|         | Combined Uranium<br>(U-234, U-235, & U-238) | 30  | ug/L   | 0.18                    | 1         | EPA 200.8            | 0.031      | 0.031 |                   | 09/15/2009       | 22:45            | E82574                     |

\*\* If the results exceed 5 pC/L, a measurement for radium-226 is required.

\*\*\* If the results exceed 5 pCi/L, a measurement for radium-226 is required. If the results exceed 15 pCi/L, measurements for radium-226 and uranium are required.

""" if uranium (U) is reported as a measurement of activity (pCi/L) it will be converted to a mass measurement (µg/L) by multiplying the result by 1.5.

NOTE: Effective Jenuary 1, 2004, results indicating non-detection with a reported lab MDL >50% of the NCL will not be accepted for compliance with 62-850.310(4)(b).

Reporting Formet 62-850.730 Effective January 1995, Revised January 2004

Page 7 of 7

Tresults must be reported with appropriate qualifiers in accordance with Florida Administrative Code Rute 62-160. Table 1. Results qualified with A, F, H. N.O, T, Z, ?, \*, are unacceptable for compliance with 62-550. Results qualified with a J, Q. R, or Y must be accompanied by written justification and will be evaluated on a case by case basis. To avoid a monitoring violation, unacceptable results must be replaced with acceptable results from samples collected during the same monitoring period.

#### **Tomoka View PWS Flushing Plan**

January 2010

#### Purpose:

The purpose of this flushing program is to maintain quality and appearance of the water in the Tomoka View water distribution system.

#### Intent:

The intent of this plan is to provide guidelines to operations personnel in daily operations. Specific conditions in the distribution system may dictate additional flushing and monitoring.

#### Distribution System Monitoring, Action Levels, & Actions:

Manual conventional flushing may be necessary should conditions dictate in response to water quality parameters approaching the trigger in Table 1, or in response to customer complaints of black or discolored water or taste and odor. In these cases, flushing will be conducted to achieve and maintain goals for the water quality parameters specified in Table 1. The water quality parameters should be tested twice per week at the point of entry and at least two locations in the distribution system and the MRT for a total of four locations.

| Parameter                      | Goals          | Action Level               | Action                                                                                                                                        |
|--------------------------------|----------------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Total Cl <sub>2</sub> Residual | >2 mg/L as Ch  | <2 mg/L as Cl <sub>2</sub> | Flush until residual >2 mg/L as Cl <sub>2</sub>                                                                                               |
| Free NH3-N                     | <0.5 mg/L as N | >0.5 mg/L as N             | Increase plant Cl <sub>2</sub> /NH <sub>3</sub> ratio, start daily<br>monitoring, if not <0.5 mg/L after 2 days flush<br>until <0.5 mg/L as N |
| pH                             | 7.9-8.3        | N/A                        | Monitor                                                                                                                                       |
| NO <sub>2</sub> -N             | <0.1 mg/L as N | >0.1 mg/L as N             | Monitor daily if 0.1 - 0.3 mg/L as N<br>If >0.3 mg/L as N, revert to free chlorine                                                            |

Table 1. Distribution System Action Levels and Actions

#### Automatic Flushing:

The following locations currently have automatic flushing devices installed and shall continue to be programmed to run/flush as indicated:

| Location           | Frequency | Duration per Event |
|--------------------|-----------|--------------------|
| 265 Cherokee Ave   | 2 per day | 1 hour             |
| 380 Seminole Dr.   | 2 per day | 1 hour             |
| 109 Seminole Dr.   | 2 per day | 1 hour             |
| 160 Greenbriar Ln. | 2 per day | 1 hour             |

#### **Unidirectional Flushing:**

. . . .

The following locations shall be manually flushed (unidirectionally) as indicated below until water is visibly clear and an acceptable total chlorine residual is achieved. Flush each section in its entirety before moving to the next section. Refer to the system flushing map for locations of flush points and valves. The system should be unidirectionally flushed twice per year. Additional manual flushing should be performed by section in response to customer complaints or water quality parameter triggers in a particular section.

| Section | Open and<br>Close Valves<br>in this Order<br>Left to Right | Valves to<br>Close   | Hydrant #<br>or<br>B/O #<br>to open | Time to<br>Flush<br>(minute) | Minimum<br>Gallons<br>Flushed | Hydrant<br># or<br>B/O #<br>to<br>Close | Valves to<br>Open    | Special<br>Notes:<br>GPM &<br>PSI |

#### Implementation:

The flushing program will be implemented at the time chloramination goes online in the Tomoka View water system and shall remain in effect while the system is on chloramination.

ŝ

C. Martin

## **Rosalie Oaks Flushing Plan**

#### Purpose:

The purpose of this program is to insure the quality of the potable water provided to the Aqua Utility Florida, Inc. customers in the Rosalie Oaks service area. The population consists of seasonal/weekend customers, therefore proper flushing is important to provide quality water.

#### Intent:

The intent of this program is to provide minimum guidelines to operations personnel in daily operations. Specific conditions in the distribution system and customer complaints may dictate additional flushing and monitoring.

#### Flushing:

The system shall be flushed directionally in the order below every Thursday. At a minimum, each flush point shall flush the volume of water specified.

# Zephyr Shores PWS Flushing Plan

#### Purpose:

The purpose of this flushing program is to maintain quality and appearance of the water in the Zephyr Shores water distribution system.

#### Intent:

The intent of this plan is to provide guidelines to operations personnel in daily operations. Specific conditions in the distribution system may dictate additional flushing and monitoring.

#### Distribution System Monitoring, Action Levels, & Actions:

)UA

Manual conventional flushing may be necessary at any time should conditions dictate in response to water quality parameters approaching the trigger in Table 1, or in response to customer complaints of black or discolored water or taste and odor. In these cases, flushing will be conducted to achieve and maintain chlorine residuals at or above the minimums in Table 1.

#### Table 1. Distribution System Action Levels and Actions

| Parameter     | Goals        | Action Level | Action                            |
|---------------|--------------|--------------|-----------------------------------|
| Free Chlorine | >0.2 mg/L as | <0.2 mg/L as | Flush until residual >0.5 mg/L as |
| Residual      | Cb           | Ch           | Ch                                |

#### **Unidirectional Flushing:**

The second second

4

ч

The following locations shall be manually unidirectionally flushed as indicated below until water is visibly clear and an acceptable chlorine residual is achieved. Completely flush each section in its entirety before moving to the next section. Refer to the system flushing map for locations of flush points and valves. The system should be unidirectionally flushed twice per year or more often as customer complaints or water quality dictates.

#### Implementation:

Nation le la

. . • 5

The flushing program is currently being implemented in the Zephyr Shores water system and shall remain in effect until the system is on chloramination.

# Leisure Lakes PWS Flushing Plan

#### Purpose:

The purpose of this flushing program is to maintain quality and appearance of the water in the Leisure Lakes water distribution system.

#### Intent:

The intent of this plan is to provide guidelines to operations personnel in daily operations. Specific conditions in the distribution system may dictate additional flushing and monitoring.

#### Distribution System Monitoring, Action Levels, & Actions:

UA

Manual conventional flushing may be necessary at any time should conditions dictate in response to water quality parameters approaching the trigger in Table 1, or in response to customer complaints of black or discolored water or taste and odor. In these cases, flushing will be conducted to achieve and maintain chlorine residuals at or above the minimums in Table 1.

#### Table 1. Distribution System Action Levels and Actions

| Parameter     | Goals           | Action Level | Action                            |
|---------------|-----------------|--------------|-----------------------------------|
| Free Chlorine | >0.2 mg/L as    | <0.2 mg/L as | Flush until residual >0.5 mg/L as |
| Residual      | Cl <sub>2</sub> | Cb           | Ch                                |

Docket No. 100330-WS Final Phase II QSM Report Exhibit SC-3, Page 000107 of 000183 Page 2 of 3

#### **Unidirectional Flushing:**

.

• ... • • • •

.

The following locations shall be manually unidirectionally flushed as indicated below until water is visibly clear and an acceptable chlorine residual is achieved. Completely flush each section in its entirety before moving to the next section. Refer to the system flushing map for locations of flush points and valves. The system should be unidirectionally flushed twice per year or more often as customer complaints or water quality dictates.

# Serratia marcescens

From Wikipedia, the free encyclopedia

Serratia marcescens is a species of Gram-negative, rod-shaped bacterium in the family Enterobacteriaceae. A human pathogen, S. marcescens is involved in nosocomial infections, particularly catheter-associated bacteremia, urinary tract infections and wound infections,<sup>[1][2]</sup> and is responsible for 1.4% of nosocomial bacteremia cases in the United States.<sup>[3]</sup> It is commonly found in the respiratory and urinary tracts of hospitalized adults and in the gastrointestinal system of children.

Due to its ubiquitous presence in the environment, and its preference for damp conditions, *S. marcescens* is commonly found growing in bathrooms (especially on tile grout, shower corners, toilet water line, and basin), where it manifests as a pink discoloration and slimy film feeding off ply sphoruscontaining materials or fatty substances such as soap and shampoo residue. Once established, complete eradication of the organism is often difficult, but can be accomplished by application of a bleach-based disinfectant. Rinsing and drying surfaces after use can also prevent the establishment of the bacteria by removing its food source and making the environment less hospitable.

