BEFORE THE
FLORIDA PUBLIC SERVICE COMMISSION

In the Matter of:

DOCKET NO.: UNDOCKETED

2013 HURRICANE SEASON
PREPARATION BRIEFING BY
ELECTRIC UTILITIES AND THE
THREE MAJOR INCUMBENT LOCAL
EXCHANGE CARRIERS.

RECEIVED-FPSC
13 APR 12 PM 1:50
COMMISSION
CLERK

PROCEEDINGS: STAFF WORKSHOP

TAKEN AT THE
INSTANCE OF: The Staff of the Florida
Public Service Commission

DATE: Wednesday, April 3, 2013

TIME: Commenced at 9:00 a.m.
Concluded at 10:57 a.m.

PLACE: Betty Easley Conference Center
Hearing Room 148
4075 Esplanade Way
Tallahassee, Florida

REPORTED BY: LINDA BOLES, CRR, RPR
Official FPSC Reporter
(850) 413-6734

1 IN APPEARANCES:

2

3 **FOR THE FPSC:**

4 MELISSA L'AMOREAUX, MICHAEL LAWSON, CLAYTON
5 LEWIS, PAUL VICKERY, and TOM BALLINGER.

6

7 **OTHER APPEARANCES:**

8 SAM MOORE, Florida Power & Light Corporation.

9 JASON CUTLIFFE, Progress Energy Florida.

10 DAVID SWEAT, Tampa Electric Company.

11 EDWARD BATTAGLIA, Gulf Power Company.

12 MARK CUTSHAW, Florida Public Utilities

13 Company.

14 BARRY MOLINE, Florida Municipal Electric

15 Association.

16 HOWARD PRIM and JOE MARINA, Withlacoochee

17 River Electric.

P R O C E E D I N G S

1
2 **MR. LAWSON:** On behalf of the Commission we'll
3 go ahead and get started. I will now read the notice.

4 Notice is hereby given that the Florida Public
5 Service Commission will conduct an informal staff
6 workshop on the 2013 hurricane season preparation by
7 Florida electric utilities and three major incumbent
8 local exchange carriers to which all persons are
9 invited. The time and the place -- time and place of
10 this event is noticed herein.

11 And with that, let's, if we could, we'll move
12 on. And I presume we'll take appearances?

13 **MS. L'AMOREAUX:** Yes. If we can go in the
14 order that the presenters are presenting and get your
15 names and make sure you're here. So --

16 **MR. MOORE:** Florida Power & Light, Sam Moore.

17 **MR. BATTAGLIA:** I was going to wait for the
18 other couple of utilities. I'm with Gulf Power. You
19 said present in order?

20 **MR. LAWSON:** Yeah. Feel free to go ahead and
21 come up to the firing line.

22 **MR. CUTLIFFE:** Progress Energy Florida, Jason
23 Cutliffe.

24 **MR. SWEAT:** David Sweat, Tampa Electric.

25 **MR. BATTAGLIA:** Edward Battaglia from Gulf

1 Power.

2 **MR. CUTSHAW:** Mark Cutshaw, Florida Public
3 Utilities Company.

4 **MS. L'AMOREAUX:** Do we have the muni and
5 co-ops?

6 **MR. PRIM:** Howard Prim, Withlacoochee River
7 Electric.

8 **MR. MARINA:** Joe Marina, Withlacoochee
9 Electric.

10 **MS. L'AMOREAUX:** All right. In 2006 the
11 Florida Public Service Commission adopted a multifaceted
12 approach and a response to ensure all utility
13 infrastructures will be better able to withstand the
14 impact of hurricanes and implement lessons learned from
15 the 2004/2005 seasons. The Commission adopted ten storm
16 hardening initiatives and required investor-owned
17 utilities to file formal storm hardening plans subject
18 to the Commission's approval.

19 In our July 2007 report to the Legislature the
20 Commission cited our most critical recommendation that
21 Florida maintain a high level of storm preparation. The
22 annual hurricane season preparation workshop provides
23 utility and local exchange companies a forum to advise
24 us of their individual hurricane season preparation
25 activities. This is, this is the eighth year we have

1 conducted such a workshop.

2 After years with no hurricanes visiting
3 Florida, fading memories can lead towards complacency.
4 We, however, should view the hurricane season of 2013
5 with caution and recognize that preparation is the key
6 to minimizing storm impacts. The forecasters remind us
7 that only one hurricane making landfall in our area will
8 make it an active season for us.

9 We ask that each presenter is candidly --
10 candidly addresses the status of the company's
11 preparation for the 2013 hurricane season. Please
12 include the status of work achieved to protect
13 facilities to date, work in progress, work to be
14 accomplished in the near future, and the additional
15 questions in the notice.

16 Finally, we ask that you address areas of
17 vulnerability in your service area and let us know if
18 there's anything that the Public Service Commission can
19 do to help.

20 And with that, we'll start with our first
21 presenter from Florida Power & Light, Sam Moore.

22 **MR. MOORE:** Good morning, staff. My name is
23 Sam Moore. I am FPL's General Manager of Distribution
24 Operations for the Miami-Dade/Broward County region.

25 Included in my responsibilities is being part

1 of a team that oversees FPL's storm restoration and
2 storm activities. Thank you for providing us this
3 opportunity to review FPL's hurricane preparedness plans
4 for the 2013 storm season. My presentation will address
5 activities and results for our distribution and
6 transmission systems.

7 Let me start off by saying FPL is well
8 prepared and we are ready to respond should our
9 communities be faced with hurricane activity this year.

10 And even though we have been fortunate in avoiding a
11 major hurricane since 2005, we have maintained our focus
12 and continued our efforts to improve our systems and
13 processes as well as strengthen our infrastructure to be
14 better prepared for this and future storm seasons.

15 FPL's hurricane preparedness plan focuses on
16 four key elements. First, we continue to strengthen our
17 distribution and transmission infrastructure. This is
18 being accomplished through our hardening plans, our pole
19 inspection program, and our vegetation management
20 programs, all of which have been reviewed and approved
21 by the Commission.

22 Second, as we do every year, we continue to
23 prepare our storm organization, ensuring we have the
24 right people in the right roles with the necessary
25 training and knowledge so that they can respond quickly

1 and safely.

2 Third, we continue to improve our already
3 well-tested restoration plan by incorporating lessons
4 learned and utilizing technology.

5 Finally, we continue to look for ways to
6 provide more and better communication and information to
7 our customers.

8 Now I'll review each of these in a little more
9 review. For our distribution hardening, hardening is a
10 key component of our plan to strengthen our
11 infrastructure. For our distribution system FPL
12 continues to implement a three-prong approach.

13 We're hardening our critical infrastructure
14 facilities, or CIFs -- for example, these are hospitals,
15 911 centers, police and fire stations -- and we are
16 hardening those circuits to the National Electric Safety
17 Code extreme wind loading criteria.

18 Second, we're incrementally hardening up to
19 and including our extreme wind loading design what we
20 refer to as our community projects. These are major
21 thoroughfares where key community needs like grocery
22 stores, gas stations, and pharmacies are located. And
23 we're also utilizing our extreme wind loading design
24 criteria to construct all new overhead facilities, major
25 planned work and relocation projects, as well as our

1 daily work activities.

2 For our CIFs we've now completed 269 projects,
3 including hardening all major hospitals and acute care
4 facilities and essentially all 911 and emergency
5 operation centers throughout our system. Since 2006,
6 we've hardened 1,253 miles and 361 feeders, serving 385
7 CIF customers, as well as other community needs.

8 Now FPL is still finalizing its 2013 through
9 2015 hardening plans. While the focus on the type of
10 CIF projects will remain the same as in previous years,
11 our hospitals, 911 centers, emergency and operational
12 centers, we have not yet finalized the specific CIF
13 projects that will be implemented in 2013 through 2015.

14 As part of the process of identifying the
15 appropriate CIF projects for the 2013 through 2015
16 hardening plan, we are evaluating a return to the higher
17 annual levels of CIF hardening that were submitted and
18 approved in our first hardening plan back in 2007.

19 We've undertaken this review in light of
20 recent weather events inside and outside of Florida,
21 consistent with our philosophy of continuous
22 improvement.

23 Our transmission hardening. While FPL's
24 transmission system is already constructed to extreme
25 wind loading criteria, we continue to improve the

1 strength and resilience of the transmission system by
2 replacing all wood poles and structures with concrete
3 and replacing ceramic post insulators on concrete poles
4 with more reliable power and post insulators.

