and
10 throughout Florida. The company solicited and committed
11 to the task force's participation in the siting program
12 so that local and state public concerns would be
13 addressed. The Siting Task Force met monthly from
14 October 1989 through September 1990 to review and guide
15 the siting process and to make a final recommendation.
16 The recommended site was what is now known as Polk
17 Station. The site currently consists of Polk Unit 1, a
18 255 MW IGCC unit, and Polk Units 2 through 5, four
19 combustion turbines totaling 645 MW.

20
21 Tampa Electric's proposed Polk Unit 6 will provide
22 benefits to 1) our customers by meeting future
23 generation needs in the most cost-effective manner; 2)
24 the state of Florida by improving fuel diversity and
25 security of fuel supply; and 3) the environment by

1 achieving extremely low emissions by utilizing a proven
2 technology that is well positioned to address potential
3 future carbon regulations. All of these benefits will
4 be achieved at a site that was selected by a citizen's
5 task force with overall community support. For Tampa
6 Electric, Polk Unit 6 is clearly the right technology,
7 at the right location, at the right time.

8
9 Tampa Electric's 10 witnesses will present testimony
10 demonstrating that Polk Unit 6 is the most cost-
11 effective alternative for meeting Tampa Electric's need
12 for additional generating capacity, while enhancing the
13 company's fuel diversity of its generating fleet,
14 reducing the impact of fuel price volatility, increasing
15 system reliability and improving the state's
16 environmental profile. Among other things, witnesses
17 will provide a complete analysis of the 2013 generation
18 need considering demand and energy forecasts that take
19 into account comprehensive demand-side management
20 ("DSM") programs and renewable energy alternatives. The
21 analysis considers alternative technologies while
22 focusing on the company's energy mix by fuel type and
23 the need for more fuel diversity. Last, but certainly
24 not least, the analysis considers current and expected
25 future environmental regulations and puts the proposed

1 plant at the lowest emission levels of any other coal
2 facility in Florida.

3

4 **Q.** Why is Tampa Electric proposing to construct Polk Unit
5 6?

6

7 **A.** As the state of Florida continues its rapid population
8 growth, Tampa Electric expects to add almost 164,000 new
9 customers over the next 10 years to its current base of
10 654,000 customers. As discussed in the testimony of
11 witness Lorraine L. Cifuentes, the projected increase in
12 customers and the increase in per-customer demand will
13 increase the company's summer peak by almost 1,200 MW
14 over the next decade. While some of the demand will be
15 met by the company's DSM programs and renewable energy,
16 the projected growth in demand for electricity must also
17 be met through peaking capacity additions and the
18 additional baseload capacity Polk Unit 6 will provide.

19

20 Additionally, as discussed in the testimony of witness
21 Mark J. Hornick, Tampa Electric has 14 years of
22 experience with IGCC technology, beginning with the
23 design, construction and operation of its 255 MW Polk
24 Unit 1, which has been in commercial operation for over
25 10 years. Polk Unit 1 is one of the best known and

1 highly acclaimed power generating units in the world.
2 As discussed in the testimony of witness Michael R.
3 Rivers, the basic configuration of Polk Unit 6 will be
4 similar to Polk Unit 1 with some improvements based on
5 the lessons learned from the operations of Polk Unit 1.
6 Utilization of IGCC technology allows the company to
7 leverage its existing operational experience while
8 diversifying its generation fuel portfolio and providing
9 a cost-effective solution to meet the projected
10 increased customer demand for electricity in an
11 environmentally sensitive way.

12
13 Finally, Polk Unit 6, which will be built on an existing
14 power plant site that was originally selected by a
15 community based task force, supports the company's
16 commitment of balancing the need to be environmentally
17 responsible with the need to provide its customers with
18 reliable, cost-effective electricity. Tampa Electric
19 has taken a leadership role in activities that protect
20 the environment and in 1999, the company committed to a
21 sweeping \$1.2 billion environmental improvement plan to
22 reduce emissions from fossil fuels. Polk Unit 6, which
23 will be one of the cleanest and most efficient solid
24 fuel units in the country, is the next step in the
25 company's on-going efforts towards responsible

1 environmental stewardship.

2

3 **Q.** Have there been any policy recommendations or mandates
4 for utilities to focus on fuel diversity and/or advanced
5 generation technologies?