S. marcescens may also be found in environments such as dirt, supposedly "sterile" places, and the subgingival biofilm of teeth. Due to this, and the fact that S. marcescens produces a reddish-orange tripyrrole pigment called prodigiosin, S. marcescens may cause extrinsic staining of the teeth. The biochemical pathway illustrating the production of prodigiosin by S. marcescens is unknown except for the final two steps. In

these steps, a monopyrrole (MAD) and a bipyrrole (MBC) undergo a condensation reaction by way of a condensing enzyme to ultimately form prodigiosin.

# **Pathogenesis**

S. marcescens can cause infection in several sites, including the urinary tract, respiratory tract, wounds, <sup>[3]</sup> and the eye, where it may cause conjunctivitis, keratitis, endophthalmitis, and tear duct infections.<sup>[5]</sup> It is also a rare cause of endocarditis and osteomyelitis (particularly in people who use intravenous drugs recreationally), pneumonia, and meningitis.<sup>[2][3]</sup> Most S. marcescens strains are resistant to several antibiotics because of the presence of R-factors, which are a type of plasmid that carry one or more genes that encode resistance; all are considered intrinsically resistant to ampicillin, macrolides, and first-generation cephalosporins (such as cefalexin).<sup>[2]</sup>

In elkhorn coral, S. marcescens is the cause of the disease known as white pox disease.<sup>[6]</sup> In silkworms, it sometimes occurs as a secondary pathogen in viral flacherie disease.<sup>[citation needed]</sup>

Also in Drosophila research laboratories, infection with S. marcescens is common. It manifests itself as a pink discolouration or plaque in or on larvae, pupae, or the usually starch and sugar-based food (especially when improperly prepared).

# History

Serratia marcescens was discovered in 1819 by Venetian pharmacist Bartolomeo Bizio, as the cause of an episode of blood-red discoloration of polenta in the city of Padua.<sup>[7]</sup> Bizio named the organism four years later in honor of Serafino Serrati, a physicist who developed an early steamboat; the epithet marcescens (Latin for "decaying") was chosen because of the pigment's rapid deterioration (Bizio's observations led him to believe that the organism decayed into a mucilage-like substance upon reaching maturity).<sup>[8]</sup> Serratia was later renamed Monas prodigiosus and Bacillus prodigiosus before Bizio's original name was restored in the 1920s.<sup>[7]</sup>

Until the 1950s, S. marcescens was erroneously believed to be a non-pathogenic "saprophyte", [3] and its reddish coloration was used in school experiments to track infections. It has also been used as a simulant in biological warfare tests by the United States Military. [9][10] On September 26 and 27, 1950, the United States Navy conducted a secret experiment named "Operation Sea-Spray" in which some S. marcescens was released by bursting balloons of it over urban areas of the San Francisco Bay Area in California. Although the Navy later claimed the bacteria were harmless, beginning on September 29 eleven patients at a local hospital developed very rare, serious urinary tract infections and one of these individuals, Edward J. Nevin, died. Cases of pneumonia in San Francisco also increased after S. marcescens was released. [11], [12]

http://en.wikipedia.org/wiki/Serratia marcescens

Docket No. 100330-WS Final Phase II QSM Report Exhibit SC-3, Page 000111 of 000183

Since 1950, S. marcescens has steadily increased as a cause of human infection, with many strains resistant to multiple antibiotics.<sup>[1]</sup> The first indications of problems with the influenza vaccine produced by Chiron Corporation in 2004 involved S. marcescens contamination.

Because of its red pigmentation, caused by expression of the pigment prodigiosin,<sup>[13]</sup> and its ability to grow on bread, *S. marcescens* has been evoked as a naturalistic explanation of Medieval accounts of the "miraculous" appearance of blood on the Eucharist that led to Pope Urban IV instituting the Feast of Corpus Christi in 1264. This followed celebration of a Mass at Bolsena in 1263, led by a Bohemian priest who had doubts concerning transubstantiation, or the turning of bread and wine into the Body and Blood of Christ during the Mass. During the Mass, the Eucharist appeared to bleed and each time the priest wiped away the blood, more would appear. While it is possible that Serratia could generate a single appearance of red pigment, it is unclear how it could have generated more pigment after each wiping, leaving this proposed explanation open to doubt. This event is celebrated in a fresco in the Apostolic Palace in the Vatican City, painted by Raphael.<sup>[14]</sup>

In early 2008 the U.S. Food and Drug Administration (FDA) issued a nationwide recall of one lot of Pre-Filled Heparin Lock Flush Solution USP<sup>[15]</sup>. The heparin IV flush syringes had been found to be contaminated with *Serratia marcescens*, which resulted in patient infections. The Centers for Disease Control (CDC) confirmed growth of *Serratia marcescens* from several unopened syringes of this product.

What is that black "stuff" in my toilet, shower or pet's dish?

Each year, a few Northshore Utility District customers call to ask about a black slimy substance that occasionally forms in moist areas around their home. Customers most frequently observe it in toilet bowls, on the surfaces in shower stalls and bathtub enclosures, in sinks and pet water dishes.

A black fungus or mold is thought to be the cause of the black stuff. The fungus or mold is common inhabitants of our environment. They can be found in many places, including human and animal feces, dust soil, and surface water. The fungus or mold will grow in any moist location where phosphorous containing materials or fatty substances accumulate. Sources of these substances include soap residue in bathing areas, feces in toilets, soap and food residues in pet dishes. The fungus or mold can also grow in locations such as toilets. The chlorine residual will dissipate from the toilet where water is left standing for an extended period of time. The black fungus or mold is not known to cause any waterborne diseases.

Once the fungus or mold is established, it cannot be eliminated entirely. However, periodic and thorough cleaning of the surfaces followed by disinfection with chlorine bleach can control the fungus or mold. Scrub the surfaces with a brush and household cleaner. Disinfect the surfaces with a strong chlorine bleach solution, let stand for 10-20 minutes and thoroughly rinse away with clean water.

To control the growth in the toilet, thoroughly clean the toilet bowl with a brush and a toilet bowl cleaner. Disinfect the toilet bowl rim with a chlorine solution. You may also add a ¼ cup of chlorine bleach to the toilet tank. Let the solution stand for 10-20 minutes. Flush the toilet a couple of times to rinse the disinfectant out of the toilet tank and the toilet bowl.

If you have any questions regarding this mold, please contact Mick Holte our Water Quality Coordinator at (425) 398-4417.

Accountable Management - Responsible Usage

| Why is there chlorine in the water?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | please call our Cus                                | tomer Care Department                         |  |  |  |  |

#### Docket No. 100330-WS Final Phase II QSM Report

BCWS adds in criter to the water to ensure the water is free from Fialman bacterial Page 000115 of 000183 department has installed several chlorine pump stations throughout our service area. On average there are about 0.6 parts per million of chlorine in our water.

# How do I decrease the amount of chlorine in my water (for fish tanks, plant watering, etc.)?

Fill a clean container and leaving it slightly uncovered, allow it to stand overnight. The chlorine will evaporate. To speed up the process, warm the water. Store the dechlorinated water in the refrigerator.

#### Is there is lead in my water?

BCWS follows EPA regulations and guidelines for water system lead testing. Our tests indicate that, system-wide, the lead levels in BCWS's water are below the EPA limits.

However, lead from your home's plumbing can leach into your water. Lead pipes are easily scratched with a house key, leaving a shiny streak. A private laboratory can test a sample of your water to test for lead.

For more information, see:

- EPA's website
- BCWS's Lead and Copper Fact Sheet

#### Why is there fluoride in the water?

Fluoride prevents tooth decay and is essential for proper development of bones and teeth. On average there is 1 part per million of fluoride in our drinking water.

#### What is the hardness level of BCWS's water?

The hardness of the water is usually between 145 and 170 parts per million. This equals 8-9 grains per gallon.

#### What is the pH level of BCWS's water?

The pH of our water usually ranges between 8.8 and 9.4.

#### If my water has an odor, what should I do?

Often odors that appear to be coming from running water are coming from the drain. If it spens that your water has a "sewer gas" odor, fill a glass with water and take it to another room. If the water has no odor in the other room, then the odor is probably coming from the drain. Cleaning the drain will usually correct the problem.

Chlorine odors occur when the residual chlorine disinfectant gases (CiO2) combine with gases given off by common household items. New carpets, paint, flowers, pine wreaths, upholstery, scented soaps and other household products produce gases called VOCs. When the chlorine gas and VOCs combine, you may get a smell that does not smell like either chlorine or the source of the VOC. Some of the most common descriptions of the odors are cat urine, fuel oil or chemicals.

To reduce these odors, try putting a fan in your window to air out your home to reduce the level of VOCs or use a carbon fliter to reduce the level of ClO2.

If you are unable to determine the origin of the odor; please call our Customer Care Department at (513) 887-3066.

#### Why is my water sometimes rusty?

Rusty or yellow water comes from mineral deposits stirred up during hydrant flushing, fire-fighting, line breaks or maintenance. The local fire department lists scheduled hydrant flushing in the newspaper. Try not to use water during these times to avoid pulling deposits into your home's plumbing.