5 Since 2006, FPL has replaced more than 11,000
6 wood transmission structures. Additionally, we have
7 replaced ceramic post insulators on more than
8 3,900 structures.

9 In light of recent weather events inside and
10 out of Florida and consistent with our philosophy of
11 continuous improvement, FPL is currently evaluating and
12 considering changing two of the ten storm preparedness
13 initiatives. While FPL has not yet finalized its 2013
14 through 2015 plans for transmission hardening, which is
15 initiative number four, FPL is evaluating an increase in
16 its annual level of transmission hardening replacing
17 CLPs and wood structures.

18 Additionally, FPL is evaluating the
19 appropriate inspection cycle for its steel and concrete
20 transmission structures, which is initiative number
21 three.

22 As far as distribution pole inspections, FPL
23 began to implement implementation of its systemwide
24 eight-year distribution pole inspection program in May
25 of 2006, ensuring that each pole meets strength and

1 loading requirements. And FPL is on schedule to
2 complete its first eight-year pole inspection cycle
3 target by the end of this year.

4 Pole inspections for our transmission system.
5 All of our approximately 66,000 wood, concrete, and
6 steel transmission structures are on a six-year
7 inspection cycle. In 2012 FPL began its second six-year
8 inspection cycle, and in 2013 plans to inspect one-sixth
9 of its transmission structures.

10 Additionally, we plan to complete inspections
11 on all 500 kV lines and transmission facilities serving
12 critical infrastructure facilities prior to the 2013
13 storm season.

14 Our distribution vegetation management
15 activities. Like hardening, vegetation management is a
16 key component in our plan to strengthen the
17 infrastructure and prepare for storms. We continue to
18 maintain our feeders on a three-year average trim cycle,
19 and in 2012 we completed our approved implementation
20 plan to achieve a six-year average trim cycle for
21 laterals by the end of 2012.

22 In 2013 we plan to trim approximately
23 one-third of our system feeder miles and one-sixth of
24 our lateral system miles. Also, we're on schedule to
25 complete the trimming of all lines serving our top

1 critical infrastructure facilities prior to the height
2 of the 2013 storm season.

3 Finally, we continue to proactively promote
4 our "Right Tree - Right Place" program with our
5 community leaders to ensure that future planting of
6 trees will avoid conflicts with our overhead lines.

7 Vegetation management for transmission. Twice
8 a year we inspect our transmission right-of-way and
9 perform all necessary trimming to make sure that the
10 required NERC standard clearances are maintained.

11 Our annual preparations. Each year we ensure
12 that all storm roles are identified and staffed with the
13 right personnel. We conduct extensive training,
14 including our annual company-wide hurricane dry run
15 exercise that includes our field as well as support
16 personnel. During this two-day event we simulate the
17 preparations and processes that would occur leading up
18 to impact from a major storm with 72-, 48- and 24-hour
19 pre-landfall exercises in order to test our system and
20 processes to ensure they're ready. This year's exercise
21 will be conducted on May 2nd and 3rd and, for the second
22 year, will be directed from FPL's Category 5-rated
23 command center in Palm Beach County.

24 Also, FPL's storm organization includes
25 forensic teams that are responsible for observations and

1 the collection of data associated with damaged
2 infrastructure. Forensic information will allow us to
3 better understand how our infrastructure performed and
4 provide valuable lessons for future evaluation and
5 actions.

6 Our restoration plans. Our restoration plan
7 has one clear objective: To safely restore electric
8 service to our communities' electrical infrastructure
9 functions and needs, along with the greatest number of
10 customers in the shortest time possible.

11 For the 2013 storm season all of our resource
12 plans are in place. For example, we have the necessary
13 arrangements for catering, housing, water, staging sites
14 throughout our system, equipment for these sites,
15 arrangements with foreign utilities through mutual
16 assistance agreements, agreements with contract crews,
17 and increased material and fuel inventories.

18 Also in 2013 FPL plans to continue to explore
19 opportunities to further its implementation of the
20 Incident Command Structure, which correlates with the
21 National Incident Management System. Integrating the
22 key features of ICS into FPL's plans should further
23 enhance communications with external agencies in
24 standardized key roles.

25 As far as communications, experience during

1 the 2004 and 2005 storm seasons taught us that
2 communicating with our customers and communities can be
3 just as important as the restoration efforts itself.
4 Each year before the start of the storm season we work
5 with the media to communicate our storm plan and
6 restoration process. After an event we provide system
7 level, county level, and sub-county ETRs throughout our
8 media channels. We also support each of the 27 county
9 and eight satellite emergency operation centers located
10 throughout our service territory.

11 And finally, FPL continues to actively
12 participate in the National Hurricane Conference,
13 discussing with government and community leaders how
14 best to bring communities back to normal after severe
15 storm events. We also continue to participate in and
16 support the Governor's Hurricane Conference.

17 Our support to Hurricane Sandy in the
18 northeast. FPL fully understands the challenges of
19 responding to major weather events, and the company has
20 benefited from the support of its mutual assistance
21 allies after previous storms in Florida. Through the
22 industry's mutual assistance network FPL quickly
23 responded by deploying nearly 1,000 workers and
24 additional resources to assist the 11 utilities to
25 restore power and rebuild their electrical systems after

1 the impact of Hurricane Sandy. Supporting the northeast
2 utility hurricane -- utilities after Hurricane Sandy
3 provided a great opportunity to identify best practices
4 and compare to FPL's.

5 One takeaway was that Consolidated Edison did
6 a remarkable job restoring the network system in
7 Manhattan following the extensive flooding. As a
8 result, FPL is reviewing its network system in downtown
9 Miami and plans to modify some of its aboveground vaults
10 to help mitigate the potential for equipment damage due
11 to storm surge and flooding. FPL was honored to support
12 its fellow utilities throughout the northeast and
13 helping them recover from one of the worst storms in the
14 region's history.

15 Areas of concern and some vulnerability for
16 us. These have not changed for us as in past years.
17 The first one, being affected by multiple storms over a
18 short period of time similar to what we had in 2004 and
19 2005. The second one, being impacted by catastrophic
20 storms like Hurricane Andrew or Hurricane Katrina, which
21 can destroy everything in their path. The third is
22 experiencing a short -- a shortage of sufficient
23 resources, whether it be material, equipment, or
24 personnel. And last, although we've made great progress
25 to date, our service territory may be affected by a

1 storm or storms before we're able to complete all of our
2 hardening efforts. While some of these are beyond our
3 control and means, we will still do all we can to
4 reasonably mitigate the occurrences.

5 In summary, FPL is confident that it is well
6 prepared for the 2013 season. Our hardening, vegetation
7 management, and pole inspection initiatives are
8 strengthening our system. Our storm organization is in
9 place, well trained, and ready. We've refined our
10 already well-tested restoration plan. And lastly, we're
11 in position to better communicate with our customers.
12 We, like you, are all hoping for an inactive hurricane
13 season. However, if hurricanes affect our communities
14 in 2013, FPL is ready to respond. Thank you.

15 **MS. L'AMOREAUX:** Thank you, Mr. Moore, for
16 your presentation. I have no questions to you.

17 Anybody else? All right. Thank you.

18 And I guess we'll move on to Progress Energy,
19 Jason Cutcliffe.

20 **MR. CUTLIFFE:** Good morning, staff. Thank you
21 for the opportunity to speak today. What I would like
22 to do -- you have our presentation material. We
23 prepared some, some text to go with it to communicate
24 all the facts and figures. So what I'd like to do this
25 morning is review our overall readiness, I'd like to

1 address a couple of the staff questions directly, and
2 then speak about our lessons learned from the Sandy, the
3 Sandy deployment last fall.

4 So let me begin with really an overall summary
5 of what's contained in the material we provided a couple
6 of weeks ago. The Progress Energy Florida organization
7 is, is, is prepared for the 2013 hurricane season.
8 We're in the process of conducting drills and internal
9 assessments right now to, to line up with the June 1st
10 start of the season. We're in full compliance with the
11 storm hardening rule, the vegetation management plan,
12 the pole inspection and replacements. And really
13 evidence of that -- it came through last year -- 2012
14 was our best reliability year since we've been keeping
15 records.

