### Aqua Utilities Florida Secondary Water Quality Project Report July 2010

### Lake Josephine & Sebring Lakes

Aqua Utilities Florida (Aqua) owns and operates dozens of separate small water and wastewater systems throughout the state that are not interconnected. When Aqua acquired these systems, we focused first on full environmental compliance, now nearly completed. IN an effort to further improve our customer service, Aqua has been assessing ways to enhance the "secondary" or aesthetic characteristics of our water.

Lake Josephine and Sebring Lakes is a community of about 553 and 76 customer respectively in Highlands County. Aqua surveyed customers in Lake Josephine and Sebring Lakes in December 2009.

Aqua determined that the aesthetic water quality issue in Lake Josephine and Sebring Lakes primarily involved a sulfur odor. Aqua plans to install an AdEdge treatment system at Lake Josephine and Sebring Lakes to eliminate the naturally occurring sulfur in the water. We expect that this project will be operational by December 31<sup>st</sup>.

Aqua also received customer complaints from Lake Josephine RV Park and Camp Ground of low water pressure. Aqua's field personnel and engineering conducted a review of the distribution system and determine an Interconnection between Sebring Lakes with Lake Josephine was necessary to improve water pressure. Aqua permitted the interconnection with DEP and the Water Management District and the interconnection was opened permanently and water pressure complaints have been eliminated.

### Aqua Utilities Florida Secondary Water Quality Project Report July 2010

### Leisure Lakes

### Background

Aqua Utilities Florida (Aqua) owns and operates dozens of separate small water and wastewater systems throughout the state that are not interconnected. When Aqua acquired these systems, we focused first on full environmental compliance, now nearly completed. In an effort to further improve our customer service, Aqua has been assessing ways to enhance the "secondary", or aesthetic characteristics of our water.

Leisure Lakes is a community of about 273 Aqua customers in Highlands County. Aqua surveyed customers in Leisure Lakes in December 2009.

### Solution

Aqua determined that the aesthetic water quality issues in Leisure Lakes primarily involved a sulfur odor. Aqua plans to install an AdEdge treatment system at Leisure Lakes to eliminate the naturally occurring sulfur in the water. We expect that this project will be operational by December 31st.

We also enhanced our existing flushing plan. Directional flushing takes place on a monthly basis.

All results meet the requirements of NELAC.

<sup>6</sup> Results must be reported with sportageline quelifiers in accordance with Flands Administrative Code Rule 62-160, Table 1. Results qualified with a A, F, H, N, O, T, Z, ?,\*, are unacceptable for compliwith 65:550. Results qualified with a J, Q, R, or Y manufe accompanied by written justification and will be evaluated on a case by case basis. To avoid a monitoring violation, unacceptable results result result for a monitoring period.

### Aqua Utilities Florida Secondary Water Quality Project Report July 2010

### **Rosalie Oaks Water System**

Rosalie Oaks is a community of about 89 Aqua Utilities Florida customers in Polk County.

In the past year, Aqua has worked to tackle the arsthetic qualities — the look, smell and taste — of tap water in the system. Although these aesthetic qualities are considered "secondary" water quality standards, and Aqua has not exceeded the secondary standards for iron, manganese, alkalinity, and hardness. Aqua has moved forward with initiatives to address customer concerns.

Minerals and sediments in the Rosalie Oaks water sometimes can cause a black ring to form in toilets. These sediments can accumulate when water rests in pipes — a particular problem when weekend and seasonal customers are away for long periods of time. Aqua determined that an extensive new water main flushing program should keep the water moving more consistently and improve its smell and appearance. Aqua's contractor installed two new flushing valves last fall, and the local operator launched an aggressive new flushing schedule in October. At first, Aqua flushed the system weekly to clean the pipes thoroughly. Currently, operators flush the system monthly and before holidays.

Many Rosalic Oaks residents are "seasonal customers" — they live elsewhere during the summer months and return to Florida for the winter. That means water can sit in their service line or household plumbing for months, creating odors and discolored water. Customers might need to flush water through their fixtures and household plumbing after water has been standing in the pipes for an extended period of time.

