

BEFORE THE
FLORIDA PUBLIC SERVICE COMMISSION

DOCKET NO. 110009-EI

In the Matter of:

NUCLEAR COST RECOVERY CLAUSE.
_____ /

VOLUME 5

Pages 649 through 808

PROCEEDINGS: HEARING

COMMISSIONERS
PARTICIPATING:

CHAIRMAN ART GRAHAM
COMMISSIONER LISA POLAK EDGAR
COMMISSIONER RONALD A. BRISÉ
COMMISSIONER EDUARDO E. BALBIS
COMMISSIONER JULIE I. BROWN

DATE: Wednesday, August 10, 2011

TIME: Commenced at 4:25 p.m.
Concluded at 5:09 p.m.

PLACE: Betty Easley Conference Center
Room 148
4075 Esplanade Way
Tallahassee, Florida

REPORTED BY: JANE FAUROT, RPR
Official FPSC Reporter
(850) 413-6734

3 Volume 4.)

4 **CHAIRMAN GRAHAM:** You can call your next
5 witness.

6 **MR. ANDERSON:** Thank you.

7 FPL would call as its next witness Terry
8 Jones. Mr. Jones has not been in the room to be sworn.
9 I'm sorry, I am told he was. And I remember that now,
10 too.

TERRY JONES

11
12 was called as a witness on behalf of Florida Power and
13 Light Company, and having been duly sworn, testified as
14 follows:

D I R E C T E X A M I N A T I O N

15
16 **BY MR. ANDERSON:**

17 Q. Mr. Jones, if you could just look up when you
18 are settled and ready to go, we'll proceed.

19 Thank you. It has been noted on the record
20 that you have been sworn as a witness. Would you please
21 state your name and your business address?

22 A. My name is Terry Jones. My business address
23 is 700 Universe, Juno Beach, Florida.

24 Q. By whom are you employed and in what capacity?

25 A. I'm employed by Florida Power and Light; I'm

1 the Vice-President for the Extended Power Uprate
2 Project.

3 Q. Have you prepared and caused to be filed 39
4 pages of Prefiled Direct Testimony in this proceeding on
5 March 1, 2011, entitled Extended Power Uprates, 2009?

6 A. Yes, I have.

7 Q. Did you prepare and caused to be filed 38
8 pages of Prefiled Direct Testimony in this proceeding on
9 March 1, 2011, entitled Extended Power Uprates, 2010?

10 A. Yes, I have.

11 Q. Have you prepared and caused to be filed 40
12 pages of Prefiled Direct Testimony in this proceeding on
13 May 2nd, 2011, entitled Nuclear Power Plant
14 Cost-Recovery for the Years Ending December 2011 and
15 2012?

16 A. Yes, I have.

17 Q. Did you also cause to be filed one page of
18 errata on June 10, 2011?

19 A. That's correct.

20 Q. Did you prepare and cause to be filed four
21 pages of Prefiled Supplemental Direct Testimony on
22 July 15th?

23 A. That is correct.

24 Q. Do you have any other changes or revisions to
25 your Prefiled Direct Testimony?

1 A. No, I do not.

2 Q. If I asked you the same questions contained in
3 your Prefiled Direct Testimony, would your answers be
4 the same?

5 A. Yes, they would.

6 **MR. ANDERSON:** Mr. Chairman, Florida Power and
7 Light Company asks that the Prefiled Direct Testimony be
8 inserted into the record as though read.

9 **CHAIRMAN GRAHAM:** We will insert Mr. Jones'
10 Prefiled Direct Testimony into the record as though
11 read.

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION**FLORIDA POWER & LIGHT COMPANY****DIRECT TESTIMONY OF TERRY O. JONES****DOCKET NO. 110009-EI****MARCH 1, 2011**

Q. Please state your name and business address.

A. My name is Terry O. Jones, and my business address is 700 Universe Boulevard, Juno Beach, FL 33408.

Q. By whom are you employed and what is your position?

A. I am employed by Florida Power & Light Company (FPL) as Vice President, Nuclear Power Uprate.

Q. Please describe your duties and responsibilities in that position.

A. In my current role, I report directly to the Chief Nuclear Officer. I am responsible for the management and execution of the Extended Power Uprate ("EPU" or "Uprate") Project.

Q. Please describe your educational background and professional experience.

A. I was appointed Vice President, Nuclear Power Uprate on August 1, 2009. In my current position I provide executive leadership, governance and oversight to ensure the safe and reliable implementation of the EPU Projects for the four FPL nuclear units.

I joined FPL in 1987 in the Nuclear Operations Department at Turkey Point. Since then, my positions at FPL have included Vice President, Operations, Midwest Region; Vice President, Nuclear Plant Support; Vice President, Special Projects; Vice

DOCUMENT NUMBER-DATE

01387 MAR-11

FPSC-COMMISSION CLERK

1 President, Turkey Point Nuclear Power Plant; Plant General Manager; Maintenance
2 Manager; Operations Manager and Operations Supervisor. Prior to my employment at
3 FPL, I worked for the Tennessee Valley Authority at the Browns Ferry Nuclear Plant
4 and served in the US Nuclear Navy. I hold a Bachelors of Science degree and an MBA
5 from the University of Miami.

6 **Q. Are you sponsoring any exhibits in this proceeding?**

7 A. Yes, I am sponsoring the following exhibits which are incorporated herein by
8 reference:

- 9 • Exhibit TOJ-1, T-Schedules, 2009 EPU Construction Costs, containing schedules
10 T-1 through T-7A. Page 2 of Exhibit TOJ-1 contains a table of contents listing the
11 schedules that are sponsored and co-sponsored by FPL Witness Powers and myself.
- 12 • Exhibit TOJ-2, 2009 Extended Power Uprate Project Instructions (EPPI) Index as
13 of December 31, 2009
- 14 • Exhibit TOJ-3, 2009 Extended Power Uprate Project Organization Chart
- 15 • Exhibit TOJ-4, Extended Power Uprate Project Reports - 2009
- 16 • Exhibit TOJ-5, St. Lucie Low Pressure (LP) Turbine Rotors
- 17 • Exhibit TOJ-6, St. Lucie Low Pressure (LP) Turbine Rotor Rings
- 18 • Exhibit TOJ-7, St. Lucie Low Pressure (LP) Turbine Rotor Ring Testing
- 19 • Exhibit TOJ-8, Plant Change Modification (PCM) Status as of December 31, 2009
- 20 • Exhibit TOJ-9, Extended Power Uprate Equipment List as of December 31, 2009
- 21 • Exhibit TOJ-10, Extended Power Uprate Project Schedule as of December 31, 2009
- 22 • Exhibit TOJ-11, Summary of 2009 Extended Power Uprate Construction Costs

23 **Q. What is the purpose of your testimony?**

1 A. The purpose of my testimony is to present and explain the EPU project, key
2 management decisions and Uprate project activities that occurred in 2009, FPL's 2009
3 construction expenditures, and the procedures, processes and controls that ensure that
4 those expenditures are reasonable and the result of prudent decision making. My
5 testimony also explains the careful engineering-based process employed by FPL to
6 ensure that it is including only nuclear uprate costs that are "separate and apart" from
7 other costs, such as those for base rate nuclear operations and maintenance or capital
8 projects that are unrelated to the nuclear Uprates.

9 **Q. Please summarize your testimony.**

10 A. The EPU project is a complex undertaking to safely increase the capacity of FPL's four
11 existing nuclear units – St. Lucie (PSL) Units 1 & 2 and Turkey Point (PTN) Units 3 &
12 4 – which will provide significant and quantifiable benefits for customers without
13 expanding the footprint of FPL's existing nuclear power plant sites. Upon completion,
14 FPL estimates that approximately 450 megawatts electric power (MWe) of baseload,
15 non-greenhouse gas emitting generation will be provided by the EPU project for FPL's
16 customers, and that customers will realize significant fuel cost savings as a result.

17
18 The project team is in the process of performing design engineering, procuring long
19 lead equipment and materials, obtaining regulatory approvals, and implementing plant
20 modifications to support the uprate conditions in multiple refueling outages for each of
21 the nuclear units. This process is supported by robust and overlapping project schedule
22 and cost controls, along with rigorous risk management. Additionally, the EPU team

1 manages the Uprate work in a manner that ensures that only the costs necessary for the
2 Uprates are expended and included in the Nuclear Cost Recovery process.

3
4 Significant progress was made in 2009, including continued engineering evaluation
5 and analyses in support of EPU License Amendment Request (LAR) submittals to the
6 Nuclear Regulatory Commission (NRC), the submittal of the PTN Alternative Source
7 Term (AST) LAR to the NRC, activities and quality inspections related to the
8 manufacture of long lead equipment, the management and implementation of the
9 Engineering Procurement and Construction (EPC) contract, and detailed reviews of the
10 modification installation planning and EPU outage schedules. Also, FPL made
11 adjustments to the project organizational structure reflecting a shift of responsibilities
12 to the individual sites, revised several project instructions, and continued with project
13 staffing. Overall, FPL prudently incurred approximately \$238 million in EPU costs
14 during 2009, as compared to the May 1, 2009 actual/estimated amount of
15 approximately \$259 million.

16 **Q. Please describe how the remainder of your testimony is organized.**

17 **A. My testimony includes the following sections:**

- 18 1. 2009 Project Summary
- 19 2. Project Management Internal Controls
- 20 3. Procurement Processes and Controls
- 21 4. Internal/External Audits and Reviews
- 22 5. "Separate and Apart" Considerations
- 23 6. 2009 Project Activities

1 7. 2009 Construction Costs

2 8. Conclusion

3
4 **2009 PROJECT SUMMARY**

5
6 **Q. What is the EPU Project?**

7 A. The EPU project will increase FPL's nuclear generating capacity from its four existing
8 nuclear units by fitting the units with higher capacity and more efficient turbines and
9 other necessary equipment to accommodate increased steam flow that will result from
10 loading fuel with increased reactivity into each reactor. This involves the modification
11 or outright replacement of a large number of components and support structures within
12 FPL's operating nuclear power plants. Each modification/replacement is considered a
13 project in and of itself. In the case of some major modifications, some permanent plant
14 equipment will have to be removed and then reinstalled as a part of the construction
15 process.

16
17 Because the project will modify FPL's operating nuclear plants, it is a much different
18 construction project than constructing a new combined cycle generating unit at a
19 greenfield site. FPL plans to perform the modifications during the units' pre-planned
20 refueling outages. Performing the Uprate work during the refueling outages minimizes
21 the amount of time that these low fuel-cost generators are off line.

1 Upon completion, the Uprates will produce a minimum of 399 MWe and could
2 produce a theoretical maximum of up to 463 MWe for FPL's customers. The
3 minimum reflects FPL's need determination assumption (414 MWe), less the St. Lucie
4 Unit 2 co-owners' share of the output. The maximum reflects the turbine vendor's
5 estimate of the turbine generator's performance (approximately 500 MWe) if the "best
6 case scenario" of plant parameters are achieved, less the co-owners' share of PSL Unit
7 2 and increased plant electrical requirements. Taking into account the current
8 uncertainty of whether "best case" plant parameters will be achieved, FPL's current
9 estimate is that a total of about 450 MWe will be produced by the uprated units for
10 FPL's customers.

11 **Q. How will customers benefit from the EPU project?**

12 A. Among other benefits, this increase in nuclear power will: (i) enhance system
13 reliability and integrity by diversifying FPL's fuel mix; (ii) provide energy and
14 baseload capacity to FPL's customers with zero greenhouse gas emissions; and (iii)
15 provide significant fuel cost and environmental compliance cost savings. Some of
16 these benefits will be realized as early as 2011, when the replacement of a low pressure
17 turbine generator at St. Lucie Unit 2 with a more efficient low pressure turbine
18 generator will result in a projected total increased electrical power output of
19 approximately 20 MWe and FPL's customers are projected to receive approximately
20 17 MWe of this increased output. Quantification of these types of benefits will be
21 provided along with an updated project feasibility analysis in FPL's May 2011
22 testimony.

23 **Q. Please describe the general approach to the EPU project.**

1 A. In 2007, FPL prepared an initial conceptual engineering study for performing an EPU
2 at St. Lucie and Turkey Point which included a conceptual cost estimate based on a
3 preliminary scope. This study provided the basis for FPL's request for a
4 determination of need. In 2008, Shaw Stone & Webster (Shaw) performed a scoping
5 study which included an order-of-magnitude estimate for part of the preliminary
6 scope. The 2008 Shaw order-of-magnitude estimate was confirmatory of the 2007
7 FPL conceptual estimate.

8
9 The EPU project is currently being implemented in four overlapping phases.

- 10 1. In the Engineering Analysis Phase, the analyses that support the LAR are
11 performed. During this phase, the major modifications required to implement the
12 EPU are identified and confirmed, the LARs are prepared and submitted to the
13 NRC for review, the NRC approves a license amendment for each plant (or unit,
14 as applicable), and the conceptual scope is better defined.
- 15 2. In the Long Lead Equipment Procurement Phase, the major long lead equipment
16 is procured. During this phase, purchase specifications are developed, vendor
17 quotes are requested, vendor proposals are received and evaluated, contracts are
18 awarded, and the cost of long lead equipment is better defined.
- 19 3. In the Engineering Design Modification Phase, the detailed modification packages
20 are prepared. During this phase, calculations are prepared, construction drawings
21 are issued, some equipment and materials are procured, general installation
22 instructions are provided, and high level testing requirements are identified. These

1 activities provide the basis for preparing detailed estimates of the implementation
2 costs.

- 3 4. The final Implementation Phase consists of two major parts. The first is planning
4 and scheduling. Planning is the process to convert the design packages into
5 detailed work orders for implementation. During this part of the implementation,
6 revisions to the design may be warranted based on constructability. Scheduling is
7 the process that takes the detailed work orders and converts them into a detailed
8 integrated implementation schedule which ultimately is the point at which the
9 final outage durations are determined. The second part of the final
10 implementation is actual execution of the physical work in the plant including
11 extensive testing and systematic turnover to operations.

12 **Q. Are some activities being performed in parallel?**

13 A. Yes. FPL is performing many activities in parallel in order to bring the benefits of
14 additional nuclear power generation to its customers as soon as practical. The current
15 project schedule is approximately 5 years long, and all necessary work is being
16 performed prior to a particular unit's outage. On the other hand, if FPL had worked
17 through each phase of the project in sequence (i.e., by performing all LAR analyses for
18 all units first, then procuring all equipment for all units next, etc.) the EPU project
19 would have taken many more years. Additionally, by performing EPU work in this
20 manner, Floridians will receive the benefit of approximately 20 additional electrical
21 megawatts of nuclear power from St. Lucie Unit 2 in 2011 – prior to the unit operating
22 at its final uprated level – by virtue of the installation of a more efficient low pressure

1 turbine generator. FPL's customers are projected to receive approximately 17 MWe of
2 this increased output.

3 **Q. Does FPL include industry best practices into the work being performed for the**
4 **EPU project?**

5 A. Yes. For example, the FPL project team members participate in nuclear industry
6 working groups organized by the Institute of Nuclear Plant Operations (INPO) and the
7 Nuclear Energy Institute (NEI) and benefit from lessons learned. This is supplemented
8 with direct engagement with our industry peers through benchmarking trips to other
9 nuclear sites which have performed similar scopes of work to incorporate best
10 practices. These sources help ensure project decisions are supported by the best
11 information currently available.

12 **Q. Please briefly describe the status of the project in 2009.**

13 A. Through 2009, the EPU project was well into the Engineering Analysis Phase and
14 about half-way through the Long Lead Procurement phase, and only in the early stages
15 of Engineering Design Modification and Implementation. The project scope was not
16 (and is not at the date of this testimony) fully defined and thus definitive cost estimates
17 were not completed – nor were they expected to be completed.

18 **Q. Will project scope continue to evolve as the project moves forward?**

19 A. Yes. Even after completion of the engineering analyses required for the LAR
20 submittal, the potential exists that additional scope will be required by the NRC. After
21 the NRC approves the LARs, the project scope will be further defined and,
22 commensurate with engineering design modification progress, the cost estimate range
23 will be further adjusted. Once the modification packages are final and the work order

1 planning is complete, the implementation scope will be fully defined allowing the final
2 refinement of the detailed implementation cost estimates and schedule durations.
3 These activities lead to increased cost certainty with the achievement of each
4 milestone.

5 **Q. Please provide a brief overview of 2009 activities and costs.**

6 A. Several key activities occurred in 2009, including: (i) continued forward-looking
7 project management which included modification of the EPU project management
8 organization and adjustments to project procedures; (ii) submittal of the AST LAR to
9 the NRC in support of the Turkey Point Units 3 and 4 uprate and continued
10 engineering analyses in support of submitting the EPU LARs; (iii) the execution of
11 vendor contracts for long lead equipment and quality inspections of long lead
12 equipment; (iv) modification engineering for the St. Lucie and Turkey Point units; (v)
13 rigorous management of the EPC vendor and consideration of EPC alternatives; and
14 (vi) detailed reviews of the modification installation planning and EPU outage
15 modification assignments. In total, FPL spent approximately \$238 million in 2009 (as
16 compared to the \$259 million that was previously estimated) to carry out these key
17 activities and proceed with the development of the Uprate projects, all of which work
18 was subject to the robust project planning, management, and cost control processes that
19 FPL has in place and continuously works to improve.

20
21 FPL's EPU activities and expenditures, as well as its internal processes and controls,
22 are described in more detail below.

23

PROJECT MANAGEMENT INTERNAL CONTROLS

1
2
3 **Q. Please describe the EPU project management organization during 2009.**

4 A. As described below, FPL has robust project planning, management, and execution
5 processes in place. These efforts are spearheaded by personnel with significant
6 experience in project management within the nuclear industry. Additionally, the EPU
7 project uses guidelines and Project Instructions to assist project personnel in the
8 performance of their assigned duties. Exhibit TOJ-2, Extended Power Uprate Project
9 Instructions (EPPI) Index as of December 31, 2009 is provided to illustrate the types of
10 instructions that were used.

11
12 FPL has a dedicated Nuclear Power Uprate team within the NextEra Energy, Inc.
13 Nuclear Division that is responsible for monitoring and managing the uprate project,
14 schedule, and costs. During the earliest stages of the project through mid-2009, the
15 organization was largely centralized, with support from smaller EPU Project groups at
16 the respective St. Lucie and Turkey Point Sites. This organizational structure was
17 appropriate – and indeed effective – for the solicitation and execution of major
18 contracts and preliminary project-planning activities.

19
20 As would be expected for a continuously evolving project, in June 2009, it was
21 appropriate to transition from an organization that was centralized to a decentralized
22 organization as the project progressed into the Implementation Phase. The move
23 would allow for better alignment and integration of EPU activities with operating plant

1 processes. This organizational change was implemented in conjunction with a broader
2 Nuclear Division reorganization. As implemented in 2009, and continuing today, there
3 is an EPU Site Director and an EPU organization at each site responsible for the
4 efficient and effective engineering and implementation of the EPU project
5 modifications. Exhibit TOJ-3, Extended Power Uprate Project Organization Chart,
6 illustrates the organizational structure after it was modified effective August 2009, as
7 the project entered a new stage of execution.

8
9 There is also a separate Nuclear Business Operations (NBO) group that provides
10 accounting and regulatory oversight for the EPU Project. This organization is
11 independent of the EPU Project team and reports to the Nuclear Division Controller.

12 **Q. Please describe the role of the NBO group in more detail.**

13 A. As described in EPPI-150, NBO provides accounting and regulatory oversight for the
14 EPU Project. It is independent of the EPU Project team and reports to the Nuclear
15 Division Controller. NBO's primary responsibilities include:

- 16 • Review, approval, and recording of monthly accruals prepared by the Site Cost
17 Engineers;
- 18 • Conducting monthly detail transaction reviews to ensure that labor costs recorded to
19 the EPU Project are only for those FPL personnel authorized to charge time to the
20 EPU Project;
- 21 • Conducting on-going analysis to evaluate project costs to ensure they are "separate
22 and apart";

- 1 • Creating monthly variance reports that include cost figures used in the EPU Monthly
- 2 Operating Performance Report;
- 3 • Performing analyses of the costs being incurred by the project to ensure that those
- 4 costs are appropriately allocated to the correct Capital Expenditure Requisitions
- 5 established for each nuclear unit's outages;
- 6 • Assisting in the classification of Property Retirement Units;
- 7 • Setting up and maintaining the EPU Project account coding structure;
- 8 • Providing accounting guidance and training to the EPU Team;
- 9 • Working closely with FPL's Accounting and Regulatory Accounting Departments to
- 10 determine which costs related to the EPU Project are capital and which are O&M;
- 11 • Managing internal and external financial audit requests and ensuring that findings
- 12 and recommendations are dispositioned, as appropriate; and
- 13 • Providing oversight and guidance to the EPU Project Team in developing and
- 14 maintaining accounting-related project instructions to ensure compliance with
- 15 corporate policies and procedures and Sarbanes Oxley processes.

16 **Q. What other schedule and cost monitoring controls were in place during 2009?**

17 A. FPL utilizes a variety of mutually reinforcing schedule and cost controls and draws

18 upon the expertise provided by employees within the project team, employees within

19 the separate NBO group, and executive management. Within the organization of the

20 Vice President, Nuclear Power Uprate is a Controls Group. The Controls Director

21 provides functional leadership, governance and oversight. Each site has a dedicated

22 EPU Project Controls group lead by a Project Controls Supervisor. The site Project

23 Controls organization provides cost and schedule analysis and associated performance

1 indicators on a routine and forward-looking basis thus allowing Project Management to
2 make informed decisions. Exhibit TOJ-4 lists many of the reports that are a direct
3 result of the information the Controls organization provides, analyzes and produces.
4

5 FPL's efforts to meet the desired completion date of each uprate is tracked through the
6 use of Primavera P-6 scheduling software, enabling FPL to track the schedule daily
7 and update the schedule weekly. This allows project management to monitor and
8 report schedule status on a periodic basis. Updates to the schedule and scope of project
9 are made as such changes are approved by management. FPL's use of this scheduling
10 software system allows management to examine the project status at any time as well
11 as request the development and generation of specialized reports to facilitate informed
12 decision making. When FPL identifies a scheduled milestone date that may have a
13 high probability of missing its schedule date, a mitigation plan is prepared, reviewed,
14 approved, and implemented with increased management attention to restore the
15 scheduled milestone date or mitigate any impact of missing the scheduled date.
16

17 As part of the site Project Controls Group there are several highly experienced Cost
18 Engineers assigned to monitor, analyze, and report project costs associated with the
19 Uprate Projects. Governed by well established procedures and work instructions, the
20 Cost Engineer receives contractor invoices and forwards them to technical
21 representatives to ensure the scope of work has been completed and the deliverables
22 have been accepted. For fixed-price contracts, the Cost Engineer matches the invoice
23 amount to the correct amount and the deliverable work received from the subject

1 matter expert, which is then sent to the appropriate personnel for approval and
2 payment. The Cost Engineer also prepares accruals and reviews variance reports
3 monthly for each of the sites, to monitor and document expenditures and commitments
4 to the approved budget. The Project Controls organization operates in a transparent
5 manner and its accountability is clear in providing sound analysis based on all
6 available information at their disposal.

7 **Q. What periodic reviews were conducted in 2009 to ensure that the project and key**
8 **decisions were appropriately analyzed and vetted?**

9 A. Regularly scheduled meetings are held to help effectively manage the uprate project
10 and communicate the performance of the project in terms of quality, schedule and
11 costs. In 2009, these included the following:

- 12 • Daily meetings to mutually share lessons learned information from each of the
13 projects and to coordinate project activities;
- 14 • Weekly project management, project controls, and risk meetings to review the
15 status of the schedules and project costs, and to identify areas needing attention;
- 16 • Biweekly meetings with the Chief Nuclear Officer; Vice President, Power Uprate;
17 Implementation Owner South; and other project leaders to review project progress
18 and work through any identified risks to schedules or costs;
- 19 • Routine, usually monthly, FPL Executive Steering Committee meetings where
20 project management presents the status of the project. Strategy discussions take
21 place to help improve management of risk areas;
- 22 • Monthly Project Meetings involving FPL and individual major vendors during
23 which the project schedules and challenges are discussed; and

- 1 • Quarterly Project Meetings involving FPL and its major vendors during which
2 strategy discussions take place to help improve management of risk areas.
3

4 The EPU Project also produces several reports. Exhibit TOJ-4, Extended Power
5 Uprate Project Reports, is a listing of reports generated by the project during 2009 with
6 a brief description, the periodicity, and the intended audience of each report.
7 Generally, the project reports provide a status of the project, scope changes, schedule
8 and cost adherence/variance, safety, quality, risks, risk mitigation, and a path forward
9 as appropriate. The information provided by these reports assists in the overall
10 management of the EPU Project.
11

12 Finally, the project is annually reviewed to assess its continued economic feasibility.
13 This analysis is conducted in a similar manner to the analysis that supported the
14 affirmative need determination by the Commission, but it is updated to reflect
15 engineering progress and what is currently known regarding project scope and project
16 cost, project schedule, and the cost and viability of alternative generation technologies.
17 The analyses submitted by FPL Witness Sim in 2008 and 2009 demonstrated that the
18 EPU project continued to present a significant economic advantage in a majority of
19 fuel and environmental compliance cost scenarios. An updated feasibility analysis will
20 be provided on May 1, 2011.