16 So all those things point to continued
17 readiness, continuous improvement on the system. And in
18 addition to that, what I'm happy to share this year is
19 as part of our merger with Duke Energy, Progress Energy
20 Florida is now part of a much larger organization. And
21 we're in the process, as part of our normal preparation,
22 in ensuring that we're taking full advantage of that
23 larger organization, the new partnership. That was
24 evidenced in our response to Sandy. And what, what it
25 gives us primarily is in addition to our mutual

1 assistance access to resources, we've now got an
2 organization roughly five times the size of our Progress
3 Energy Florida organization.

4 We've got, we've got an employee base and a
5 contractor base about five times that size that we can
6 take advantage of and marshal resources prior to a
7 hurricane event. So those are logistics that we're
8 working out now to be able to efficiently move those
9 folks, but that will make a significant difference in
10 any kind of event that threatens us.

11 In particular, a couple of the questions I
12 wanted to comment on that were in the package that staff
13 shared this year. The first one is reference to the
14 vegetation management plan. So going back to 2006 when
15 our storm hardening, our formal storm hardening efforts
16 first began, Progress Energy Florida is on a
17 3/5 vegetation cycle. It's three years for backbones,
18 five years for laterals. And since the program began,
19 we've hit anniversaries on the backbone portion of our
20 system in 2008 and 2011, and our next one is in 2014.
21 We hit our complete mileage in each of those prior two
22 years, '08 and '011, and we're on track to make the
23 anniversary year in 2014 as well.

24 On our lateral miles we hit our first
25 anniversary in 2010 and our next will come up in 2015.

1 So we made it in 2010 and we're on track to make the
2 same mileage and complete the system in 2015 as well.

3 In addition to that, we're conducting,
4 starting this week, over a six-week period a process to
5 patrol all of the backbone miles on our system. We send
6 people out to do foot patrols, and any vegetation
7 conditions that have come up since the last trim are
8 identified. And in the, in the final three weeks of
9 that period we'll do the trimming that's been identified
10 that would jeopardize any of those, those backbones in
11 hurricane season.

12 The other item I wanted to comment on was the
13 wood pole replacement plan; again, a part of the
14 hardening program. And these numbers are in the
15 package. But we're on track to finish our entire wood
16 pole -- on the distribution system, our entire wood pole
17 fleet around the middle of 2014. So this goes back to
18 May of 2006 when the eight-year cycle began. So we're
19 on track to finish the complete system the middle of
20 next year. And to date we've replaced somewhere around
21 17,800 poles that have been identified through these,
22 these inspections. Did about 4,600 of those last year
23 alone. And what we're seeing is a significant ramping
24 up of those efforts to reflect what we're finding on the
25 inspections and the accumulation of that data and

1 information. So significant improvements coming in that
2 arena as well.

3 The items in the storm hardening, the 10-point
4 plan and other areas are itemized in the material we've
5 provided, so I won't go into that.

6 But I did want to comment on some lessons from
7 the Superstorm Sandy deployment last fall. We were, we
8 were very, very much involved from our Florida
9 organization. We sent around 600 employees and
10 contractors. That was, that was right around 20% of our
11 entire workforce in Florida. So it was the largest
12 off-system deployment we have made since we've been
13 keeping records.

14 We, we had people there for two and a half
15 weeks. We supported a utility outside of Philadelphia
16 and a utility in New Jersey. What we saw in the course
17 of that deployment were great examples of things done
18 very well, which we've adopted, and some examples of
19 gaps that we don't intend to be caught with.

20 So I'll summarize for you -- and, again, this
21 is in the package -- but some things that we took away
22 from that deployment.

23 Number one, were -- to be -- to eliminate some
24 of the travel, the impediments to travel that off-system
25 resources face when they come to Florida to help us.

1 Things as simple as tolls and travel waivers through
2 weigh stations. Traveling through multiple states,
3 these can be significant and can cause substantial
4 delays in people getting on the ground and being
5 productive and doing work. So we're working through EEI
6 to get toll waivers, to get travel waivers to streamline
7 that process so when we make the call for off-system
8 resources, we get them here in Florida quicker.

9 We sent damage assessment crews along with our
10 restoration crews, and those proved to be invaluable;
11 not just in the beginning of the event, but in the end
12 when we were sending trucks into backlots and into
13 neighborhoods and our instructions were to repair all
14 remaining damage down to the service level. When it got
15 to that point, having those extra people to run ahead to
16 assess damage, to identify work locations and take care
17 of logistics made our craft resources, our employees,
18 far more effective. And so we've incorporated that into
19 our plan when we bring resources in is to have that type
20 of support with the crews.

21 And then lastly -- and this falls under
22 staging site management. When we bring large, large
23 numbers of resources into Florida, we rely heavily on
24 staging sites. We have a number of them across the
25 state. We have them located close to where we believe

1 the damage is going to be. But what we learned through
2 Sandy is that there are a number of details that can get
3 in the way of people getting into the staging site,
4 getting fed, getting their material, getting a work
5 package, and getting out to the field where they do
6 their work.

7 So we have incorporated a level of operational
8 leadership in our staging site management this year that
9 we believe is going to significantly improve that
10 efficiency, and it all goes to getting, getting crews
11 fed and to their work locations ready to work when the
12 sun comes up and not losing time in that exchange. It
13 also includes work packages consistently being delivered
14 to those staging sites where the bulk of our resources
15 start their day.

16 We learned firsthand the frustration and the
17 delays that can result when our crew leads have to go to
18 either local operating centers or other locations to
19 pick up work packages and we wind up with a lot of
20 people sitting idle unnecessarily.

21 So we've incorporated many of those staging
22 site efficiency and leadership aspects of the Sandy
23 deployment into our own plan, and it will be in our
24 drills which begin this month as well as we work through
25 our own plan.

1 So those were the major points I wanted to
2 share. I just would summarize that our, our drill
3 process, which we've used since 2005 when our last
4 direct hurricane impact occurred, continues. You know,
5 we've got new people to train every year, so we're
6 focused on that. But what I wanted to share with you
7 this morning, we're also very aware of what goes on
8 elsewhere in the country, and the value of sending
9 people out of state is, is -- we reap benefits in a
10 number of ways. Of course, we build goodwill so that
11 people will come help us in Florida when we have a need,
12 but we're also very tuned in to what we see firsthand,
13 learning lessons -- we've done it with Sandy, we've done
14 it with other deployments -- and we bring those lessons
15 back and incorporate it into our plan.

16 So I'll take any questions at this time.

17 **MR. LEWIS:** Hello. My name is Clayton Lewis,
18 a staff engineer.

19 Mr. Cutcliffe, I had a question concerning your
20 last aspect there concerning the site management
21 staging. Could you give us a picture of how that was
22 managed during Sandy, what led you to that, that
23 observation? I'm trying to get an idea of what was the
24 level of liaison support for the, you know, emergency
25 operation centers via the utility because we're also

1 involved in emergency operations here in the State of
2 Florida.

3 **MR. CUTLIFFE:** We saw two -- there were two
4 facets of, of inefficiency, I guess I'd categorize them,
5 that we experienced. One was the logistics of feeding
6 crews and getting material to them. So that was more of
7 the movement of the trucks and getting people, getting
8 people situated to work. And the second was in
9 providing the work packages that, that allowed them to
10 plan their day and to, and to know what kind of material
11 and what sort of construction requirements they were
12 going to face.

13 The two things we ran into were delays in
14 getting work packages to the crew leaders. And what our
15 folks ultimately wound up doing is making, making
16 arrangements to meet their contacts away from the
17 staging sites at a hotel, at a restaurant, someplace
18 where they could go through the work and organize their
19 day as best they could at the start of the day with
20 their utility contact as part of that conversation.

21 The staging sites themselves can be very
22 hectic. You're talking about thousands of, of people,
23 hundreds of trucks coming and going every night and
24 every morning. And what our folks ran into is things as
25 simple as getting out of the parking area because they

1 were boxed in by vehicles in front of them, getting,
2 getting fed and out of the staging area on time with
3 their schedule. There were waves of people coming in
4 and there were wait times associated with those waves.

5 So what, what our, what our leadership worked
6 out were specific feeding times to avoid some of those,
7 some of those, some of those peaks, if you will, for the
8 resources.