6

7 **A.** Yes. In 2006, state policymakers took actions to
8 encourage utilities in Florida to pursue increased fuel
9 diversity. Florida's Energy Plan, which addresses the
10 importance of fuel diversity and the need to avoid
11 reliance on any single fuel, was issued on January 17,
12 2006.

13

14 On June 19, 2006, then-Governor Jeb Bush signed into law
15 House Bill 888, which amended the Florida Power Plant
16 Siting Act, Section 403.519, Florida Statutes. The
17 amended law requires the Commission to explicitly
18 consider "the need for fuel diversity and supply
19 reliability" when making a determination of need for new
20 electric generating capacity.

21

22 On June 12, 2007, House Bill 549 was signed into law by
23 Governor Charlie Crist. This legislation amended
24 Section 366.93, Florida Statutes, to add new IGCC
25 technology to the section that allowed advanced cost

1 recovery for siting, design, licensing, and construction
2 of new nuclear power plants. The statute expressly
3 states that the intent is to "promote" and "encourage"
4 investor-owned utility investment in nuclear power and
5 IGCC technology. The law also directs the Commission to
6 consider the balance of fuel diversity when evaluating
7 an IGCC's cost-effectiveness during a determination of
8 need proceeding.

9
10 In addition, the Federal Energy Policy Act of 2005
11 authorized the United States Department of the Treasury
12 to allocate tax credits as incentives to move advanced
13 generation technologies into the marketplace, including
14 certain coal technologies. Congress specifically
15 authorized \$350 million in tax credits for advanced
16 gasification projects. As discussed in the testimony of
17 witness Chrys A. Remmers, Tampa Electric was awarded the
18 maximum Section 48A tax credits of \$133.5 million for
19 its proposed IGCC Polk Unit 6 project. As a result of
20 the tax credits, Tampa Electric's customers will benefit
21 through lower annual revenue requirements.

22
23 Q. Why should Florida and specifically, Tampa Electric,
24 focus on increasing fuel diversity?

25

1 **A.** Fuel diversity provides two key benefits. The first
2 advantage of fuel diversity is greater reliability.
3 Using a wider variety of fuels helps to mitigate the
4 impact of supply disruptions of any one fuel source.
5 Florida learned this lesson in 2004 and 2005 when
6 several hurricanes posed threats to gas supply in the
7 Gulf of Mexico. The second benefit of fuel diversity is
8 mitigation of fuel price volatility. Again, the 2004
9 and 2005 hurricane seasons resulted in daily prices into
10 Florida peaking at \$20.52 per MMBtu. With a more
11 balanced fuel supply portfolio, price spikes have less
12 effect than if the utility's fuel supply were heavily
13 weighted toward one particular fuel.

14
15 **Q.** Please elaborate on the preference for coal and pet coke
16 as the fuel sources for its next baseload unit.

17
18 **A.** In recent years, Tampa Electric, as well as most
19 utilities in Florida, has increased its share of natural
20 gas fired generation. In Tampa Electric's case, this
21 has improved the fuel diversity of the company's
22 generation portfolio. In 2007, the company's energy mix
23 by fuel type is expected to be 45 percent natural gas,
24 49 percent solid fuels and 6 percent fuel oil and other
25 sources.

1 Natural gas prices have increased, relative to the price
2 of coal, in recent years. As discussed in witness Joann
3 T. Wehle's testimony, while fuel prices cannot be
4 predicted with certainty, market conditions indicate
5 that this price differential will be maintained and may
6 even grow in the future. In addition, natural gas
7 prices are much more volatile today than a decade ago,
8 when much of the recent natural gas expansion was
9 planned. Currently, the level and volatility of natural
10 gas market prices, combined with abundant coal reserves,
11 make solid fuels more attractive from a price
12 perspective and a supply reliability standpoint.

13
14 If the Commission approves the construction of Polk Unit
15 6, Tampa Electric's energy mix by fuel type will be 34
16 percent natural gas, 64 percent solid fuels and 2
17 percent fuel oil and cogeneration purchases in 2013.
18 Additional solid fuel-fired generation enhances fuel
19 diversity, reliability and price stability in future
20 years, compared to constructing a new natural gas-fired
21 unit.

22
23 Q. What is the expected effect on Tampa Electric's fuel
24 diversity if the Commission does not approve
25 construction of Polk Unit 6?