21 **Q. Please describe the risk management process for the EPU project.**

22 A. FPL's risk management process is governed by EPPI-340 and EPPI-345. FPL's risk
23 management process is used to identify and manage potential risks associated with the

1 Uprates. A Project Risk Committee, consisting of site project directors and subject
2 matter experts reviews and evaluates initial cost and schedule projections and any
3 potential significant variances. This committee enables senior managers to critically
4 assess and discuss risks faced by the EPU projects from different departmental
5 perspectives. The committee also ensures that actions are taken to mitigate or
6 eliminate identified risks. When an identified risk is evaluated as high, a risk
7 mitigation action plan is prepared, approved, and executed. The high risk item is
8 monitored through this process until it is reduced or eliminated. Additionally, an EPU
9 Project Risk Management report is presented at meetings with senior management,
10 identifying potential risks by site, unit, priority, probability, cost impact, and the unit or
11 persons responsible for mitigating or eliminating the risk. These steps ensure
12 continuous, vigilant identification of and response to potential project risks that could
13 pose an adverse impact on cost or schedule performance of the project.

14 **Q. Please describe the risk management process as it applies to Operational risk.**

15 A. EPU Project work will be performed during normal plant operations and during
16 planned refueling outages. The amount of work that can be safely performed during
17 these plant conditions is dependent upon the minimum required systems or
18 components needed to support the plant operating condition. Extreme care in the
19 planning, scheduling, and execution of the work activities is required to ensure the
20 plant is operated in accordance with applicable NRC regulatory and plant technical
21 specification requirements. This requires proper sequencing of work activities that can
22 be safely performed during normal plant operations or those that must be performed
23 during planned refueling outages, including work activities that can be safely

1 performed in parallel and those that must be performed in series. This operational risk
2 management accomplishes two major objectives: first is to ensure the equipment is in a
3 state that makes it safe for workers to perform the work, and secondly that the plant
4 systems and components are properly maintained to ensure public safety. This
5 operational risk management through the careful planning, scheduling and execution of
6 work activities, adds to the complexity of the implementation phase of the EPU
7 project.

8 9 **PROCUREMENT PROCESSES AND CONTROLS**

10
11 **Q. Please describe the contractor selection and contractor management procedures**
12 **that applied to the EPU projects in 2009.**

13 A. The contractor selection procedures applicable to the uprate project are found in
14 General Operating Procedure 705 and Nuclear Fleet Policy NP-1100, Procurement
15 Control. As explained in those policies, the standard approach for the procurement of
16 materials or services with a value in excess of \$25,000 is to use competitive bidding.
17 During 2009, the majority of the equipment and work contracted out for the EPU
18 project was competitively bid. However, the use of single source, sole source, and
19 Original Equipment Manufacturer (OEM) providers is also necessary in certain
20 situations. FPL's policies require proper documentation of justifications and senior-
21 level management approval of single or sole source procurements.

1 Over the course of 2009, and in response to considerations raised by the Commission
2 in the 2008 NCRC proceedings, FPL identified opportunities to improve the
3 documentation of its procurement practices and began implementing enhanced
4 measures late in 2008. FPL has maintained its focus on the process of documenting
5 and approving single and sole source procurements, to ensure compliance with NP-
6 1100 and to facilitate review by third parties who are not directly involved in the
7 nuclear procurement process. Training is provided to personnel responsible for having
8 Single and Sole Source Justifications (SSJs) prepared, the SSJ expectations are
9 included in appropriate project instructions, and all new applicable personnel assigned
10 to the EPU Project are required to review and understand the SSJ expectations.

11
12 With respect to vendor management, the EPU Project Directors at each site assure
13 vendor oversight is provided by the Site Senior Project Managers, Project Managers,
14 the site Technical Representative, and Contract Coordinators. Together, these
15 representatives provide management direction and coordinate vendor performance
16 reviews while the vendors are on site. The Site Technical Representative verifies that
17 the vendor has met all obligations and determines whether any outstanding deliverable
18 issues exist using a Contract Compliance Matrix. In addition to assisting with the
19 development and administration of contracts, Nuclear Sourcing and Integrated Supply
20 Chain (ISC) groups complete updates as necessary to a Project Contract Log and report
21 the status of contracts to project management. EPU management also holds quarterly
22 vendor integration meetings as mentioned above.

23 **Q. What is FPL's approach to contracting for the EPU project?**

1 A. FPL structures its contracts and purchase orders to include specific scope, deliverables,
2 completion dates, terms of payment, commercial terms and conditions, reports from
3 the vendor, and work quality specifications. Project Management has several types of
4 contracts available depending on how well the scope of work and the risk associated
5 with the work scope can be defined. Fixed price or lump sum contracts are used where
6 practical. An example would be where project work scope is well-defined and risk is
7 limited. Project Management will use a time and material contract where project work
8 scope is not well-defined and where there is greater risk to completing the work scope.
9 These and other contract provisions help ensure the contractors perform the right work
10 at the right time for the right price, which benefits FPL's customers.

12 **INTERNAL/EXTERNAL AUDITS AND REVIEWS**

13
14 **Q. Are FPL's financial controls and management controls audited?**

15 A. Yes. Several audits have been conducted to ensure compliance with applicable project
16 controls.

17 **Q. What internal audits or reviews have been conducted to ensure the project
18 controls are adequate and costs are reasonable?**

19 A. In 2010, Jefferson Wells on behalf of the FPL Internal Audit Department conducted an
20 internal audit of the 2009 expenses charged to the EPU project. Specifically, the
21 audits focused on whether costs charged to the project are actually for the EPU project
22 and are recorded in accordance with FPSC Rule 25-6.0423. Independent testing of
23 expenses charged to the EPU project for the period January 1, 2009 to December 31,

1 2009 was conducted. The overall opinion was that the controls over the EPU project
2 are adequate and Jefferson Wells identified no significant issues.

3 **Q. What external audits or reviews have been conducted to ensure the project**
4 **controls are adequate and costs are reasonable?**

5 A. FPSC staff completed two audits in 2009 – a financial audit and an internal controls
6 audit. FPL also engaged Concentric Energy Advisors to conduct a review of project
7 management in 2009. Witness Reed discusses Concentric’s review of the EPU Project
8 in his testimony.

9
10 **“SEPARATE AND APART” CONSIDERATIONS**

11
12 **Q. Would any of the EPU costs included in FPL’s filing have been incurred if the**
13 **FPL nuclear generating units were not being uprated?**

14 A. No. The construction costs and associated carrying charges and recoverable
15 Operations & Maintenance (O&M) expenses for which FPL is requesting recovery
16 through the NCRC process were caused only by activities necessary for the Uprate
17 projects, and would not have been incurred otherwise. I note that as explained in FPL
18 Witness Powers’ testimony and schedules, only carrying costs and recoverable O&M
19 expenses are requested for recovery for the EPU Projects, consistent with the
20 Commission’s NCRC rule.

21 **Q. Please explain the processes utilized by FPL to ensure that only those costs**
22 **necessary for the implementation of the Uprates are included for NCRC**
23 **purposes.**

1 A. FPL conducted engineering analyses to identify major components that must be
2 modified or replaced in order to enable the units to function safely and reliably in the
3 uprated condition. However, as inspections, LAR engineering analyses, and design
4 engineering modifications are performed, the need for additional modifications or
5 replacements necessary for the Uprate may be identified. Likewise, it may be
6 determined that certain modifications previously identified as necessary to the Uprate
7 project are determined not to be necessary for the Uprate and can be removed from the
8 scope.

9
10 Further, FPL considered whether any of the major component modifications or
11 replacements required for the Uprates were already required as a condition of receiving
12 its NRC license renewals. FPL reviewed the "License Renewal Action Items" issued
13 by the NRC and compiled by FPL in conjunction with the approval of FPL's requested
14 license renewals. In doing so, it verified that none of the major component
15 modifications or replacements identified by FPL as necessary for the EPU project were
16 duplicative of the activities required by the NRC for license renewals. FPL also
17 confirmed that none of the EPU activities were previously planned as regular O&M or
18 capital improvement. Additionally, when a scope change is required, a review of the
19 NRC License Renewal Action Items and the seven year capital expenditure plan is
20 conducted to ensure the proposed scope change is separate and apart. FPL's 2009 EPU
21 activities, and their associated costs, were "separate and apart" as required by the
22 NCRC process.

23

2009 PROJECT ACTIVITIES

1
2
3 **Q. What key activities occurred in 2009 in execution of the uprate projects?**

4 A. Several key activities occurred in 2009, including: (i) submittal of the AST LAR to the
5 NRC in support of the Turkey Point Units 3 and 4 uprate and continued engineering
6 analyses in support of submitting the EPU LARs; (ii) the execution of vendor contracts
7 for long lead equipment and quality inspections of long lead equipment; (iii)
8 modification engineering for the St. Lucie and Turkey Point units; (iv) rigorous
9 management of the EPC vendor; and (v) detailed reviews of the modification
10 installation planning and EPU outage modification assignments.

11 **Q. Please describe the Project Management structure for the EPU Project.**

12 A. The management structure that was in place from project inception through the first
13 half of 2009 was appropriate for the earliest stages of the project. The management
14 structure that was in place for the last half of 2009 was appropriate as the EPU Project
15 moved into the implementation phases at each of the sites. These changes permit EPU
16 project personnel to more efficiently integrate with the site unit staff for planning and
17 scheduling the installation of EPU modifications. These activities include, but are not
18 limited, to the following:

- 19 • arrival and safe storage of EPU components and equipment;
- 20 • any baseline inspections or testing needed in support of the EPU project;
- 21 • direct management and oversight of the EPC contractor and other vendors used
22 in preparing engineering modifications or specification development;
- 23 • FPL engineering reviews and acceptance of vendor prepared documents;

- 1 • work order planning of the modifications;
- 2 • implementation of the modifications;
- 3 • accurate accounting for the EPU costs being incurred; and
- 4 • development of scope changes necessary for the success of the EPU Project.

5 **Q. Did FPL incur any imprudent costs in the reorganization of the EPU project team**
6 **or the broader Nuclear Division reorganization discussed previously?**

7 A. No. FPL did not incur any imprudent costs as a result of the project reorganization.
8 To the contrary, reorganizing project management by shifting more responsibilities to
9 the sites was the prudent course of action as the project enters its implementation stage.
10 With respect to the Nuclear Division reorganization, this change did not affect the
11 types or amounts of costs incurred for the EPU project.

12 **Q. Please describe the license amendment preparation and submittal activities in**
13 **2009.**

14 A. FPL submitted to the NRC the AST LAR for Turkey Point Units 3 and 4 on June 25,
15 2009. The NRC accepted the AST LAR for review on September 25, 2009, and the
16 review and approval process was expected to take approximately 12 months. As of the
17 time of this filing, the NRC had not completed its review. The AST LAR includes
18 uprate conditions information and is required by the NRC prior to submitting the EPU
19 LAR. The potential exists that additional EPU project scope may be required as a
20 result of the NRC's AST LAR review process.

21
22 FPL also continued to manage the engineering analyses and preparations of the EPU
23 LARs to the NRC and respond to NRC Requests for Additional Information (RAIs) in

1 a timely manner. There is one EPU LAR submittal for Turkey Point and two EPU
2 LARs for St. Lucie (one for each unit). One EPU LAR for each St. Lucie unit is
3 required due to the differences in the plant design bases and the nuclear fuel used in
4 each of the units. Work was conducted in 2009 to support the planned submittal of the
5 three EPU LARs in 2010.

6 **Q. Please describe the engineering analyses in support of License Amendment**
7 **Requests in more detail.**

8 A. The EPU LARs contain nuclear fuels, mechanical, electrical, chemical and material
9 engineering evaluations required for NRC review and approval of the uprated
10 condition. For example, the engineering analyses conducted in 2009 included a review
11 of the Nuclear Steam Supply System (NSSS) design bases using the power uprate
12 parameters to ensure the original design safety margins could be maintained, or are not
13 challenged, when a plant is operated in the uprate condition.

14 **Q. Who is performing these analyses?**

15 A. Engineering analyses for the St. Lucie and Turkey Point EPU LARs are being
16 performed by the following major organizations: Westinghouse, which is an OEM for
17 the NSSS and is one of the fuel suppliers (PTN 3 and 4 and PSL 1); Shaw Stone &
18 Webster, which is performing the secondary or Balance of Plant (BOP) analyses;
19 Areva, which is an OEM for portions of the NSSS and is one of the fuel suppliers (PSL
20 2); and FPL, which reviews engineering materials prepared by the contracted
21 companies.

1 **Q. Were any state regulatory approvals sought or obtained in 2009?**

2 A. Yes. Agreement on the Conditions of Certification for the Turkey Point Site
3 Certification Amendment was reached with the South Florida Water Management
4 District on October 14, 2009, favorably closing out this issue.

5 **Q. Please describe activities related to the Long Lead Procurement phase in 2009.**

6 A. The engineering analysis was completed for major equipment and components in 2009.
7 Several increased capacity heat exchangers, pumps, and motors were specified and
8 contracted. Adjustments to the milestone payments for some of the long lead
9 equipment items resulted in fewer payments being made in 2009 and orders for
10 equipment were rescheduled as a result of the adjusted outage modification
11 assignments.

12
13 Significant progress was made in 2009 on the manufacturing of items previously
14 contracted, including the turbine closed cooling heat exchangers, high pressure (HP)
15 feedwater heat exchangers, moisture separator reheaters, main feedwater pumps,
16 feedwater heat exchangers, main condensers, turbine plant cooling water heat
17 exchangers, feedwater isolation valves, and other components. The St. Lucie main
18 turbine low pressure (LP) rotors were forged and machined in 2009. Exhibits TOJ-5
19 through TOJ-7 are pictures of the manufacturing process for the St. Lucie LP Rotor
20 and illustrate the size and nature of these major forgings. Exhibit TOJ-5 is a picture of
21 the machined St. Lucie LP turbine rotors. Exhibit TOJ-6 is a picture of the St. Lucie
22 LP turbine rotor rings that will hold the turbine blades.

1 **Q. Please describe the quality inspections related to the manufacture of long lead**
2 **equipment for the EPU Project.**

3 A. FPL Quality Assurance (QA) personnel witnessed various portions of the
4 manufacturing process and performed vendor audits of the manufacturer's processes to
5 ensure vendor quality control processes were adhered to and specifications were being
6 met. For example, Exhibit TOJ-7 is a picture of a vendor technician performing
7 ultrasonic testing to evaluate the integrity of one of the St. Lucie LP turbine rotor rings.
8 This process was witnessed by FPL QA personnel. QA verified that the individual
9 performing the testing was qualified to operate the equipment and perform the testing
10 and that the instrumentation was properly calibrated. QA prepares reports of their
11 inspections/audits.

12 **Q. Please describe the management of the major EPU project vendors in 2009.**

13 A. At all times EPU management exercises vigilant oversight of its vendors, including
14 routine visits to its vendors' headquarters, and adherence to the internal management
15 controls and vendor oversight controls discussed above. Throughout 2009, FPL
16 particularly focused on the staffing projections being provided by its EPC vendor to
17 begin the engineering for the Plant Change Modifications (PCM). A PCM will include
18 as necessary the mechanical, electrical, civil, instrumentation and control requirements,
19 requirements for removing interferences, and requirements for installing and pre-
20 operational or operational testing of the equipment as appropriate. When a PCM nears
21 completion, a more definitive cost for that modification can be estimated for use in
22 project management and budgeting. Early in 2009, the EPC vendor proposed

1 mobilization staffing and personnel ramp-up that would have resulted in costs that
2 were greater than originally estimated.

3 **Q. How did FPL respond to the EPC vendor's proposals?**

4 A. The EPU site organizations challenged these projections by requiring the EPC vendor
5 to justify each position for mobilization. The site organizations then approved
6 mobilization of only those positions that were appropriate for that stage of the project,
7 including EPC management and engineering staff. Additionally, the corporate EPU
8 organization entered into blanket contracts with three specialty vendors that perform
9 nuclear project estimating with the intent of using their estimating expertise on
10 portions of the EPU project if needed.

11
12 During the second quarter of 2009, the EPU project team determined there was a need
13 to more aggressively explore and implement ways to test, validate, and report cost
14 projection information such as that which the Company had begun to receive from its
15 EPC vendor, especially for the out-years of the Uprate project. Also, executive
16 management directed the EPU team to continue challenging the EPC vendor's
17 estimates, to consider alternative EPC vendors for at least a portion of the work, and to
18 engage third party estimating support to assist in advancing the project cost estimate
19 and to use as a tool in challenging vendor estimates. Following several iterations of
20 vendor negotiations and challenges by the site EPU project organizations and EPU
21 management, the EPC vendor's projected staffing levels were adjusted downward, and
22 continue to be adjusted from time to time as appropriate.

1 **Q. What was the effect on the total EPU project cost forecast?**

2 A. The fluctuating vendor proposals were reflected in the standard project cost reports and
3 varied the total project cost forecast at completion from month to month. The project
4 cost forecasts represent a snapshot of current trends but do not necessarily represent
5 everything known about the project. For example, while a particular month's forecast
6 may have incorporated a recent EPC vendor staffing estimate, it would not have
7 reflected the fact that EPU management was considering EPC vendor alternatives with
8 the potential to reduce costs. Due to the extensive project management activity in mid-
9 to late-2009, and considerations that put both upward and downward pressure on
10 potential total project costs, FPL had an insufficient basis upon which to revise its non-
11 binding cost estimate for the EPU project. This topic is also discussed by FPL Witness
12 Art Stall.

13 **Q. Was there any effect on the 2009 EPU project costs?**

14 A. No. The cost uncertainty discussed above concerned future year projections, not
15 current or near-term expenditures. No imprudent costs were incurred in 2009.

16 **Q. What was the status of the Plant Change Modification packages as of December
17 31, 2009?**

18 A. Exhibit TOJ-8, Plant Change Modification (PCM) Status as of December 31, 2009, is a
19 chart that illustrates the number of identified engineering modifications as of
20 December 31, 2009, the number of PCMs that were initiated, and those that reached
21 30%, 90%, and final completion. As can be seen in this exhibit, there were 185 PCMs
22 identified of which only 4 were finalized and approved for issuance. This exhibit

1 demonstrates that the Project was in the very early stages of the implementation
2 engineering.

3 **Q. Does FPL have a list of the equipment modifications planned for the EPU**
4 **project?**

5 A. Yes. Exhibit TOJ-9, Extended Power Uprate Equipment List, provides a listing of the
6 equipment modifications or replacements, a description as to why it is needed for the
7 uprate conditions, current vendors and contract Purchase Orders (PO) where available,
8 and the source document identifying the equipment modification or replacement, as of
9 December 31, 2009.

10 **Q. Please describe the modification installation planning and EPU outage**
11 **modification assignments performed by project personnel.**

12 A. In 2009 the project team analyzed which modifications should be performed in which
13 outages based on the long lead equipment schedule for delivery, the sequencing of the
14 outages, vendor capabilities, and the amount of EPU modification work that was
15 proposed for each outage. Discussions took place with executive management, each of
16 the site's outage and operations management, FPL's nuclear fuels department, the
17 major equipment suppliers, and the EPC vendor to determine the impact of changing
18 the implementation sequence of EPU modifications, and an adjustment to the outage
19 assignments was made.

20
21 There are some risks associated with adjusting outage modification assignments,
22 including the need to accommodate any additional modifications that result from the
23 NRC's LAR reviews and the ability of the project vendors to integrate outage

1 sequencing with their other work commitments. But there are several potential
2 benefits to the adjusted outage modification assignments as well. The outage
3 modification assignments will permit an earlier increase in the electrical generation
4 from one of the units, and may also reduce total off-line time which would benefit
5 customers through additional cost savings. Also, because the initial EPU outages will
6 now have more limited scope, the site implementation teams will be able to use initial
7 outage experience to enhance second outage performance, when there will be more
8 scope. Finally, the reassignment provides for more time to develop more of the EPU
9 engineering modifications and installation packages now that they will be implemented
10 during the second outage for each unit. It should be expected, however, that as the
11 LAR reviews, design engineering, and implementation planning progresses, additional
12 changes to outage modification assignments may occur.

13 **Q. As of December 31, 2009, what was the overall EPU project schedule?**

14 A. Exhibit TOJ-10, Extended Power Uprate Project Schedule as of December 31, 2009,
15 illustrates the LAR, long lead material, engineering design, and implementation
16 schedule for the EPU Project. Underlying this high-level schedule are tens of
17 thousands of individually-scheduled activities. These scheduled activities provide a
18 roadmap for the project. Activities are logically-tied to ensure a sequence of activities
19 needed to support a future activity are completed prior to the future activity being
20 started or completed, as required. FPL's overall project schedule in 2009 included the
21 following:

- 22 • The LAR analyses were scheduled to be completed and submitted to the NRC with
23 sufficient time for an extended NRC review before the license amendment

1 approval is needed by FPL to increase the power output at the completion of the
2 second EPU outage for each of the units.

- 3 • Long lead material items were scheduled to arrive on site prior to the outage during
4 which the equipment will be installed.
- 5 • PCM engineering design for each of the 185 identified modifications was
6 scheduled to be approved for implementation prior to the unit outage when each
7 modification will be implemented.
- 8 • Implementation of the EPU modifications was scheduled to be completed during
9 the scheduled refueling outages for each of the units.

10 **Q. Did FPL conduct a “feasibility analysis” of the EPU project in 2009?**

11 A. Yes. FPL Witness Steve Sim conducted a feasibility analysis in 2009, which
12 demonstrated that in all nine combinations of projected fuel cost and environmental
13 compliance cost scenarios the EPU project was the cost-effective choice for FPL’s
14 customers. Dr. Sim’s analysis and results were discussed in detail in the testimony
15 provided in Docket No. 090009-EI and approved by the Commission.

16
17 **2009 CONSTRUCTION COSTS**

18
19 **Q. What type of costs did FPL incur for the uprate project in 2009?**

20 A. As demonstrated in Exhibit TOJ-1, Schedule T-6 and T-4, and summarized on Exhibit
21 TOJ-11, Tables 1 through 9, costs were incurred in the following categories: License
22 Application; Engineering and Design; Permitting; Project Management; Power Block
23 Engineering, Procurement, Etc.; Non Power Block Engineering, Procurement, Etc.;

1 and Recoverable O&M. These costs were the direct result of the prudent project
2 management, decision making, and actions described in detail above. Each category
3 reflects some variance against what was originally estimated and budgeted, which is to
4 be expected, particularly given the relatively early stage of the project. The overall
5 variance in 2009 is driven primarily by the reduced payments for long lead equipment
6 items, downward adjustments to engineering and EPC contractor resources due to the
7 vendor oversight efforts described above, and downward adjustments to staff resources
8 due to the adjusted EPU outage modification assignments. Staffing levels will be
9 increased later in the project to provide appropriate staffing for the EPU long duration
10 outages. Exhibit TOJ-11, 2009 Extended Power Uprate Construction Costs contains
11 summaries of the EPU expenditures in 2009 for each of the NFR schedule categories.
12 Table 1 to Exhibit TOJ-11 is a summary of each of the categories showing the actual
13 expenditure amounts prior to any adjustments.

14 **Q. Please describe the costs incurred in the License Application category and the**
15 **variance, if any, from the 2009 actual/estimated costs in this category.**

16 A. Licensing Costs consist primarily of charges for consulting and contractor services
17 rendered in support of preparing the LARs. The primary contractors that provide
18 services in this category are Westinghouse, Areva, and Shaw Stone & Webster. FPL
19 incurred \$66.9 million in this category in 2009, which was \$7.9 million more than the
20 actual/estimated amount. This was primarily attributable to the preparation of more
21 analyses than expected and a longer period of contractor mobilization in performing
22 the NSSS/Fuel Engineering work. The longer period of mobilization and the increased

1 quantity of analyses are due to additional scope identified during the initial phases of
2 these evaluations.

3 **Q. Please describe the costs incurred in the Engineering and Design category and the**
4 **variance, if any, from the actual/estimated costs in this category.**

5 A. Engineering & Design Costs consist primarily of costs for FPL personnel and
6 contractor personnel in the FPL engineering organizations at both sites and in the
7 central organization. Some of these personnel provide management, oversight and
8 review of the LAR activities, while others are oriented towards management, oversight
9 and review of the detail design activities being performed by the EPC contractor. FPL
10 incurred \$12.6 million in this category in 2009, which is \$1.9 million more than the
11 actual/estimated amount. This was primarily attributable to LAR scope growth and
12 actual costs required to manage the EPC contractor engineering effort.