9 And then material. There were different
10 efforts to provide particularly poles. One utility made
11 an effort to deliver poles to sites. And that worked
12 well when they were on time. It did not work well when
13 we had crews waiting on poles ready to go. So our folks
14 were able to work around that after a number of days,
15 and pre, you know, prearranged the need for poles and
16 the locations, get some commitments on time. But
17 precious time was lost in the time it took to work those
18 arrangements out. And so what we've done with our own
19 plan is look at how we're going to issue poles within
20 the staging sites and how we're going to deliver the
21 work packages to the crew leads who will be at those
22 sites, and feeding people in waves, bringing trucks in,
23 bringing trucks out in waves, and doing it in a way that
24 doesn't overtax the site.

25 **MR. LEWIS:** Thank you.

1 **MS. L'AMOREAUX:** I have a question. I didn't
2 really see it in the packet, but can you kind of go over
3 your critical infrastructure improvements that you've
4 done and plan to complete?

5 **MR. CUTLIFFE:** We have a list of projects. We
6 had 57 from our 2010 storm hardening plan. We've, we've
7 completed all of those. And we're currently developing
8 our list for the 2013 hardening plan. It's just about
9 there. We're ready to file that in May.

10 But in addition to those specific projects
11 which are itemized, we're continuing with the
12 replacement of all wood transmission structures with
13 steel and concrete, which brings them up to extreme wind
14 condition.

15 And as it relates to the entire system, our
16 replacement of distribution wood poles is, is
17 significant because we're getting all of the, the poles
18 that don't meet our standards from the inspections moved
19 into the construction process. And our material shows,
20 shows progress there as well.

21 **MS. L'AMOREAUX:** Thank you. You're excused.
22 Thank you so much.

23 We'll start with our next presenter. From
24 Tampa Electric, David Sweat.

25

1 **MR. SWEAT:** Thank you. Good morning, staff.
2 Thank you for the opportunity to review our Tampa
3 Electric hurricane preparedness for 2013 and to discuss
4 some of the lessons learned from the 2012 season.

5 I'll cover three major areas, starting with
6 the system infrastructure, the pre-storm prep and
7 coordination, and finish up with some of the areas of
8 concern.

9 Beginning with the system infrastructure, we
10 will go with the wood pole inspections. In 2012 Tampa
11 Electric completed nearly 54,000 pole inspections. In
12 2013 we plan to inspect over 49,000, and we're on track
13 to meet our eight-year cycle.

14 For the pole loading analysis, our practice --
15 any pole, excuse me, that is determined to be overloaded
16 will be corrected. Our practice is to repair it,
17 reinforce it, and replace it, if necessary, with new
18 wood -- with non-wood poles.

19 Distribution poles are designed to our Grade B
20 standard. Excuse me. Distribution poles are designed
21 to Grade B, which is the highest NESC standard, versus
22 the Grade C, and replaced with the appropriate wood
23 poles when necessary to meet the particular design need.

24 Vegetation management. Tampa Electric is
25 presently on a four-year tree trim cycle as we move from

1 a three-year to the four-year cycle as approved by the
2 Commission in June of 2012 in Docket Number 120038-EI.

3 In 2012 we trimmed over a quarter of our
4 system. And as part of our vegetation management
5 program we too employ and promote the "Right Tree -
6 Right Place" program, which will encourage the customers
7 to plant trees that will not interfere with electrical
8 facilities.

9 We provide educational presentations to the
10 community. And we have received our fifth consecutive
11 National Arbor Day Foundation Tree Line USA program
12 designation, which we thought was, was very important.

13 For joint use attachers we have streamlined
14 our processes and -- for the request. We've reviewed
15 all the attachment records and verified the joint use
16 agreements with the attaching entities. We presently
17 have 37 joint use attachments, agreements in place.

18 Transmission inspections are accomplished
19 through a multipronged approach of one-, six-, and
20 eight-year cycles.

21 First would be the ground patrol is performed
22 annually as a visual inspection for any deficiencies.
23 This includes all 230, 138, and 69 critical circuits
24 which are being patrolled prior to the hurricane season.

25 Aboveground inspections are on a six-year

1 cycle and provide a greater detailed review of the
2 transmission structures. 2012 was the beginning of
3 Tampa Electric's second six-year cycle. And ground line
4 inspections are on an eight-year cycle and focus on the
5 integrity of the poles. Tampa Electric inspected nearly
6 4,800 transmission poles in 2012. Issues found during
7 any inspection cycle will be addressed.

8 Tampa Electric is hardening its transmission
9 system in a prudent, cost-effective manner by utilizing
10 its inspection and maintenance program to systematically
11 replace wood structures with non-wood structures. In
12 2012 Tampa Electric hardened nearly 900 structures,
13 700 structure replacements, and 200 sets of insulators;
14 and in 2013 the plans are to harden nearly a thousand
15 structures.

16 Tampa Electric continues our relationship with
17 an outside consultant for forensic analysis, and we are
18 presently renewing our contract with that entity. We
19 have a process in place to gather the necessary data to
20 be used in determining the root cause of damage
21 following a significant storm event. Fortunately in
22 2012 we did not have to use any of the forensic analysis
23 because we did not have one.

24 Underground and overhead performance data
25 collection. We were minimally impacted by two weather

1 events. Based on the lack of severity, meaningful
2 performance data of the underground and overhead systems
3 were not available.

4 As a point of reference too, the number of
5 poles that have been replaced since the beginning of the
6 program -- for distribution we've replaced approximately
7 17,000; and transmission poles, approximately 4,600.

8 In 2012 Tampa Electric focused on maintaining
9 vital government contacts and participation on standing
10 disaster recovery planning committees such as a storm
11 workshop between Hillsborough County and Polk County
12 emergency management teams. We also participated in the
13 post-disaster redevelopment plan project involving both
14 government and businesses.

15 And we were part of the emergency ops center
16 for the City of Tampa and Hillsborough County, which was
17 activated three times and which we were a part of.
18 Also, we've taken participation in a new vulnerable
19 population task force to improve the recovery plans.
20 This entails working with the Hillsborough County
21 Emergency Management, City of Tampa Emergency
22 Management, Red Cross, Department of Health, and others.

23 For 2013 these efforts have continued and will
24 help to streamline the flow of information to both the
25 companies and local governments' efforts to restore all

1 services as quickly as possible.

2 Tampa Electric's emergency management plans
3 address all hazards, including extreme weather
4 conditions. In 2012 we continued to participate in
5 internal and external preparedness exercises and
6 collaborated with government emergency management
7 agencies at local, state, and federal levels.

8 Prior to June of 2012 all emergency support
9 functions were reviewed, personnel were trained, and ICS
10 logistics and planning section plans were tested. This
11 will also be the case for 2013.

12 For 2013 Tampa Electric will continue in a
13 leadership role in county and national preparedness
14 groups such as Hillsborough County Post-Disaster
15 Redevelopment Plan, Hillsborough County Local Mitigation
16 Strategy Group, Tampa Bay Regional Planning Council, and
17 the Edison Electric Institute, to name but a few.

18 In January of 2013 Tampa Electric's
19 contingency response and business continuity plan were
20 reviewed and updated.

21 The 2010 to 2012 storm hardening plan has been
22 followed, and the 2013 to 2015 plan is being developed
23 and will be filed in May. Elements of both plans
24 include Tampa Electric builds to Grade B construction
25 for the distribution and extreme wind for transmission,

1 non-wood construction for the transmission, and we build
2 to extreme wind for the 230kV system.

3 Conversion of the overhead distribution
4 interstate crossings to underground are complete, and
5 any additional crossings will be converted to
6 underground as construction and maintenance activities
7 are identified. The network protectors have been
8 inspected for the downtown area of Tampa and have been
9 tested and repaired or replaced as needed.

10 And the underground construction -- the
11 stainless steel transformers are now the new standard
12 for us, which aligns very nicely with our standard of
13 stainless steel switchgear.

14 Although Tampa Electric's standard
15 distribution construction is already to the highest
16 level of the Grade B, as part of the hardening
17 initiative TECO chose to do these two projects due to
18 their importance to the region and to the state as well:
19 St. Joe's being a major trauma center; and the Port of
20 Tampa, which has the ability to deliver 40% of Florida's
21 gas supply. These projects are completed. The
22 performance will be evaluated when and if a major storm
23 occurs, and hopefully that will not be the case.