Reporting Formet 62-550.730

Effective January 1995, Revised January 2004

Page 6 of 7

Results must be reported with appropriete qualifiers in accordance with Florida Administrative Code Rule 52-160, Table 1. Results qualified with A, F, H, N, O, T, Z, Z, \*, are unacceptable for compliance with B2-550. Results qualified with a J, G, R, or Y must be accompanied by written justification and will be evaluated on a case by case basis. To avoid a monitoring violation, unacceptable results must be replaced with acceptable results from samples collected during the same monitoring period.

### Aqua Utilities Florida Secondary Water Quality Project Report July 2010

### **Tangerine Water System**

Tangerine is a community of about 278 Aqua Utilities Florida customers in Orange County.

In the past year, Aqua has worked to tackle the aesthetic qualities – the look, smell and taste – of the tap water in the Tangenine system. Although these aesthetic qualities are considered "secondary" water quality standards, and Aqua has not exceeded the secondary standards for iron and manganese, Aqua has moved forward with initiatives to address customer concerns.

Aqua will be installing 2,000 feet of new water main in July to connect dead ends and areas that now experience low water pressure, primarily along Huron Street, Scott Avenue, Section Street, Pine Street, and Orange Blossom Train. We also replaced 1,100 feet of old main along Orange Blossom Train and Pine Street.

Aqua also applied for a state permit to install a "sequestration" treatment system in Tangerine, and contractors installed the system in March awaiting DEP Issuance of the clearance to operate the system. This system will bind the naturally occurring calcium and manganese in the system's well water, which should reduce the residue customers might see on their dishes and fixtures.

Reporting Formet 62-550.730 Effective January 1996, Revised January 2007

\* Results must be reported with appropriate qualifiers in accordance with Florida Administrative Code Rule \$2-160, Table 1. Results Qualified with A, F, H, N, O, T, Z, ?, \*, are recorptable for compliance with \$2-560. Results qualified with a J, Q, R, or Y must be accompanied by written justification and will be evoluted on a case by case basis. To wold a monitoring violation, unacceptable results must be replaced with acceptable results from samples collected during the same monitoring period.

Results must be reported with appropriate qualifiers in accordance with Florida Administrative Code Rule 62-160, Table 1. Results Qualified with A, F, H, N, O, T, Z, ?, \*, are succeptable for compliance with 62-660. Results qualified with a J, Q, R, or Y must be accompanied by written justification and will be evaluated on a case by case basis. To rold a monitoring violation, unacceptable results must be replaced with acceptable results from samples collected during the same monitoring period.

### Aqua Utilities Florida Secondary Water Quality Project Report July 2010

### Tomoka View Water System

Aqua's primary focus in Tomoka View has been to develop options to resolve the total trihalomethane (TTHM) problem in the water system. Aqua received a permit from the Volusia County Health Department of Health in December 2009 to install new chloramination treatment equipment, and we Tangerine is a community of about 263 Aqua Utilities Florida customers in Volusia County.

Aqua's installed and launched the system later that month to reduce elevated TTHM's. Chloramination – the use of chloramines – has been used as a disinfectant in water distribution systems for many years in many communities throughout the U.S, and Canada. This new treatment system is working: TTHM levels have dropped, and the water now meets federal standards. We will continue to closely monitor the situation.

In the past year, Aqua also has worked to tackle the aesthetic qualities -- the look, smell and taste of tap water in Tomoka View. Although these aesthetic qualities are considered "secondary" water quality standards, and Aqua has not exceeded these secondary standards, we have moved forward with initiatives to address customer concerns.

In July 2009, Aqua determined that a new flushing program would help improve the appearance of Tomoka View's water. The water can contain natural minerals that can accumulate in distribution system pipes, and sudden changes in flow in distribution system can disturb deposits in the mains and cause discolored water. Aqua installed eight new isolation valves, and blow-off assemblies in strategic areas so that we can target more aggressive flushing where it's needed most. Aqua also devised a systematic schedule that involves operating valves in a specific sequence to maximize the effectiveness of the flushing. The plan cleaned up accumulated natural deposits in the mains and should reduce discolored water in the future. Field operations employees take regular samples from the distribution system and, if the water quality begins to degrade, they will adjust the automatic flushing devices to operate more often and for a longer duration.