1 **A.** If the Commission does not approve the construction of
2 Polk Unit 6, given the timing of Tampa Electric's
3 capacity need and the uncertainty regarding the time
4 frames for the next generation of nuclear units, the
5 only remaining viable option would be the construction
6 of a natural gas-fired unit. The resulting 2013 energy
7 mix by fuel type would be 51 percent natural gas, 47
8 percent solid fuels and 2 percent fuel oil and other
9 sources.

10

11 **Q.** Please describe how Tampa Electric determined that the
12 construction of Polk Unit 6 is the most cost-effective
13 alternative means of meeting Tampa Electric's customers'
14 need for electricity.

15

16 **A.** As explained by witness William A. Smotherman, Polk Unit
17 6 will provide a cumulative net present value savings of
18 more than \$184 million to Tampa Electric customers when
19 compared to a natural gas combined cycle unit and
20 savings of over \$93 million compared to a supercritical
21 pulverized coal unit. This represents cash savings in
22 addition to the benefits of fuel diversity,
23 environmental compliance by providing a technology
24 platform for future carbon capture, and the further
25 development of renewable energy resources that will flow

1 from this project.

2

3 **Q.** What did Tampa Electric consider in its evaluation of
4 the most cost-effective generating alternative?

5

6 **A.** As described in greater detail in witness Smotherman's
7 testimony, Tampa Electric conducted a thorough analysis
8 of all viable demand and supply alternatives, including
9 consideration of operational, strategic, and cost-
10 effectiveness factors. Tampa Electric utilized an
11 integrated resource planning process in the analyses
12 that resulted in the selection of Polk Unit 6 to satisfy
13 its need for additional capacity. After implementing
14 additional demand and energy reduction programs which
15 reduce the system energy and demand requirements, a
16 reliability analysis determined the magnitude and timing
17 of its new resource needs. The company next identified
18 the options available to meet the need, including the
19 self-build option on its existing Polk Station site.
20 The supply alternative analysis included consideration
21 of system concerns such as fuel diversity, as well as
22 consideration of different technology options such as
23 supercritical pulverized coal, circulating fluidized
24 bed, natural gas fired combined cycle and IGCC
25 technology.

1 Q. How will Polk Unit 6 benefit Tampa Electric and its
2 customers?

3
4 A. Polk Unit 6 will provide numerous benefits to Tampa
5 Electric and its customers. Tampa Electric's evaluation
6 of the capacity need incorporated many factors. Given
7 the company's existing generating portfolio and the
8 expected markets for solid fuels, we concluded that
9 solid fuel-fired baseload capacity is the best choice to
10 reliably and cost-effectively meet the expected 2013
11 need. Polk Unit 6 will provide the benefits of greater
12 fuel diversity and increased reliability, while meeting
13 or exceeding environmental requirements.

14
15 Polk Unit 6 will burn solid fuels that are widely
16 available from domestic and international sources and
17 are less susceptible to disruptions from severe weather,
18 or other events, than natural gas. Witness Wehle's
19 testimony, explains that solid fuels are readily
20 available and the Energy Information Administration
21 indicates there are well over 200 years of coal reserves
22 in the United States alone. The use of solid fuels is
23 cost-effective and is expected to mitigate price
24 volatility due to adverse weather or political events in
25 other countries by lessening our company's reliance on

1 natural gas, with its associated volatile pricing, and
2 increasing our reliance on solid fuel, which enjoys
3 historical price stability. The unit will burn natural
4 gas as a backup fuel, which provides reliability
5 enhancements. With the use of the backup fuel, Polk
6 Unit 6 is expected to improve the overall availability
7 from 86 percent to 95 percent. The use of a backup fuel
8 to improve reliability is unique to IGCC technology as
9 compared to other solid fuel technologies.

10
11 Polk Unit 6 will use commercially proven IGCC technology
12 to generate electricity with very low emissions. As
13 described in the testimony of witness Hornick, the IGCC
14 process uniquely allows for the use of an efficient
15 combined cycle system, which optimizes the power output
16 per unit of fuel input or heat rate. By recovering
17 waste heat from the synthesis gas production and the
18 combustion process and converting it to power output,
19 more power can be produced with fewer emissions. The
20 proposed power plant will be one of the cleanest and
21 most efficient planned power plants in the country.