24 Next we'll quickly address the pre-storm prep
25 and coordination. In May of 2012 a mock storm provided

1 a functional exercise to key employees from several
2 levels and departments throughout Tampa Electric. This
3 resulted in 65 action items that were identified and
4 which have now been addressed. A few include what are
5 we going to do to accommodate foreign crews versus our
6 local contractors, which became an issue during the RNC;
7 review the policy for load shedding prior, during, and
8 after the storm; streamlining information flow with our
9 new SAP system; and to evaluate lineman-to-damage-
10 assessor and tree-trim-to-lineman ratios. These were
11 some -- a few of those.

12 In 2013 this -- in May we'll be doing our next
13 mock storm exercise, and it will simulate an impact to
14 the Tampa Bay area with a direct hit.

15 In addition to mock storms, lessons learned.
16 From more actual relief efforts we found some things
17 that were beneficial to us as well. We're going to look
18 now at our estimated time of restoration, the ETRs. So
19 we're putting together a more targeted ETR response. In
20 prior years a general ETR was communicated to the media
21 and was more of a global estimate for restoration of the
22 entire system. Response will now be done by a more
23 geographic region, by circuit, or some other more
24 targeted method.

25 Tampa Electric is presently working on a

1 preference page where customers can be contacted by
2 their preferred method, whether that be home phone,
3 cell, Facebook, or Twitter.

4 Tampa Electric will be incorporating Peoples'
5 Gas employees to serve as drivers for assessments,
6 thereby increasing the number of assessment teams.

7 Also, we're a part of the AEIC Storm Practices
8 Subcommittee. We're giving consideration to adding
9 someone at each incident base to collect the ETRs and
10 report them centrally and maintain updates, and modify
11 our method for keeping outage management systems
12 up-to-date in the initial stages of storm restoration.
13 In 2012 we helped with restoration for Baltimore Gas &
14 Electric, Florida Power & Light, and Jersey Central
15 Power & Light.

16 One modification that we've noted with one of
17 our programs to be considered as our damage forecaster,
18 it's our model to help predict the system damage based
19 on the strength and path of an event. It was recognized
20 that due to the hardening efforts that we put in place
21 and the shorter tree trimming cycles that we have have
22 contributed to Tampa Electric's system being less
23 success -- susceptible, excuse me, to extensive damage,
24 and that needs to be considered in our damage forecaster
25 model.

1 The incident base. Tampa Electric has worked
2 with local business owners and officials to verify
3 existing incident bases were still available. The
4 company renewed existing agreements for primary sites
5 and secured backup locations as additional
6 contingencies.

7 In order to maximize our team members' role in
8 the restoration effort, they will participate in the
9 mock storm exercise to come. They will review their
10 emergency role assignment, which will ensure that each
11 team member understands their emergency tasks, and
12 review their personnel preparation through information
13 provided to team members and family members on how to
14 prepare for the storm season.

15 In 2012 and prior to the 2013 hurricane season
16 Tampa Electric reviewed and increased its storm
17 inventory by securing a four-day supply of overhead
18 distribution materials. Procurement contracts are in
19 place to provide additional supplies within four days of
20 landfall and will replenish them throughout the
21 restoration event.

22 For the restoration providers we look to
23 Southeastern Electric Exchange and contractors to assist
24 us with restoration efforts, if necessary.

25 Local government coordination. Tampa Electric

1 participated in several Hillsborough County led
2 initiatives focusing on joint efforts to rebuild and
3 revive the area after a storm. Also participated in
4 joint mock exercises with Hillsborough County emergency
5 management personnel. And we've met with various
6 government agencies to enhance our communication and
7 coordination of emergency management.

8 Public communication. Tampa Electric provides
9 public service information at the beginning of every
10 storm season through the local news media and anything
11 else that is needed to effectively communicate with the
12 public, such as, such as the other -- like a Twitter and
13 Facebook and the like.

14 Hurricane season news releases are used to all
15 major media outlets in the service area and posted on
16 our website, and hurricane guides are published in major
17 newspapers. As mentioned, we also use the social media
18 like Facebook and Twitter. And as an industry best
19 practice, we found that social media has provided a
20 great way to communicate to customers when their power
21 is out because so many people have smart phones. This
22 would be in addition to our usual methods of news
23 releases and providing our own website information and
24 media interviews.

25 In closing, we'll look at the areas of

1 concern. We share other utilities' concerns regarding
2 availability of resources. Should we have multiple
3 storms, our resources would be taxed. Also, if a major
4 storm were to deliver a catastrophic blow to our service
5 area, we'd be challenged to maintain enough people,
6 material, and equipment, which would depend on the
7 impact to Florida as a whole.

8 In a severe event utilities share resources
9 through the Southeastern Electric Exchange Mutual
10 Assistance Program. If Tampa Electric is severely
11 impacted, most likely our neighbors would be also and
12 there may not be enough resources to go around. Any
13 limitation of resources will impact our ability to
14 restore our service.

15 In summary, our transmission and distribution
16 systems are stronger and we've hardened our sources to
17 our critical facilities. Our people are trained and
18 they are ready. Our storm plan has been reviewed.
19 We've coordinated efforts with our external
20 relationships, reviewed and updated our contracts, and
21 are prepared for the 2013 storm season. Thank you.

22 **MS. L'AMOREAUX:** Thank you.

23 **MR. BALLINGER:** I have a question, Melissa, if
24 I can. And actually this is probably for the other
25 utilities, if you want to pipe up too.

1 In your customer notification, do you ask
2 people to try to prepare themselves to be
3 self-sufficient for a day or two after a storm to at
4 least have that kind of readiness?

5 **MR. SWEAT:** Yes.

6 **MR. BALLINGER:** To not expect assistance right
7 away. Is that message getting out still?

8 **MR. SWEAT:** That is the message, that they
9 need to be prepared to take care of themselves for a
10 short duration until -- it could be days, it could be
11 weeks depending on the severity of the storm.

12 **MR. BALLINGER:** All right. I see some nodding
13 heads. I guess everybody is on board with that? Okay.
14 Thank you.

15 **MR. LEWIS:** Yes, sir. I had a question.

16 You mentioned your involvement with the
17 vulnerable population task force.

18 **MR. SWEAT:** Yes.

19 **MR. LEWIS:** Can you elaborate on some of the
20 input and your criteria as far as established
21 priorities?

22 **MR. SWEAT:** For that particular -- that is,
23 that's brand new. That just actually came in. So I can
24 get you the details to that, but that was one that just
25 came in this morning. I thought it might be helpful to

1 pass that along.

2 **MR. LEWIS:** Okay. Thank you.

3 **MR. SWEAT:** Yes.

4 **MS. L'AMOREAUX:** Anymore questions?

5 All right. Thank you.

6 **MR. SWEAT:** Thank you.

7 **MS. L'AMOREAUX:** All right. Our next
8 presenter, from Gulf Power, Edward Battaglia.

9 **MR. BATTAGLIA:** Good morning, staff. As
10 you've already surmised, I'm not Sharon Pinkerton.
11 Unfortunately Sharon had a family member pass away over
12 the weekend and could not be here today.

13 My name is Ed Battaglia. I'm Technical
14 Services Manager at Gulf Power Company, and I'll be
15 presenting Gulf's 2013 storm preparedness briefing. And
16 as I present each slide, I will also cover the questions
17 that staff provided with the workshop notification.

18 Preparedness activities. All of these
19 distribution and transmission activities I will cover
20 today are part of our culture of preparedness. Storm
21 readiness never stops. It's a year-round process of
22 refinement with every storm we participate in, whether
23 it is on system or assisting others. At this time Gulf
24 has no plans for modifying any of our storm preparedness
25 programs.

1 Distribution inspections, vegetation
2 management. Each year one-third of the mainline feeders
3 will be systematically pruned, while the remaining
4 two-thirds will be inspected and trimmed to correct any
5 deficiencies that could pose a reliability problem for
6 the distribution system over the next 12 months.

7 Each year lateral circuits, reliability
8 performance, date of last trim, and field conditions are
9 used to evaluate and schedule lateral circuits for
10 maintenance trim, while ensuring each lateral circuit is
11 trimmed within an effective four-year cycle. In
12 addition, Gulf's vegetation program addresses vegetation
13 overhang and removal of hazard trees located outside the
14 normally maintained pruning zone off right-of-way.

15 The 1,294 lateral circuit miles, a quarter of
16 the system laterals, scheduled for maintenance trim in
17 2013 are on target to be completed as planned.