13 **Q. Please describe the costs incurred in the Permitting category and the variance, if**
14 **any, from the actual/estimated costs in this category.**

15 A. Permitting Costs are primarily attributable to the State of Florida Site Certification
16 Application for the St. Lucie and Turkey Point sites. This consists of consulting
17 services related to environmental work for the Site Certification Application (SCA)
18 and Compliance of Certification (CoC), and FPL employee support. FPL incurred
19 \$512,725 in this category in 2009, which was \$410,295 more than the actual/estimated
20 amount. This was primarily due to more than expected costs to reach closure on the
21 manner in which FPL would comply with the CoC for the Turkey Point SCA.
22 Specifically, resources were required to develop the scope of the Turkey Point Cooling
23 Canal monitoring program required by the CoC.

1 **Q. Please describe the costs incurred in the Project Management category and the**
2 **variance, if any, from the actual/estimated costs in this category.**

3 A. Project Management Costs relate to overall project oversight including project and
4 construction management, project controls and non-NRC regulatory compliance.
5 These oversight activities are performed by personnel located at both sites; and by the
6 EPU central organization and by non-EPU organizations such as NBO, New Nuclear
7 Accounting, and Regulatory Affairs. FPL incurred \$15.5 million in this category in
8 2009 which was \$4.7 million less than the actual/estimated amount. This was
9 primarily attributable to the movement of more field management responsibilities to
10 the EPC vendor. In addition, the ramp up of EPU project staff was revised to support
11 the adjusted outage modification assignments.

12 **Q. Please describe the costs incurred in the Power Block Engineering, Procurement,**
13 **Etc. category and the variance, if any, from the actual/estimated costs in this**
14 **category.**

15 A. The majority of these costs continue to be for milestone payments for long lead
16 equipment items. This includes payments to Siemens for turbines and generator rotors,
17 and payments to TEI for feedwater heaters and moisture separator reheaters, main
18 condensers, and increased capacity heat exchangers and pumps required to support the
19 uprate conditions. These costs also include the EPC vendor contract for the
20 engineering and design of modifications of currently identified project scope. In
21 addition, FPL completed the modifications to the St. Lucie Unit 2 Turbine Gantry
22 Crane in 2009 and incurred most of the expected project costs. On December 4, 2009,

1 FPL filed a petition to include costs associated with the St. Lucie Unit 2 Turbine
2 Gantry Crane in base rates.

3 FPL incurred \$141.2 million in this category in 2009 which is \$26.6 million less than
4 the actual/estimated amount. The majority of the variance is attributable to less than
5 expected utilization of the EPC contractor and deferral of some milestone payments to
6 vendors for the long lead procurement equipment. A contributing factor was the
7 adjusted outage modification assignments which moved some plant modifications
8 between the outages. In 2009, this resulted in a less intensive EPC engineering effort
9 and a less pronounced EPC organization ramp up, and later delivery requirements for
10 certain major equipment.

11 **Q. Please describe the costs incurred in the Power Block Engineering, Procurement,**
12 **Etc. category for the completed modifications to the St. Lucie Unit 2 Turbine**
13 **Gantry Crane.**

14 A. The St. Lucie Unit 2 Turbine Gantry Crane upgrade field implementation started in
15 August 2009. Performance testing was completed and the PSL Unit 2 Turbine Gantry
16 Crane was placed in service on December 22, 2009.

17
18 The St. Lucie Plant has two Turbine Gantry Cranes, one for each unit. During the
19 initial evaluations of the proposed schedule for implementation of the EPU
20 modifications, the Turbine Gantry Crane activities became the critical path during
21 implementation of the EPU modifications. An engineering evaluation of each Turbine
22 Gantry Crane was performed resulting in proposed modifications to each crane for
23 increased efficiency and precision in removing and installing the many pieces of

1 heavy equipment. The modifications to each Turbine Gantry Crane can be performed
2 during normal plant operation, saving plant outage time. The modifications were
3 performed on the PSL Unit 2 Turbine Gantry Crane in 2009. Some of the
4 modifications performed included installing bridge and trolley motors and hoists
5 capable of infinitely variable speed control from the operator's cab or from a pendant
6 control that can be used by the crane operator outside of the cab on the turbine deck at
7 the same level as the load being moved.

8
9 The cost of the PSL 2 Turbine Gantry Crane upgrades was \$2,856,822, as of the
10 fourth quarter of 2009, as reflected in Appendix A of Exhibit TOJ-1. On December 4,
11 2009, FPL filed a petition with the Commission to include the St. Lucie Unit 2
12 Turbine Gantry Crane modification costs associated with the EPU Project in Base
13 Rates (Docket No. 090529-EI). That request was granted on March 16, 2010.

14 **Q. Please describe the costs incurred in the Non-Power Block Engineering,**
15 **Procurement, Etc. category and the variance, if any, from the actual/estimated**
16 **costs in this category.**

17 A. Non-Power Block Engineering Costs consist primarily of costs for facilities for
18 engineering and project staff at site locations and the simulator upgrades required to
19 reflect the uprate conditions. FPL incurred \$535,251 in this category in 2009. This
20 represents \$445,101 more than the actual/estimated amount. The variance is primarily
21 attributable to costs for the simulator modifications being incurred earlier than planned.

1 **Q. Please describe the costs incurred as Recoverable O&M.**

2 A. FPL incurred \$498,077 in recoverable O&M. This represents a variance of \$69,923
3 less than the actual/estimated amount. Consistent with FPL's capitalization policy, the
4 commodities that make up these expenditures consist primarily of non-capitalizable
5 computer hardware and software, and office furniture and fixtures needed for new
6 project-bound hires – all of which are segregated for EPU Project personnel use only –
7 incremental staff, and augmented contract staff. In addition, with the completion of the
8 St. Lucie Unit 2 Turbine Gantry Crane modification in late 2009, Recoverable O&M
9 also includes the write-off of inventory rendered obsolete because of EPU
10 modifications. Through 2009, \$18,864 in inventory has been written off.

11 **Q. Please describe the costs incurred in the Transmission category.**

12 A. The expenditures in Transmission include line engineering, substation engineering, and
13 line construction and totaled \$368,559. The cost is \$659,565 less than the
14 actual/estimated amount. The variance is the result of revising the schedule for
15 substation and transmission construction activities. FPL moved some of the substation
16 construction activities originally scheduled for 2010 to outages scheduled in 2011 and
17 2012. This shift resulted in reduced 2009 substation engineering costs. Additionally,
18 due to restrictions in removing certain transmission lines from service in 2009, part of
19 the transmission line engineering and construction costs scheduled during the PSL Unit
20 2 spring 2009 outage were deferred to the PSL Unit 1 spring 2010 outage.

CONCLUSION

1

2

3 **Q. Were FPL's 2009 EPU expenditures prudently incurred?**

4 A. Yes. FPL incurred costs of approximately \$238 million in 2009. FPL's actual costs
5 were less than its estimate for the reasons described above. All of FPL's expenditures
6 were necessary so that the uprate work can be performed during the planned outages.
7 Through experienced personnel's application of the robust internal schedule and cost
8 controls, careful vendor oversight, and the ability to continuously adjust based on
9 lessons learned and the project's evolving needs, FPL is confident that its EPU
10 management decisions are well-founded and prudent. All costs incurred in 2009 were
11 the product of such decisions, were reasonable and prudently incurred, and should be
12 approved.

13 **Q. Does this conclude your direct testimony?**

14 A. Yes.

1 **BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION**

2 **FLORIDA POWER & LIGHT COMPANY**

3 **DIRECT TESTIMONY OF TERRY O. JONES**

4 **DOCKET NO. 110009-EI**

5 **MARCH 1, 2011**

6 **Q. Please state your name and business address.**

7 A. My name is Terry O. Jones, and my business address is 700 Universe Boulevard, Juno
8 Beach, FL 33408.

9 **Q. By whom are you employed and what is your position?**

10 A. I am employed by Florida Power & Light Company (FPL) as Vice President, Nuclear
11 Power Uprate.

12 **Q. Please describe your duties and responsibilities in that position.**

13 A. In my current role, I report directly to the Chief Nuclear Officer. I am responsible for
14 the management and execution of the Extended Power Uprate (“EPU” or “Uprate”)
15 Project.

16 **Q. Please describe your educational background and professional experience.**

17 A. I was appointed Vice President, Nuclear Power Uprate on August 1, 2009. In my
18 current position I provide executive leadership, governance and oversight to ensure the
19 safe and reliable implementation of the EPU Projects for the four FPL nuclear units.

20
21 I joined FPL in 1987 in the Nuclear Operations Department at Turkey Point. Since
22 then, my positions at FPL have included Vice President, Operations, Midwest Region;
23 Vice President, Nuclear Plant Support; Vice President, Special Projects; Vice

1 President, Turkey Point Nuclear Power Plant; Plant General Manager; Maintenance
2 Manager; Operations Manager and Operations Supervisor. Prior to my employment at
3 FPL, I worked for the Tennessee Valley Authority at the Browns Ferry Nuclear Plant
4 and served in the US Nuclear Navy. I hold a Bachelors of Science degree and an MBA
5 from the University of Miami.

6 **Q. Are you sponsoring any exhibits in this proceeding?**

7 A. Yes, I am sponsoring the following exhibits which are incorporated herein by
8 reference:

- 9 • Exhibit TOJ-12, AE Schedules, 2010 EPU Construction Costs, containing
10 schedules AE-1 through AE-7B. Page 2 of Exhibit TOJ-12 contains a table of
11 contents listing the schedules that are sponsored and co-sponsored by FPL Witness
12 Powers and myself.
- 13 • Exhibit TOJ-13, T-Schedules, 2010 EPU Construction Costs, containing schedules
14 T-1 through T-7B. Page 2 of Exhibit TOJ-13 contains a table of contents listing the
15 schedules that are sponsored and co-sponsored by FPL Witness Powers and myself.
- 16 • Exhibit TOJ-14, 2010 Extended Power Uprate Project Instructions (EPPI) Index as
17 of December 31, 2010
- 18 • Exhibit TOJ-15, 2010 Extended Power Uprate Project Site Centered Organization
19 Chart
- 20 • Exhibit TOJ-16, Extended Power Uprate Project Reports - 2010
- 21 • Exhibit TOJ-17 Plant Change Modification (PCM) Status as of December 31, 2010
- 22 • Exhibit TOJ-18, Extended Power Uprate Equipment List as of December 31, 2010
- 23 • Exhibit TOJ-19, Extended Power Uprate Project Schedule as of December 31, 2010

- Exhibit TOJ-20, Summary of 2010 Extended Power Uprate Construction Costs

Q. What is the purpose of your testimony?

A. The purpose of my testimony is to present and explain the EPU project, key management decisions and Uprate project activities that occurred in 2010, FPL's 2010 Uprate construction expenditures, and the procedures, processes and controls that ensure that those expenditures are reasonable and the result of prudent decision making. My testimony also explains the careful engineering-based process employed by FPL to ensure that it is including only nuclear uprate costs that are "separate and apart" from other costs, such as those for base rate nuclear operations and maintenance or capital projects that are unrelated to the nuclear Uprates.

Q. Please summarize your testimony.

A. The EPU project is a complex undertaking to safely increase the capacity of FPL's four existing nuclear units – St. Lucie (PSL) Units 1 & 2 and Turkey Point (PTN) Units 3 & 4 – which will provide significant and quantifiable benefits for customers without expanding the footprint of FPL's existing nuclear power plant sites. Upon completion, FPL estimates that approximately 450 megawatts electric power (MWe) of baseload, non-greenhouse gas emitting generation will be provided by the EPU project for FPL's customers, and that customers will realize significant fuel cost savings as a result.

The project team is in the process of performing design engineering, procuring long lead equipment and materials, obtaining regulatory approvals, and implementing plant modifications to support the uprate conditions in multiple refueling outages for each of the nuclear units. This process is supported by robust and overlapping project schedule

1 and cost controls, along with rigorous risk management. Additionally, the EPU team
2 manages the Uprate work in a manner that ensures that only the costs necessary for the
3 Uprates are expended and included in the Nuclear Cost Recovery process.
4

5 Progress in 2010 included the following: the successful completion of the first of two
6 EPU outages at St. Lucie Unit 1 and Turkey Point Unit 3; continuance of the LAR
7 engineering evaluations along with the submittal of two EPU LARs and a Spent Fuel
8 Criticality LAR for Turkey Point; EPC vendor work towards completing the
9 engineering design of approximately 207 plant design modification packages;
10 continued scheduling and planning for implementation of the modifications in proper
11 sequence; and a decision to revise the planned outage durations. FPL prudently
12 incurred approximately \$319 million of EPU costs during 2010, as compared to the
13 May 2, 2010 actual/estimated amount of approximately \$321 million.

14 **Q. Please describe how the remainder of your testimony is organized.**

15 A. My testimony includes the following sections:

- 16 1. 2010 Project Summary
- 17 2. Project Management Internal Controls
- 18 3. Procurement Processes and Controls
- 19 4. Internal/External Audits and Reviews
- 20 5. "Separate and Apart" Considerations
- 21 6. 2010 Project Activities
- 22 7. 2010 Construction Costs
- 23 8. Conclusion

4

2010 PROJECT SUMMARY

5
6
7
8
9
10
11

Q. What is the EPU Project?

12
13
14
15
16
17
18
19
20

A. The EPU project will increase FPL's nuclear generating capacity from its four existing nuclear units by fitting the units with higher capacity and more efficient turbines and other necessary equipment to accommodate increased steam flow that will result from loading fuel with increased reactivity into each reactor. This involves the modification or outright replacement of a large number of components and support structures within FPL's operating nuclear power plants. Each modification/replacement is considered a project in and of itself. In the case of some major modifications, some permanent plant equipment will have to be removed and then reinstalled as part of the construction process.

21
22
23

Because the project will modify FPL's operating nuclear plants, it is a much different construction project than constructing a new combined cycle generating unit at a greenfield site. FPL plans to perform the modifications during the units' pre-planned refueling outages. Performing the Uprate work during the refueling outages minimizes the amount of time that these low fuel-cost generators are off line.

Upon completion, the Uprates will produce a minimum of 399 MWe and could produce a theoretical maximum of up to 463 MWe for FPL's customers. The minimum reflects FPL's need determination assumption (414 MWe), less the St. Lucie

1 Unit 2 co-owners' share of the output. The maximum reflects the turbine vendor's
2 estimate of the turbine generator's performance (approximately 500 MWe) if the "best
3 case scenario" of plant parameters are achieved, less the co-owners' share of PSL Unit
4 2 and increased plant electrical requirements. Taking into account the current
5 uncertainty of whether "best case" plant parameters will be achieved, FPL's current
6 estimate is that a total of about 450 MWe will be produced by the uprated units for
7 FPL's customers.

8 **Q. How will customers benefit from the EPU project?**

9 A. Among other benefits, this increase in nuclear power will: (i) enhance system
10 reliability and integrity by diversifying FPL's fuel mix; (ii) provide energy and
11 baseload capacity to FPL's customers with zero greenhouse gas emissions; and (iii)
12 provide significant fuel cost and environmental compliance cost savings. Some of
13 these benefits will be realized as early as 2011, when the replacement of a low pressure
14 turbine generator at St. Lucie Unit 2 with a more efficient low pressure turbine
15 generator will result in a projected total increased electrical power output of
16 approximately 20 MWe and FPL's customers are projected to receive approximately
17 17 MWe of this increased output. Quantification of these types of benefits will be
18 provided along with an updated project feasibility analysis in FPL's May 2011
19 testimony.

20 **Q. Please describe the general approach to the EPU project.**

21 A. In 2007, FPL prepared an initial conceptual engineering study for performing an EPU
22 at St. Lucie and Turkey Point which included a conceptual cost estimate based on a
23 preliminary scope. This study provided the basis for FPL's request for a

1 determination of need. In 2008, Shaw Stone & Webster (Shaw) performed a scoping
2 study which included an order-of-magnitude estimate for part of the preliminary
3 scope. The 2008 Shaw order-of-magnitude estimate was confirmatory of the 2007
4 FPL conceptual estimate.

5
6 The EPU project is currently being implemented in four overlapping phases.

- 7 1. In the Engineering Analysis Phase, the analyses that support the LAR are
8 performed. During this phase, the major modifications required to implement the
9 EPU are identified and confirmed, the LARs are prepared and submitted to the
10 NRC for review, the NRC approves a license amendment for each plant (or unit,
11 as applicable), and the conceptual scope is better defined.
- 12 2. In the Long Lead Equipment Procurement Phase, the major long lead equipment
13 is procured. During this phase, purchase specifications are developed, vendor
14 quotes are requested, vendor proposals are received and evaluated, contracts are
15 awarded, and the cost of long lead equipment is better defined.
- 16 3. In the Engineering Design Modification Phase, the detailed modification packages
17 are prepared. During this phase, calculations are prepared, construction drawings
18 are issued, some equipment and materials are procured, general installation
19 instructions are provided, and high level testing requirements are identified. These
20 activities provide the basis for preparing detailed estimates of the implementation
21 costs.
- 22 4. The final Implementation Phase consists of two major parts. The first is planning
23 and scheduling. Planning is the process to convert the design packages into

1 detailed work orders for implementation. During this part of the implementation,
2 revisions to the design may be warranted based on constructability. Scheduling is
3 the process that takes the detailed work orders and converts them into a detailed
4 integrated implementation schedule which ultimately is the point at which the
5 final outage durations are determined. The second part of the final
6 implementation is actual execution of the physical work in the plant including
7 extensive testing and systematic turnover to operations.

8 **Q. Are some activities being performed in parallel?**

9 A. Yes. FPL is performing many activities in parallel in order to bring the benefits of
10 additional nuclear power generation to its customers as soon as practical. The current
11 project schedule is approximately 5 years long, and all necessary work is being
12 performed prior to a particular unit's outage. On the other hand, if FPL had worked
13 through each phase of the project in sequence (i.e., by performing all LAR analyses for
14 all units first, then procuring all equipment for all units next, etc.) the EPU project
15 would have taken many more years. Additionally, by performing EPU work in this
16 manner, Floridians will receive the benefit of approximately 20 additional electrical
17 megawatts of nuclear power from St. Lucie Unit 2 in 2011 – prior to the unit operating
18 at its final uprated level – by virtue of the installation of a more efficient low pressure
19 turbine generator. FPL's customers are projected to receive approximately 17 MWe of
20 this increased output.

21 **Q. Does FPL include industry best practices into the work being performed for the**
22 **EPU project?**

1 A. Yes. For example, the FPL project team members participate in nuclear industry
2 working groups organized by the Institute of Nuclear Plant Operations (INPO) and the
3 Nuclear Energy Institute (NEI) and benefit from lessons learned. This is supplemented
4 with direct engagement with our industry peers through benchmarking trips to other
5 nuclear sites which have performed similar scopes of work to incorporate best
6 practices. These sources help ensure project decisions are supported by the best
7 information currently available.

8 **Q. Please briefly describe the status of the project in 2010.**

9 A. Through 2010, the EPU project was nearing completion of the Engineering Analysis
10 Phase, well into the Long Lead Procurement Phase, and progressing with the
11 Engineering Design Modification and Implementation Phases in support of each
12 outage. The project scope was not (and is not at the date of this testimony) fully
13 defined and thus definitive cost estimates were not completed – nor were they expected
14 to be completed. FPL developed a non-binding cost estimate range in 2010 that
15 recognized the uncertainties of the early stage of the project and quantified the
16 associated project risks based on known information.

17 **Q. Will project scope continue to evolve as the project moves forward?**

18 A. Yes. Even after completion of the engineering analyses required for the LAR
19 submittal, the potential exists that additional scope will be required by the NRC. After
20 the NRC approves the LARs, the project scope will be further defined and,
21 commensurate with engineering design modification progress, the cost estimate range
22 will be further adjusted. Once the modification packages are final and the work order
23 planning is complete, the implementation scope will be fully defined allowing the final

1 refinement of the detailed implementation cost estimates and schedule durations.
2 These activities lead to increased cost certainty with the achievement of each
3 milestone.

4 **Q. Please provide a brief overview of 2010 activities and costs.**

5 A. In 2010, FPL continued work on the overlapping phases of the project. Several of the
6 key activities that occurred in 2010 include: (i) submittal of the St. Lucie Unit 1 EPU
7 LAR, the Turkey Point Units 3 and 4 EPU LAR, and the Turkey Point Spent Fuel
8 Criticality LAR to the NRC for review and approval of the engineering evaluation and
9 analyses, and the progress of activities related to the St. Lucie Unit 2 EPU LAR; (ii)
10 the progress of modification engineering for the St. Lucie and Turkey Point Units; (iii)
11 the execution and quality inspections of the vendor contracts for long lead procurement
12 equipment as well as inspection, receipt, and storage of long lead procurement items;
13 (iv) continued vigilant oversight and management of vendors; (v) preparation for and
14 successful execution of implementation activities during the St. Lucie Unit 1 spring
15 outage and the Turkey Point Unit 3 fall outage; (vi) receipt of an independent third
16 party estimate of implementation man-power requirements and costs; and (vii)
17 continued forward-looking project management resulting in adjustments to outage
18 durations, project plans and procedures. In total, FPL spent approximately \$319
19 million in 2010 (as compared to the \$321 million that was previously estimated) to
20 carry out these key activities and proceed with the development of the uprate projects,
21 all of which work was subject to the robust project planning, management, and cost
22 control processes that FPL has in place and continuously works to improve.

23

1 FPL's EPU activities and expenditures, as well as its internal processes and controls,
2 are described in more detail below.

4 PROJECT MANAGEMENT INTERNAL CONTROLS

5
6 **Q. Please describe the EPU project management organization during 2010.**

7 A. As described below, FPL has robust project planning, management, and execution
8 processes in place. These efforts are spearheaded by personnel with significant
9 experience in project management within the nuclear industry. Additionally, the EPU
10 project uses guidelines and Project Instructions to assist project personnel in the
11 performance of their assigned duties. Exhibit TOJ-14, Extended Power Uprate Project
12 Instructions (EPPI) Index as of December 31, 2010 is provided to illustrate the types of
13 instructions that were used.

14
15 FPL has a dedicated Nuclear Power Uprate team within the NextEra Energy, Inc.
16 Nuclear Division that is responsible for monitoring and managing the uprate project,
17 schedule, and costs. Exhibit TOJ-15, EPU Project Site Centered Organization,
18 illustrates the organizational structure in place during 2010. In addition to some
19 centralized project oversight, there is an EPU Site Director and an EPU organization at
20 each site responsible for the efficient and effective engineering and implementation of
21 the EPU project modifications. This decentralized management structure is
22 appropriate as the EPU Project enters the implementation phases at each of the sites to
23 better integrate EPU activities with plant operating activities.

1
2 There is also a separate Nuclear Business Operations (NBO) group that provides
3 accounting and regulatory oversight for the EPU Project. This organization is
4 independent of the EPU Project team and reports to the Nuclear Division Controller.

5 **Q. Please describe the role of the NBO group in more detail.**

6 A. As described in EPPI-150, NBO provides accounting and regulatory oversight for the
7 EPU Project. It is independent of the EPU Project team and reports to the Nuclear
8 Division Controller. NBO's primary responsibilities include:

- 9 • Review, approval, and recording of monthly accruals prepared by the Site Cost
10 Engineers;
- 11 • Conducting monthly detail transaction reviews to ensure that labor costs recorded to
12 the EPU Project are only for those FPL personnel authorized to charge time to the
13 EPU Project;
- 14 • Conducting on-going analysis to evaluate project costs to ensure they are "separate
15 and apart";
- 16 • Creating monthly variance reports that include cost figures used in the EPU Monthly
17 Operating Performance Report;
- 18 • Performing analyses of the costs being incurred by the project to ensure that those
19 costs are appropriately allocated to the correct Capital Expenditure Requisitions
20 established for each nuclear unit's outages;
- 21 • Assisting in the classification of Property Retirement Units;
- 22 • Setting up and maintaining the EPU Project account coding structure;
- 23 • Providing accounting guidance and training to the EPU Team;

- 1 • Working closely with FPL's Accounting and Regulatory Accounting Departments to
- 2 determine which costs related to the EPU Project are capital and which are O&M;
- 3 • Managing internal and external financial audit requests and ensuring that findings
- 4 and recommendations are dispositioned, as appropriate; and
- 5 • Providing oversight and guidance to the EPU Project Team in developing and
- 6 maintaining accounting-related project instructions to ensure compliance with
- 7 corporate policies and procedures, and Sarbanes Oxley processes.

8 **Q. What other schedule and cost monitoring controls were in place during 2010?**

9 A. FPL utilizes a variety of mutually reinforcing schedule and cost controls and draws
10 upon the expertise provided by employees within the project team, employees within
11 the separate NBO group, and executive management. Within the organization of the
12 Vice President, Nuclear Power Uprate is a Controls Group. The Controls Director
13 provides functional leadership, governance and oversight. Each site has a dedicated
14 EPU Project Controls group lead by a Project Controls Supervisor. The site Project
15 Controls organization provides cost and schedule analysis and associated performance
16 indicators on a routine and forward-looking basis thus allowing Project Management to
17 make informed decisions. Exhibit TOJ-16 lists many of the reports that are a direct
18 result of the information the Controls organization provides, analyzes and produces.