22
23 Q. Why is IGCC technology the most appropriate choice for
24 Tampa Electric?

25

1 **A.** IGCC technology is the most appropriate choice for Tampa
2 Electric because 1) it is the most cost-effective
3 alternative for meeting the company's future need for
4 additional generating capacity; 2) Tampa Electric has
5 used IGCC technology to generate electricity for over 10
6 years, generating more than 13 million MWH of
7 electricity; 3) the fuel flexibility will allow Polk
8 Unit 6 to burn the most cost-effective fuel blends,
9 including biomass, to minimize fuel cost; 4) Tampa
10 Electric's previous experience designing, building,
11 owning and operating an IGCC unit will enhance the
12 operation of Polk Unit 6; 5) the emissions will be much
13 lower than any other conventional coal plant currently
14 planned in the state of Florida; and, 6) the unit design
15 layout provides space for additional equipment that
16 would be needed to meet potential future carbon emission
17 regulations.

18
19 **Q.** Please describe the positive environmental results that
20 will be achieved by Polk Unit 6.

21
22 **A.** Tampa Electric is designing Polk Unit 6 to use proven
23 emission controls, and its air emission rates are
24 expected to be the lowest in comparison to comparable
25 planned projects in Florida. Witness Paul L. Carpinone

1 provides specific information about environmental
2 compliance and comparisons of Polk Unit 6 to the
3 emission rates for comparable projects planned in
4 Florida. Not only will Polk Unit 6 be capable of
5 meeting all current regulatory requirements and permit
6 levels, but Tampa Electric is designing the unit with
7 consideration of potential future CO₂ emission
8 regulations. The design provides space for commercially
9 available and technically proven carbon control
10 equipment to be added should future legislation be
11 passed. This approach will ultimately result in lower
12 costs, compared to retro-fitting other technologies that
13 have not considered carbon capture in the design.

14
15 At this time, IGCC technology is the only coal-based
16 generating technology with commercially proven carbon
17 capture capability. Additionally, Tampa Electric has
18 already begun evaluating the potential for carbon
19 sequestration at its Polk Station site, in conjunction
20 with the University of South Florida and others, and the
21 company will continue those efforts.

22
23 Q. What is Tampa Electric's position regarding greenhouse
24 gas emissions such as CO₂?

25

1 **A.** Tampa Electric, with the support of this Commission,
2 made environmental strides long before focus on global
3 climate change and greenhouse gas emissions became
4 prominent. As a result of our overall environmental
5 improvement program, Tampa Electric's current CO₂
6 emissions are 20 percent lower than in 2000. As
7 discussed in witness Carpinone's testimony, the company
8 believes that any legislation addressing the greenhouse
9 gas emission issue should apply to all industries, while
10 ensuring implementation does not economically
11 disadvantage the United States. Furthermore, the
12 legislation should encourage technology development to
13 address reductions with tax incentives, give credit to
14 companies, like Tampa Electric, who have taken early
15 actions, and support a realistic timeframe for
16 addressing climate change that maintains fuel diversity.

17
18 **Q.** Please describe Tampa Electric's DSM efforts to defer or
19 reduce the need for Polk Unit 6.

20
21 **A.** From the mid-1970s to the present, Tampa Electric has
22 been offering its customers cost-effective DSM programs
23 along with a comprehensive educational emphasis on the
24 efficient use of energy. Tampa Electric is viewed as a
25 national leader for its DSM accomplishments. According

1 to the Energy Information Administration of the United
2 States Department of Energy reports for the 2001 through
3 2005 period, Tampa Electric has ranked nationally in the
4 96th percentile for cumulative energy conservation and
5 the 90th percentile for load management achievements.
6 Through 2006, Tampa Electric has achieved winter and
7 summer cumulative reductions of 659 MW and 222 MW,
8 respectively and 600 GWH of annual energy savings. This
9 amount of peak load reduction has eliminated the need
10 for the equivalent of more than three 180 MW power
11 plants.

12
13 As discussed in the testimony of witness Howard T.
14 Bryant, Tampa Electric recently filed for Commission
15 approval of numerous new and modified DSM programs which
16 will increase winter and summer cumulative reductions in
17 2013 to 707 MW and 263 MW, respectively. Despite all
18 these efforts and given Tampa Electric's projected load
19 growth, the company's proactive DSM initiatives do not
20 eliminate or delay the need for Polk Unit 6.