18 Tree removals off the right-of-way have
19 diminished the further out we get from Ivan and Dennis.
20 In Gulf Power's initial storm hardening plan filing we
21 did have a danger tree program -- danger tree removal
22 program. There is still a tree replacement program that
23 is used in isolated cases where a customer allows us to
24 remove a tree that otherwise could have posed potential
25 problems in the future. In working with our customers

1 on that, a gift card is usually offered to purchase an
2 approved replacement tree. No dollars were spent in
3 2012 on that program.

4 We have also -- we have always removed trees
5 from the right-of-way, but we do not track removal costs
6 separately. It is just part of our vegetation
7 management daily work.

8 Pole inspections. 2012 was the sixth year of
9 our eight-year inspection program. We remain on
10 schedule. Gulf has 208,171 distribution poles, and have
11 replaced a total of 4,049 poles since 2007 as a result
12 of our Osmose pole inspection program.

13 In respect to infrared inspections, infrared
14 looks for hot spots such as connectors, insulators
15 overheating, lightning arrestors that were hit but not
16 blown. We have already completed our inspections and
17 are on track to complete our corrective measures by
18 June 1st.

19 Additional storm hardening measures. We have
20 already talked about the distribution vegetation
21 management program and our pole inspections. In respect
22 to extreme wind loading projects, as a part of its 2010
23 to 2012 storm hardening plan, Gulf targeted critical
24 pole lines with multiple feeders on them and converted
25 them, excuse me, to Grade B construction. In addition,

1 the existing wooden poles were replaced with concrete
2 poles from the substations to strategic operational
3 points on the feeders. Using concrete poles provides
4 both uniform pole strength for the entire pole height
5 and will extend the life of the installation by
6 minimizing the impact of salt spray tracking.

7 Gulf spent a total of 1.3 million on critical
8 infrastructure projects in 2012 consisting of, in our
9 eastern district, Panama City area: Long Beach
10 substation feeders, approximately a quarter of a mile;
11 Hathaway substation feeders, approximately 1.2 miles.
12 In our central district, Destin area, at our Miramar
13 substation feeders we converted approximately one mile.

14 The 2013 to 2015 storm hardening plan is
15 currently being developed, which will be filed May 1st.
16 It continues to focus starting with our 2010 to 2012
17 plan on ramping up on our conversion to Grade B
18 construction.

19 Gulf has already targeted its 2013 projects.
20 In our central district Destin area we'll be converting
21 approximately one mile with double circuit pole line
22 along Highway 98 consisting of three phases. And in our
23 western district, Pensacola area, specifically Gulf
24 Breeze, we'll be doing a storm hardening project along
25 98 and where there's a major overpass to Pensacola

1 Beach.

2 The exact locations of the 2014 and 2015
3 projects are still to be determined by engineering. In
4 general, they will be in our coastal areas that have the
5 highest storm risks and will be sections of mainline
6 feeders with the highest customer exposure. Our total
7 extreme wind loading budget for '13 to '15 is
8 \$3.7 million.

9 Forensic data collection. Gulf will collect
10 forensic data in predetermined areas that have both
11 overhead and underground distribution lines adjacent to
12 each other. The extreme wind loading projects will also
13 be included in our data collection process. Both
14 coastal and inland areas will be evaluated. Handheld
15 computers downloaded with Gulf's infrastructure database
16 are used to collect the information, and restoration
17 will not be slowed down due to these data collections.

18 KEMA is our consulting group that will analyze
19 the data. And as others have already said, we have been
20 fortunate that we have not had to pull the trigger on
21 forensic evaluation to date, but we are prepared to do
22 so if the event warrants it. We continue to do annual
23 refresher training to ensure we are prepared.

24 Additional coordination efforts. Gulf has a
25 strong presence with the local EOCs during an actual

1 event. We also participate in both EOC and state drill
2 events. Gulf personnel assigned to the EOCs have
3 certifications through FEMA's Emergency Management
4 Institute. District and local managers continue to
5 interact with city and county personnel on a regular
6 basis.

7 Concerning outreach programs, beginning
8 June 1st one of the major tiles in the company's main
9 web page will focus on storm preparedness throughout the
10 hurricane season. If a storm enters the Gulf, the
11 entire focus of our web page is devoted to the storm
12 event. There are constant updates provided through this
13 medium, as well as Facebook and Twitter. Storm
14 information is provided to our customers in the May --
15 in the May/June time frame in customer newsletters as
16 well.

17 BRACE, Be Ready Alliance for Coordinating
18 Emergencies, is an Escambia County organization unique
19 to Florida, but part of a federal government directive
20 that encourages communities to develop more effective
21 preparedness programs for various types of disasters.
22 If requested, storm presentations are always available
23 to civic groups. Requests are fewer than they were
24 immediately after Ivan and Dennis.

25 Additional coordination efforts. Third party

1 meetings are designed to enhance communications among
2 Gulf's field personnel and their counterparts at the
3 telephone and cable companies, as well as all other
4 attachers. We have two sets of meetings, one in the
5 first quarter, with the second one in the third quarter.
6 These meetings are important for storm hardening because
7 detailed information on actual or proposed detachments
8 is provided, which is needed for computer modeling of
9 our facilities to Grade B standards.

10 Additionally there is a designated employee
11 assigned to help out with the flow of communications to
12 third party attachers in the event of a storm.

13 Our seven certified arborists maintain
14 effective communications within the communities we serve
15 on vegetation management projects, right-of-way
16 maintenance, and new construction projects.

17 Transmission inspections, vegetation
18 management, Gulf is in compliance with NERC, National
19 Electric Reliability Council, standard FAC 003-1 and on
20 schedule with transmission vegetation management
21 initiatives.

22 Concerning transmission pole inspections, Gulf
23 will complete all 2013 scheduled transmission
24 inspections by year-end. We have different programs
25 which run simultaneously such that, such that every pole

1 is visited at least every six years. And that's a
2 combination of ground line inspections, comprehensive
3 walking, climbing inspections, the use of helicopters at
4 times on some of the steel structures, and typically we
5 do an aerial patrol every quarter by fixed-wing
6 aircraft.

7 Some specific storm, transmission storm
8 hardening measures. Gulf completed the five-year guy
9 installation program last year. There were 1,721
10 structures which were unguayed. We are in year six of a
11 ten-year arm replacement program. There were
12 2,191 structures with wood crossarms. Beginning in 2013
13 there are 913 remaining. 200 of these are scheduled for
14 replacement this year.

15 Post-storm recovery plans. Gulf is currently
16 updating, reviewing, and revising our 2013 procedures
17 which can apply to any natural disaster. We enhance our
18 plans based on lessons learned, which most recently have
19 been from off-system efforts. Best practices are noted
20 and brought back home.

21 We ensure contracts and arrangements are in
22 place for logistics and materials. The lead time for
23 some equipment is significant: Months. Arrangements
24 are in place for fuel as well. We rely on assistance
25 from the SEE, our Southern Company sister companies, and

1 independent contractors.

2 Drills and training. Last year's storm drill
3 reenacted the April 2011 Tuscaloosa tornadoes. We
4 realized that a natural disaster event may occur with
5 minimal notice as opposed to days and weeks with a
6 hurricane. There were fewer personnel available to
7 respond immediately and it took time to account for
8 everyone's well-being.

9 The storm drill this year will be held at the
10 Okaloosa County EOC in our central district. Our drill
11 this year focuses on the customer's perspective and also
12 looks at storm restoration from the point of view of one
13 of our EOCs, what information they need from us, and how
14 the decisions they make affect us.

15 We make sure our employees understand their
16 role through numerous refresher training classes. And
17 to let you know how serious storm restoration is at
18 Gulf, storm duty is a condition of employment at Gulf
19 Power. New employee orientation covers storm
20 responsibilities, expectations, and preparedness for
21 your home and family.

22 Last year Gulf implemented a check-in process,
23 which included safety briefings, with Isaac on a small
24 scale, which provided the opportunity to test our
25 procedures. We critiqued the process and we are making

1 improvements: Items such as the physical layout,
2 communication enhancements, revised forms, and so on.
3 We have also tested our employee emergency notification
4 system several times.

5 Gulf's response to Hurricane Sandy. Gulf sent
6 29% of our line workers to assist with Sandy. Gulf
7 personnel worked safely in West Virginia, Pennsylvania,
8 and New Jersey. During restoration efforts the movement
9 of our trucks and work team was impeded with the
10 numerous stops at toll booths and weigh stations, as
11 others have already mentioned. During a declaration of
12 emergency it would be helpful to waive such
13 requirements.