19
20 FPL's efforts to meet the desired completion date of each uprate is tracked through the
21 use of Primavera P-6 scheduling software, enabling FPL to track the schedule daily
22 and update the schedule weekly. This allows project management to monitor and
23 report schedule status on a periodic basis. Updates to the schedule and scope of project

1 are made as such changes are approved by management. FPL's use of this scheduling
2 software system allows management to examine the project status at any time as well
3 as request the development and generation of specialized reports to facilitate informed
4 decision making. When FPL identifies a scheduled milestone date that may have a
5 high probability of missing its schedule date, a mitigation plan is prepared, reviewed,
6 approved, and implemented with increased management attention to restore the
7 scheduled milestone date or mitigate any impact of missing the scheduled date.

8
9 As part of the site Project Controls Group, there are several highly experienced Cost
10 Engineers assigned to monitor, analyze, and report project costs associated with the
11 Uprate Projects. Governed by well established procedures and work instructions, the
12 Cost Engineer receives contractor invoices and forwards them to technical
13 representatives to ensure the scope of work has been completed and the deliverables
14 have been accepted. For fixed-price contracts, the Cost Engineer matches the invoice
15 amount to the correct amount and the deliverable work received from the subject
16 matter expert, which is then sent to the appropriate personnel for approval and
17 payment. The Cost Engineer also prepares accruals and reviews variance reports
18 monthly for each of the sites, to monitor and document expenditures and commitments
19 to the approved budget. The Project Controls organization operates in a transparent
20 manner and its accountability is clear in providing sound analysis based on all
21 available information at their disposal.

22 **Q. What periodic reviews were conducted in 2010 to ensure that the project and key**
23 **decisions were appropriately analyzed and vetted?**

1 A. Regularly scheduled meetings are held to help effectively manage the uprate project
2 and communicate the performance of the project in terms of quality, schedule and
3 costs. These include the following:

- 4 • Daily meetings to mutually share lessons learned information from each of the
5 projects and to coordinate project activities;
- 6 • Weekly project management, project controls, and risk meetings to review the
7 status of the schedules and project costs, and to identify areas needing attention;
- 8 • Biweekly meetings with the Chief Nuclear Officer; Vice President, Power Uprate;
9 Implementation Owner South; and other project leaders to review project progress
10 and work through any identified risks to schedules or costs;
- 11 • Routine, usually quarterly, FPL Executive Steering Committee meetings where
12 project management presents the status of the project. Strategy discussions take
13 place to help improve management of risk areas;
- 14 • Monthly Project Meetings involving FPL and individual major vendors during
15 which the project schedules and challenges are discussed; and
- 16 • Quarterly Project Meetings involving FPL and its major vendors during which
17 strategy discussions take place to help improve management of risk areas.

18
19 The EPU Project also produces several reports. Exhibit TOJ-16, Extended Power
20 Uprate Project Reports, is a listing of reports generated by the project during 2010 with
21 a brief description, the periodicity, and the intended audience of each report.
22 Generally, the project reports provide a status of the project, scope changes, schedule
23 and cost adherence/variance, safety, quality, risks, risk mitigation, and a path forward

1 as appropriate. The information provided by these reports assists in the overall
2 management of the EPU Project.

3
4 Finally, the project is annually reviewed to assess its continued economic feasibility.
5 This analysis is conducted in a similar manner to the analysis that supported the
6 affirmative need determination by the Commission, but it is updated to reflect
7 engineering progress and what is currently known regarding project scope and project
8 cost, project schedule, and the cost and viability of alternative generation technologies.
9 The analyses submitted by FPL Witness Sim in 2010 demonstrated that the EPU
10 project continued to present a significant economic advantage in a majority of fuel and
11 environmental compliance cost scenarios. An updated feasibility analysis will be
12 provided in May, 2011.

13 **Q. Please describe the risk management process for the EPU project.**

14 A. FPL's risk management process is governed by EPPI-340 and EPPI-345. FPL's risk
15 management process is used to identify and manage potential risks associated with the
16 uprates. A Project Risk Committee, consisting of site project directors and subject
17 matter experts reviews and evaluates initial cost and schedule projections and any
18 potential significant variances. This committee enables senior managers to critically
19 assess and discuss risks faced by the EPU projects from different departmental
20 perspectives. The committee also ensures that actions are taken to mitigate or
21 eliminate identified risks. When an identified risk is evaluated as high, a risk
22 mitigation action plan is prepared, approved, and executed. The high risk item is
23 monitored through this process until it is reduced or eliminated. Additionally, an EPU

1 Project Risk Management report is presented at meetings with senior management,
2 identifying potential risks by site, unit, priority, probability, cost impact, and the unit or
3 persons responsible for mitigating or eliminating the risk. These steps ensure
4 continuous, vigilant identification of and response to potential project risks that could
5 pose an adverse impact on cost or schedule performance of the project.

6 **Q. Please describe the risk management process as it applies to Operational risk.**

7 A. EPU Project work will be performed during normal plant operations and during
8 planned refueling outages. The amount of work that can be safely performed during
9 these plant conditions is dependent upon the minimum required systems or
10 components needed to support the plant operating condition. Extreme care in the
11 planning, scheduling, and execution of the work activities is required to ensure the
12 plant is operated in accordance with applicable NRC regulatory and plant technical
13 specification requirements. This requires proper sequencing of work activities that can
14 be safely performed during normal plant operations or those that must be performed
15 during planned refueling outages, including work activities that can be safely
16 performed in parallel and those that must be performed in series. This operational risk
17 management accomplishes two major objectives: first is to ensure the equipment is in a
18 state that makes it safe for workers to perform the work, and secondly that the plant
19 systems and components are properly maintained to ensure public safety. This
20 operational risk management through the careful planning, scheduling and execution of
21 work activities, adds to the complexity of the implementation phase of the EPU
22 project.

PROCUREMENT PROCESSES AND CONTROLS

1
2
3 **Q. Please describe the contractor selection and contractor management procedures**
4 **that applied to the EPU projects in 2010.**

5 A. The contractor selection procedures applicable to the uprate project are found in
6 General Operating Procedure 705 and Nuclear Fleet Guideline BO-AA-102-1008,
7 Procurement Control. As explained in those procedures, the standard approach for the
8 procurement of materials or services with a value in excess of \$25,000 is to use
9 competitive bidding. Excluding Original Equipment Manufacturer (OEM) work, the
10 majority of the equipment and work contracts initiated for the EPU project in 2010
11 were competitively bid. However, the use of single source, sole source, and OEM
12 providers is also necessary in certain situations. FPL's policies require proper
13 documentation of justifications and senior-level management approval of single or sole
14 source procurements.

15
16 In response to considerations raised by the Commission in the 2008 NCRC
17 proceedings, FPL has maintained its focus on the process of documenting and
18 approving single and sole source procurements, to ensure compliance with BO-AA-
19 102-1008 and to facilitate review by third parties who are not directly involved in the
20 nuclear procurement process. Training is provided to personnel responsible for having
21 Single and Sole Source Justifications (SSJs) prepared, the SSJ expectations are
22 included in appropriate project instructions, and all new applicable personnel assigned
23 to the EPU Project are required to review and understand the SSJ expectations.

1
2 With respect to vendor management, the EPU Project Directors at each site assure
3 vendor oversight is provided by the Site Senior Project Managers, Project Managers,
4 the site Technical Representative, and Contract Coordinators. Together, these
5 representatives provide management direction and coordinate vendor performance
6 reviews while the vendors are on site. The Site Technical Representative verifies that
7 the vendor has met all obligations and determines whether any outstanding deliverable
8 issues exist using a Contract Compliance Matrix. In addition to assisting with the
9 development and administration of contracts, Nuclear Sourcing and Integrated Supply
10 Chain (ISC) groups complete updates as necessary to a Project Contract Log and report
11 the status of contracts to project management. EPU management also holds quarterly
12 vendor integration meetings as previously mentioned.

13 **Q. What is FPL's approach to contracting for the EPU project?**

14 A. FPL structures its contracts and purchase orders to include specific scope, deliverables,
15 completion dates, terms of payment, commercial terms and conditions, reports from
16 the vendor, and work quality specifications. Project Management has several types of
17 contracts available depending on how well the scope of work and the risk associated
18 with the work scope can be defined. Fixed price or lump sum contracts are used where
19 practical. An example would be where project work scope is well-defined and risk is
20 limited. Project Management will use a time and material contract where project work
21 scope is not well-defined and where there is greater risk to completing the work scope.
22 These and other contract provisions help ensure the contractors perform the right work
23 at the right time for the right price, which benefits FPL's customers.

INTERNAL/EXTERNAL AUDITS AND REVIEWS

Q. Are FPL's financial controls and management controls audited?

A. Yes. Several audits have been conducted to ensure compliance with applicable project controls.

Q. What internal audits or reviews have been conducted to ensure the project controls are adequate and costs are reasonable?

A. Jefferson Wells is in the process of performing an audit of 2010 expenses on behalf of the FPL Internal Audit Department. Specifically, the audit is focusing on whether costs charged to the project are actually for the EPU project and are recorded in accordance with FPSC Rule 25-6.0423. Independent testing of expenses charged to the EPU project for the period January 1, 2010 to December 31, 2010 is being conducted. The 2010 audit will be available for Commission review upon completion.

Q. What external audits or reviews have been conducted to ensure the project controls are adequate and costs are reasonable?

A. FPSC staff is conducting two audits related to 2010 – a financial audit and an internal controls audit. The 2010 FPSC staff financial and internal controls audits will be provided to the Commission when completed. FPL also engaged William Derrickson to conduct a review of project management in 2010 as the project entered the early stages of implementation. Witness Derrickson discusses his review in his testimony.

1 Further, FPL considered whether any of the major component modifications or
2 replacements required for the Uprates were already required as a condition of receiving
3 its NRC license renewals. FPL reviewed the “License Renewal Action Items” issued
4 by the NRC and compiled by FPL in conjunction with the approval of FPL’s requested
5 license renewals. In doing so, it verified that none of the major component
6 modifications or replacements identified by FPL as necessary for the EPU project were
7 duplicative of the activities required by the NRC for license renewal. FPL also
8 confirmed that none of the EPU activities were previously planned as regular O&M or
9 capital improvement. Additionally, when a scope change is required, a review of the
10 NRC License Renewal Action Items and the seven year capital expenditure plan is
11 conducted to ensure the proposed scope change is separate and apart. FPL’s 2010 EPU
12 activities, and their associated costs, were “separate and apart” as required by the
13 NCRC process.

14 15 2010 PROJECT ACTIVITIES

16 17 **Q. What key activities occurred in 2010 in execution of the EPU project?**

18 A. Several key activities occurred in 2010, including: (i) submittal of the St. Lucie Unit 1
19 EPU LAR, the Turkey Point Units 3 and 4 EPU LAR, and the Turkey Point Spent
20 Fuel Criticality LAR to the NRC for review and approval, and continued engineering
21 analyses in support of submitting the St. Lucie Unit 2 EPU LAR; (ii) the execution of
22 vendor contracts for long lead procurement equipment, as well as quality inspection,
23 receipt, and storage of long lead procurement items; (iii) modification engineering for

1 the St. Lucie and Turkey Point Units and continued management of the EPC vendor;
2 (iv) receipt of independent third party estimate of implementation man-power
3 requirements and costs; (v) preparation for, and successful execution of,
4 implementation activities during the St. Lucie Unit 1 spring 2010 outage and the
5 Turkey Point Unit 3 fall 2010 outage; and (vi) adoption of revisions to the planned
6 future outage durations.

7 **Q. Was the 2010 organizational structure appropriate for the project in 2010?**

8 A. Yes. Exhibit TOJ-15, EPU Site Centered Organization, is a graphic representation of
9 the 2010 EPU Project organizations for PSL and PTN, which continued to support
10 authority and responsibility for the four overlapping phases of the project at the site
11 organizations.

12 **Q. Please describe the license amendment preparation and submittal activities in**
13 **2010.**

14 A. FPL submitted two EPU LARs to the NRC in 2010, as well as one additional LAR – a
15 Spent Fuel Criticality LAR for Turkey Point. The St. Lucie Unit 1 EPU LAR was
16 submitted on April 16, 2010, and the Turkey Point Plant EPU LAR was submitted on
17 October 21, 2010. Both EPU LARs were prepared and filed consistent with historical
18 NRC expectations. Nonetheless, FPL had to withdraw and resubmit its St. Lucie Unit
19 1 EPU LAR in November 2010, as described below. The St. Lucie Unit 2 EPU LAR
20 was planned for submittal to the NRC in February 2011; accordingly, FPL's efforts in
21 2010 included the continuing engineering analyses in support of that submittal.
22 Additionally, the NRC continued its review of the Turkey Point AST LAR in 2010,
23 which FPL submitted on June 16, 2009. FPL has responded to NRC requests for

1 additional information in a timely manner. The NRC is expected to accept the Turkey
2 Point EPU LAR for review once the Turkey Point AST LAR is approved. The NRC
3 review and approval time for each EPU LAR is estimated to be approximately 14
4 months following LAR submittal for review.

5 **Q. Please explain the status of the St. Lucie Unit 1 EPU LAR in 2010.**

6 A. During the NRC acceptance review of the St. Lucie Unit 1 LAR, NRC staff changed
7 its expectations for spent fuel storage pool criticality analyses, even though the
8 methodology used by FPL was an NRC-approved design basis methodology. The
9 NRC also required additional analyses in the areas of spent fuel criticality, a reactor
10 control rod withdrawal event, and a station blackout event – each of which was
11 outside the St. Lucie Unit 1 design basis and therefore exceeded the reasonably
12 expected scope of a typical EPU LAR review.

13
14 On August 13, 2010, following meetings with the NRC, FPL management withdrew
15 the St. Lucie Unit 1 LAR to ensure the new NRC expectations would be satisfied and
16 incorporated into the LAR prior to the NRC's formal review. Choosing not to
17 withdraw the LAR and work with the NRC likely would have delayed NRC approval
18 substantially. After it had withdrawn the St. Lucie Unit 1 LAR, FPL met with the
19 NRC on August 18, 2010 to discuss a path forward for the engineering analysis
20 methodology the NRC decided it would now require for the spent fuel pool criticality
21 analyses, as well as additional detail concerning the station blackout and control rod
22 withdrawal scenarios. The St. Lucie Unit 1 LAR was re-submitted to the NRC on

1 November 22, 2010, reflecting the information learned from the NRC in the previous
2 meetings.

3
4 Ultimately, FPL must comply with the NRC's expectations, whether it has advance
5 notice of those expectations or not. These events provide a good example of the types
6 of project activity risks and costs that are beyond FPL's control. FPL manages such
7 emergent issues rigorously and prudently when they arise.

8 **Q. Were any state regulatory approvals sought or obtained in 2010?**

9 A. Yes. On March 23, 2010, FPL submitted a Substantial Revision Application for
10 Increasing Discharge Temperature to the Florida Department of Environmental
11 Protection (FDEP) for the St. Lucie Plant. FPL successfully obtained an amendment to
12 the St. Lucie Industrial Wastewater Permit, issued on December 23, 2010, favorably
13 resolving a risk that FPL might be prevented from operating the plant at full capacity
14 during certain times of the year. The amendment requires FPL to perform additional
15 ambient, thermal and pre- and post- EPU biological monitoring in the Atlantic Ocean.

16 **Q. Please describe activities related to the Long Lead Procurement phase in 2010.**

17 A. In 2010, FPL contracted for several major pieces of long lead equipment, including
18 heat exchangers, generator stator core equipment, and main steam turbine controls.

19
20 Several long lead procurement items were received, inspected, and stored or prepared
21 for installation at the St. Lucie and Turkey Point plants. These items include steam
22 turbine and generator rotors, and feedwater heaters. FPL also conducted several
23 quality assurance reviews at the equipment manufacturing or testing locations.

1 **Q. Please describe the management of the EPC vendor and the progress in**
2 **modification engineering made in 2010.**

3 A. The EPC vendor continued its efforts to prepare the detailed modification packages in
4 2010. During this phase, calculations are prepared, construction drawings are issued,
5 some equipment and materials are procured, general installation instructions are
6 provided, and high level testing requirements are identified. These activities provide
7 the basis for preparing detailed estimates of the implementation costs. By the end of
8 2010, 48 of approximately 207 packages were completed.

9
10 FPL continued to manage the EPC vendor to ensure the costs expended for the EPC
11 work are reasonable and appropriate, including challenging estimates of future staffing
12 requirements. For example, FPL conducted a senior-level management meeting in
13 Frederick, Maryland at the vendor's headquarters to address then-current trends and
14 metrics. The EPC vendor responded to that meeting with a formal proposal for
15 managing trends and improving metrics in November, 2010. FPL also awarded scopes
16 of EPC work at St. Lucie to another vendor, Day & Zimmermann NPS (DZNPS),
17 which is FPL's on-site construction vendor. These assignments were made as part of
18 FPL's continuing effort to control costs.

19
20 FPL also contracted with one of the cost estimating experts that was the subject of a
21 blanket PO issued by EPU management in early 2009, and used the output of that
22 estimating work product to continue to manage and challenge its EPC vendor on cost
23 control.

1 **Q. Please describe the use of a third party cost estimator in more detail.**

2 A. Late in 2009, FPL contracted with a third party vendor, High Bridge Associates, with
3 expertise in detailed estimating of nuclear project work, particularly with respect to the
4 implementation of modifications. The Turkey Point Unit 3 EPU outage work was
5 chosen for this estimating effort because more engineering design modification
6 packages had been completed in preparation for the 2010 fall outage. High Bridge
7 identified additional modifications that may be necessary as a result of those planned,
8 and then quantified and priced all aspects of the project costs, such as equipment,
9 shipping costs, and materials, as well as craft labor, supervisors, and overhead. This
10 estimating effort was completed in June 2010. The results provided an independent
11 implementation cost estimate that could be used by FPL to ensure the EPC vendor
12 implementation man-power requirements and cost estimates were reasonable, and to
13 use as a tool for continued EPC vendor management. Additionally, the independent
14 implementation estimate provided additional information that could be used in
15 considering the total EPU Project nonbinding cost estimate range.

16 **Q. Did FPL adjust its non-binding cost estimate in 2010?**

17 A. Yes. By early 2010, enough progress had been achieved (i.e., in terms of EPC vendor
18 negotiations, LAR engineering analyses, and the beginning of modification
19 engineering) that a revision to the non-binding cost estimate was warranted. However,
20 because the project was still in the early stages of modification engineering and an
21 expected level of uncertainty remained, it was appropriate to provide such a revision in
22 terms of a non-binding cost estimate range, totaling \$2,050 million to \$2,300 million.

1 **Q. What was the status of the Plant Change Modification packages as of December**
2 **31, 2010?**

3 A. Exhibit TOJ-17, Plant Change Modification (PCM) Status as of December 31, 2010, is
4 a chart that illustrates the number of identified engineering modifications as of
5 December 31, 2010, the number of PCMs that have been initiated, and those that have
6 reached 30%, 90%, and final completion. As can be seen in this exhibit, there were
7 207 PCMs identified of which 48 were finalized and approved for issuance. This
8 exhibit demonstrates that the Project was still in the early stages of the implementation
9 engineering.

10 **Q. Please discuss the outage work that was successfully completed.**

11 A. St. Lucie Unit 1 and Turkey Point Unit 3 successfully completed their first EPU
12 outages in 2010. The activities at the units included instrumentation installations for
13 baseline testing and future power uprate testing, feedwater heater inspections and
14 modifications, upgrades to the St. Lucie Unit 1 Turbine Gantry Crane, and feedwater
15 heater drain valve installations. During each unit outage transmission and substation
16 upgrade work was performed in preparation for the increased electrical output from the
17 power uprates. FPL completed all scheduled EPU work during the duration of these
18 two outages as planned.

19 **Q. Did FPL continue to adjust modification assignments in 2010?**

20 A. Yes, but to a much lesser extent than occurred in 2009. FPL adjusted a few
21 modifications out of the St. Lucie Unit 1 spring 2010 outage into the fall 2011 outage,
22 and out of the Turkey Point Unit 3 fall 2010 outage into the spring 2012 outage.

1 Additionally, some transmission and substation work was moved to outages in 2011
2 and 2012.

3 **Q. Did the adjustments to modification assignments affect the equipment placed in**
4 **service in 2010?**

5 A. Yes. FPL decided to perform a large amount of Turkey Point Unit 3 feedwater heater
6 work during the unit's 2012 outage rather than the 2010 outage because the main
7 stream line break analysis showed that NRC approval would first be required prior to
8 operating the plant with the new feedwater heaters. Additionally, several other Turkey
9 Point Unit 3 modifications were initiated during the 2010 outage, with other portions
10 of the modifications planned for completion during the 2012 outage. The impact of
11 these changes on base rate revenue requirements is discussed in Witness Powers'
12 testimony.

13 **Q. Were other project planning assumptions revised in 2010?**

14 A. Yes. FPL determined in 2010 that the outage durations planned for 2011 and 2012
15 needed to be adjusted. The adjustments to the planned outage durations were
16 necessary in order to accommodate the refined work scope assigned to each outage,
17 which scope reflects the modifications previously made to outage assignments as well
18 as increased project scope overall. FPL uses a variety of inputs to plan outages,
19 including industry and fleet work experience from earlier outages where similar work
20 activities were completed, refined engineering modifications scope and requirements,
21 previous inspection results, and proper sequencing of the EPU modifications which
22 must be coordinated with the NRC approval of the EPU LARs. As always, FPL must
23 also factor into its planning and scheduling the safety of personnel performing work,

1 e.g., securing system electrical, mechanical, and thermal energy sources, and ensuring
2 that the plant is operated safely in accordance with the operating license issued by the
3 NRC.

4 **Q. As of December 31, 2010, what was the overall EPU project schedule?**

5 A. Exhibit TOJ-19, Extended Power Uprate Project Schedule as of December 31, 2010,
6 illustrates the LAR, long lead material, engineering design, and implementation
7 schedule for the EPU Project. Underlying this high-level schedule are tens of
8 thousands of individually-scheduled activities. FPL's overall project schedule
9 reflected the following:

- 10 • The LAR analyses were scheduled to be completed and submitted to the NRC, but
11 NRC review before the license amendment approval is needed by FPL to increase
12 the power output at the completion of the second EPU outage for St. Lucie Unit 1
13 was challenged. Review and approval prior to completion of the second outage for
14 the other units was still expected.
- 15 • Long lead material items were scheduled to arrive on site prior to the outage during
16 which the equipment will be installed.
- 17 • PCM engineering design for each of the identified modifications was scheduled to
18 be approved for implementation prior to the unit outage when each modification
19 will be implemented.
- 20 • Implementation of the EPU modifications was scheduled to be completed during
21 the revised durations of the scheduled refueling outages for each of the units.

1 **Q. Did FPL conduct a “feasibility analysis” of the EPU project in 2010?**

2 A. Yes. FPL Witness Steve Sim conducted a feasibility analysis in 2010 using the high
3 end of FPL’s 2010 revised non-binding cost estimate range, which demonstrated that
4 the EPU project was projected to be solidly cost-effective for FPL’s customers.
5 Specifically, a resource plan that included the EPU project was projected to cost less
6 than a resource plan that did not include the EPU project in seven out of seven
7 scenarios of fuels cost forecasts and environmental compliance cost forecasts. FPL
8 also conducted 14 sensitivity analyses examining the effect of a higher cost of capital
9 and/or lower than expected EPU electrical output, 13 of which continued to support the
10 cost-effectiveness of the EPU project.

11
12 **2010 CONSTRUCTION COSTS**

13
14 **Q. Did FPL perform a partial year true-up of 2010 costs in 2010?**

15 A. Yes. The schedules presenting FPL's actual/estimated 2010 costs as of May 2010 are
16 attached hereto as Exhibit TOJ-12. These schedules reflected actual costs through
17 February 2010, and an estimate for the remainder of the year.

18 **Q. Please describe how FPL developed its 2010 actual/estimated costs.**

19 A. The 2010 projected costs were developed from Project Controls forecasts for all known
20 project activities in 2010. Included in the forecasts are the vendor long-lead materials
21 contracts that have scheduled milestone payments in 2010, which are cash flowed
22 based upon the latest fabrication and delivery schedule information. Each major labor
23 related services vendor forecast is based upon the most recent cumulative purchase

1 order value, which would include the original awarded value and all approved changes.
2 Added to this would be an estimate of any known pending changes to arrive at a best
3 forecast at completion for each vendor. Owner engineering and project management
4 support forecasts are derived from detailed staffing plans. Each approved position is
5 cash flowed for the expected assignment duration and expected overtime, where
6 applicable. The large construction related vendor forecasts are based upon previous
7 experience, known scope(s) of work, productivity factors related to outage conditions
8 and prevailing pertinent wage rates. Items identified in the Risk Register are cash
9 flowed based upon anticipated engineering, material procurement and outage
10 implementation time horizons.