Rusty water will generally clear up within 2-3 hours after the line is repaired or hydrant closed. You will need to run your cold water for several minutes to flush the rusty water from the lines in your house. Try not to run the hot water because that can deposit rust in your hot water tank.

If your laundry gets stained by rusty water, keep it moist. Buy a rust remover and follow the directions on the package.

#### Why does my water look cloudy?

Cloudy or mility-looking water is usually caused by dissolved air bubbles in the water. Air bubbles are harmless and are caused by pressure changes, temperature changes, water that is too hot (above 140° F) and faucet aerators. To check for air bubbles, fill a glass container with water: if

#### http://www.butlercountydes.org/html/drinkingwater/WaterFAQs.cfm

#### Docket No. 100330-WS Final Phase II QSM Report

the cloudiness is caused by air bubbles, it will clear from the bottlinkhibit SC-3. Page 000116 of 000183 top.

#### Why are there particles floating in my water?

Black, brown or rusty particles can be caused by minerals breaking loose during hydrant flushing, line breaks or line maintenance. Flush your lines by running the cold water for several minutes. If the water does not clear, the particles could be coming from breakthroughs in your hot water heater or filter system. Call a licensed plumber to investigate the problem.

If white or tan particles are floating on the surface of the water, the problem may be coming from your hot water heater. The plastic dip tubes in water heaters often disintegrate with pieces going through the plumbing and being trapped in faucet aerators. Call a licensed plumber to investigate the problem.

#### Why is there a pink or black ring in my tollet?

Bacteria, fungus and mold spores normally found in the air cause rings in your toilet bonk. Wet surfaces provide ideal conditions, and the organisms reproduce rapidly, growing together to form a ring. The color of the ring depends on the species of bacteria, mold or lungus.

You can easily remove the rings with a toilet bowl brush and household cleaners. Close the tollet lid to reduce the number of spons and reduce the light needed for growth.

#### What causes pinhole leaks?

Scientists have not yet discovered why pinhole leaks occur. National experts currently think that pitting in pipes can start from many factors, including:

- substandard pipe manufacturing
- improper installation
- Improper electrical grounding
- excess plumbing flux

#### Water Quality

- 1. My water appears milky, cloudy or white, when poured in a class it clears from bottom to top, is it safe to drink?
- 2. Why does my water appear brown or orange, when it is not used for a while?
- 3. Why is our whole neighborhood experiencing brown or orange water coming out of the tap?
- 4. Why is there a black ring inside my toilet bowl?
- 5. What are the particles that are clogging my serator, distwasher hoses, etc.?
- 6. I have a skin rash, is the water to blame?
- 7. Why does my water taste and smell like algae, or grass or dirt?
- 8. Why did all my fish die, after I put fresh water in my aquarlum?
- 9. Why does my water smell like bleach?

My water appears mility, cloudy or white, when poured in a glass it clears from bottom to top, is it safe to drink?

Yes, your water is safe to drink. The cloudiness is simply air. Air-bound water is most frequently seen when the water temperature is colder than the ambient air. This effect may be enhanced when an aerator is attached to the faucet's tap. The presence of air-bound water is not harmful and no action needs to be taken to correct this phenomenon. Back to Top.

Why does my water appear brown or orange, when it is not used for a while?

This is probably due to rust within your internal plumbing at your residence. We suggest you let the water run for a few minutes, until it clears, before use.

Back to Top

Why is our whole neighborhood experiencing brown or orange water coming out of the tap?

Call the water department at 851-4704 or 851-4747. We will check to see if work is being done in your neighborhood. Often, when a nearby hydrant is being used, or vibration from construction activity is occurring, the flow of water in the main is upset or interrupted. This may cause minerals deposited on the walls of the main, to detach and become suspended in the water.

We suggest that you, and your neighbors, run the water for a time. The greater the water usage in your area, the faster the minerals deposited in your water will clear. If possible, run the water from the cold-water tap closest to your water meter. This may prevent these minerals from traveling to other faucets farther along your water pipes. Once the water clears, it may be necessary to remove, and clean any aerators that are attached to you faucets.

What are the particles that are clogging my serator, distorasher hoses, etc.?

Let's do a quick test to see what these particles are. Collect some of these particles and place them in a small cup. Slowly and carefully pour a small amount of household vinegar in this cup. If these particles dissolve in the vinegar, they are probably mineral deposits, it is quite natural

Docket No. 100330-WS Final Phase II QSM Report Exhibit SC-3, Page 000118 of 000183

#### to see small amounts of minerals coming from your water pipes.

But if the particles do not dissolve in vinegar, they may be plastic coming from the "dip tube" in your hot water tank. This broken down "dip tube" material closely resembles mineral deposits, but are much more abundant. When the plastic "dip tube" in a hot water tank begins to disintegrate it may wreak havoc in your plumbing. You will eventually notice a loss of hot water pressure, along with blocked aerators and hoses. The "dip tube" or perhaps the entire hot water tank may need to be replaced. Back to Too.

#### I have a skin rash, is the water to blame?

You may have dry skin, or any number of different skin aliments (e.g. eczema), that become initated when in contact with water. Water does not create these aliments, but the aliments may become worse when it comes in contact with water because instead of hydrating the skin, water may draw moisture away from your skin. Talk to your doctor or pharmacist regarding a remedy.

#### Why does my water taste and smell like algae, or grass or dirt?

During the end of summer through fall you may notice a foul taste and odor in your water. This is an after taste do to the presence of algae in Lake Eria. We do remove, filter and disinfect algae in the production of finished water, but often the aftertaste will remain (see Aesthetic Qualities for details). Despite the taste & odor, your water is perfectly safe to consume. We suggest you place a container of water in your refrigerator. The colder the water, the less noticeable the taste. Back to Top

Why did all my fish die, after I put fresh water in my aquarium?

Tap water contains residual chlorine to keep it disinfected. This residual chlorine is deadly to fish. Before adding tap water to a fish tank it is necessary to dechlorinate the water. This can be achieved by adding a dechlorination agent, available at any pet supply store. You can also collect a quantity of water in an open container, and allow the chlorine to dissipate naturally. Back to Too.

#### Why does my water small like bleach?

This is a normal smell when using tap water. We add chlorine to water to keep it disinfected. At certain times of the year the chlorine smell is more noticeable. This is especially apparent when the water temperature is warmer than air temperature.

Chorine, like all gases, will travel from a warm environment to a colder one. This phenomenon is the driving force of lake effect show as well as chlorine gas in water.

If you find the chlorine smell objectionable, try placing a container of water in your refrigerator overnight. The chlorine will escape and the chlorine odor will be gone. This water should be kept in your refrigerator because it will no longer have chlorine in it to keep it disinfected. Back to Top

#### Rate Structure

In an effort to address affordability in its rate case, Aqua proposed a state-wide uniform rate for both water and wastewater. Also, Aqua proposed a two-tier inclining block rate structure for water, with the second block having a factor of 1.25 times the first block. Under its proposed rate structure, customers throughout the state of Florida would have paid approximately \$40.92 for water and \$88.91 for wastewater for 5,000 gallons. However, the FPSC staff recommended a different rate structure using a grouping of systems. The Commission approved this recommended rate structure which included the most aggressive three-tier inclining block gallonage charges ever approved. The third block begins at 10,000 and has a factor of 3 times the first block. This has caused a great amount of concern on the part of customers throughout the state of Florida. Further, the FPSC created the gallonage charges with 65% of the approved revenue requirement included. Thus, only 35% of the revenue requirement is recovered through the BFC. Finally, the FPSC also took some of the revenue requirement from the wastewater systems and again spread this over the water rates. These three factors taken together, has created very high gallonage charges for Aqua's customers.

## Exhibit H

## Final Quarterly Environmental Compliance Update

## (Report on Warning Letters, Consent Orders and NOVs for the Period October, 2010) through December 2010)

**Chuluota WTP** – The water in the Chuluota region originates in the Floridan aquifer. The water is characteristically difficult to treat for public drinking water purposes due to naturally occurring total organic carbon (TOC) and hydrogen sulfides, which are indigenous in the local water table. As a consequence, residents in the Chuluota area have struggled with water quality issues for more than 30 years.

AUF bought the Chuluota system in 2004 as part of its purchase of Florida Water. Since that time, AUF has collaborated with the FDEP and worked closely with the agency to resolve issues stemming from TOCs and hydrogen sulfides.

In 2009, AUF hired Dr. James Taylor who recommended AUF pilot two treatment systems to address the removal of hydrogen sulfides and TOC. Based on the results of this pilot study, AUF ultimately selected an ion exchange system manufactured by Tonka Water Systems. This system was selected based on its cost effectiveness as well as the effectiveness of the treatment process. The pilot testing showed the process to be very effective in removing both the natural precursors that form TTHMs and the sulfides that contribute to taste and odor in the water. The ion exchange system will not only result in lower TTHMs, it also will reduce the hydrogen sulfide in the well water and improve the taste and odor of the drinking water.