14 Areas of concern. In respect to multiple
15 events where you can have the situation for -- where
16 restoration from one event is not completed before those
17 resources are needed for another event. Competition is
18 high for qualified electrical workers. And even though
19 we beef up our inventory levels during storm season,
20 some equipment has a long lead time, as I mentioned
21 before, months. We do have established vendor
22 relationships and we can call on our sister companies
23 and other IOUs as well.

24 Social media is something we have to prepare
25 for in order to effectively communicate information with

1 our customers. There are changing demands and
2 expectations of providing restoration information in
3 real time. Meeting their expectations is vital to our
4 communities. The nature of storms, however, requires
5 field evaluation to determine the magnitude of the
6 damage, which can sometimes delay the time it takes to
7 report back to our customers. Gulf has several
8 initiatives in place already regarding social media. We
9 do have the Facebook and Twitter accounts.

10 In summary, Gulf Power is fully prepared for
11 the 2013 storm season through our transmission and
12 distribution storm hardening initiatives, our
13 communication efforts, and with our past storm
14 experience both on system and off.

15 Plans, programs, and initiatives will be
16 tested with a major landfall. But, for example, after
17 Ivan and Dennis, many of us have new and stronger roofs,
18 storm shutters and so on, but we'll only know how
19 effective those changes are when the next storm hits.

20 That concludes my presentation. Thank you for
21 your time, and I will answer any questions.

22 **MR. VICKERY:** Yes, sir. I have one question.
23 In your coordination efforts you talked about a new
24 outreach program called BRACE. Is that relatively new
25 or --

1 **MR. BATTAGLIA:** No, sir. That's been in place
2 for several years now. And I believe we mentioned it in
3 our, some of our previous storm briefings. So it has
4 been out there for a while in our Pensacola area.

5 **MR. VICKERY:** So what was the acronym for
6 again? Be Ready Alliance --

7 **MR. BATTAGLIA:** Let me flip back and get that
8 for you. Be Ready Alliance for Coordinating
9 Emergencies. And we can get you some more information
10 on that, if you would like it.

11 **MR. VICKERY:** No. That's fine, sir. Thank
12 you very much.

13 **MR. BATTAGLIA:** Okay. Yes, sir.

14 **MR. LEWIS:** Yes, sir. On one of your bullet
15 points on -- in your assistance you provided to First
16 Energy and I think PECO, under lessons learned, I'm
17 thinking kind of like in reverse, you state -- or the
18 bullet states "need help with declarations."

19 I'm asking a question what, you know, what did
20 you run into and how can we mitigate that in response to
21 Florida needing assistance?

22 **MR. BATTAGLIA:** Well, and what we were really,
23 I mean, were initially referring to, which was pretty
24 major at least for us, and I think a few others
25 mentioned it when we helped out with Sandy as far as the

1 number of tolls, weigh stations involved. And when we
2 head to South Florida to assist, you can run into some
3 similar conditions.

4 So again with our, with the declaration of
5 emergency and all, if somehow, some way there was a way
6 to prepave the way for utilities that basically are
7 headed down that way to be able to show perhaps some
8 documentation that does not slow them down as much as
9 the typical inspection process does.

10 **MR. LEWIS:** Okay. So this is like, more like
11 a transportation issue, getting personnel --

12 **MR. BATTAGLIA:** Yes. It's, it's, it's moving
13 vehicles predominantly. It's moving vehicles with
14 personnel, bringing supplies in, material supplies that
15 may be needed that are not readily on hand. Those type
16 of things.

17 **MR. LEWIS:** All right. Thank you.

18 **MS. L'AMOREAUX:** Thank you. Before we go to
19 our next presenter, I just wanted everyone to know
20 there's more copies of the presentations on either side
21 of the room.

22 Now we move on to Florida Public Utilities,
23 Mark Cutshaw.

24 **MR. CUTSHAW:** Good morning, staff. I am Mark
25 Cutshaw and serve as the General Manager for our

1 Northeast Florida division of Florida Public Utilities
2 Company. We appreciate the opportunity to update you
3 regarding our hurricane season preparedness for Florida
4 Public Utilities Company.

5 Today's presentation includes some brief
6 information regarding FPU, the status of our wood pole
7 and facility inspection, and areas of focus regarding
8 our system maintenance and reliability improvements. I
9 will also discuss some of our storm hardening projects
10 and impacts on the critical infrastructure. In
11 addition, I'll give an overview of our coordination with
12 utility, government, and community groups, storm
13 recovery plans, and forensic analysis plans.

14 Florida Public Utilities is a subsidiary of
15 Chesapeake Utilities Corporation and is headquartered in
16 Dover, Delaware. Chesapeake is an investor-owned
17 natural gas, electric utility which also includes
18 nonregulated business units in propane gas and business
19 software development.

20 Electric business units include operations in
21 Nassau, Jackson, Calhoun, and Liberty counties in
22 Florida, and provide service to approximately 29,000
23 customers.

24 Natural gas and propane business units include
25 operations in Florida, Delaware, and Maryland, and

1 provide service to approximately 122,000 natural gas
2 customers and approximately 49,000 propane gas
3 customers.

4 FPU electric, natural gas, and propane
5 business units have a presence in many counties
6 throughout Florida, with a major focus on the central
7 part of Florida.

8 During 2012 FPU completed the fifth year of
9 our eight-year cycle for wood pole inspections. To date
10 approximately 66% of our 26,000 poles have been
11 inspected. During this period approximately 1,268, or
12 7.3% of our wood poles failed the inspection criteria
13 established. Poles that fail the inspection process are
14 then prioritized and replaced based on the worst poles
15 first. This process considers the remaining strength of
16 the pole and prioritizes replacement based on this
17 criteria.

18 To date, pole replacements completed represent
19 2.9% of our pole population. A total of 753 poles have
20 been replaced since the plan inception, which includes
21 replacement of 215 poles in 2011 and 242 poles in 2012.
22 New poles are installed based on the existing storm
23 hardening standards which are outlined in our storm
24 hardening plan.

25 FPU completed the six-year transmission line

1 inspection during 2012, which included all 138 and 69 kV
2 poles and structures. A separate infrared inspection of
3 the transmission system was also completed. The
4 infrared inspection was expanded to include the
5 inspection of certain substation and distribution
6 facilities. The inspections assisted in the
7 identification of several transmission and substation
8 issues that are being addressed in 2013 prior to the
9 hurricane season. A variety of other routine
10 inspections were conducted during 2012 which -- with
11 frequency ranges from weekly to annual.

12 The ongoing distribution system vegetation
13 management program includes a three-year main feeder and
14 six-year lateral circuit trim cycle. This program also
15 includes a three-year trim cycle on transmission lines.
16 Information regarding tree safety and tree placement
17 options are provided to customers using various types of
18 printed materials in an effort to prevent future safety
19 and reliability issues.

20 FPU also routinely cooperates with local
21 governments to address local tree conflicts. Tree
22 replacement programs have been discussed but are not
23 currently used by FPU or any of the local governments in
24 our service territory.

25 Removal of danger trees. Annual distribution

1 feeder hot spot inspections and annual transmission line
2 hot spot inspections are included on an as-needed basis
3 within the vegetation management program.

4 As previously mentioned, the six-year
5 transmission line inspection and an infrared substation
6 inspection identified various issues to address. The
7 transmission line inspection identified 31 wooden 69 kV
8 transmission poles that were, that required replacement
9 mainly due to woodpecker damage. The engineer for the
10 replacement for the wood poles with concrete poles and
11 the material acquisition began in 2012, with completion
12 anticipated prior to the hurricane season in 2013.

13 The infrared inspection also identified the
14 need to replace a certain portion of the internal bus
15 work at our Amelia Island Plantation substation. This
16 work, which required coordination with several
17 contractors and required the entire substation to be
18 energized for several weeks, was completed earlier this
19 year. Other maintenance and reliability projects
20 include replacement of underground cable on Amelia
21 Island, installation of distribution feeders along the
22 coastal highway, and replacement of porcelain
23 underground terminators that have performed poorly.

24 During 2012 two storm hardening projects were
25 completed. The Highway 90 West feeder in Marianna was

1 relocated from an inaccessible location along Highway 90
2 from Nolen Street to St. Clair Street to an accessible
3 area which was, which was constructed using storm
4 hardening standards. A similar project was completed
5 along 14th Street in Fernandina Beach, which was in
6 accordance with the Department of Transportation road
7 widening project.