11 **Q. Were FPL's 2010 actual/estimated costs reasonable?**

12 A. Yes. Careful vendor oversight, continued use of competitive bidding when
13 appropriate, and the application of the robust internal schedule and cost controls and
14 internal management processes all support a finding that FPL's actual/estimated 2010
15 expenditures were reasonable.

16 **Q. What type of costs did FPL incur for the uprate projects in 2010?**

17 A. As demonstrated in Exhibit TOJ-13, Schedule T-6 and T-4, and summarized on
18 Exhibit TOJ-20, Tables 1 through 9 (all reflecting the true-up of actual 2010 costs),
19 costs were incurred in the following categories: License Application; Engineering and
20 Design; Permitting; Project Management; Power Block Engineering, Procurement,
21 Etc.; Non Power Block Engineering, Procurement, Etc.; and Recoverable O&M.
22 These costs were the direct result of the prudent project management, decision making,
23 and actions described in detail above. Each category reflects some variance against

1 what was originally estimated and budgeted, which is to be expected, particularly
2 given the relatively early stage of the project. The overall variance in 2010 is driven
3 primarily by the reduced payments for long lead equipment items, adjustments to
4 engineering and EPC contractor resources, and adjustments to staff resources due to
5 the EPU outage modification assignments made in 2009 and 2010. Exhibit TOJ-20,
6 2010 Extended Power Uprate Construction Costs contains summaries of the EPU
7 expenditures in 2010 for each of the NFR schedule categories. Table 1 is a summary
8 of each of the categories showing the actual expenditure amounts. The amounts shown
9 in the exhibits are slightly different than the NFR schedules as footnoted on the
10 exhibit.

11 **Q. Please describe the costs incurred in the License Application category and the**
12 **variance, if any, from the 2010 actual/estimated costs in this category.**

13 A. 2010 Licensing Costs consist primarily of charges for consulting and contractor
14 services rendered in support of preparing the NRC LARs. The primary contractors are
15 Westinghouse, Areva and Shaw Stone & Webster. FPL incurred \$26.3 million in this
16 category in 2010, which was \$3.1 million less than the actual/estimated amount. This
17 variance was primarily attributable to fact that NRC review costs were less than
18 expected. The costs associated with the additional NRC-required engineering analyses
19 and evaluations for St. Lucie Unit 1 are also included in this category.

20 **Q. Please describe the costs incurred in the Engineering and Design category and the**
21 **variance, if any, from the actual/estimated costs in this category.**

22 A. Engineering & Design Costs consist primarily of costs for FPL personnel and
23 contractor personnel in the FPL engineering organizations at both sites and in the

1 central organization. Some of these personnel provide management, oversight and
2 review of the LAR activities, while others are oriented towards management, oversight
3 and review of the detail design activities being performed by the EPC contractor. FPL
4 incurred \$19.8 million in this category in 2010, which is \$7.8 million more than the
5 actual/estimated amount. This was primarily attributable to LAR scope growth and the
6 costs required to manage the EPC contractor's engineering and implementation efforts
7 for the PSL Unit 1 and PTN Unit 3 2010 outages.

8 **Q. Please describe the costs incurred in the Permitting category and the variance, if
9 any, from the actual/estimated costs in this category.**

10 A. Permitting Costs reflect costs attributable to the State of Florida Site Certification
11 Application for the St. Lucie and Turkey Point sites and the Substantial Revision
12 Application for Increasing Discharge Temperature to the FDEP for the St. Lucie Plant.
13 These costs consist primarily of consulting services related to environmental work for
14 site certification, compliance certification, FDEP application preparation, and FPL
15 employee support. FPL incurred \$274,880 in this category in 2010, which was
16 \$98,818 more than the actual/estimated amount. This was primarily attributable to
17 environmental work in the preparation of the Substantial Revision Application for
18 Increasing Discharge Temperature to the FDEP for the St. Lucie Plant.

19 **Q. Please describe the costs incurred in the Project Management category and the
20 variance, if any, from the actual/estimated costs in this category.**

21 A. Project Management Costs relate to overall project oversight including project and
22 construction management, and project controls and non-NRC regulatory compliance.
23 These oversight activities are performed by personnel located at both sites, and by the

1 EPU central organization and by non-EPU organizations such as NBO, New Nuclear
2 Accounting and Regulatory Affairs. FPL incurred \$22.6 million in this category in
3 2010 which was \$2.6 million more than the actual/estimated amount. This was
4 primarily attributable to an increase in FPL project and construction management
5 oversight of the EPC vendor.

6 **Q. Please describe the costs incurred in the Power Block Engineering, Procurement,**
7 **Etc. category and the variance, if any, from the actual/estimated costs in this**
8 **category.**

9 A. The majority of the costs in this category reflect payments to the EPC vendor for the
10 successful completion of the EPU outages at PSL Unit 1 and PTN Unit 3 in 2010, the
11 continued engineering efforts to prepare for the 2011 and 2012 outages, payments to
12 Siemens for turbines and generator rotors, and payments to TEI for feedwater heaters
13 and moisture separator reheaters, main condensers, and increased capacity heat
14 exchangers and pumps required to support the uprate conditions. This category also
15 includes the cost to contract with High Bridge for the purpose of conducting a specific
16 scope of project cost estimating, as described above.

17
18 Additionally, this category includes the cost to complete the modifications to the St.
19 Lucie Unit 1 Turbine Gantry Crane in 2010. An engineering evaluation of each
20 Turbine Gantry Crane was performed resulting in proposed modifications to each
21 crane for increased efficiency and precision in removing and installing the many
22 pieces of heavy equipment. The modifications to each Turbine Gantry Crane are
23 performed during normal plant operation thus saving plant outage time. On October

1 7, 2010, FPL filed a petition with the Commission to include the costs of the St. Lucie
2 Unit 1 Turbine Gantry Crane and other equipment placed into service in 2010
3 associated with the EPU Project in base rates, and on January 11, 2011, the FPSC
4 voted to grant the base rate increase. The only salvageable equipment from the St.
5 Lucie Unit 1 Turbine Gantry Crane was the trolley assembly. The salvage value of
6 the trolley assembly was \$13,010, and it was disposed of in July 2010 and was applied
7 back to the EPU project appropriately.

8
9 FPL incurred \$222.0 million in this category in 2010, which is \$18.4 million less than
10 the actual/estimated amount. The primary contributor to this variance was the adjusted
11 outage modification assignments which moved some plant modifications between the
12 outages, deferring some costs to a later year. This variance was partially offset by
13 utilization of the EPC contractor due to work scope increase identified in the licensing
14 and engineering design modification phases. Further outage modification adjustments
15 will be necessary as the LAR reviews, design engineering, and implementation
16 planning activities progress.

17 **Q. Please describe the costs incurred in the Non-Power Block Engineering,**
18 **Procurement, Etc. category and the variance, if any, from the actual/estimated**
19 **costs in this category.**

20 A. Non-Power Block Engineering Costs consist primarily of costs for facilities for
21 engineering and project staff at site locations and the simulator upgrades required to
22 reflect the uprate conditions. FPL incurred \$6.2 million in this category in 2010. This
23 represents \$1.2 million less than the actual/estimated amount. The variance is

1 primarily attributable to costs for the simulator modifications being moved to later than
2 originally planned.

3 **Q. Please describe the costs incurred as EPU Recoverable O&M.**

4 A. Recoverable O&M expenses in 2010 were \$7.2 million. This represents a variance of
5 \$4.0 million more than the actual/estimated amount. Consistent with FPL's
6 capitalization policy, the commodities that make up these expenditures consist of non-
7 capitalizable computer hardware and software and office furniture and fixtures needed
8 for new project-bound hires, all of which are segregated for EPU Project personnel use
9 only, as well as incremental staff and augmented contract staff. Additionally, costs
10 necessary to preserve adequate laydown space for the EPU project at Turkey Point
11 were included in this category. Also, with the completion of the St. Lucie Unit 1
12 Turbine Gantry Crane modifications in late 2010, Recoverable O&M also includes the
13 write-off of inventory rendered obsolete because of the modifications. Through 2010,
14 \$18,864 in inventory has been written off.

15 **Q. Please describe the costs incurred in the Transmission category.**

16 A. Transmission Costs were \$14.6 million in 2010, which is \$5.8 million more than the
17 actual/estimated amount. The expenditures in the Transmission category include plant
18 engineering, line engineering, substation engineering, and line construction. This
19 variance is a result of the reclassification of the plant engineering for the procurement
20 and installation of the new main transformer at PSL 2. Part of the substation
21 construction originally scheduled for 2010 at Turkey Point was deferred to 2011 at the
22 request of the Nuclear Security Department to give them additional time to review
23 design changes they had requested. Additionally, favorable transmission line

1 construction bids obtained for 2010 work resulted in overall costs lower than originally
2 budgeted for the non-plant engineering Transmission work.

3
4 **CONCLUSION**

5
6 **Q. Were FPL's 2010 EPU expenditures prudently incurred?**

7 A. Yes. FPL incurred costs of approximately \$319 million in 2010. FPL's costs were
8 less than its estimate for the reasons described above. All of FPL's expenditures were
9 necessary so that the uprate work can be performed during the planned outages.
10 Through experienced personnel's application of the robust internal schedule and cost
11 controls, careful vendor oversight, and the ability to continuously adjust based on
12 lessons learned and the project's evolving needs, FPL is confident that its EPU
13 management decisions are well-founded and prudent. All costs incurred in 2010 were
14 the product of such decisions, were reasonable and prudently incurred, and should be
15 approved.

16 **Q. Does this conclude your direct testimony?**

17 A. Yes.

1 **BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION**

2 **FLORIDA POWER & LIGHT COMPANY**

3 **DIRECT TESTIMONY OF TERRY O. JONES**

4 **DOCKET NO. 110009-EI**

5 **MAY 2, 2011**

6

7 **Q. Please state your name and business address.**

8 My name is Terry O. Jones, and my business address is 700 Universe
9 Boulevard, Juno Beach, FL 33408.

10 **Q. By whom are you employed and what is your position?**

11 A. I am employed with Florida Power & Light Company (FPL) as Vice
12 President, Nuclear Power Uprates.

13 **Q. Have you previously filed testimony in this docket?**

14 A. Yes.

15 **Q. Are you sponsoring any exhibits to this testimony?**

16 A. Yes. I am sponsoring the following exhibits:

- 17 • Exhibit TOJ-21 consists of 2011 P Schedules and 2011 TOR
18 Schedules. The NFR Schedules contain a table of contents listing the
19 schedules that are sponsored and co-sponsored by FPL Witness
20 Powers, and me, respectively. FPL has included the 2011 P Schedules
21 as they are the basis for determining the reasonableness of the true-up
22 of FPL's 2011 AE Schedules. The 2011 TOR Schedules present a
23 summary of costs that are the basis for the revenue requirements being
24 recovered in 2011.

1 • Exhibit TOJ-22 consists of 2011 AE Schedules, 2012 P Schedules, and
2 2012 TOR Schedules. The NFR Schedules contain a table of contents
3 listing the schedules that are sponsored and co-sponsored by FPL
4 Witness Powers and me, respectively.

5 • TOJ-23, Extended Power Uprate Project Schedule as of April 2011

6 • TOJ-24, 2011 Extended Power Uprate Work Activities

7 • TOJ-25, EPU Actual/Estimated 2011 Summary Cost Tables

8 • TOJ-26, 2012 Extended Power Uprate Work Activities

9 • TOJ-27, EPU Projected 2012 Summary Cost Tables

10 **Q. Please describe how your testimony is organized.**

11 A. My testimony includes the following sections:

12 1. Project Status and Schedule

13 2. Project Management Internal Controls

14 3. 2011 Actual/Estimated Construction Activities and Costs

15 4. 2012 Projected Construction Activities and Costs

16 5. True-Up to Original Cost and Updated Cost Estimate Range

17 6. Long Term Feasibility

18 **Q. What is the purpose of your testimony?**

19 A. My testimony presents and explains FPL's Extended Power Uprates (EPU or
20 Uprate) project at its St. Lucie (PSL) and Turkey Point (PTN) power plants,
21 the reasonableness of FPL's 2011 actual/estimated EPU costs, and the
22 reasonableness of FPL's 2012 projected EPU costs. The activities and
23 expenditures for these years are described in separate sections below. My

1 testimony also presents the True-up to Original Projections for the Uprate
2 project for the years 2008 through 2013, provides an updated total project cost
3 estimate range, and summarizes FPL's updated EPU feasibility analysis,
4 which continues to demonstrate that the project is a cost-effective generation
5 addition for FPL's customers. FPL Witness Dr. Steven R. Sim describes the
6 economic feasibility analysis in detail in his testimony and exhibits.

7 **Q. Would you please provide an overview of the expected benefits of the**
8 **EPU project for FPL's customers?**

9 A. Yes. Taking into account the updated project information related in this
10 testimony, FPL expects that the EPU project will:

- 11 • Provide estimated fuel cost savings for customers of approximately \$106
12 million in the first full year of operation;
- 13 • Provide estimated fuel cost savings for FPL's customers over the life of the
14 plants of approximately \$4.6 billion (nominal);
- 15 • Diversify FPL's fuel sources by decreasing reliance on natural gas by 2%
16 beginning in the first full year of operation;
- 17 • Provide a total amount of energy that is equivalent to the usage of
18 approximately 209,500 residential customers;
- 19 • Reduce annual fossil fuel usage by the equivalent of 5 million barrels of oil or
20 29 million mmBTU of natural gas annually; and
- 21 • Reduce CO₂ emissions by an estimated 31 million tons over the life of the
22 plants, which is the equivalent of operating FPL's entire generating system
23 with zero CO₂ emissions for 9 months.

1 These quantifications are set forth in FPL Witness Dr. Sim's testimony and
2 Exhibit SRS-1.

3 **Q. Please summarize your testimony.**

4 A. FPL is working to deliver the substantial benefits of additional nuclear
5 generating capacity to its customers, without expanding the footprint of its
6 existing nuclear generating plants, by performing an extended power uprate of
7 its existing St. Lucie Units 1 & 2 and Turkey Point Units 3 & 4. Upon
8 completion, FPL estimates that approximately 450 megawatts electric power
9 (MWe) of baseload, non-greenhouse gas emitting generation will be provided
10 by the EPU project for its customers, and that customers will realize
11 significant fuel cost savings as a result. In addition, the benefits to FPL's
12 customers from additional nuclear generation will be realized through the
13 EPU project at least a decade earlier than if additional nuclear generation were
14 to be delivered solely through new nuclear units.

15
16 The EPU project is of extraordinary managerial and technical difficulty.
17 FPL's EPU project represents one of the largest and most complex nuclear
18 design, engineering and construction projects undertaken in the nuclear
19 industry since the construction of the last generation of U.S. nuclear plants.
20 As of May 2011, FPL estimates that the project will require the orchestration
21 and management of approximately 1 million total hours of design engineering
22 and total EPU project work of approximately 10 million hours. This is the
23 equivalent of approximately 500 person-years of design engineering time and

1 5,000 person-years of total EPU work time. All of this work is being
2 conducted on four operating nuclear units with live steam, electrical and
3 nuclear fuel equipment and systems. FPL is committed to efficiently
4 managing all of this work in a way that maximizes the benefits of the EPU
5 project for FPL's customers and in a manner that maintains nuclear and
6 industrial safety.

7
8 The project team is in the process of performing design engineering, procuring
9 long lead equipment and materials, obtaining regulatory approvals, and
10 implementing plant modifications to support the uprate conditions in multiple
11 refueling outages for each of the nuclear units. This process is supported by
12 robust and overlapping project schedule and cost controls, along with rigorous
13 risk management. Additionally, the EPU team manages the Uprate work in a
14 manner that ensures that only the costs necessary for the Uprates are expended
15 and included in the Nuclear Cost Recovery Clause (NCRC).

16
17 As detailed in this testimony and accompanying exhibits, FPL plans to invest
18 a total of approximately \$610 million during 2011 and approximately \$799
19 million during 2012 in the Uprate project. FPL also plans to place certain
20 Uprate project systems into service. The estimated equipment in-service
21 amounts for 2011 are approximately \$218 million, and for 2012 are
22 approximately \$1,186 million. (Please note that the dollar values in my
23 testimony are the forecasted EPU resource requirements, and do not include

1 certain accounting adjustments made by FPL Witness Powers, unless noted
2 otherwise.) The 2011-2012 EPU project carrying costs on its capital
3 investments, Operations & Maintenance expenses, and revenue requirements
4 for in-service components contribute to a total Company request to recover
5 approximately \$196 million in 2012, as described by FPL Witness Powers.
6 This equates to a residential customer monthly bill impact of \$2.09 per 1,000
7 kWh.

8
9 FPL has updated its nonbinding total cost estimate range to reflect the
10 progress made on the project and information learned through the beginning
11 of 2011 to approximately \$2,324 million to \$2,479 million (including
12 transmission and carrying costs) and has utilized the high end of this range as
13 the starting point for an economic feasibility analysis performed consistent
14 with the direction of the Commission. While the current nonbinding cost
15 estimate range is slightly higher than the high-end of the total nonbinding cost
16 estimate range used in the economic analyses conducted last year, the
17 testimony and exhibits of FPL Witness Dr. Sim show that the EPU project
18 continues to result in substantial economic benefits for FPL's customers and
19 continues to be in the best interest of customers to pursue. For example, FPL
20 Witness Dr. Sim's Exhibit SRS-8 shows that in the Medium Fuel Cost,
21 Environmental II cost scenario, the project is currently expected to reduce
22 costs to customers by more than \$622 million in cumulative present value of
23 revenue requirements compared to a plan without the EPU project.

1
2 FPL's EPU activities, the reasonableness of its 2011 and 2012 costs, and its
3 updated nonbinding cost estimate range and feasibility analysis are described
4 in more detail below.

5
6 **PROJECT STATUS AND SCHEDULE**

7
8 **Q. Please provide an overview of the current status of the Uprate Project.**

9 A. As described in my March 1, 2011 testimony addressing 2009 and 2010
10 activities and costs, the EPU is being achieved in four overlapping phases.
11 Those four phases are explained in detail in my March testimony. In 2011,
12 FPL expects to complete the Engineering Analysis Phase. FPL will also
13 continue the Long Lead Procurement, Engineering Design Modification, and
14 Implementation phases of the project to support the planned unit outages in
15 2011 and 2012. FPL is committed to approximately 95% of its long lead
16 procurement items for the St. Lucie units and approximately 80% of its long
17 lead procurement items for the Turkey Point units. FPL is currently
18 performing the Engineering Design Modification Phase, and has successfully
19 completed two of eight planned EPU outages in the Implementation Phase.
20 FPL has also amended its contract with Bechtel, the Engineering, Procurement
21 & Construction (EPC) vendor, for the St. Lucie scope of work to include a
22 target price, better aligning FPL's and Bechtel's project goals.

23 **Q. Please describe the Federal licensing needed for the EPU Project.**

1 A. FPL must obtain a license amendment to the renewed operating licenses for
2 St. Lucie Unit 1, St. Lucie Unit 2, Turkey Point Unit 3 and Turkey Point Unit
3 4 in order to operate at the EPU conditions. The Turkey Point EPU License
4 Amendment Request (LAR) was submitted to the Nuclear Regulatory
5 Commission (NRC) in October 2010 and the St. Lucie Unit 1 EPU LAR was
6 resubmitted to the NRC in November 2010, as described in my March
7 testimony addressing 2010 activities and costs. The St. Lucie Unit 2 EPU
8 LAR was submitted to the NRC in February 2011.

9
10 The St. Lucie Unit 1 and Turkey Point EPU LARs were accepted for technical
11 review by the NRC on March 9 and 11, 2011, respectively. According to
12 NRC projections, each of these submittals will take approximately 12 months
13 from acceptance for the NRC to review, request additional information, and
14 approve. Also, as a result of the LAR review process, the NRC may require
15 additional modifications or analyses to be performed. EPU project
16 management is monitoring the progress of the NRC LAR reviews and is
17 prepared to address any questions or issues that may arise during the NRC's
18 review.

19 **Q. Please explain the timing of the LAR approvals and their effect on the**
20 **operation of the uprated units in more detail.**

21 A. Each plant is unique with respect to the effect of the timing of the NRC
22 approvals. At Turkey Point, the units cannot be restarted following their
23 second (final) EPU outage unless the NRC has approved the EPU LAR. At

1 St. Lucie, the units can be restarted with the EPU modifications completed
2 (with the exception of the instrumentation setpoints and software changes),
3 but would be operated at existing reactor power levels as opposed to the
4 uprated power levels if FPL has not received approval of the St. Lucie Unit
5 EPU LARs. The St. Lucie units would operate at a slightly increased
6 electrical power output due to the more efficient equipment being operated at
7 existing reactor power levels. In such a scenario, after receipt of NRC
8 approvals for the St. Lucie uprates, FPL may be required to modify the
9 instrumentation setpoints during an off-cycle shutdown to enable the plant to
10 operate at the uprate condition.

11 **Q. Are there any remaining Local and/or State permits needed for the EPU**
12 **Project?**

13 A. No. State and local permitting has been completed for the EPU Projects.
14 Requirements of the revised permits are being implemented.

15 **Q. Please describe the current EPU project schedule.**

16 A. Exhibit TOJ-23, Extended Power Uprate Project Schedule as of April 2011, is
17 the schedule of the EPU Project and the overlapping phases of the work
18 activities presently proposed to take place. This schedule reflects the outage
19 assignment revisions and the outage duration revisions that were discussed in
20 my March 1, 2011 testimony. Additionally, this schedule reflects a 2011
21 decision to change several of the outage start dates. This project schedule
22 continues to support a project completion date in early 2013.

1 **Q. Please describe the modification installation planning process and the**
2 **assignment of modifications to particular outages.**

3 A. A critical component to the modification installation planning is the
4 assignment of particular modifications, and the associated construction work,
5 to particular outages and within those outages. This concept was discussed in
6 my March 1, 2011 testimony, and outage assignments continue to be refined.
7 Consideration is given to several aspects of each of the modifications, such as
8 whether the time provided for the engineering of the modification is sufficient
9 to support the needed reviews, approvals, and planning by the unit's outage
10 management; whether the equipment will arrive at the site early enough
11 before the outage to allow for inspections and preparation work prior to
12 installation; whether there is a sufficient labor force to support the amount of
13 work planned; and whether the modification work can be performed in
14 parallel with other work or if it needs to be performed in a series of critical
15 activities.

16 **Q. Did the reassignment of certain modifications to different outages affect**
17 **FPL's 2011 EPU costs?**

18 A. Yes. As a result of FPL's 2010 outage assignment review, FPL's
19 actual/estimated 2011 costs being presented in this docket are more than what
20 FPL projected its 2011 costs would be last year in Docket No. 100009-EI.
21 FPL moved a significant amount of work planned for St. Lucie in 2010 to
22 2011, thereby shifting construction costs out of 2010 and into 2011.
23 Additionally, due to this reassignment, the carrying charges for 2011

1 increased. The revenue requirement computations are sponsored by FPL
2 Witness Powers.

3 **Q. Please explain the benefits of changing outage start dates.**

4 A. The benefits resulting from adjusting outage dates are the maximization of
5 nuclear fuel “burnup” and the minimization of the off-line time of the nuclear
6 units. FPL recently evaluated the need to adjust outage start dates primarily to
7 maximize nuclear fuel burnup and increase the certainty that the EPC vendor
8 will complete the engineering design phase and the first part of the
9 implementation phase – the planning, scheduling, and constructability reviews
10 of modifications – for the successful execution of the implementation
11 performed during each outage. Additionally, project management continues
12 to assess and work with its EPC vendor to ensure it has the right support and
13 resources to complete its work in a timely manner.

14 **Q. Were there any unanticipated schedule changes this year?**

15 A. Yes. The EPU portion of the St. Lucie Unit 2 spring 2011 outage lasted
16 longer than planned, due to an error by Siemens, the vendor who is
17 performing the turbine generator upgrade work.

18
19 It was determined that a small tool – an alignment pin – had been left inside
20 the generator stator core by Siemens personnel. When the stator core was
21 tested for performance, the alignment pin caused damage. As a result, the
22 replacement of some of the stator core iron was required to repair the damage
23 caused by the pin, and this work caused the outage to be extended.

1 **Q. Was FPL prudent in the hiring and oversight of Siemens?**

2 A. Yes. Siemens is the Original Equipment Manufacturer and therefore owns all
3 the intellectual property necessary to perform this scope of work. Siemens is
4 highly specialized and has an excellent track record with similar work on
5 other FPL projects. Moreover, it has a robust system of practices and
6 procedures that have resulted in successful projects over the years. FPL
7 contracted with Siemens in 2008, which was subject to the Commission's
8 prudence review of 2008 decisions and costs in 2009.

9
10 FPL reviewed and benchmarked Siemens's performance at other locations to
11 validate those practices and procedures, and continues to be diligent in its
12 oversight of Siemens.