The water in Tomoka View also contains naturally occurring copper, which Aqua determined could be removed by a "sequestration" treatment system. Aqua contracted with AquaMag, which installed the system in December 2009. AquaMag samples water from the distribution system monthly to monitor the effects of the sequestering program.

Aqua management has met with Tomoka View customers regularly to discuss customer concerns and create strategies to improve the look, taste and smell of their water. We will continue to talk with our customers and keep them informed as our plans progress.

Dear Will Fontaine;

Analytical results presented in this report have been reviewed for compliance with the HBEL, Inc. Quality Systems Manual and have been determined to meet applicable Method guidelines and Standards referenced in the July 2003 National Environmental Laboratory Accreditation Program (NELAP) Quality Manual unless otherwise noted. The Analytical Results within these report pages reflect the values obtained from tests performed on Samples As Received by the laboratory unless indicated differently.

FDOH Safe Drinking Water Act, Clean Water Act and RCRA Certification #s:

E96080, E83509

Questions regarding this report should be directed to the Report Signatory at (772) 485-8584 referencing the HBEL Workorder ID [Number].

Respectfully submitted,

Eric Charest / HBEL, Inc. Laboratory Manager

#### Aqua Utilities Florida Secondary Water Quality Project Report July 2010

#### Zephyr Shores Water System

Zephyr Shores is a community of about 500 Aqua Utilities Florida customers in Pasco County.

Aqua has worked diligently over the past several years to improve the operation and reliability of the Zephyr Shores system. As the Florida Public Service Commission noted in Aqua's last rate case decision, Aqua installed a second well and a generator to the system and entered a consent order with the Florida Department of Environmental Protection (FDEP) to address reliability and permitting issues. That consent order was closed on October 29, 2007. A consent order was issued in April 2009 for the late submittal of Quarterly Arsenic Samples, and that order was satisfied on August 24, 2009.

In the past year, Aqua has worked to tackle the aesthetic qualities — the look, smell and taste — of tap water in the system. Although these aesthetic qualities are considered "secondary" water quality standards, and Aqua has not exceeded the secondary standards for iron and manganese, Aqua has moved forward with initiatives to address customer concerns.

Aqua surveyed customers in Zephyr Shores in October 2009.

Like many Floridians, customers in Zephyr Shores get their water from the Floridan aquifer. The water can contain natural minerals that can accumulate in distribution system pipes. Sudden changes in flow in the distribution system can disturb deposits in the mains and cause discolored water. To address this issue, Aqua recently installed new flushing equipment and devised a systematic flushing schedule to clean the water mains. The program involves operating valves in a specific sequence to maximize the effectiveness of the flushing. This plan will address accumulated natural deposits in the mains and will reduce the incidents of discolored water.

Natural minerals in the water can also cause staining or deposit scale on fixtures over time and leave spots on glasses and dishes. Aqua has designed, permitted and installed a "sequestration" treatment system that will reduce the effects of natural minerals in the water. The FDEP has scheduled a clearance inspection for March 16, 2010, and Aqua expects to place the new treatment system in service shortly thereafter.

Many Zephyr Shores residents are "seasonal customers" — they live elsewhere during the summer months and return to Florida for the winter. That means water can sit in their service line or household plumbing for months, creating odors and discolored water. Customers might need to flush water through their fixtures and household plumbing after water has been standing in the pipes for an extended period of time.

Aqua management has been meeting with Zephyr Shores customers regularly to discuss customer concerns and create strategies to improve the look, taste and smell of their water. We will continue to talk with our customers and keep them informed as our plans progress.

**Zephyrhills** 

- 71% of respondents rated Aqua's overall water service 1 or 2 on a scale of 1-5
- 68% of respondents are not satisfied with the taste of their water
- 64% of respondents are not satisfied with the odor of their water
- 46% of respondents are not satisfied with the color of their water
- 59% of respondents are not satisfied with the hardness of their water
- 48% of respondents are not satisfied with the reliability of their service
- 45% of respondents are not satisfied with Aqua's customer service
- 92% of respondents are not satisfied with the value of their water service for the money
- 65% of respondents rated Aqua's attention and response to water quality issues involved in providing water service 1 or 2 on a scale of 1-5