To expedite the construction and meet the consent order timelines, AUF divided the work into two phases. As part of Phase 1, AUF modified the pipe configuration, installed new pumps, and placed into service a 50,000 gallon ground storage tank. The project was designed to add chlorine into the smaller storage tank, reducing the time it has to react with the organics in the water before ammonia is added thereby reducing the formation of TTHMs in the distribution system. Phase 1 was placed in service at the end of February 2010.

Phase 2 consisted of the installation of the ion exchange treatment units and the raw water pipeline from plant 1 to plant 2. Construction began in March 2010. In accordance with the consent order, construction was timely completed with FDEP clearance received June 24, 2010. Thereafter, the new treatment facilities were placed into service.

Once the treatment was optimized, flushing was reduced and the residual disinfection in the distribution system was changed to free chlorine. Sampling shows that the Chuluota water system was in compliance with the TTHM standards for all of 2010.

FDEP closed-out the consent order on December 23, 2010. The closure letter from FDEP is appended as Attachment "1". A follow up inspection by FDEP in January 2011 found no deficiencies. A copy of the inspection report is appended as Attachment "2".

The total cost of the project, including the ion exchange units, the raw water main from plant 1, converting plant 1 to a storage/booster station and all of the modification needed at plant 2 was \$2.3 million.

**Tomoka View Estates WTP** – AUF signed a consent order for this system on December 18, 2009. As indicated in previous reports, AUF completed construction of the Chloramination system which was placed in service in December 2009. The results from the quarterly samples taken from December 2009 to June 2010 and the RAA for the  $2^{nd}$  quarter of 2010 were all well below the TTHM standards AUF has received notification from the Volusia County Health Department that the system has been put on reduced monitoring for TTHMs. The consent order is closed.

Village Water WWTF – Village Water effluent ponds were constructed such that the bottom of the ponds were below ground water table and appear to receive extra ground water associated with the relatively new Polk County Parkway. Pursuant to the consent order, AUF is obligated to identify alternative disposal options for the effluent by May 2011. Before identifying a viable solution, AUF explored a number of potential options including connecting with Polk County and the City of Lakeland for effluent disposal. Although AUF has had multiple meetings with the City of Lakeland and Polk County officials, it could not overcome the political, engineering, high cost challenges of delivering the treated effluent to either entity.

Following those efforts, AUF has now identified a viable solution for effluent reuse and is negotiating an agreement with a nearby property owner. AUF expects the site will accommodate all of the treated effluent and has drafted a proposed 20 year agreement for the use of the land. AUF has also engaged Andreyev Engineering Inc. to conduct and analyze soil borings and BESH Engineering Inc to design and permit the spray field. AUF anticipates having the spray field operational by November 2011. Meanwhile, AUF has installed monitoring wells around the percolation ponds and is monitoring in accordance with consent Order. To date, that monitoring has revealed no adverse impacts.

Jasmine Lakes WWTF – Three of the four effluent disposal ponds at Jasmine Lakes were constructed prior to the regulations requiring separation from the prevailing ground water table and periodic drying and scarifying. Such ponds are routinely "grandfathered"

under the old regulations. In December of 2002 FDEP began citing the previous owners for the ponds not drying. The previous owners and AUF explored several strategies to dry the ponds, none of which were successful. AUF agreed to dredge the ponds in 2009 to remove accumulated sediment as an alternative to drying and scarifying. A careful review of Rule 62-610.100(9), F.A.C. supported Aqua's position that the ponds were "grandfathered" under the prior rules and thus were not required to be dried. AUF and FDEP have completed extensive hydrogeologic studies of ponds that demonstrate that they are performing as designed. After prolonged negotiations, FDEP and AUF entered into a settlement agreement whereby FDEP has issued a short form consent order. This case is closed. A copy of the FDEP consent order closure letter is appended as Attachment "3".

**Palm Terrace WWTF** – Similar to the Jasmine Lakes ponds discussed above, the Palm Terrace ponds were constructed around the same time with the same disposal strategies. FDEP initially issued a warning letter asserting that the percolation ponds in this system needed to comply with new FDEP rules. However, a consent order was never issued because FDEP now understands that these ponds were "grandfathered" under the prior rules similar to the Jasmine Lakes matter. As a result, this issue has been resolved and is considered closed.

Subsequently, FDEP has issued a new 5 year permit renewal for operating the WWTP, which included language indicating that this system is "grandfathered", thus remedying the issue identified in the previous warning letter. The newly issued permit includes language that does not require the drying of the ponds. As part of the permit conditions, AUF installed a cross-over pipe between ponds 1 & 2. The two percolation ponds and the spray field are permitted and designed to take the permitted flows from this facility.

**Sunny Hills WTP** – On December 2, 2010, AUF and FDEP executed a consent order for this system which addresses ground storage capacity, system configuration and other issues. See Attachment "4". When AUF became aware of the issues that prompted the consent order, it retained the services of Hatch Mott McDonald Consulting Engineers ("Hatch Mott") to inspect the tanks for compliance and evaluate the current ground storage capacity. Hatch Mott completed its evaluation, finalized design, and submitted to the FDEP a permit application to interconnect plant 1 and plant 4 with the storage tank. In the event either well is out of service the storage tank will remain in service thus continuing to improve reliability to the customer. The consent order provides that the project is to be completed within 120 days of issuance of permits by FDEP. AUF is complying with all terms and timelines in the consent order. AUF fully expects to complete the storage tank project this year.

While not part of the consent order, as part of AUF's Original Aesthetics Program, it directed Hatch Mott to conduct a pilot sequestering study to determine whether the addition of a sequestering agent to the treatment process will reduce aesthetic concerns

3

related to iron in the water. The study proved that levels of iron in the water can be sequestered so Hatch Mott prepared a design and permit package for FDEP's approval. AUF received project clearance from FDEP on June 21, 2010. This sequestering treatment is working very well.

**Peace River Heights WTP** – AUF met with FDEP staff on November 9, 2009 to discuss the warning letter regarding an alleged gross alpha exceedance. Since that meeting, AUF sent split samples to several independent laboratories and had Wisconsin State Laboratory for Hygiene conduct a very thorough analysis of samples from this system. AUF's testing conducted by independent laboratories demonstrated that the original exceedance of the Gross Alpha MCL was an artifact of the analytical method. The system has been in compliance with all radiological limits for all of 2010. However, levels of naturally occurring Combined Radium are close to the MCL. FDEP issued a consent order requiring special bi-monthly sampling for Gross Alpha and Combined Radium for two years. The consent order set a trigger for implementation of treatment if two of twelve individual test results exceeded the trigger. AUF signed the consent order on June 24, 2010.

AUF has been performing the required bi-monthly monitoring while also conducting a pilot study with ion exchange for radium treatment The pilot testing has been completed and demonstrated that the treatment would work if the conditions of the consent order are triggered requiring installation of treatment. AUF is proceeding with preliminary design for treatment so that plans can be filed expeditiously if the trigger is exceeded. Part of the engineering evaluation has been the installation of a flow chart recorder to gather information on system demand to optimize the sizing of treatment, storage and pumps if treatment is needed The bi-monthly sampling began July of 2010 with the results currently not triggering treatment. The bi-monthly sampling is required to continue for two years.

South Seas WWTF – This facility was constructed with four bolted glass-lined steel tanks - one for flow equalization and three for reject water tanks. Because of the very aggressive environment (from the wastewater and salt spray from the Gulf), these tanks had deteriorated in the years since the plant was built. Hurricane Charlie in 2004 also cause substantial damage at the plant and the golf course used for disposal.

AUF made repairs to the tanks on several occasions, and installed disk filters to replace old sand filters and improve the quality of the effluent for reuse.

AUF received a warning letter on February 25, 2010 regarding a leak at the facility's reject storage tanks, which AUF had previously reported to the FDEP. Prior to receiving the warning letter, AUF had already contacted contractors to evaluate the flow equalization tank and the 3 reject storage tanks at the facility. Subsequently, the flow equalization tank failed resulting in a spill of raw wastewater. Aqua had temporary

4

repairs made to the tank and initiated plans to replace all four tanks. FDEP issued a proposed draft Consent Order to replace the tanks and make other upgrades. That draft consent order has not been finalized, but Aqua has replaced all four storage tanks at a cost of over \$400,000.

Jungle Den WTF - This is a consecutive water system that purchases bulk water from St. John's River Utility("SJRU"). SJRU was required to install a new chloramination treatment system and AUF was required to notify customers that it's bulk supplier was moving to a new treatment system. AUF provided that notice to customers after SJRU's new treatment system became operational. In November of 2010 FDEP emailed AUF that it had failed to issued notice before SJRU placed its new system into service. AUF is working with FDEP and expects the agency to issue a short form consent order in the first part of 2011.

Other: Except as set forth herein, as of December 31, 2010 AUF has no NOVs from the FDEP or FDOH, and no new consent orders from those agencies.

Seminole County - PW Chuluota Water System PWS ID # 3590186 Consent Crder – OGC Case No. 06-2432 Case Closure

Dear Mr. Lihvarcik:

The above-referenced enforcement case is closed by this office effective December 22, 2010. Department records indicate that the Consent Order requirements have been met. Our records show that the last two quarters of total trihalomethanes (TTHMs) and haloacetic acids (five) (HAA5s), and odor results were below the maximum contaminant levels (MCLs).