13 **Q. Was there any effect on the cost of the project?**

14 A. It is FPL's position that Siemens is required to repair the damage at no cost to
15 FPL, and that is currently being pursued. However, as with any major nuclear
16 outage work contract, there are limits to Siemens's liability, and recovery of
17 replacement generation and fuel costs on FPL's system is not provided for by
18 the contract. Such limitations on liability are industry-standard, and in fact
19 necessary as no vendor would agree to such cost exposure, and such vendors
20 are necessary to perform this type of nuclear outage work. These system costs
21 are not included in FPL's Nuclear Cost Recovery request.

22 **Q. Will the earthquake and tsunami in Japan, and resulting effects on the**
23 **nuclear power plants there, affect the EPU project?**

1 A. It is too soon to tell whether or how the events in Japan will affect the EPU
2 project. It is likely that those events will have operational, regulatory and
3 political ramifications for the U.S. nuclear industry in general. FPL Witness
4 Dr. Nils Diaz addresses this topic in his May 2, 2011 testimony. It is also
5 possible that the events in Japan will affect the EPU LAR approval process
6 and the total cost of the project if the NRC requires additional analyses or
7 modifications. However, it is not possible to quantify such effects at this time.

8

9

PROJECT MANAGEMENT INTERNAL CONTROLS

10

11 **Q. Please describe the project management internal controls that FPL has in**
12 **place to ensure that the project is effectively managed.**

13 A. As described in detail in my March 1, 2011 testimony, FPL has robust project
14 planning, management, and execution processes in place. FPL utilizes a
15 variety of mutually reinforcing schedules and cost controls, and draws upon
16 the expertise provided by employees within the project team, employees
17 within the separate Nuclear Business Operations group, and executive
18 management. Those controls continue to be utilized in 2011.

19

20 One of the key project management tools utilized by the EPU team is the
21 project Risk Register. Risk matrices, such as EPU's Risk Register, are a
22 common project management tool. The Risk Register allows for identified
23 risks – including potential increases to scope – to be logged and assessed in

1 terms of cost and probability. Resolutions are also tracked in the Risk
2 Register, which may include avoidance or mitigation of the identified risk, or
3 incorporation of the particular item within the project scope. Periodic
4 presentations are made to executive management where risks, costs, and
5 schedules are discussed.

6 **Q. Have there been any changes in the project management system FPL is**
7 **using to ensure that the 2011 actual/estimated and 2012 projected costs**
8 **are reasonable?**

9 A. Yes. The EPU project management processes are adjusted to implement and
10 use industry best practices through self-assessment, peer reviews, independent
11 third party reviews, internal and external audits, and executive oversight and
12 direction. In 2011, FPL made adjustments to controls related to site report
13 generation; staffing ramp levels; work scope assignments, and outage
14 implementation interface.

15 **Q. Are any internal audit activities underway?**

16 A. Yes. The annual internal audit of the EPU financials is currently being
17 conducted, which provides a review of project expenditures through 2010.
18 FPL anticipates that this audit will be completed this summer. An internal
19 audit will be conducted next year to review 2011 expenditures.

Q. Please summarize the activity planned for 2011.

A. In 2011, FPL submitted the third and final EPU LAR to the NRC, and has shifted from performing the engineering analyses and developing the LARs to supporting the NRC's review of the LARs. The Long Lead Equipment procurement phase will continue as necessary equipment is delivered to support the outages in 2011 and 2012. The Engineering Design Modification Phase will continue with the EPC vendor preparing modification packages, and performing support activities for outage modifications. The Implementation Phase will continue with the EPC vendor performing implementation activities, the planning and scheduling of EPU outage activities, and the execution of activities during the 2011 outages. There are three EPU outages scheduled to commence in 2011: the St. Lucie Unit 2 outage which will be completed in May 2011, the Turkey Point Unit 4 spring outage which started in March 2011, and the St. Lucie Unit 1 outage which is scheduled to start in November 2011. The return to service from the St. Lucie Unit 2 outage will result in an increase of approximately 20 MWe in the output of the unit due to the installation of a more efficient low pressure turbine rotor during the outage, approximately 17 MWe of which will be for the benefit of FPL's customers. The additional electrical output resulting from more efficient equipment does not require prior NRC license amendment approval.

1 **Q. Did FPL project its 2011 EPU costs for these types of activities in 2010?**

2 A. Yes. FPL prepared and filed a projection of 2011 costs in Docket No.
3 100009-EI. FPL's previously-projected 2011 costs are provided in Exhibit
4 TOJ-21.

5 **Q. Please describe how FPL developed its projections of 2011 costs for the**
6 **NFRs submitted in 2010.**

7 A. The 2011 projected costs were developed from Project Controls forecasts
8 derived from the best available information for all known project activities in
9 2011. Included in the forecasts are the vendor long lead material contracts
10 that have scheduled milestone payments in 2011. Cash flows are based upon
11 the latest fabrication and delivery schedule information. Each major labor
12 related services vendor forecast is based upon the original awarded value and
13 all approved changes. Added to this, where applicable, would be an estimate
14 of any known pending changes to arrive at a best forecast at completion for
15 each vendor. Owner engineering and project management support forecasts
16 are derived from approved detailed staffing plans. Cash flows are developed
17 for each approved position based on the expected assignment duration and
18 expected overtime, where applicable. The large construction related vendor
19 forecasts are based upon previous experience, known scope(s) of work,
20 productivity factors related to outage conditions and prevailing pertinent wage
21 rates. Cash flow projections for items identified in the Risk Register are based
22 upon anticipated engineering, material procurement, and outage
23 implementation time horizons.

1 **Q. Were FPL's projected 2011 costs reasonable?**

2 A. Yes. Careful vendor oversight, use of competitive bidding when appropriate,
3 and the application of the robust internal schedule and cost controls and
4 internal management processes all helped ensure that FPL's projected 2011
5 expenditures were reasonable.

6 **Q. Has FPL trued up these projections to develop 2011 Actual/Estimated**
7 **costs?**

8 A. Yes. Exhibit TOJ-22 presents FPL's 2011 Actual/Estimated costs.

9 **Q. Please describe how FPL developed its 2011 Actual/Estimated costs.**

10 A. On a monthly basis, a detailed project cost review is held, in which project
11 management reviews actual and estimated costs. Each major category is
12 examined and, where applicable, performance measurement tools are
13 analyzed. Schedule Performance Index (SPI) and Cost Performance Index
14 (CPI) tools are used along with Earned Value Progress Measurement reporting
15 as appropriate.

16

17 The 2011 actual/estimated costs were developed from Project Controls
18 forecasts as described above.

19

20 Actual 2011 costs come from a monthly download of project charges from the
21 FPL accounting system. These charges are for materials and services from
22 multiple vendors and are applied to the total project cost on an ongoing basis.

23 Each charge is applied using a coding structure which defines which of the

1 units the charges apply to. For project management purposes, the charges are
2 subsequently broken down by major vendor or appropriate cost control
3 grouping which ultimately supports project management analysis and
4 forecasting.

5 **Q. What types of costs does FPL plan to incur for the Uprate Project in**
6 **2011?**

7 A. Schedule AE-6 of Exhibit TOJ-22 breaks the 2011 actual/estimated total costs
8 of \$569,779,321 down into the following categories: License Application
9 \$19,797,804; Engineering and Design \$20,251,942; Permitting \$45,451;
10 Project Management \$33,835,035; Power Block Engineering, Procurement,
11 Etc. \$489,873,573; and Non-Power Block Engineering, Procurement, Etc.
12 \$5,975,515. Exhibit TOJ-25, EPU Actual/Estimated 2011 Costs Tables,
13 includes 9 tables summarizing the EPU Project 2011 Actual/Estimated (A/E)
14 costs by NFR category which includes post in-service amounts.

15 **Q. Please describe the 2011 activities in the License Application category.**

16 A. For the period ending December 31, 2011, License Application costs are
17 estimated to be \$19,797,804 as shown on Line 3 of Schedule AE-6 of Exhibit
18 TOJ-22. These license application costs consist primarily of payments to
19 vendors for the preparation of the PSL Unit 2 LAR, responding to the NRC
20 Requests for Additional Information (RAIs) as necessary in 2011, and NRC
21 fees. This was approximately \$9.4 million more than projected due to
22 increased scope and a longer duration for completing the licensing effort.

1 **Q. Please describe the 2011 activities in the Engineering and Design**
2 **category.**

3 A. For the period ending December 31, 2011, Engineering and Design costs are
4 estimated to be \$20,251,942 as shown on Line 4 of Schedule AE-6 of Exhibit
5 TOJ-22. This amount consists primarily of FPL's engineering and design
6 work in support of review and approval of the engineered design modification
7 packages prepared for the St. Lucie and Turkey Point sites by Bechtel, FPL's
8 EPC vendor on the EPU's. This was approximately \$11 million more than
9 projected due to the need for additional resources to support the increased
10 scope for design engineering.

11 **Q. Please describe the 2011 activities in the Permitting category.**

12 A. For the period ending December 31, 2011, Permitting costs are estimated to be
13 \$45,451 as shown on Line 5 of Schedule AE-6 of Exhibit TOJ-22. This
14 amount consists primarily of environmental studies and application
15 preparation and submittal to modify the PSL discharge permit. This is
16 approximately \$105,000 less than projected due to the completion of the
17 permitting efforts. This amount does not include required permit compliance
18 ordered stipulations, which include monitoring and reporting.

19 **Q. Please describe the 2011 activities in the Project Management category**
20 **and how those activities help ensure that the Uprate Project will be**
21 **completed on a reasonable schedule and at a reasonable cost.**

22 A. For the period ending December 31, 2011, Project Management costs are
23 estimated to be \$33,835,035 as shown on Line 6 of Schedule AE-6 of Exhibit

1 TOJ-22. This category includes FPL and contractor management personnel at
2 each of the sites and those in the Juno Beach Office. This work and the
3 associated costs are required to ensure the uprate project is managed in an
4 efficient and cost-effective manner. This is approximately \$9.9 million more
5 than projected due to additional support needed for the implementation of the
6 three EPU outages scheduled for 2011.

7 **Q. Please describe the 2011 activities in the Power Block Engineering,**
8 **Procurement, Etc. category.**

9 A. For the period ending December 31, 2011, Power Block Engineering and
10 Procurement costs are estimated to be \$489,873,573 as shown on Line 9 of
11 Schedule AE-6 of Exhibit TOJ-22. This amount is primarily for the
12 development of the engineering design modification packages and for the
13 implementation of the scheduled work for the three outages scheduled for
14 2011. This work includes preparation of the modification packages (part of
15 the Engineering Design Modification Phase); the development of directions
16 for the removal, replacement and/or modification of components, equipment,
17 systems and structures as needed to support the uprate condition, and the
18 performance of field walkdowns by Bechtel. This also includes certain
19 implementation activities, including the preparation of work orders for
20 implementation and integration of modifications into the unit outage schedule.
21 The second part of this phase is the physical execution of the work, some of
22 which will occur in the three scheduled 2011 outages.

23

1 Some modifications can be performed when the units are operating, reducing
2 the complexity of the outage and limiting the outage duration. FPL evaluates
3 the risk to the continued operation of the unit and if determined to be an
4 acceptable risk, the modifications will be performed while the unit is on line.
5 One such modification is the modification of the Turkey Point turbine gantry
6 crane. Modifications to the crane are necessary for increased capacity and
7 efficiency in removing and installing, with precise movements, many pieces
8 of heavy equipment. The needed modifications to this crane will be
9 performed while the respective unit is operating thus saving plant outage time.

10
11 Procurement costs include the purchase of long lead equipment items and
12 progress payments to manufacturing vendors. FPL is continuing to execute on
13 contracts for the procurement of major pieces of equipment which include
14 steam turbines, main generator rotors, pumps, motors, valves, and heat
15 exchangers of various specifications. This is approximately \$1.4 million less
16 than projected due to scope being deferred to the second PSL1 EPU outage to
17 be completed in 2012.

18 **Q. Please describe the 2011 activities in the Non-Power Block Engineering,**
19 **Procurement, Etc. category.**

20 **A.** For the period ending December 31, 2011, Non-Power Block Engineering
21 costs are estimated to be \$5,975,515 as shown on Line 10 of Schedule AE-6
22 of Exhibit TOJ-22. This category consists primarily of the following:

1 engineering, permitting, and construction of temporary facilities; upgrades to
2 training simulators; and additional dry cask storage for spent fuel.

3
4 A fabrication area used to pre-fabricate piping and valves reduces the outage
5 time because work can be performed prior to the outage and at the same time
6 as other work, instead of in a series sequence of field activities during the
7 outage. A warehouse is used to store and stage delivered materials for the
8 EPU project prior to installation and to provide an area for the training and
9 qualification of craft labor. A site training and qualification area is necessary
10 to ensure Turkey Point has the needed qualified craft labor support to perform
11 the many tasks needed to remove, install or modify plant equipment.

12
13 This category also includes the modifications to each site's operator training
14 simulators. The training simulators require modifications to reflect the
15 equipment and operating parameters in the uprate condition. Additionally, this
16 category includes costs associated with increased scope for six dry cask
17 storage containers, which scope was added to the project in December 2010.
18 This category of costs is approximately \$1.1 million more than projected,
19 primarily due to the addition of the dry cask storage containers.

20 **Q. Please describe the 2011 activities in the Transmission category.**

21 **A** For the period ending December 31, 2011, Transmission costs are estimated to
22 be \$18,066,007 as shown on Line 34 of Schedule AE-6 of Exhibit TOJ-22.
23 This amount is primarily related to costs associated with the upgrades to the

1 main transformers and plant yard electrical components at the sites. This is
2 approximately \$10.2 million more than projected due to the purchase of the
3 transformers with some transmission outage work accelerated and some
4 deferred due to line and switchyard availability.

5 **Q. Please describe the 2011 actual/estimated recoverable O&M costs.**

6 A. Actual/Estimated recoverable O&M costs for the EPU project in 2011 include
7 \$12,701,007 for EPU, shown on Line 19 of Schedule AE-4 of Exhibit TOJ-22,
8 and \$5,909 for Transmission, as shown on Line 28 of Schedule P-4 of Exhibit
9 TOJ-22. Recoverable O&M primarily consists of costs for performing
10 inspections of the 1 through 4 feedwater heaters at PSL Unit 2 and PTN Unit
11 4 and an estimate of obsolete materials that will be expensed as a result of
12 modifications completed in 2011. Additionally, costs for commodities that do
13 not meet FPL's capitalization policy are included. This is approximately \$8.6
14 million more due to an increased scope of required equipment inspections
15 which do not meet capitalization criteria.

16 **Q. Please describe the equipment going into service in 2011.**

17 A. Exhibit TOJ-24, 2011 Extended Power Uprate Work Activities, is a listing by
18 outage of major 2011 work activities for PSL Unit 1, PSL Unit 2 and PTN
19 Unit 4. To the extent the work activities are subject to capitalization as units
20 of property and the modification is completed in 2011, the plant components
21 will be placed into service. The items going into service include, but are not
22 limited to, feedwater heater drain valves, main generators, and isophase bus
23 duct modifications. Certain Transmission and Distribution equipment will

1 also be placed in service in 2011 which includes a main transformer and main
2 transformer cooler upgrades.

3 **Q. Are the 2011 actual/estimated costs presented in your testimony**
4 **“separate and apart” from other nuclear plant expenditures?**

5 A. Yes, the 2011 actual/estimated costs presented are “separate and apart” from
6 other nuclear plant expenditures. The construction costs and associated
7 carrying charges and recoverable O&M expenses for which FPL is requesting
8 recovery through this proceeding were caused only by activities necessary for
9 the EPU, and would not have been incurred otherwise. As explained in my
10 testimony submitted in this docket on March 1, 2011, FPL’s identification of
11 the major components that must be modified or replaced to enable the units to
12 function properly and reliably in the uprated condition is based on engineering
13 analyses. A review of historical site planning documents and the License
14 Renewal Action Items compiled in conjunction with the NRC’s approval of
15 FPL’s requested license renewals confirmed that the uprate costs were
16 “separate and apart” from other planned nuclear activities and expenditures.
17 FPL has continued to carefully follow all of the safeguards in this respect,
18 which the Commission has previously reviewed and found to be reasonable
19 and appropriate.

20 **Q. Are FPL’s actual/estimated 2011 EPU costs reasonable?**

21 A. Yes. The majority of FPL’s 2011 expenditures are for (i) payments to long
22 lead equipment manufacturers pursuant to competitively bid contracts; (ii)
23 payments to the competitively bid EPC vendor; (iii) payments to original

1 equipment manufacturers for LAR engineering analyses; and (iv) the
2 implementation costs associated with three EPU outages.

3
4 Careful vendor oversight, continued use of competitive bidding when
5 appropriate, and the application of the robust internal schedule and cost
6 controls and internal management processes all support a finding that FPL's
7 actual/estimated 2011 expenditures are reasonable.

8
9 **2012 PROJECTED CONSTRUCTION ACTIVITIES AND COSTS**

10
11 **Q. Please summarize the construction activities projected for 2012.**

12 **A.** In 2012, for the EPU LAR Engineering Analysis phase, FPL will continue to
13 support the NRC review process, including, responding to NRC RAIs and
14 interfacing with the NRC Staff. The Long Lead Equipment Procurement
15 Phase will be completed, including equipment for the modifications in the
16 2012 outages. The Engineering Design Modification Phase will continue with
17 modification package preparation for the final EPU outages in 2012.
18 Implementation will be worked for each of the three outages in 2012: the PTN
19 Unit 3 and PSL Unit 2 spring outages, and the PTN Unit 4 fall outage. Each
20 outage requires long lead equipment, planning, schedule integration, and the
21 actual execution of the physical work in the plants, including extensive testing
22 and systematic turnover to operations. Exhibit TOJ-26, 2012 Extended Power

1 Uprate Work Activities, includes the unit outage, the work activity, and a
2 description of why it is necessary for the EPU Project.

3 **Q. Please describe how FPL developed its projections of 2012 costs for its**
4 **NFRs?**

5 A. The 2012 projected costs were developed from Project Controls forecasts as
6 described above.

7 **Q. What types of costs does FPL project to incur for the Uprate Project in**
8 **2012?**

9 A. Schedule P-6 of Exhibit TOJ-22 breaks the 2012 projected total costs of
10 \$708,960,295 down into the following categories: License Application
11 \$5,312,846; Engineering and Design \$11,091,593; Permitting \$0; Project
12 Management \$26,330,854; and Power Block Engineering, Procurement, Etc.
13 \$665,777,875; and Non-Power Block Engineering, Procurement, Etc.
14 \$447,127. Exhibit TOJ-27, EPU Project 2012 Projected Costs Tables,
15 provides a summary of the projected EPU Project costs for the NFR categories
16 which includes post in-service amounts.

17 **Q. Please describe the activities in the License Application category for 2012.**

18 A. For the period ending December 31, 2012, License Application costs are
19 projected to be \$5,312,846 as shown on Line 3 of Schedule P-6 of Exhibit
20 TOJ-22. These amounts consist primarily of vendor payments necessary for
21 responding to NRC RAIs, FPL support and interface with NRC staff, and
22 NRC review fees.

23 **Q. Please describe the activities in the Engineering and Design category.**

1 A. For the period ending December 31, 2012, Engineering and Design costs are
2 projected to be \$11,091,593 as shown on Line 4 of Schedule P-6 of Exhibit
3 TOJ-22. The amounts consist primarily of FPL engineering activities in
4 support of the review and approval of the engineered modification packages.

5 **Q. Please describe the activities in the Project Management category and**
6 **how those activities help to ensure that the Uprate Project will be**
7 **completed on a reasonable schedule and at a reasonable cost.**

8 A. For the period ending December 31, 2012, Project Management costs are
9 projected to be \$26,330,854 as shown on Line 6 of Schedule P-6 of Exhibit
10 TOJ-22. This category includes the project management costs associated with
11 the oversight and management of the engineering of modification packages,
12 and implementation of modifications during the planned outages at PSL Unit
13 2, PTN Unit 3, and PTN Unit 4 occurring in 2012. This work and the
14 associated costs are required to ensure the uprate project is managed in a safe,
15 efficient, and cost-effective manner.

16 **Q. Please describe the 2012 activities in the Power Block Engineering,**
17 **Procurement, Etc. category.**

18 A. For the period ending December 31, 2012, Power Block Engineering and
19 Procurement costs are projected to be \$665,777,875, as shown on Line 9 of
20 Schedule P-6 of Exhibit TOJ-22. This amount consists of milestone payments
21 made to manufacturers of long lead materials and payments made to the EPC
22 vendor for the vast work associated with the implementation of the engineered
23 modification packages in the three planned 2012 outages. This includes final

1 known payments to vendors following installation and testing of the
2 equipment supplied for the Uprates completed through 2012.

3
4 The St. Lucie Unit 2 spring 2012 outage is the second of the two planned EPU
5 outages for the unit. Some of the modifications planned for the spring 2012
6 outage are: condensate pump replacement, High Pressure turbine rotor
7 replacement, feedwater heater 5A and 5B replacement, feedwater heater drain
8 pumps and valves replacements, and Moisture Separator Reheater (MSR)
9 replacements.

10
11 The Turkey Point Unit 3 spring 2012 outage is the second of the two planned
12 EPU outages for the unit. Some of the modifications planned for the 2012
13 outage are: main turbine upgrades, main generator rewind, MSR
14 replacements, main condenser replacement, condensate pumps and motors
15 replacements, and replacement of feedwater heaters 5A and B and 6A and B.

16
17 The Turkey Point Unit 4 fall 2012 outage is the second of the two EPU
18 outages planned for the unit. Some of the modifications planned for the fall
19 2012 outage are: main turbine upgrades, main generator rewind, MSR
20 replacements, main condenser replacement, condensate pumps and motors
21 replacements, and replacement of feedwater heaters 5A and B and 6A and B,
22 and feedwater heater 5 drain piping upgrade.

1 **Q. Please describe the activities in the Non-Power Block Engineering,**
2 **Procurement, Etc. category.**

3 A. For the period ending December 31, 2012, Non-Power Block Engineering
4 costs are estimated to be \$447,127 as shown on Line 10 of Schedule P-6 of
5 Exhibit TOJ-22. This category consists primarily of costs for simulator
6 upgrades and temporary facilities needed to support the project.

7 **Q. Please describe the 2012 activities in the Transmission category.**

8 A. For the period ending December 31, 2012, Transmission costs are projected to
9 be \$27,238,132 as shown on Line 34 of Schedule P-6 of Exhibit TOJ-22. This
10 amount is required primarily for the following: Replacement of transformers,
11 transformer cooler upgrades, switchyard breaker replacement with higher
12 capacity breakers, and line and breaker monitoring equipment.

13 **Q. Please describe the 2012 projected recoverable O&M costs.**

14 A. Projected recoverable O&M costs for the EPU project in 2012 total
15 \$5,611,503 as shown on Line 19 of schedule P-4 of Exhibit TOJ-22.
16 Recoverable O&M primarily consists of costs for performing equipment
17 inspections and an estimate of obsolete materials that will be expensed as a
18 result of modifications completed in 2012. Additionally, commodities and
19 consumables that do not meet FPL's capitalization policy are included.

20 **Q. Please describe the items going into service in 2012.**

21 A. Exhibit TOJ-26, Extended Power Uprate Work Activities for 2012, is a listing
22 of equipment and control devices that are planned for installation; many of
23 which are planned to be placed into service in 2012. This extensive list

1 includes the Transmission upgraded items and items such as the main
2 generator rotors, high pressure turbine rotors, main transformers and cooler
3 modifications, feedwater heaters, condensate pumps, and main condensers,
4 among others.

5 **Q. Are the 2012 cost projections presented in your testimony “separate and
6 apart” from other nuclear plant expenditures?**

7 A. Yes. The 2012 cost projections presented are “separate and apart” from other
8 nuclear plant expenditures. As explained in my testimony submitted in this
9 docket on March 1, 2011, FPL’s identification of the major components that
10 must be modified or replaced to enable the units to function properly and
11 reliably in the uprated condition is based on engineering analyses. A review
12 of historical site planning documents and the License Renewal Action Items
13 compiled in conjunction with the NRC’s approval of FPL’s requested license
14 renewals confirmed that the uprate costs were “separate and apart” from other
15 planned nuclear activities and expenditures. FPL has continued to carefully
16 follow all of the safeguards in this respect, which the Commission has
17 previously reviewed and found to be reasonable and appropriate.

18 **Q. Are FPL’s projected 2012 EPU costs reasonable?**

19 A. Yes. FPL’s projected 2012 costs reflect the significant amount of
20 implementation work that is planned to occur in that year and the large
21 number of systems going into service, as the project nears completion. Project
22 staffing levels, including vendor staffing, will be higher to support the
23 modification package engineering design, implementation, and outage

1 support. The majority of FPL's costs, however, will continue to flow from the
2 many ongoing contracts introduced and reviewed in prior proceedings.
3 Careful vendor oversight, continued use of competitive bidding when
4 appropriate, and the application of the robust internal schedule and cost
5 controls and internal management processes, all demonstrate that FPL's
6 projected 2012 expenditures are reasonable.