21
22 Q. Please describe Tampa Electric's efforts to utilize
23 renewable energy sources to meet the projected customer
24 load growth.

25

1 **A.** Tampa Electric recognizes the growing importance of
2 renewable energy as a vital component of its resources
3 utilized to meet customer load. Witness Bryant's
4 testimony describes the company photovoltaic ("PV")
5 arrays which are located on local schools, the company's
6 Manatee Viewing Center and the Tampa Museum of Science
7 and Industry. In May 2007, the company unveiled the
8 largest PV system installed to date, a 10 kW array
9 deployed at a local high school. Tampa Electric also
10 offers a permanent renewable energy program which allows
11 customers the option of paying an additional charge for
12 incremental renewable energy. Finally, in June 2007,
13 the company issued an RFP for renewable energy that
14 seeks new and existing renewable generating sources.

15
16 Tampa Electric also engages in a number of other
17 renewable energy activities aimed at increasing the
18 amount of clean, renewable energy on its system.
19 Annually, the company purchases over 125,000 MWH of
20 renewable energy produced from the waste heat of
21 phosphate production. Tampa Electric also has 42 MW of
22 firm capacity under contract from the municipal solid
23 waste industry. Finally, Tampa Electric is generating
24 renewable energy through a landfill gas facility
25 utilizing a micro-turbine as the generating unit.

1 Q. What is the expected relative rate impact of Polk Unit 6
2 compared to the NGCC alternative?

3
4 A. As discussed in the testimony of witness Smotherman, the
5 projected relative rate impact analysis comparing IGCC as
6 the optimal solid fuel technology to NGCC resulted in the
7 IGCC plan being \$2.72 per MWH higher than the NGCC plan
8 in 2013. This is primarily due to higher capital costs;
9 however, the rate impact for IGCC is estimated to be
10 lower by 2017 and through the balance of the remaining
11 life of the unit due primarily to lower fuel and
12 purchased power costs.

13
14 Q. Please summarize your testimony.

15
16 A. My testimony addresses and supports the need for Polk
17 Unit 6, an IGCC unit with 610 MW and 647 MW summer and
18 winter net capacity, respectively, to meet the projected
19 need for additional generating capacity on Tampa
20 Electric's system in 2013.

21
22 My testimony describes the careful and detailed analysis
23 the company has performed to ensure that Polk Unit 6 is
24 the most cost-effective means of meeting our future
25 capacity needs. I describe the benefits associated with

1 the proposed plant addition including improvements in
2 fuel diversity and reliability along with the
3 environmental benefits of the proven IGCC technology
4 including the compatibility of the plant design layout
5 for potential CO₂ control requirements if required by
6 future legislation.

7
8 I also describe recent state and federal legislation
9 designed to encourage the development of advanced clean
10 coal technology projects like Polk Unit 6, including
11 significant federal tax credit incentives that will help
12 reduce the cost of Polk Unit 6 to our customers.

13
14 Finally, I describe the significant DSM efforts that
15 Tampa Electric has put forth since the mid-1970's in a
16 concerted effort to avoid or defer the need for
17 additional generating capacity, along with the exemplary
18 results those efforts have achieved. I also describe the
19 company's demonstrated commitment to the development and
20 reliance upon renewable energy resources. Even after
21 these DSM and renewable energy efforts and achievements
22 are factored into the analysis, Tampa Electric,
23 nevertheless, will need the planned output of Polk Unit
24 6 in order to meet its customers' demand and energy
25 requirements by 2013.

1 The witnesses who will testify in support of the need
2 for Polk Unit 6 are representatives for an even larger
3 and fully dedicated Tampa Electric team. Our team's
4 charge was to develop the most cost-effective means
5 available for meeting the needs of Tampa Electric's
6 customers and to do so in a manner that is consistent
7 with all applicable statutory criteria, as implemented
8 by this Commission. We believe that the evidence
9 presented by the company demonstrates that Tampa
10 Electric has accomplished this task. I, therefore,
11 respectfully urge the Commission to recognize and
12 approve the need for Polk Unit 6.

13
14 **Q.** Does this conclude your testimony?

15
16 **A.** Yes, it does.
17
18
19
20
21
22
23
24
25