Public notice is no longer required, because the running annual average for TTHMs and HAA5s is currently below the MCLs. Please continue to conduct routine (annual) monitoring for TTHMs and HAA5s. The next annual compliance monitoring for TTHMS and HAA5s shall be conducted during July through September 2011. Odor sampling shall be conducted during 2012.

Thank you for your cooperation. You may email Nathan Hess at <u>Nathan.Hess@dep.state.fl.us</u>, or contact him by phone at (407) 893-3988, should you have any further questions.

Sincerely,

mishanne C. Leward

Dear Mr. Lihvarcik:

This confirms a visit to the subject public water system on January 25, 2011, by Nathan Hess to conduct a sanitary survey inspection. A copy of the sanitary survey inspection report is attached for your reference and records.

There were no deficiencies at your water plant at the time of our visit. The overall operation of the water plant was good, which is a credit to both you and your operator. The Department appreciates the excellent work being done on your water system and values your continued spirit of cooperation in complying with Department rules.

If you have any questions, please contact Nathan Hess by e-mail at Nathan. Hess@dep.state.fl.us or by phone at (407) 894-7555, extension 2276.

Sincerely,

Kim Dodson, Program Manager Drinking Water Compliance and Enforcement

## **COMMENTS/REMINDERS:**

- 1. Water treatment plant one is no longer viewed by the Department as an active water treatment plant:
  - Submission of monthly operation reports (MORs) for water treatment plant one and the MOR summation page are no longer required.
  - All point of entry (POE) sampling is to be conducted at the POE for water treatment plant two.
  - Only one maximum residence time (MRT) location is required to be sampled for Stage 1 Disinfectant/Disinfection Byproduct Rule sampling.
- 2. Water Treatment plant two has been approved for four log virus removal/inactivation. Beginning with the February 2011 MOR, CT calculations will be required. Failure to meet the required CT for more than four hours will result in a treatment technique violation.

Re: Proposed Settlement of Aqua Utilities Florida, Inc. OGC File No. 07-1021 Jasmine Lake S/D WWTF Facility ID No. FLA012768 Pasco County

Dear Mr. Lihvarcik:

The purpose of this letter is to complete the resolution of the matter previously identified by the Department in the Warning Letter No. WL07-0002DW51SWD, dated March 8, 2007, a copy of which is attached. The Department finds that Aqua Utilities Florida, Inc. was in violation of Florida Rules and Statutes. In order to resolve the matters identified, Aqua Utilities Florida, Inc. is assessed civil penalties in the amount of \$21,500.00 for violation of Rules 62-520.400 and 62-601.500(2), Florida Administrative Code, in accordance with Section 403.141(1), Florida Statutes, along with \$1,500.00 to reimburse the Department costs, for a total of \$23,000.00.

The Department is not assessing civil penalties for violations of Rule 62-600.410(6) or Rule 62-610.523(4), Florida Administrative Code. Fursuant to Rule 62-610.100(9)(b), Florida Administrative Code, the Facility is an "existing installation" since the facility had on file with the Department an approved permit on or before April 5, 1989. Existing installations are not required to comply with Rules 62-610.523(4), (6) and (7), Florida Administrative Code. Furthermore, pursuant to Rule 62-522.200(1), Florida Administrative Code, the Facility is an "existing installation" since the Facility had on file with the Department a complete application for a permit on or before January 1, 1983. Pursuant to Rule 62-522.300(8), Florida Administrative Code, existing installations discharging to Class G-II ground water are exempt from compliance with secondary drinking water standards outside of a zone of discharge obtained by Department permit.

The Department acknowledges that the payment of these civil penalties by Aqua Utilities Florida, Inc. does not constitute an admission of liability. This payment must be made payable to the Department of Environmental Protection by cashier's check or money order and shall include the OGC File Number assigned above and the notation "Ecosystem Management and Restoration Trust Fund". Payment shall be sent to the Department of Environmental Protection, 13051 North Telecom Parkway, Temple Terrace, Florida, 33637-0926, within 30 days of your signing this letter.

> "More Protection, Less Process" www.dep.state.fl.us

Proposed Settlement of Warning Letter No. WL07-0002DW51SWD OGC File No. 07-1021 Pasco County Page 2 of 4

Your signing this letter constitutes Aqua Utilities Florida, Inc.'s acceptance of the Department's offer to resolve this matter on these terms. If you elect to sign this letter, please return it to the Department at the address indicated. The Department will then countersign the letter and file it with the Clerk of the Department. When the signed letter is filed with the Clerk, the letter shall constitute final agency action of the Department, which shall be enforceable pursuant to Sections 120.69 and 403.121, Florida Statutes.

If you do not sign and return this letter to the Department at the District address by September 15, 2010, the Department will assume that Aqua Utilities Florida, Inc. is not interested in settling this matter on the above-described terms, and will proceed accordingly. None of Aqua Utilities Florida, Inc.'s rights or substantial interests are determined by this letter unless you sign it and it is filed with the Department Clerk.

#### NOTICE OF RIGHTS

Persons who are not parties to this Consent Order but whose substantial interests are affected by this Consent Order have a right, pursuant to Sections 120.569 and 120.57, Florida Statutes, to petition for an administrative hearing on it. The Petition must contain the information set forth below and must be filed (received) at the Department's Office of General Counsel, 3900 Commonwealth Boulevard, MS-35, Tallahassee, Florida 32399-3000, within 21 days of receipt of this notice. A copy of the Petition must also be mailed at the time of filing to the District Office named above at the address indicated. Failure to file a petition within the 21 days constitutes a waiver of any right such person has to an administrative hearing pursuant to Sections 120.569 and 120.57, Florida Statutes.

The petition shall contain the following information:

(a) The Department's Consent Order identification number and the county in which the subject matter or activity is located; (b) The name, address, and telephone number of each petitioner; the name, address, and telephone number of the petitioner's representative, if any, which shall be the address for service purposes during the course of the proceeding; (c) An explanation of how the petitioner's substantial interests will be affected by the Consent Order; (d) A statement of when and how the petitioner received notice of the Consent Order; (e) A statement of all material facts disputed by petitioner, if any; (f) A statement of the specific facts the petitioner contends warrant reversal or modification of the Consent Order; (g) A statement of which rules or statutes the petitioner contends require reversal or modification of the Consent Order; and (h) A statement of the relief sought by the petitioner, stating precisely the action petitioner wishes the Department to take with respect to the Consent Order.

If a petition is filed, the administrative hearing process is designed to formulate agency action. Accordingly, the Department's final action may be different from the position taken by it in this Notice. Persons whose substantial interests will be affected by any decision of the Department with regard to the subject Consent Order have the right to petition to become a party to the proceeding. The petition must conform to the requirements specified above and be filed (received) within 21 days of receipt of this notice in the Office of General Counsel at the above address of the Department. Failure to petition within the allowed time frame constitutes a waiver of any right such person has to request a hearing under Sections 120.569 and 120.57, Florida Statutes, and to participate as a party to this proceeding. Any subsequent intervention will only be at the approval of the presiding officer upon motion filed pursuant to Rule 28-106.205, Florida Administrative Code.

Mediation under Section 120.573, Florida Statutes, is not available in this proceeding.

Re: Warning Letter No. WL07-0002DW51SWD Jammine Lakes WWIF Pacility ID No. FLA012768 Pasco County

Dear Mr. Lihvarcik:

The purpose of this letter is to advise you of possible violations of law for which you may be responsible and to seek your cooperation in resolving the matter. A field importion conducted on February 22, 2007 and a subsequent file review of the Jeaning Lakes Wastewater Treatment Facility ("Facility") indicates that a violation of Florida Statutes and Rules may exist at the above-referenced facility. Department of Environmental Protection personnel observed the following:

- The Part IV rapid-rate percolation pand system was not being operated properly. The four
  percolation ponds were hydraulically loaded to the point that prevents the ponds from functioning
  as intended. Rule 62-600.410(6), Florida Administrative Code (F.A.C.), provides that all
  facilities and equipment necessary for the treatment, reuse and disposal of domestic wastewater
  and domestic wastewater residuals shall be maintained, at a minimum, so as to function as
  intended.
- 2. The operator's log indicated that two of the four percolation pouls had not received any effluent over the past 12 months, yet both pouls remained wet. Rule 62-610.523 (4), P.A.C., provides that hydraulic loading periods of one to seven days, with resting periods of five to 14 days to dry the pouls are required.
- 3. Ground water monitoring data submitted from the first quarter 2005 through the fourth quarter 2006 indicated that compliance well limit values were exceeded for sodium, in MWC-02, from the third quarter 2005 through the fourth quarter 2006 and for chloride in the fourth quarter 2005 and third quarter 2006. In addition, MWC-02 exceeded the ammonia value in the fourth quarter 2006. Rule 62-520.400, F.A.C., provides that ground water minimum criteria shall be met within the sone of discharge.
- 4. Ground water monitoring data submitted from the first quarter 2005 through the fourth quarter 2006 indicated that compliance well limit values were exceeded for sodium, in MWC-03, in the second and fourth quarters 2005, and the first, second and third quarters 2006 and for chloride in the second and fourth quarters 2005 and third quarter 2005. In addition, MWC-03 exceeded the

vs.