7
8 **TRUE-UP TO ORIGINAL COST AND UPDATED COST ESTIMATE RANGE**
9

10 **Q. Did FPL prepare a true-up of the total project costs in 2010?**

11 A. Yes. FPL's 2010 True-up to Original schedule is included in TOJ-22.

12 **Q. Have you prepared a current true-up of the total project costs through**
13 **the current reporting period?**

14 A. Yes. Exhibit TOJ-22 includes the 2012 TOR schedules that compare the
15 current projections to FPL's originally filed Project costs. The 2012 TOR
16 schedules provide information on the project costs through the end of 2013.
17 The 2012 TOR schedules provide the best information currently available for
18 the cost recovery period through 2013.

19 **Q. Has FPL updated its total nonbinding cost forecast for the project?**

20 A. Yes. Pursuant to the Commission's direction in Order No. PSC-09-0783-
21 FOF-EI, FPL has updated its capital cost forecast. FPL has developed an
22 updated cost forecast range for the EPU project that reflects increased scope
23 that is necessary to support NRC regulatory requirements, power generation in

1 the uprate condition, and implementation support. The updated cost estimate
2 range is approximately \$2,324 million to \$2,479 million, including
3 transmission costs and carrying costs, as shown on NFR Schedule TOR-2.

4 **Q. Why is FPL providing a nonbinding range instead of a single point**
5 **estimate?**

6 A. The progression of project activities over the last several years provides FPL
7 with additional insight to revise its nonbinding cost forecast. However, the
8 project is still in the design engineering phase and there remains an expected
9 level of uncertainty with respect to project scope. Accordingly, it is only
10 appropriate to provide the total project cost in terms of a range.

11
12 This approach is consistent with generally accepted project management best
13 practices. For example, the Project Management Institute's "A Guide to the
14 Project Management Body of Knowledge" states the following at page 161:

15 The accuracy of a project estimate will increase as the
16 project progresses through the project life cycle. For
17 example, a project in the initiation phase could have a
18 rough order of magnitude (ROM) estimate in the range of
19 -50% to +100%. Later in the project, as more information
20 is known, estimates could narrow to a range of -10% to
21 +15%.

22
23 As activities such as final design engineering analyses, associated NRC
24 reviews, and construction planning progress, FPL will be able to provide
25 additional certainty to the total project cost forecast.

26 **Q. Please describe the development of the current non-binding cost estimate**
27 **range for the EPU Project.**

1 A. The low end of the non-binding cost estimate range represents the current
2 forecast, approximately \$2.324 million, at this stage of the project based on
3 the following status of tasks: i) the completion of the LAR engineering effort;
4 ii) the approximately 95% committed costs for long lead equipment, which
5 represents approximately \$250 million of \$510 million of these costs (as of
6 March 2011); iii) the approximately 50% completion of the design
7 modification phase of the project, which represents approximately 625,000
8 hours of 940,000 hours of this phase (as of April 2011); and iv) an estimate of
9 implementation costs. The LAR analyses and design modification
10 engineering activities have added work scope to the project. The high end of
11 the range reflects the current forecast, an evaluation of the existing trends for
12 weighted risks, and undefined scope. This resulted in a high end non-binding
13 cost estimate range amount of approximately \$2,479 million.

14 **Q. Please compare the current cost estimate range of the EPU Project to the**
15 **nonbinding cost estimate presented in FPL's Need Filing.**

16 A. FPL's need filing in September 2007 for the EPU Project included a
17 nonbinding cost estimate of \$1,798 million. This initiation phase estimate
18 was based on FPL's preliminary feasibility and scoping studies and reflected
19 the best information available at that time. (Please note that FPL's original
20 non-binding cost estimate included the participant's share of St. Lucie Unit 2.)

21 **Q. Please describe the primary reasons why the current nonbinding cost**
22 **estimate range is higher than the nonbinding cost estimate previously**
23 **provided.**

1 A. The major reason for the higher cost estimate is the increase in project scope
2 that can be categorized into three areas: Regulatory and Safety Margin, Power
3 Generation, and Implementation Support. For example, in the Regulatory and
4 Safety Margin area, the applicant must demonstrate through engineering
5 analyses submitted to the NRC that the increased operating conditions meet
6 regulatory safety criteria. In many instances, in performing the LAR
7 engineering analyses, the need for a modification to a system, structure, or
8 component to obtain acceptable results was identified. As more modifications
9 are identified by the NRC LAR review process, costs for labor and non-labor
10 resources increase.

11
12 With respect to Power Generation, modification design engineering has
13 identified additional scope that is required for the units to operate in the power
14 uprate conditions. For example, the replacement of the main steam isolation
15 valve assemblies and the heater drain pressure re-rate could only be identified
16 through design engineering.

17
18 Additionally, increases in Implementation Support costs reflect increased
19 project complexity. The EPC vendor is responsible for detailed design of the
20 modifications, procurement of components, and the implementation of
21 modifications. As described above, the EPC vendor, Bechtel, is performing
22 the modification design engineering process and estimating the additional
23 resources required for planning and implementation. These reviews indicate

1 that modification implementation will be more complex than originally
2 anticipated. This complexity is primarily related to the following:

- 3 • Structural Integrity
- 4 • Limited Work and Staging Space
- 5 • Rigging of Equipment
- 6 • Operating Plant Environment
- 7 • Work Order Planning and Integration with Routine Outage Activities

8 **Q. Please describe how these components impact projected costs.**

9 A. Structural integrity refers to the existing structures, secondary plant floor
10 elevations and their ability to accommodate heavier and/or larger pieces of
11 equipment supported from the existing structure. Detailed engineering
12 evaluations of the structures are required to support removal, transport and
13 placement of the equipment. Such detailed engineering evaluations had not
14 been performed at the time that the initial non-binding cost estimate was
15 developed. The two components of the additional costs are the engineering
16 analyses needed to assess structural integrity and the resultant plant
17 modifications.

18
19 In regards to limited work and staging space, the secondary plant equipment
20 being modified for the EPU Project is located on all of the floors of the
21 secondary plant which includes below grade areas with minimal space for
22 removal, replacement, or modification work. Typically, the modification or
23 replacement of a piece of equipment during a normal refueling outage can be

1 accomplished while routine work is scheduled to minimize interference with a
2 planned major modification. The EPU Project replaces or modifies numerous
3 major pieces of equipment during a single refueling outage. This work
4 increases the complexity, planning, scheduling, and duration of the outage.
5 EPU modification engineering, work order planning and scheduling activities
6 are integrated with routine outage activities to optimize outage performance.
7 The two components of the additional costs are the engineering analyses
8 needed to assess the limited work and staging space and the resultant plant
9 modifications.

10
11 In regards to rigging of equipment, some of the equipment being replaced or
12 modified weighs up to approximately 185 tons. This equipment must be
13 stored, staged, and carefully moved into proper location with precise
14 execution. These heavy lifts, including moving existing equipment out of the
15 way to allow new equipment to be installed, requires individual detailed
16 rigging plans. A rigging plan defines the lifting devices to be used, where the
17 equipment can be landed, and the safe load path for moving the equipment.
18 These rigging plans are then integrated into the work orders and the schedule
19 for crane usage, space, and qualified craft labor availability. The additional
20 costs are associated with the engineering analyses, the additional planning,
21 and implementation of resultant engineered lifts.

22

1 In regards to operating plant environment, performing work at an operating
2 plant requires strict adherence to federal, state, and local regulations including
3 industrial safety practices, nuclear safety practices, security requirements, and
4 plant technical specifications. All of these requirements are considered and
5 factored into the integrated planning and scheduling when working in an
6 operating plant environment, and result in additional planning and
7 implementation costs.

8
9 Work order planning and integration with routine outage activities is
10 particularly challenging. Planned modifications are assigned to an outage to
11 accomplish the work in a prescribed sequence of removing, installing, or
12 modifying the equipment in preparation for operation in the uprate condition.
13 Once the design engineering modification packages are completed, work
14 orders delineating a step-by-step process for performing the work are
15 prepared. The work orders may include equipment clearance orders to ensure
16 equipment is isolated from mechanical energy and electrically de-energized,
17 confined space entry permits requiring additional safety personnel, and hot
18 work permits which may require a fire watch for grinding and welding
19 activities for equipment being removed, installed or modified. These
20 activities are then integrated into the outage schedule for proper sequencing in
21 a manner that maintains the plant in a safely shutdown condition while
22 accomplishing the needed modifications. Schedule integration includes when
23 and what equipment will be moved by the cranes, where equipment will be

1 staged for supporting the work activity, when a confined space can be entered
2 safely, and ensuring regulations are met. All of these requirements are
3 considered and factored into the integrated planning, scheduling, and
4 implementation of outages, resulting in additional costs.

5
6 **LONG TERM FEASIBILITY**
7

8 **Q. What total project cost did FPL use for purposes of the economic**
9 **feasibility analysis?**

10 A. FPL performed its feasibility analysis with an estimated going forward project
11 cost figure of \$1,780 million, which includes transmission and carrying costs.
12 Thus, FPL conservatively assumed the high end of its current nonbinding cost
13 estimate range in order to evaluate project feasibility. Pursuant to Order No.
14 PSC-09-0783-FOF-EI, the amount used accounts for sunk costs.

15 **Q. What assumed megawatt output did FPL use for purposes of the**
16 **economic feasibility analysis?**

17 A. FPL assumed that the Uprate would provide an additional 450 MWe for
18 feasibility analysis purposes – more than the 399 MWe assumed during the
19 need determination process. The best case scenario for FPL's customers
20 would be an increase in output of approximately 463 MWe. However, it
21 remains to be seen whether the target steam parameters supporting such
22 output will be achieved at each unit. Accordingly, FPL used 450 MWe in its

1 feasibility analysis, in order to provide feasibility results that are conservative
2 and not reliant upon this best case scenario.

3 **Q. Please summarize the results of the EPU economic feasibility analysis.**

4 A. As discussed in detail by FPL Witness Dr. Sim, the most current feasibility
5 analysis affirms the cost-effectiveness and benefits associated with the Uprate
6 project.

7 **Q. Has FPL examined other aspects of project feasibility?**

8 A. Yes. FPL continuously assesses the financial, technical, and regulatory
9 aspects of the EPU project, and the project remains feasible at this time. This
10 assessment is reflected in the numerous reports and tracking tools used by the
11 project.

12 **Q. Is it technically feasible to accomplish the Uprate Project?**

13 A. Yes. The Project remains technically feasible. The LAR engineering
14 analyses revealed challenges to the Uprates, but the challenges are being
15 addressed. Further, Bechtel has demonstrated that it is capable of performing
16 both the necessary engineering design and implementation scope of work.

17 **Q. Is it feasible to finance the Uprate Project?**

18 A. Yes. The Uprate Project is financed by the general capital FPL raises each
19 year, and FPL's finance department expects that adequate amounts of capital
20 will be obtained to complete the project.

21 **Q. Is it feasible to obtain all necessary licenses and permits?**

22 A. Yes. As described above, FPL has completed the state licensing/permitting
23 process. FPL also has submitted all necessary LARs to the NRC, and expects

1 that they will be approved. Timing consideration related to these approvals
2 were discussed previously in this testimony.

3 **Q. Are there other aspects to feasibility that FPL has examined?**

4 A. Yes. Inherent to the project management process is the recognition of factors
5 such as resource availability/constraints, potential cost escalations, and
6 industry-critical events such as the cancellation of the Yucca Mountain spent
7 fuel disposal project and the recent events in Japan following the March 2011
8 earthquake and tsunami. FPL monitors these and other factors. None of these
9 issues has caused the project to cease being feasible.

10 **Q. Are these items required to be included in the feasibility analysis set forth
11 in Rule 25-6.0423(c)5, F.A.C.?**

12 A. No. FPL's economic feasibility analysis sponsored by Witness Dr. Sim is
13 being provided in satisfaction of Rule 25-6.0423(c)5, F.A.C. On February 4,
14 2010, Commission Staff requested that FPL address these feasibility-related
15 topics. Accordingly, FPL has summarized its assessment of the non-economic
16 topics related to feasibility in response to Staff's request.

17 **Q. Does this conclude your testimony?**

18 A. Yes.

BEFORE THE
FLORIDA PUBLIC SERVICE COMMISSION

In re: Nuclear Power Plant)
Cost Recovery Clause)

1 **BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION**2 **FLORIDA POWER & LIGHT COMPANY**3 **SUPPLMENTAL TESTIMONY OF TERRY O. JONES**4 **DOCKET NO. 110009-EI**5 **JULY 15, 2011**6
7 **Q. Please state your name and business address.**8 My name is Terry O. Jones, and my business address is 700 Universe Boulevard, Juno
9 Beach, FL 33408.10 **Q. By whom are you employed and what is your position?**11 A. I am employed with Florida Power & Light Company (FPL) as Vice President, Nuclear
12 Power Uprates.13 **Q. Have you previously filed testimony in this docket?**14 A. Yes. I provided testimony on March 1, 2011 related to the Extended Power Uprate
15 (EPU) project activities and costs in 2009, testimony on March 1, 2011 related to the
16 EPU project activities and costs in 2010, and testimony on May 2, 2011 related to
17 anticipated EPU project activities and costs in 2011 and 2012. This is a supplement to
18 my May 2, 2011 testimony.19 **Q. What is the purpose of this supplement to your testimony?**20 A. The purpose of this supplement is to provide the Florida Public Service Commission
21 (Commission), Commission Staff, and all parties with an update on three aspects of the
22 EPU project: (i) the outage schedules; (ii) the increased output currently being realized
23 from St. Lucie Unit 2, following the work that was performed earlier this year during the

1 St. Lucie Unit 2 spring outage; and (iii) the acceptance or approval of two License
2 Amendment Requests.

3 **Q. Please provide the update related to the outage schedules.**

4 A. Several changes have been made to the outage schedules since my May 2, 2011
5 testimony. These changes have been fully vetted and approved for the EPU project.
6 First, as stated in my testimony at pages 11-12, the St. Lucie Unit 2 spring 2011 outage
7 lasted longer than planned, and the outage was not complete at the time my testimony
8 was filed. The outage concluded and the unit was returned to service on May 8, 2011.

9
10 Second, we are now planning for longer durations for the remaining four EPU outages.
11 As stated in my May 2, 2011 testimony at page 4, “[a]s the engineering analyses continue
12 and as modification designs are finalized and construction plans are developed, FPL will
13 be able to refine the planned outage durations, implementation resource requirements,
14 and the total project cost”. Since the preparation of my testimony, FPL has in fact
15 adjusted the planned outage durations. Each of the outages has been extended, for
16 planning purposes at this time, between 10 and 40 days, for a total of 85 additional days.
17 FPL determined that additional time needed to be assumed to allow for construction and
18 logistical discovery during implementation. This decision reflects the operating
19 experience gained from completing the implementation of the first FPL EPU outages and
20 non-FPL EPU outages, as well as progress that has been made in the engineering design
21 phase and implementation phase – specifically, the planning and constructability reviews
22 for the implementation of the EPU modifications. The longer planned duration outages

1 also include time for pre-operational and functional testing of modifications prior to
2 turnover to operations.

3
4 Third, the start dates of the remaining St. Lucie Unit 2 and Turkey Point Unit 4 outages
5 have been pushed back slightly, while the start date for the Turkey Point Unit 3 outage
6 has advanced slightly. The start dates were adjusted to minimize the overlap of
7 generating unit outages (not just nuclear unit outages) on FPL's system and to maximize
8 the usage of nuclear fuel.

9 **Q. Please provide the update related to the increased output being realized from St.
10 Lucie Unit 2.**

11 A. As stated in my testimony at page 15, FPL anticipated that the return to service from the
12 St. Lucie Unit 2 outage would result in an increase of approximately 20 MWe in the
13 output of the unit due to the installation of a more efficient low pressure turbine rotor,
14 and that approximately 17 MWe of that increased output would be for the benefit of
15 FPL's customers (after accounting for the co-owners' share). As mentioned above, St.
16 Lucie Unit 2 was returned to service on May 8, 2011. Preliminary testing indicates that
17 there is an increase of approximately 34 MWe, 29 MWe of which is for the benefit of
18 FPL's customers.

19 **Q. Please provide the update related to the progress of FPL's License Amendment
20 Requests (LARs.)**

21 A. FPL has accomplished two major milestones in its licensing phase of the project. On
22 June 23, 2011, the Nuclear Regulatory Commission (NRC) accepted FPL's St. Lucie
23 Unit 2 EPU LAR for review. Also on June 23, 2011, the NRC approved FPL's Turkey

1 Point Alternate Source Term LAR – a prerequisite to approval of the Turkey Point EPU
2 LAR.

3 **Q. Do these EPU project changes affect the feasibility analyses performed by Dr. Sim?**

4 A. The outage schedule changes and the increased output of St. Lucie Unit 2 affect Dr.
5 Sim's feasibility analyses. The LAR accomplishments do not. Dr. Sim is providing
6 supplemental testimony and exhibits demonstrating the effects of the outage schedule and
7 St. Lucie Unit 2 output changes on the feasibility analyses, as well as the effects of other
8 system resource planning assumptions that have recently changed. As Dr. Sim explains
9 in his supplemental testimony, the EPU project remains solidly cost-effective for
10 customers.

11 **Q. Does that complete your supplement?**

12 A. Yes.

1 BY MR. ANDERSON:

2 Q. Mr. Jones, you are sponsoring exhibits to your
3 direct testimony?

4 A. Yes, I am.

5 Q. These are Exhibits TOJ-1 through TOJ-27, also
6 shown as Exhibits 49 through 75 on staff's exhibit list?

7 A. That is correct.

8 MR. ANDERSON: The exhibits have been
9 premarked, Mr. Chairman.

10 CHAIRMAN GRAHAM: Uh-huh.

11 BY MR. ANDERSON:

12 Q. Mr. Jones, would you please provide a summary
13 of your testimony for the Commission?

14 A. Yes, I will.

15 Good afternoon, Chairman Graham and
16 Commissioners. FPL's project team is safely and
17 cost-effectively implementing the extended power uprate
18 project at St. Lucie and Turkey Point Nuclear Power
19 Plants. I am responsible for the management and
20 execution of FPL's extended power uprate project. An
21 extended power uprate project is the largest and most
22 complex uprate that can be approved by the Nuclear
23 Regulatory Commission. It requires the replacement or
24 modification of a significant number of nuclear plant
25 components and systems in order to generate and

1 accommodate higher electrical output. When completed,
2 the EPU project will provide FPL's customers with an
3 additional 450 megawatts of clean zero-emission
4 electrical generation without expanding the footprints
5 of these plants.

6 This project will add approximately one-half
7 of the electrical output of a new nuclear unit and will
8 provide significant fuel cost savings to our customers.
9 Our customers began benefiting from fuel savings this
10 past spring following the outage at St. Lucie Unit 2
11 where a new more efficient low-pressure turbine was
12 installed for the extended power uprate, adding
13 approximately 19 megawatts of nuclear generated
14 electrical output.

15 By design, the extensive license, engineering,
16 equipment procurement, design modification engineering,
17 and implementation work all overlap with major
18 construction being incorporated into scheduled refueling
19 outages for FPL's nuclear units. We chose this
20 methodology to bring the benefits of additional nuclear
21 generation to FPL's customers as early as practical.

22 Let me briefly describe FPL's EPU work during
23 the 2009 to 2012 time period under review in this
24 proceeding. During 2009 and 2010, FPL worked on Nuclear
25 Regulatory Commission licensing, procured major

1 equipment, performed detailed design engineering for
2 required modifications, and prepared and implemented
3 many modifications required to increase nuclear
4 generation for our customers. In 2010, FPL also
5 completed two EPU implementation outages at St. Lucie
6 and Turkey Point.

7 So far in 2011, we have made good progress on
8 obtaining the required NRC licensing approvals. We
9 received NRC approval on one of our license amendments
10 with three others accepted for approval. We have also
11 successfully completed two more EPU implementation
12 outages, including the St. Lucie outage that I mentioned
13 earlier resulting in an increase of 29 megawatts of
14 electrical output for FPL's customers.

15 During 2012, FPL will continue its
16 engineering, design implementation and construction
17 work, complete additional outages at the plant, and
18 support the NRC's continued licensing review.

19 It's a big job. We are employing over ten
20 million manhours of work, or to put it another way, more
21 than 5,000 person years of work to complete the EPU
22 project. The costs incurred in 2009 and 2010 and those
23 projected for 2011 and 2012 for the EPU project are
24 prudent and reasonable. FPL's investment in additional
25 nuclear generation approved by this Commission is

1 creating thousands of jobs and will provide fuel cost
2 savings for FPL customers for decades. This concludes
3 my summary.

4 **MR. ANDERSON:** Mr. Jones is available for
5 cross-examination.

6 **CHAIRMAN GRAHAM:** Thank you. Who's up first?

7 **MS. KAUFMAN:** I guess it's me.

8 **CHAIRMAN GRAHAM:** Ms. Kaufman.

9 **MS. KAUFMAN:** Thank you, Mr. Chairman.

10 **CROSS EXAMINATION**

11 **BY MS. KAUFMAN:**

12 Q. Good afternoon, Mr. Jones.

13 A. Good afternoon.

14 Q. When did you -- you are currently
15 Vice-President of Uprates, is that correct?

16 A. That is correct.

17 Q. When did you come into that position?

18 A. I officially assumed the position August 1st,
19 2009.

20 Q. So that was obviously right before the
21 September 2009 nuclear cost-recovery hearing, is that
22 correct?

23 A. That is correct.

24 Q. Did you have any involvement in the
25 September 2009 hearing?

1 A. No, I did not.

2 Q. Now, in your testimony -- you have several
3 sets of testimony, so let me get this right. In your
4 March 1, 2011, testimony you address the activities of
5 the extended power uprate in 2009, correct?

6 A. That is correct.

7 Q. But most of this information -- would you
8 agree most of the activity occurred prior to your
9 assuming your position as VP of Uprates?

10 A. The activity that occurred in 2007, 2008, and
11 up until August 1 of 2009 were before I officially took
12 over the project. In my prior position as
13 Vice-President for Operations for the Midwest, we're
14 doing extended power uprate across the enterprise, six
15 of the eight reactors. And so I was involved quite a
16 bit in the extended power uprate as it affected the
17 utility company. So I was very much aware of what was
18 going on in the extended power uprate in Florida,
19 because at the time it was a corporate, largely
20 corporate-centric organization.

21 Q. You referenced your prior position and your
22 involvement with uprates. Where were you located prior
23 to coming to FPL Juno Beach?

24 A. Prior to coming to FPL Juno Beach, I was
25 located at Turkey Point Nuclear Power Plant, and I came

1 to Juno Beach in January of 2007.

2 Q. You referenced your experience in the midwest.
3 Where were you located then?

4 A. As the Vice-President of Operations for the
5 Midwest Region, I was located in Juno Beach, Florida.
6 And also as part of that function, it is mentioned in
7 some of the discovery documents about the technical
8 challenge and review boards of which I chaired in
9 regards to scope additions and scope deletions for the
10 Florida units that preceded me taking over as
11 Vice-President of the Extended Power Upgrades.

12 Q. If you would turn to Page 15 of your March
13 testimony we have just been talking about.

14 A. Is that the March 2011?

15 Q. The March 1 -- yes, 2011 extended power
16 upgrade, 2009, Page 15. Are you there?

17 A. I'm there.

18 Q. Okay. If you look at the question beginning
19 on Line 7, you are discussing periodic reviews conducted
20 in 2009 regarding key decisions about the EPU project,
21 is that correct?

22 A. I want to make sure that we have the same --

23 Q. I know, you have many sets of testimony. It's
24 March 1, 2011; EPU 2009. Mine has a purple cover, if
25 that's any help.

1 A. Okay. Page 15, and the question is whether
2 this is in regard to the answer to the question what
3 periodic reviews were conducted?

4 Q. Yes.

5 A. That says conducted in 2010. Hold on. Let me
6 go back one. Sorry.

7 **CHAIRMAN GRAHAM:** That's all right.

8 **BY MS. KAUFMAN:**

9 Q. Are you with me?

10 A. I'm with you.

11 Q. Okay. So we are looking at the question on
12 Page 7 about the periodic reviews conducted in 2009.
13 And you talk about regularly scheduled meetings in
14 regard to the uprate project and performance. Do you
15 see that?

16 A. Not on page -- Page 15, Line 7, correct?

17 Q. That's the question.

18 A. Got it.

19 Q. And the following answer, and beginning on
20 Line 9 you talk about regularly scheduled meetings. Do
21 you see where I am?

22 A. I do.

23 Q. Okay. Now that we're at the right place, my
24 question is in regard to those regularly scheduled
25 meetings, prior to your assuming the position of VP

1 Uprates, did you attend any of those meetings?

2 A. No, I did not.

3 Q. So the information that's contained in the --
4 let's say from Line 12 where the bullets start over to
5 the next page, any information in there that refers to
6 prior to your assuming the VP Uprates, you received that
7 information from other FPL members, staff members?