Aqua Utilities Florida, Inc. (Respondent) IN THE OFFICE OF THE NORTHWEST DISTRICT

OGC FILE NO. 10-2288-67-PW

## CONSENT ORDER

This Consent Order ("Order") is entered into between the State of Florida Department of Environmental Protection ("Department") and Aqua Utilities Florida, Inc. ("Respondent") to reach settlement of certain matters at issue between the Department and Respondent.

The Department finds and Respondent admits the following:

1. The Department is the administrative agency of the State of Florida having the power and duty to protect Florida's water resources and to administer and enforce the provisions of the Florida Safe Drinking Water Act, Sections 403.850, <u>et seq.</u>, Florida Statutes ("F.S."), and the rules promulgated and authorized in Title 62, Florida Administrative Code ("F.A.C."). The Department has jurisdiction over the matters addressed in this Order.

2. Respondent is a person within the meaning of Section 403.852(5), F.S.

3. Respondent is the owner and operator of a community water system, Sunny Hills Utilities (PWS ID No. 1670647), located at 3810 Gables Boulevard, Sunny Hills, Washington County, Florida ("System"). The System is comprised mainly of two groundwater wells (Well 1 and Well 4), which discharge to separate treatment, but which supply a common distribution system ("Well 1/Well 4 System"). Another well (Well 5) and treatment plant also supply a distant portion of the Sunny Hills community via an entirely separate distribution system ("Well 5 System"). The Well 5 System is regulated by the Department under the same PWS ID number as the Well 1/Well 4 System, but is separate from it and is not the subject of this Order.

4. The Department finds that the following violations occurred:

PW\_CO

REV. 06/09

a) Failure to provide a total useful finished-water storage capacity of at least 25 percent of the system's maximum-day water demand as required under Section 62-555.320(19)(a), F.A.C. Contributing to the violation are two factors: 1) insufficient total storage tank volume, and 2) the inability of Well 4 to fill tanks located at Well 1 due to current system configuration;

b) Failure to provide satisfactory results of a 20 sample bacteriological well survey before placing Well 1 into permanent service after having been out of operation for more than six months, as required under Section 62-555. 315(6)(b), F.A.C.;

c) Failure to perform routine and nitrate/nitrite monitoring and raw bacteriological monitoring of the water produced by Well 1 when it was producing water for public consumption in July 2007 and August 2007, as required under Rules 62-550.500, 62-550.512, and 62-550.518(2), F.A.C..

Having reached a resolution of the matter Respondent and the Department mutually agree and it is

#### **ORDERED:**

5. Respondent shall comply with the following corrective actions within the stated time periods:

a) By October 1, 2010, Respondent shall retain the services of a professional engineer, registered in the State of Florida, to evaluate the System and make recommendations that would correct the system configuration in order to allow Well 4 to fill any tanks within the Well 1/Well 4 System, and shall submit an application, along with any required application fees, to the Department for a permit for construction needed to implement the recommendations of the engineer.

b) By February 15, 2011, Respondent shall retain the services of a professional engineer, registered in the State of Florida, to evaluate the System and make recommendations for modifications to the system that would address the storage capacity violation by increasing total Well 1/Well 4 storage capacity to a level which at a minimum PW CO REV. 06/09

complies with the requirements noted in Rule 62-555.320(19)(a) and (b), F.A.C., and shall submit an application, along with any required application fees, to the Department for a permit for construction needed to implement the recommendations of the engineer.

c) If the Department requires additional information, modifications, or specifications to process the permit applications described in subparagraphs (5)(a) and (5)(b), above, the Department will issue a written request for information ("RFI") to Respondent. Respondent shall submit the requested information in writing to the Department within 15 days of receipt of the request. Respondent shall provide all information requested in any additional RFIs issued by the Department within 15 days of receipt of each request. Within 60 days of the Department's receipt of the applications described in subparagraphs (5)(a) and (5)(b), above, Respondent shall provide all information necessary to complete the application.

d) Within 120 days of issuance of any required permits described in subparagraphs (5)(a) and (5)(b), above, Respondent shall complete the permitted modifications and submit a Certification of Completion for each permit, prepared and sealed by a professional engineer registered in the State of Florida, along with all supporting documentation. Respondent shall not place the system modifications into service until Respondent receives written Department clearance.

6. Within 30 days of the effective date of this Order, Respondent shall pay the Department \$2,095.00 in settlement of the regulatory matters addressed in this Order. This amount includes \$1,595.00 for civil penalties and \$500.00 for costs and expenses incurred by the Department during the investigation of this matter and the preparation and tracking of this Order. The civil penalties are apportioned as follows: \$500.00 for violation of Rule 62-555. 315(6)(b), F.A.C.; \$500.00 for violation of Rule<u>5</u> 62-550.500, 62-550.512, and 62-550.518(2), F.A.C.; and \$595.00 for the value of the economic benefit of non-compliance for missed sampling.

7. Respondent agrees to pay the Department stipulated penalties in the amount of \$100.00 per day for each and every day Respondent fails to timely comply with any of the requirements of paragraph 5 of this Order. The Department may demand stipulated penalties

PW\_CO

REV. 06/09

at any time after violations occur. Respondent shall pay stipulated penalties owed within 30 days of the Department's issuance of written demand for payment, and shall do so as further described in paragraphs 8 and 9, below. Nothing in this paragraph shall prevent the Department from filing suit to specifically enforce any terms of this Order. Any stipulated penalties assessed under this paragraph shall be in addition to the civil penalties agreed to in paragraph 6 of this Order.

8. Respondent shall make all payments required by this Order by cashier's check or money order. Payment instruments shall be made payable to the "Department of Environmental Protection" and shall include both the OGC number assigned to this Order and the notation "Ecosystem Management and Restoration Trust Fund."

9. Except as otherwise provided, all submittals and payments required by this Order shall be sent to Department of Environmental Protection, Northwest District Office, 160 Governmental Center, Pensacola, Florida 32502-5794.

10. Respondent shall allow all authorized representatives of the Department access to the Facility and the Property at reasonable times for the purpose of determining compliance with the terms of this Order and the rules and statutes administered by the Department.

11. In the event of a sale or conveyance of the Facility or of the Property upon which the Facility is located, if all of the requirements of this Order have not been fully satisfied, Respondent shall, at least 30 days prior to the sale or conveyance of the Facility or Property, (a) notify the Department of such sale or conveyance, (b) provide the name and address of the purchaser, operator, or person(s) in control of the Facility, and (c) provide a copy of this Order with all attachments to the purchaser, operator, or person(s) in control of the Facility. The sale or conveyance of the Facility or the Property does not relieve Respondent of the obligations imposed in this Order.

12. If any event, including administrative or judicial challenges by third parties unrelated to Respondent, occurs which causes delay or the reasonable likelihood of delay in complying with the requirements of this Order, Respondent shall have the burden of proving the delay was or will be caused by circumstances beyond the reasonable control of Respondent

REV. 06/09

PW\_CO

. . . . .

and could not have been or cannot be overcome by Respondent's due diligence. Neither economic circumstances nor the failure of a contractor, subcontractor, materialman, or other agent (collectively referred to as "contractor") to whom responsibility for performance is delegated to meet contractually imposed cleadlines shall be considered circumstances beyond the control of Respondent (unless the cause of the contractor's late performance was also beyond the contractor's control). Upon occurrence of an event causing delay, or upon becoming aware of a potential for delay, Respondent shall notify the Department by the next working day and shall, within seven calendar days notify the Department in writing of (a) the anticipated length and cause of the delay, (b) the measures taken or to be taken to prevent or minimize the delay, and (c) the timetable by which Respondent intends to implement these measures. If the parties can agree that the delay or anticipated delay has been or will be caused by circumstances beyond the reasonable control of Respondent, the time for performance hereunder shall be extended. The agreement to extend compliance must identify the provision or provisions extended, the new compliance date or dates, and the additional measures Respondent must take to avoid or minimize the delay, if any. Failure of Respondent to comply with the notice requirements of this paragraph in a timely manner constitutes a waiver of Respondent's right to request an extension of time for compliance for those circumstances.

13. The Department, for and in consideration of the complete and timely performance by Respondent of all the obligations agreed to in this Order, hereby conditionally waives its right to seek judicial imposition of damages or civil penalties for the violations described above up to the date of the filing of this Order. This waiver is conditioned upon Respondent's complete compliance with all of the terms of this Order.

14. This Order is a settlement of the Department's civil and administrative authority arising under Florida law to resolve the matters addressed herein. This Order is not a settlement of any criminal liabilities which may arise under Florida law, nor is it a settlement of any violation which may be prosecuted criminally or civilly under federal law. Entry of this

REV. 06/09

PW\_CO

Order does not relieve Respondent of the need to comply with applicable federal, state, or local laws, rules, or ordinances.

15. The Department hereby expressly reserves the right to initiate appropriate legal action to address any violations of statutes or rules administered by the Department that are not specifically resolved by this Order.

16. Respondent is fully aware that a violation of the terms of this Order may subject Respondent to judicial imposition of damages, civil penalties up to \$10,000.00 per day per violation, and criminal penalties.

17. Respondent acknowledges and waives its right to an administrative hearing pursuant to sections 120.569 and 120.57, F.S., on the terms of this Order. Respondent also acknowledges and waives its right to appeal the terms of this Order pursuant to section 120.68, F.S.

18. No modifications of the terms of this Order will be effective until reduced to writing, executed by both Respondent and the Department, and filed with the clerk of the Department.

19. The terms and conditions set forth in this Order may be enforced in a court of competent jurisdiction pursuant to sections 120.69 and 403.121, F.S. Failure to comply with the terms of this Order constitutes a violation of section 403.161(1)(b), F.S.

20. This Consent Order is a final order of the Department pursuant to section 120.52(7), F.S., and it is final and effective on the date filed with the Clerk of the Department unless a Petition for Administrative Hearing is filed in accordance with Chapter 120, F.S. Upon the timely filing of a petition, this Consent Order will not be effective until further order of the Department.

21. Persons who are not parties to this Consent Order, but whose substantial interests are affected by it, have a right to petition for an administrative hearing under sections 120.569 and 120.57, Florida Statutes. Because the administrative hearing process is designed to formulate final agency action, the filing of a petition concerning this Consent Order means that

REV. 06/09

PW\_CO

the Department's final action may be different from the position it has taken in the Consent Order.

The petition for administrative hearing must contain all of the following information:

- a) The OGC Number assigned to this Consent Order;
- b) The name, address, and telephone number of each petitioner; the name, address, and telephone number of the petitioner's representative, if any, which shall be the address for service purposes during the course of the proceeding;
- c) An explanation of how the petitioner's substantial interests will be affected by the Consent Order;
- d) A statement of when and how the petitioner received notice of the Consent Order;
- e) Either a statement of all material facts disputed by the petitioner or a statement that the petitioner does not dispute any material facts;
- A statement of the specific facts the petitioner contends warrant reversal or modification of the Consent Order;
- g) A statement of the rules or statutes the petitioner contends require reversal or modification of the Consent Order; and
- h) A statement of the relief sought by the petitioner, stating precisely the action petitioner wishes the Department to take with respect to the Consent Order.

The petition must be filed (received) at the Department's Office of General Counsel, 3900 Commonwealth Boulevard, MS# 35, Tallahassee, Florida 32399-3000 within 21 days of receipt of this notice. A copy of the petition must also be mailed at the time of filing to the District Office at 160 Governmental Center, Pensacola, Florida 32502-5794. Failure to file a petition within the 21-day period constitutes a person's waiver of the right to request an administrative hearing and to participate as a party to this proceeding under sections 120.569 and 120.57, Florida Statutes. Before the deadline for filing a petition, a person whose substantial interests are affected by this Consent Order may choose to pursue mediation as an

REV. 06/09

PW\_CO

alternative remedy under section 120.573, Florida Statutes. Choosing mediation will not adversely affect such person's right to request an administrative hearing if mediation does not result in a settlement. Additional information about mediation is provided in section 120.573, Florida Statutes and Rule 62-110.106(12), Florida Administrative Code.

22. Rules referenced in this Order are available at

http://www.dep.state.fl.us/legal/Rules/rulelistnum.htm.

# **EXHIBIT I**
### Exhibit I

#### **Report on Environmental Issues in Prior Rate Case**

#### **Consent Orders**

- Chuluota Water System As explained in detail in the Final Report and in the Fourth Quarter Environmental Compliance Update, all obligations under the consent order have been met and FDEP closed out the consent order on December 23, 2010.
- The Woods Water System FDEP issued a consent order closure letter on Jan 14, 2009. (See Attachment "1".)
- Zephyr Shores Water System FDEP issued a consent order closure letter on August 24, 2009. (See Attachment "2".)
- o The Village Water Wastewater System As explained in detail in the Fourth Quarter Environmental Compliance Update, AUF was required to identify alternative disposal for the effluent from this facility by May 2011. AUF has already identified a viable solution for effluent reuse and is negotiating an agreement with a nearby property owner. AUF expects the site will accommodate all of the treated effluent and has drafted a proposed 20 year agreement for the use of the land. AUF has already engaged Andreyev Engineering Inc. to conduct and analyze soil borings and BESH Engineering Inc to design and permit a spray field. AUF anticipates having the spray field operational by November 2011. AUF also has installed monitoring wells around the percolation ponds and is monitoring in accordance with the consent order. To date, that monitoring has revealed no adverse impacts.
- o South Seas Wastewater System As explained in detail in the Fourth Quarter Environmental Compliance Update, AUF received a warning letter on February 25, 2010 regarding a leak at the facility's reject storage tanks which AUF had previously reported to the FDEP. Prior to the warning letter, AUF had already contacted contractors to evaluate the flow equalization tank and the 3 reject storage tanks at the facility. Subsequently, the flow equalization tank failed resulting in a spill of raw wastewater. AUF had temporary repairs made to the tank and initiated plans to replace all four tanks. A consent order to replace the tanks and make other upgrades has not been finalized. However, AUF has replaced all four storage tanks at a cost of over \$400,000. (See photograph appended as Attachment "3".)

### **Outstanding Warning Letters**

- Pomona Park FDEP issued a case closure letter on this matter on April 17, 2009 (See Attachment "4"). The system was inspected on June 16, 2010 and no violations or deficiencies were noted. (See Attachment "5".)
- Jasmine Lakes As explained in detail in the Fourth Quarter Environmental Compliance Update, this matter has been successfully closed.
- **Palm Terrace** As explained in detail in the Fourth Quarter Environmental Compliance Update, this matter has been successfully closed.
- o Arredondo Farms A warning letter was issued June 12, 2008 alleging effluent violations for AUF's wastewater system in Alachua County. It was determined during the permit renewal process that although the facility was permitted at 0.06 mgd its actual design capacity was no more than 0.045 mgd. The facility had been treating 0.044 mgd Annual Average Daily Flow and experienced peak days of 0.56 mgd. FDEP issued a two year permit which gave AUF time to design and construct improvements including a new head works, additional surge capacity, additional aeration volume and two digesters. The construction was completed and FDEP issued a clearance letter on August 27, 2010. (See Attachment "6".) The FDEP consent order closure letter is appended as Attachment "7".

### **Outstanding Noncompliance Letters**

- Silver Lake Oaks Wastewater System for alleged effluent violations relating to total dissolved solids, nitrates and fecal coliforms. With adjustments to the air flow, new diffusers, and diligent monitoring, the plant has returned to compliance and the matter is closed.
- Florida Central Commerce Park for alleged failure to submit pathogen monitoring results every 5 years for wastewater system in Seminole County. This wastewater system is required to monitor for pathogens and submit results every five years. This is typically completed in the years when the permit renewal application is required. Accordingly, AUF monitored for pathogens and submitted the report with the renewal application. Unfortunately the FDEP permitting section did not make the FDEP compliance section aware that the report had been received. This miscommunication was quickly resolved and the matter is closed.
- Valencia Terrace Wastewater System for alleged failure to satisfy requirement to install a new bar screen and splitter box. The new splitter box and bar screen were installed on June 9, 2009. The matter is closed.

- Morning View Wastewater System for allegedly not meeting minimum chlorine contact time and 2 reporting deficiencies. Baffles were installed to meet the minimum contact time. The reporting deficiencies arose from a misunderstanding by the operator that was cleared up. The matter is closed. A subsequent inspection letter cited no deficiencies at the plant. (See Attachment "8".)
- South Seas Wastewater System for alleged effluent violations. This matter is discussed in the Consent Order section above. Improvements have been completed and the system is currently operating in compliance with effluent limits.

#### Other

• Chuluota Wastewater System - Discharge monitoring reports allegedly showed that average daily flow to the facility had exceeded permitted capacity. FDEP requested additional information from AUF regarding permit application which was filed on December 6, 2007. AUF entered into a reuse agreement with Utilities, Inc. (subsequently acquired by the City of Oviedo) to accept treated wastewater effluent for reuse. AUF submitted plans and specifications to FDEP for the facilities to implement this agreement. FDEP issued a renewed 5-year permit for the Chuluota wastewater system on April 6, 2010. AUF has completed the installation of the reuse main and expects to begin delivering reuse water to the City of Oviedo by March 1, 2011.

Mr. John Lihvarcik, President Aqua Utilities Florida, Inc. Post Office Box 490310 Leesburg, FL 34749

Putnam County - Potable Water Sanitary Survey 2010 Pomona Park WTP // PWS ID: 2540905 RECEIVED

JUL - 7 2010

Aqua Utilities Florida Inc.

Dear Mr. Lihvarcik:

On June 16, 2010, a Sanitary Survey of the above referenced Community water system was conducted with the courteous assistance of Mr. David Haring. The Department is pleased to inform you that the above referenced facility is in compliance with the Florida Safe Drinking Water Act, Sections 403, Florida Statutes (FS), and the rules promulgated thereunder, Florida Administrative Code (FAC) Title 62.