8 A. I received that information from other FPL
9 staff members on the projects, as well as an examination
10 of the company's records and documentations, and we
11 provided those in discovery.

12 Q. Does FPL have a witness that discusses what
13 went on in these meetings prior to your taking over?
14 Have they presented a witness on that topic in this
15 hearing that you are aware of?

16 A. In this hearing?

17 Q. Yes.

18 A. I'm sorry, are you asking me is there a
19 witness that was present in those meetings here at this
20 hearing?

21 Q. Yes. Is there a witness that was there and
22 can tell us what occurred in those meetings?

23 A. There is no witness that is here that was in
24 those meetings, but I as a witness through an
25 examination of the documents from those meetings know

1 what occurred in those meetings, based on a review of
2 the documents. Although I cannot obviously account for
3 100 percent of what occurred or was said in each one of
4 those meetings, not actually having been present.

5 **MR. ANDERSON:** FPL would also just indicate
6 that Mr. Stall, our Chief Nuclear Officer at the time,
7 is a witness in this case.

8 **BY MS. KAUFMAN:**

9 Q. If you turn to Page 27 of that same set of
10 testimony, and if you would look at Line 12. The
11 question asks you about the management of major EPU
12 project vendors in 2009, is that correct?

13 A. Correct.

14 Q. Did you have any personal involvement in
15 managing vendors in 2009 prior to your assumption of the
16 VP uprate position?

17 A. I did not have personal direct involvement in
18 managing the vendors prior to August 1, 2009. Again,
19 similar to the other question, the same senior people
20 who are on the project, those same people are the ones
21 that were primarily responsible for managing the
22 vendors.

23 Q. And those individuals are not witnesses in
24 this case, correct?

25 A. No, I represent them.

1 Q. Turn over to Page 28. Beginning on Line 12,
2 you're talking about activities occurring in the second
3 quarter of 2009. Do you see that?

4 A. That is correct.

5 Q. You weren't personally involved in those
6 activities, were you?

7 A. Yes, I got involved with the project in July.
8 Well, July is not in the second quarter. So, no, I
9 wasn't directly involved. My involvement was a
10 continuation of those efforts from the second quarter,
11 and that was a part of our transition and turnover as we
12 reorganized the project team.

13 Q. Okay. I'm going to switch to another set, and
14 I want to see if we can get on the same page, and that
15 is your EPU 2010 testimony. Mine has a green cover, if
16 that helps.

17 I'm sorry, I gave you the wrong reference.
18 I'm going to look at May 2011. I'm sorry. And I'm
19 going to look at Page 11, which has to do with schedule
20 change.

21 **CHAIRMAN GRAHAM:** Ms. Kaufman, would you say
22 that reference again?

23 **MS. KAUFMAN:** Yes. It's May 2011, nuclear
24 power plant cost-recovery for the years ending
25 December 2011 and 2012. And it's Page 11. It has a tan

1 cover.

2 **THE WITNESS:** May 2, 2011, Page 11.

3 **BY MS. KAUFMAN:**

4 Q. And let's wait until everybody gets with us.

5 Beginning on Line 14, there is a question
6 about unanticipated schedule changes this year. Do you
7 see that? The question is, "Were there any
8 unanticipated schedule changes this year?"

9 A. Yes.

10 Q. And your answer discusses an outage at the St.
11 Lucie Unit, correct?

12 A. That is correct.

13 Q. How long was this outage?

14 A. I don't recall the exact duration, so I would
15 need to check that, but it was on the order of about,
16 about 120 days.

17 Q. And you tell us in your testimony here that
18 the outage was related to an incident involving the
19 Siemens' personnel, is that correct?

20 A. That is correct. We had a work stoppage due
21 to a human error during the generator rewind, that is
22 correct.

23 Q. And Siemens in this instance is the vendor
24 working on the turbine generator, is that correct?

25 A. Yes. The turbine generators at our Florida

1 units, the original equipment manufacturer is the
2 Siemens Corporation, and so they are the -- quite
3 frankly, they supply these machines worldwide, and they
4 were the vendor that we contracted to do the uprate on
5 the machines. In this particular case, the scope of the
6 work was to replace both the low-pressure turbines which
7 drive the generator, and do a complete rewind and rotor
8 replacement on the generators. So it's quite extensive
9 work, very labor intensive, and these are the experts
10 that do this for a living.

11 Q. And there was an issue as you describe it
12 there that required this outage, correct?

13 A. There was a human error made where as a part
14 of the generator rewind process, they change out a
15 portion of what is called the generator core iron.
16 There is literally thousands of these laminate sheets
17 that make up the generator core, and they can only be
18 removed and installed by hand. And in that process,
19 they have a tool that they use which looks simply no
20 different than a round bar about a half-inch diameter
21 and about 18 inches long to align in the process.

22 And, unfortunately, the worker pushed it down
23 one of the ventilation holes and didn't notice it, and
24 then on the close-out inspection it was missed. And so
25 when we performed an electrical test, because that pin

1 was in there, it caused damage to the generator core
2 iron, and so that had to be repaired.

3 Q. And so when you say human error, we are
4 talking about a mistake that one of the vendor's
5 employees made on the project as you just described it?

6 A. That is correct. And like I said, Siemens,
7 they're the equipment experts. And as typical, not only
8 us, but standard industry practice is you would bring in
9 the OEM for this type of work. It involves hundreds of
10 workers, actually, 24/7 type of operation for over two
11 months to do just this scope of work. And obviously it
12 would not be practical for us to employ that number of
13 people and turn them into turbine generator experts. So
14 the standard practice is to bring in the expert.

15 We do provide oversight, and logistic support,
16 and audits of their procedures and their training and
17 things like that to ensure quality work. But, as with
18 any major construction project, you cannot totally
19 eliminate human error. The standard of perfection is
20 just not achievable. The best you do is provide
21 intrusive oversight and minimize the risk.

22 Q. This 120-day outage, is that going to result
23 in some costs that is unanticipated?

24 A. Yes, there are -- certainly there's a cost
25 impact with the extent of the outage. There is the cost

1 impact to the project itself. There is cost associated
2 to the plant, because obviously they are in support of
3 the outage, as well as Siemens had some costs involved
4 in that. And --

5 Q Excuse me.

6 A Go ahead.

7 Q. I was going to ask if you could provide us
8 with an estimate of what you think the cost of this
9 120-day outage was?

10 MR. ANDERSON: I'm going to object. The
11 question is based on facts not in evidence. There was a
12 120-day refueling outage. A portion of it was extended
13 due to this item, and this is being continually referred
14 to as if it were a 120-day outage caused by this
15 personnel error. And I have listened to it a couple of
16 times. With the third time, I will just ask that the
17 questions reflects accurately what the witness has
18 stated, which is it was a little bit of an outage
19 extension and go from there.

20 CHAIRMAN GRAHAM: Ms. Kaufman, can you restate
21 your question.

22 MS. KAUFMAN: Yes. I apologize. I thought I
23 was repeating what the witness said, which was 120 days.

24 THE WITNESS: Can I clarify?

25 MS. KAUFMAN: Excuse me.

1 **THE WITNESS:** The refueling outage, which
2 obviously involved refueling the reactor, as well as all
3 the preventative maintenance, as well as this uprate
4 that we are doing with other planned major projects that
5 we had not related to EPU, that outage duration was
6 about 120 days. The work stoppage and this human error,
7 recovery from that did impact that outage duration. We
8 estimated it about 23 days.

9 **MS. KAUFMAN:** Okay. Thank you for that
10 clarification.

11 **BY MS. KAUFMAN:**

12 **Q.** So the outage time that was related to the
13 human error and the unanticipated schedule change you
14 are talking about was about 23 days, correct?

15 **A.** I wish it were that simple. There's other
16 activities that are also -- you know, other activities,
17 other maintenance, other delays that are occurring in
18 parallel. If other things would have gone exactly
19 according to plan, let's just say that the impact to
20 Siemens was definitely 23 days. They were definitely on
21 the project 23 days longer than what they anticipated
22 and longer than what we had anticipated. There was
23 other drivers in the outage that determined the overall
24 duration that are outside of the EPU scope.

25 **Q.** And I just want to discuss with you the

1 Siemens issue only, so that will make our discussion
2 more clear, I hope.

3 A. Okay.

4 Q. And I think you agreed earlier that there
5 obviously is a cost to the 23 days, correct?

6 A. That is correct.

7 Q. Have you or FPL estimated what that cost is?

8 A. Yes, we have.

9 Q. And what is that?

10 A. We're in commercial negotiations right now
11 with Siemens over what we think Siemens is liable for
12 and what they should have to pay. So I'm a little
13 hesitant to put those numbers out there. I can say
14 this, that as a part of the EPU project we have what we
15 call a risk register, and so anyone, either internal or
16 external, can identify an issue or problem that could
17 have an impact on schedule, quality costs, any number of
18 factors, and we will capture that in our risk register.
19 And so we identified a potential risk of as much as
20 \$15 million impact. At this stage it's going to be
21 quite a bit less than that, but as I said, we are still
22 in commercial discussion with Siemens over the claim.

23 Is that a sufficient answer?

24 Q. Yes. And I'm certainly not intending to have
25 you divulge anything that is confidential in a public

1 forum. And let me just ask you this: In regard to the
2 amount that is in contention with Siemens as to who
3 would bear that risk, is it Florida Power and Light's
4 view that the risk of that amount rests with Siemens?

5 A. There is definitely an amount that goes back
6 to Siemens as standard industry practice. As I
7 mentioned refueling outages, set EPU aside, refueling
8 outages, a big complex refueling outage is typically
9 30 to 40 days involving hundreds of supplemental workers
10 and contractors. And to do those outages in a short
11 period -- in as short a practical period of time, you
12 bring in the OEMs to do things like the refueling
13 portion, to the things like --

14 MS. KAUFMAN: Chairman Graham, I hate to
15 interrupt, but I think my question was a lot simpler
16 than where Mr. Jones wants to go.

17 CHAIRMAN GRAHAM: Ms. Kaufman, I actually have
18 to disagree with you. Having lived through many, many
19 outages myself, I know just because you schedule one
20 outage and something else happens arbitrarily to that,
21 it's kind of hard to pinpoint and directly align that.
22 And I think what he is trying to do is explain his
23 answer to you; you may want to be more concise about the
24 question you ask.

25

1 BY MS. KAUFMAN:

2 Q. Were you finished? I think the Chairman --

3 A. Okay. What was the question? Could you
4 repeat the question?

5 Q. Yes.

6 I will just try to be more concise, Mr.
7 Chairman.

8 Between the amount that is in dispute between
9 FPL and Siemens as to this human error incident, just
10 the incident involving the tool that you have explained,
11 is it Florida Power and Light's view that the risk of
12 that is on Siemens rather than on Florida Power and
13 Light?

14 A. A portion of the risk is on Siemens, a portion
15 is on Florida Power and Light.

16 Q. And that is an area that you are attempting to
17 continue to work with Siemens on?

18 A. That is correct. And all I wanted to add to,
19 if I may, is that there are limits of liability on all
20 of these contracts and major contract vendors.
21 Obviously, it is not practical for me to have a
22 workforce of 3,000 people at a nuclear plant to just
23 accommodate periodic refueling outages. So we bring in
24 the OEMs for the refueling portion and the turbine
25 generator portion, and they all have LDs because they

1 couldn't possibly accept the risk of lost generation or
2 generation replacement. It would put them out of
3 business. Thank you.

4 **MR. ANDERSON:** Just for clarification, could
5 the witness say what LDs are?

6 **THE WITNESS:** Limits to liability.

7 **BY MS. KAUFMAN:**

8 Q. Do you know if it is the company's intent to
9 come and seek whatever portion of the amount it is that
10 flows to Florida Power and Light from this incident, to
11 seek that from ratepayers?

12 A. I will only speak to the EPU scope, if I may,
13 and that is that that portion that we are able to hold
14 Siemens liable for, they will be liable for. And the
15 balance of that is a part of project risk and project
16 expense and, therefore, it is our view, is recoverable.

17 **CHAIRMAN GRAHAM:** Did that answer your
18 question?

19 **MS. KAUFMAN:** Yes.

20 **BY MS. KAUFMAN:**

21 Q. So the answer to my question is, yes, you
22 would try to recover that from ratepayers?

23 A. Yes.

24 **MS. KAUFMAN:** Thank you, Mr. Chairman, for
25 indulging me. That's all I have.

1 **CHAIRMAN GRAHAM:** That's fine. I didn't
2 really mean to interrupt, but I have lived that life.
3 Any other intervenors?

4 **CROSS EXAMINATION**

5 **BY MR. McGLOTHLIN:**

6 **Q.** Hello, Mr. Jones.

7 **A.** Hello.

8 **Q.** You indicated that you assumed your position
9 of vice-president of uprates in August 2009, is that
10 correct?

11 **A.** That's correct.

12 **Q.** Now, in earlier portions of the hearing today
13 with the prior witnesses, references were made to the
14 July meeting, or the executive steering committee, and
15 to certain estimates, or revised estimates of capital
16 costs that were the subject of that meeting.

17 As the incoming Vice-President of Uprates, you
18 would have participated in the presentation to the
19 executive steering committee that was packaged in August
20 and presented in September 2009, were you not?

21 **A.** Yes, but I want to be clear in regards to my
22 presentation -- my participation is that I was present
23 for the meeting. I did not participate in the
24 preparation of the material for the meeting.

25 **Q.** Are you familiar with the material that was

1 prepared for that meeting?

2 A. Yes, I am.

3 Q. Is it true that the project managers revised
4 the estimated capital costs beyond the increase that was
5 reflected in the July presentation?

6 A. I'm sorry, could you repeat the question?

7 Q. Yes. There has been testimony about the
8 revised estimates that Mr. Reed, among others, has
9 described, increasing the estimated capital costs
10 associated with the EPU by \$300 million.

11 My question to you is isn't it true that when
12 the project managers prepared a presentation in August
13 of 2009 that estimate was revised upwards again?

14 A. To which August presentation are you referring
15 to?

16 Q. The August presentation to the executive
17 steering -- the August presentation prepared for the
18 meeting of the executive steering committee that
19 occurred on, I think, August or September 9th, 2009?

20 A. Okay. I wasn't -- to the best of my
21 recollection, there was no August ESC presentation. So
22 are you referring to a presentation that was presented
23 on September 9th?

24 Q. Prepared in August, presented in September.

25 A. Prepared in August, presented in September.

1 The answer to that question is yes, and I would like to
2 clarify that the preliminary numbers to which due
3 diligence was in progress for from the July meeting,
4 those preliminary numbers were retained as a part of the
5 project forecast going forward while the project team
6 continued their due diligence, and so there was scope
7 added and scope deleted and other changes that were
8 captured as a part of that project forecast going
9 forward. So, yes, it would be expected and did occur
10 that those numbers were different for the September 9
11 presentation.

12 Q. They were different and they were higher than
13 July, correct?

14 A. That is correct. I'd also like to point out
15 that those numbers in July, there was at least
16 \$200 million of scope that had not been through enough
17 engineering analysis to have management review or
18 approval, which is an example of the due diligence that
19 I am referring to that had been ongoing from July, and
20 we did not complete until April of 2010.

21 Q. And when that was completed in April of 2010,
22 did the numbers turn out to be higher than they were
23 either in August or July?

24 A. Yes. We revised the nonbinding cost estimate
25 in April of 2010 following our due diligence in regards

1 to decisions on whether to continue with that particular
2 engineering procurement contractor, whether to split
3 part of that work out from the EPC self-perform part of
4 the work, and advanced CERT (phonetic) engineering
5 analysis to determine what scope would be retained and
6 what scope would be eliminated.

7 Q. The net effect of which was to increase the
8 estimates in July, again in September, and again in
9 April, correct?

10 A. Yes. And to be clear, the project forecast
11 really changes on a week-to-week basis, but we don't
12 revise the nonbinding cost estimate. And I mentioned
13 the risk register before, and there's risk register
14 meetings on a weekly basis to which people identify
15 risks associated with the project, and you quantify
16 that, and so that forecast fluctuates on a weekly basis.
17 It is true that at the end of the month we close the
18 book on the project forecast, and it is what it is. And
19 that is what we communicate to the senior executives
20 with appropriate qualification of the certainty of those
21 numbers. If you examine the September executive
22 steering committee presentation, which has been provided
23 in discovery, you will see that we qualified those costs
24 as only about 30 percent of those numbers in our view
25 were certain, and that 7 percent were still not very

1 well-defined, and that was based on engineering
2 progress.

3 Q. Thirty percent was certain -- only 30 percent
4 were certain because that represented the status of
5 design engineering at the time, correct?

6 A. Not entirely. The status of engineering
7 design, status of identification of long-lead material,
8 and the costs associated with that material, and
9 certainty around near term staffing for the upcoming
10 work.

11 Q. It is true, however, is it not, that price
12 certainty increases as the design engineering process
13 progresses?

14 A. It is true that cost certainty does increase
15 as design engineering progresses and construction and
16 planning and implementation advances.

17 Q. At Page 32 of your May testimony, and I'm
18 looking at the answer that begins at Line 6, you say the
19 progression of project activities over the last several
20 years provides FPL with additional insight to revise its
21 nonbinding cost forecast. However, the project is still
22 in the design engineering phase, and there remains an
23 expected level of uncertainty with respect to project
24 scope. Do you see that?

25 A. Yes.

1 Q. If you would, briefly define what you mean by
2 designing engineering?

3 A. Yes. Design engineering is that process which
4 you have identified the need to modify or replace a
5 component to be able to accommodate the higher energy or
6 maybe accommodate a larger structural component,
7 whatever that modification may be. And so you will have
8 a team of design engineers work through calculations and
9 produce the design similar to if you were going to have
10 a house built. You would go to an architectural
11 engineer who would design the home and produce the
12 detailed drawings and calculations to support the
13 building of the house. And that's what I mean by design
14 engineering.

15 Q. And what percentage of design engineering of
16 the EPU has been completed, as we sit here today?

17 A. Approximately 70 percent.

18 Q. And expressed in what terms, Mr. Jones?

19 A. That 70 percent is derived at by looking at
20 the total forecasted hours it would take to complete all
21 the modifications, which is roughly on the order of
22 about 960,000 engineering hours, and roughly 70 percent
23 of those hours have been earned. There's several ways
24 to measure engineering progress, and I can explain it in
25 three sentences, if you want.

1 Q. Let me pose a couple of questions that I think
2 will give you that opportunity. Seventy percent in
3 terms of hours earned, that unit does not differentiate
4 between those modifications that are completed, those
5 modifications that are partially completed, and those
6 modifications that are yet to be initiated, correct?

7 A. That is correct. There are over 200
8 modifications that have been identified as needed to
9 support the extended power uprate, and so those
10 modifications are all in some stage of completion. Does
11 that answer your question?

12 Q. Yes. And to the extent that design
13 engineering has not been completed, it is possible,
14 then, that as that work progresses additional scope may
15 be identified, correct?

16 A. Yes, it is possible as design engineering
17 progresses that additional scope could be identified.
18 And so, to that point, here's two of the considerations
19 when we prioritize the engineering that we want done and
20 when. We want the engineering done in time to support
21 those modifications that we want to make in the next
22 outage, and so those have the highest priority. The
23 next highest priority of modifications are those that
24 have the biggest risk to either schedule or cost, or the
25 most complex, and we want to advance that engineering as

1 soon as possible because, again, that brings greater
2 certainty to cost and schedule. And so I really think I
3 need to describe really briefly how we measure
4 engineering progress, if I may.

5 **MR. McGLOTHLIN:** Commissioner, he has answered
6 my question. I'm ready to go on.

7 **CHAIRMAN GRAHAM:** Okay. Please continue.

8 **MR. McGLOTHLIN:** I have a handful of
9 additional questions, but I need a bit of guidance from
10 counsel for FPL. During of the deposition of Mr. Jones,
11 I posed some questions that relate to the nature and
12 aspects of the EPC contract. I know that FPL filed a
13 request for confidentiality for at least some of that
14 transcript. I don't have the redacted portion, so I'm
15 not clear as to whether those particular questions and
16 answers were treated as confidential. And I don't want
17 to tread on anything that is shielded, and I make this
18 offer. I'm perfectly happy to deal with this by
19 excerpting that portion of the transcript of the
20 deposition and treat that as my cross-examination of the
21 witness. And I could do that tonight, if you prefer.

22 **MR. ANDERSON:** We appreciate that offer. We
23 have reviewed and determined the redaction, and we don't
24 have that here, but I think that is a very streamlined
25 and appropriate way to proceed. We accept that offer.

1 **MR. McGLOTHLIN:** Then I have no further
2 questions.

3 **CHAIRMAN GRAHAM:** Okay.

4 SACE.

5 **MR. WHITLOCK:** No questions, Mr. Chairman.

6 **CHAIRMAN GRAHAM:** Anybody else? Okay. Staff?

7 **MR. YOUNG:** No questions.

8 **CHAIRMAN GRAHAM:** Commission board? Okay.

9 Redirect.

10 **REDIRECT EXAMINATION**

11 **BY MR. ANDERSON:**

12 Q. Mr. Jones wants to explain how do you measure
13 engineering certainty, and I am very interested to know,
14 too, so that is my question.

15 **CHAIRMAN GRAHAM:** Why did I know that you were
16 going to ask that question? (Laughter.)

17 Mr. Jones.

18 A The reason I really wanted to explain that is
19 because the executive steering committee slides, you've
20 got to remember they are for the senior executives of
21 the company and not necessarily the people that run
22 construction projects, and there has just been so many
23 occasions where things are taken out of context off the
24 PowerPoint slide, which is not a detailed project
25 control book.

1 We measure engineering progress several ways.
2 As I mentioned, there is roughly 215 modification
3 packages required, and we are implementing this EPU over
4 a number of outages, so we want those engineering
5 modification packages completed for the upcoming outage.
6 And so, for example, for the St. Lucie Unit 1 outage
7 coming up around November the 27th, 33 of the 47 are
8 complete. Actually what I would call done done. And
9 that is one way to measure progress.

10 The other way is that for every single
11 modification there is a detailed analysis or forecast on
12 the number of engineering hours it should take to
13 complete that modification. And it will involve
14 mechanical, civil, electrical, INC engineering
15 disciplines. And you create mileposts that says for 100
16 hours worth of engineering, you should have completed so
17 many calculations, or for 1,000 hours of engineering.
18 So some of these design packages we require maybe 20,000
19 hours of work to complete. And so we use an earned
20 value measurement; and, that is, for the number of hours
21 you have expended on the project, have you actually
22 earned those hours? So when I say 70 percent complete,
23 that is based on the actual hours earned, actual
24 progress as compared to those milestones. Thank you.

25 **CHAIRMAN GRAHAM:** Mr. Anderson.

1 **MR. ANDERSON:** FPL has nothing further, but we
2 have some exhibits to offer. FPL offers into evidence
3 what have been premarked on Staff's Exhibit List as
4 Exhibits 49 to 75, please.

5 **CHAIRMAN GRAHAM:** Forty-nine has already been
6 added, but we will do 50 through 79 (sic), but we have
7 already done 60 and 61, and 69 and 70.

8 **MR. YOUNG:** Yes, and 49, I think.

9 **CHAIRMAN GRAHAM:** I'm sorry?

10 **MR. YOUNG:** And 49.

11 (Exhibits 49 through 75 admitted into
12 evidence.)

13 **CHAIRMAN GRAHAM:** Yes. Mr. Anderson, anything
14 else?

15 **MR. ANDERSON:** No, sir, there is not. And we
16 have our next witness prepared to proceed.

17 **CHAIRMAN GRAHAM:** And this witness is coming
18 back as well for rebuttal?

19 **MR. ANDERSON:** This witness, Mr. Jones, is
20 returning for rebuttal. Yes, he has rebuttal, so he is
21 coming back. He is shaking his head and smiling at me
22 wishfully.

23 **CHAIRMAN GRAHAM:** Thank you, sir, for your
24 testimony.

25 **THE WITNESS:** Thank you.

STATE OF FLORIDA)
 : CERTIFICATE OF REPORTER
COUNTY OF LEON)

I, JANE FAUROT, RPR, Chief, Hearing Reporter Services Section, FPSC Division of Commission Clerk, do hereby certify that the foregoing proceeding was heard at the time and place herein stated.

IT IS FURTHER CERTIFIED that I stenographically reported the said proceedings; that the same has been transcribed under my direct supervision; and that this transcript constitutes a true transcription of my notes of said proceedings.

I FURTHER CERTIFY that I am not a relative, employee, attorney or counsel of any of the parties, nor am I a relative or employee of any of the parties' attorney or counsel connected with the action, nor am I financially interested in the action.

DATED THIS 15th day of August, 2011.

JANE FAUROT, RPR
Official FPSC Hearings Reporter
(850) 413-6732