Please note that the Disinfection Byproducts sampled in 2008 was low enough whereby the system was able to reduce to triennial monitoring. Normally, the next set would be due in 2011. Due to the fact that this would put Pomona Park monitoring for Disinfection Byproducts in the same compliance year as Large Community systems, the schedule has been adjusted so that the system should sample in 2012 with the other small community water systems.

# As a reminder, this system is required to monitor for the following parameters during 2010: Total Coliform Bacteria with Residual Disinfectant Levels on a monthly basis.

A copy of the Sanitary Survey is enclosed for your records. If you have any questions, please contact me by telephone at (904) 807-3334 or e-mail at Benjamin.Piltz@dep.state.fl.us. Thank you for your cooperation with Florida's Safe Water Drinking Act.

Sincerely,

Ben'l

> Alachua County - Wastewater Certification of Completion Arredondo Farms Mobile Home Park WWTF - FLA011315

Dear Ms. Lihvarcik:

Re:

The Florida Department of Environmental Protection (FDEP) acknowledges receipt of DEP Form 62-620.910(12), Notification of Completion of Construction of:

- Hydrasieve Model 554-2-48 influent static fine screen which is 304 stainless steel traverse bar screen that is 48 inches wide by 54 inches long with 0.060 inches (1.5 mm) openings.
- An 8,500 gallons flow equalization tank. The equalization tank that has one Roots U-RAI 36 blower with a 5 hp motor. The tank also has a duplex pumping system with a capacity of 100 gpm @ 20feet total dynamic head.
- An additional 8,500 gallons aeration basin tank. The tank is set approximately 2 feet above existing tank top elevation.
- A flow splitter box to capture all the flow from aeration basin AT-4 and equally distribute flow between aeration AT-5 and AT-6 and in turn to clarifier 1 and 2. The box has adjustable aluminum weir gates.
- Two 8,500 gallons digester tanks. Aeration and mixing is provided by one Roots U-RAI 36 blower with a 5 hp motor.
- Replacement of existing diffusers with membrane type coarse bubble diffusers and replacement of some deteriorated galvanized steel aeration piping.
- Replacement of the existing outlet baffle and concrete weirs in both existing clarifiers with new outlet baffles and V-notch adjustable aluminum weirs. Remove and replace existing 4 inch return activated sludge airlift in existing clarifiers and replace with 3 inch schedule 40 PVC airlifts and 6 inch PCV gravity return piping to the head of the plant and to the new sludge holding tanks.

There were not significant changes in the design and related materials approved by the Department under Permit Number FLA011305 issued on December 15, 2009. Based on information provided, the Department accepts the project for service. If you have any questions, please contact Joseph Emery at (904) 807-3342 or Joseph.Emery@dep.state.fl.us. Your continued cooperation in our wastewater program is appreciated.

Sincerely,

AntaDurgoo

Mr. John M. Lihvarcik, President Aqua Utilities Florida, Inc. 110 Thomas Avenue Leesburg, FL 34748

Re: Alachua County - Domestic Wastewater Enforcement OGC File Number 10-1903 Arredondo Farms MHP - FLA011315

Dear Mr. Lihvarcik:

This letter is to inform you that the above-referenced enforcement project has been closed by the Florida Department of Environmental Protection. All conditions of the Consent Order have been satisfied.

Should you have any questions concerning this Consent Order, please contact Heather Webber at <u>Heather.Webber@dep.state.flu.us</u> or at 904-807-3316. Your cooperation is appreciated.

Sincerely,

RCKilling

Tom Kallemeyn Wastewater C & E Supervisor

ATTENTION JOHN LIHVARCIK PRESIDENT

> Lake County - DW Momingview WWTF Wastewater Facility - Permit No. FLA010610

Dear Mr. Lihvarcik:

On July 29, 2010, Department personnel conducted a routine inspection of your wastewater facility. At the time of the inspection, the overall operation of your facility was found to be in substantial compliance with the terms and conditions in Permit Number FLA010610. Please review the enclosed inspection report and correct any deficiencies, which have been noted.

Your continued cooperation with our wastewater program is appreciated. If you have any questions, please contact me at (407) 893-3313 or via e-mail: jenny.e.farrell@dep.state.fl.us.

Sincerely,

genny E. Faull

Revised February 11, 2010

.

Docket No. 100330-WS Final Phase II QSM Report Exhibit SC-3, Page 000182 of 000183

#### **INSPECTION SUMMARY**

Facility Name: Morningview WWTF Facility ID: FLA010610 Inspection Type: CEI Date: 7/29/2010 12:08:00 PM

#### FACILITY BACKGROUND:

Address: 1322 English Road, Leesburg, FL 34749 - 310, Lake County Permit Information: Wastewater Permit issued: 3/2/2007, and expires: 2/19/2012 Treatment Summary: Extended Aeration Sewage Treatment Plant W/Effluent To A Percolation Pond Permitted Capacity: 0.02

1. Permit: IN COMPLIANCE

1.1 Observation: A copy of the permit was onsite and available to plant personnel.

- 2. Compliance Schedules: NOT APPLICABLE
- 3. Laboratory: NOT EVALUATED
- 4. Sampling: NOT EVALUATED

#### 5. Records and Reports: OUT OF COMPLIANCE

- 5.1 Observation: General A copy of the current laboratory certification was available at the time of the inspection (62-620.350(1) F.A.C.).
- Additional Comments: Samples are analyzed by Plant Technicians Laboratory.
- 5.2 Observation: General Operators' certifications were current and available on-site.
- 5.3 Observation: General The certified operator's daily logbook was complete.

Additional Comments: The logbook was pre-numbered, bound, and contained sufficient operation/maintenance entries.

- 5.4 Observation: General A copy of the Operation and Maintenance Manual as required by Chapter 62-600, F.A.C. was available to plant personnel.
- 5.5 Observation: General Please see specific comment

Additional Comments: The RPZ was last inspected and tested on 4/8/10, according to on-site records.

5.6 Observation: General - Please see specific comment

Additional Comments: The DMR paperwork review period was from July 2009 through May 2010, all DMRs were not submitted in a timely manner, see below:

The January 2010 DMR was received by the Department on March 1, 2010, this DMR was due on or before February 28, 2010.

On the August 2009 DMR the number of exceedance column was left blank. Also, the TSS maximum result reported on Part A was 1.0 mg/L and this did not match the result reported on Part B of 6.4 mg/L.

The influent and effluent annual samples are routinely reported more often than required.

#### 6. Facility Site Review: IN COMPLIANCE

- 6.1 Observation: General The facility grounds were secured properly.
- 6.2 <u>Observation</u>: Backflow Prevention A reduced pressure zone backflow prevention device was in place on the potable water supply line.

Additional Comments: No leaks or problems were noted.

6.3 Observation: LiftStations - No problems or deficiencies noted.

Additional Comments: Two liftstations are connected to this system one master located at the plant and then one in the community.

Docket No. 100330-WS Final Phase II QSM Report Exhibit SC-3, Page 000183 of 000183

#### INSPECTION FINDINGS

6.4 Observation: Headworks - Please see specific comment

Additional Comments: The liftstation pumps influent directly into the first aeration chamber.

6.5 Observation: AerationBasins/Act.Sludge - The contents in the aeration chambers appeared to be adequately mixed.

6.6 Observation: Blowers/Motors - The blower was operational at the time of the inspection.

Additional Comments: Two blowers were onsite and covered.

6.7 Observation: Clarifiers - Please see specific comment

Additional Comments: The stilling well was good. The clarifier contained pin floc. The skimmer was not on. The weir appeared level, no flow was entering it at the time of inspection.

6.8 Observation: Disinfection - Please see specific comment

Additional Comments: Sodium hypochlorite is dripped into the parshall flume area. No flow was passing through at the time of inspection. The chlorine contact chamber contained clear effluent and baffles.

6.9 Observation: Digesters - The tank contents in the aerobic digester were well mixed.

Additional Comments: There was room for wasting.

7. Flow Measurement: IN COMPLIANCE

7.1 Observation: The copy of the flow calibration report is current and satisfactory.

Additional Comments: This flow meter was last calibrated on January 26, 2010 by Central Florida Controls, Inc.

#### 8. Operation and Maintenance: IN COMPLIANCE

8.1 Observation: General - Please see specific comment

Additional Comments: The facility grounds were well maintained.

#### 9. Effluent Ouality: IN COMPLIANCE

9.1 Observation: No exceedances were reported during this DMR review period.

Additional Comments: The DMR review period was from July 2009 through March 2010.

#### 10. Effluent Disposal: IN COMPLIANCE

- 10.1 Observation: General At the time of the inspection, no flow was entering the rapid infiltration basin (RIB).
- 10.2 Observation: General The RIBs appeared to be well maintained
- 10.3 Observation: General Advisory signs were posted around the disposal site indicating the nature of the project area.
- 10.4 Observation: General The fence surrounding the effluent disposal site provided adequate access control (62-610.518(10) F.A.C.)

#### 11. Residuals/Sludge: IN COMPLIANCE

11.1 Observation: General - Please see specific comment

Additional Comments: Residuals are hauled to 412 Biosolids RMF; sludge was last hauled on July 28, 2010.

- 12. Groundwater Ouality: NOT APPLICABLE
- 13. Other: NOT APPLICABLE