8 As previously mentioned, the project to
9 replace 31 69 kV transmission poles with concrete poles
10 was also began in 2012 and will be completed in 2013.

11 Several projects are underway which will
12 address critical infrastructure requirements, with
13 particular emphasis on Amelia Island due to the
14 vulnerability from hurricanes. Storm hardening of two
15 distribution feeders to Baptist Hospital in Nassau, an
16 additional underground feeder to provide backup service
17 to the south end of Amelia Island, and the replacement
18 of transmission poles with concrete poles are all
19 underway and will provide additional reliability should
20 the area be impacted by a hurricane.

21 Construction of a new operation center on
22 Amelia Island capable of surviving a hurricane strike
23 has also begun. The facility we're replacing, an
24 existing 70-year-old operations facility that previously
25 housed diesel generators used to provide electrical

1 service to Amelia Island as early as the 1940s.
2 Electrical service to Amelia Island is currently
3 provided using a radial of 138 kV line and as-available
4 energy from two paper mills located on the island.

5 During 2012 Rayonier Performance Fibers
6 completed the construction of a 22-megawatt renewable
7 energy turbine generator for their mill located on
8 Amelia Island. This project added to the, to the
9 existing as-available intergeneration capabilities of
10 Rayonier and RockTenn, which are located on the island.

11 In an, in an effort to address service
12 requirements should the 138 kV transmission line be
13 severely damaged during a hurricane or unavailable for
14 an extended period of time, additional generation
15 capabilities needed to provide increased
16 self-sufficiency for Amelia Island are currently in the
17 planning stages.

18 FPU actively participates in activities
19 coordinated by the Southeastern Electric Exchange,
20 including the mutual assistance process. Through the
21 SEE we provided crews to assist with post-restoration
22 efforts on five occasions during 2012. In addition to
23 participation with the SEE, we also participate with the
24 Public Utility Research Center, North American Electric
25 Reliability Corporation, Florida Reliability

1 Coordinating Council, and the Southeastern Reliability
2 Corporation. Both electric divisions actively
3 participate in emergency operation activities in the
4 counties served and provide personnel to assist the EOCs
5 as needed.

6 Safety of our employees, contractors, and the
7 public we serve is always given the high priority,
8 whether performing routine work or post-storm recovery
9 activities. FPU has a customer outreach program in
10 place that provides information to customers year-round.
11 Information is in the form of brochures, website
12 articles, bill inserts, and radio broadcasts. This
13 information can be used year-round and can be tailored
14 to up-to-the-minute information specifically addressing
15 the most current storm.

16 Each year well in advance of the storm we
17 update our emergency restoration plan and refresh,
18 train, and drill FPU employees on the procedures. These
19 interactive drills not only provide refresher training,
20 but also provide an opportunity to review and improve
21 the process based on previous experience and lessons
22 learned from other utilities.

23 The FPU storm recovery plan includes as a
24 major focus the communications with employees and
25 customers during the process. Employees are provided

1 with up-to-date information while emergency response
2 control rooms are being activated, logistics activities
3 are underway, and requests for emergency restoration
4 assistance is being communicated to outside groups.
5 Timed and focused media messages are sent to customers
6 while company personnel work with the local EOC and
7 other local government agencies to ensure everyone is
8 ready.

9 Should FPU be significantly impacted by a
10 hurricane, a contractor will be mobilized to collect
11 relevant electric system forensic data after the storm
12 has passed. FPU has been fortunate in the past few
13 years that storm impacts have been minimal. Hopefully
14 this will continue.

15 As a smaller company we're primarily concerned
16 with limited resources. If we are directly impacted by
17 a major storm, endure several storms in a short period
18 of time, or have a storm that impacts several other
19 companies, the ability to gather sufficient storm forces
20 and secure large quantities of materials is a
21 significant concern. With the much larger companies
22 engaged in their restoration efforts, resources
23 available to FPU may be very limited. However, our
24 continued active involvement in industry groups will
25 help to ensure our needs are effectively communicated

1 during restoration efforts and that resources will be
2 available.

3 I'd like to thank the staff for, for letting
4 us give you our hurricane preparation preparedness
5 statement. And I'll be available for any questions, if
6 you have them.

7 **MS. L'AMOREAUX:** I don't think we have any
8 questions. Thank you.

9 **MR. CUTSHAW:** Thank you.

10 **MS. L'AMOREAUX:** And now we'll move on to the
11 Florida Municipal Electric Association, and I believe
12 Barry Moline will be presenting.

13 **MR. MOLINE:** Thank you, Melissa. Thank you,
14 staff.

15 I'm Barry Moline with the Florida Municipal
16 Electric Association. The first few slides I'm going to
17 go through very quickly just to give you a background
18 of, of the municipal electric utilities.

19 There's 34 municipal electric utilities in
20 Florida serving 1.3 million meters. We're characterized
21 by some very large utilities, JEA in Jacksonville,
22 Orlando Utilities Commission; some very small utilities,
23 City of Bushnell, City of Moore Haven with around a
24 thousand electric meters. Combined we would be the
25 third largest utility behind FPL, Progress-Duke, and

1 then would be us. This is the market share of utilities
2 across Florida and shows where everyone sits. And this
3 is where the municipal utilities are statewide from
4 Blountstown in the Panhandle down to Key West.

5 A question that's sometimes asked is about our
6 power supply, how do you generate power, and that is the
7 small utilities do not generate power. Only 12 out of
8 the 34 generate electricity. The 14 purchase their
9 electricity through the Florida Municipal Power Agency,
10 and then others have power supply contracts with, with
11 the utilities listed there, Progress Energy, TECO, FPL,
12 Gulf, and Glades Co-op. So it's, it's an eclectic mix
13 of power supply that, that serves us.

14 For mutual aid we have many options. We, we
15 generally work in concentric rings though. First we
16 depend on each other across Florida. Because we're
17 spread out geographically, if a storm hits in the south,
18 we can get crews from the north and, and vice versa. If
19 a storm is overwhelming, we can get crews from outside
20 the region. So first we start with Florida, then we go
21 to Southeastern Mutual Aid, and then, if necessary, we
22 can work with our natural -- national mutual aid
23 partners. We all have a mutual aid agreement that we
24 sign, and in the past we've gotten support from, from
25 all over the country.

1 To, to begin to respond to some of the
2 questions that, that you listed in the meeting
3 announcement, the, we conduct preseason preparation
4 briefings with our members, and in addition individual
5 utilities hold meetings with their staff and conduct
6 exercises. It varies across the board. Larger
7 utilities have, have full staff exercises. The smaller
8 ones just have, have meetings with all staff to discuss
9 their responsibilities during a storm.

10 But one key feature of municipal electric
11 utilities is that we are integrated into our city
12 government. So when we talk about electric
13 responsiveness, we're really talking about city
14 responsiveness. And, and all of the things that we do,
15 we are generally a department of the city, so we
16 coordinate, coordinate heavily with the other
17 departments directly.

18 I would say that it tends to be an advantage.
19 If we need to work directly with law enforcement or, or
20 with the fire department, it's just a, a call over to
21 someone in another department to get those resources
22 going.

23 Pole replacement, you had questions about pole
24 replacement, and most of our utilities are completed
25 with their eight-year, the first cycle of their

1 eight-year inspection cycle. And since 2007 we've
2 replaced -- the pole replacement has been in the range
3 of, I say 2% to 10%. I'll tell you about the 10% in a
4 few slides. Generally it's been in the range of 2%, but
5 there will be a couple of cases where I'll tell you
6 about the range in 10%.

7 Regarding vegetation management, the vast
8 majority of our members are on a three-year trim cycle
9 for feeders and for laterals, and that's a reflection of
10 our local policymakers and governing boards prefer the
11 improved esthetics from a three-year cycle and the
12 improved reliability you get from a three-year cycle on
13 the laterals.

14 We did provide 150 line workers to travel to
15 provide assistance for Hurricane Sandy. But we found --
16 I'll echo some of the things that Jason said, you know,
17 about what I'd call poor on-site management, poor
18 on-site logistics. We did see some things that we
19 liked. We really thought that, that the emphasis on
20 safety was, was, was beneficial and we took back some
21 lessons there.

22 We believe that our disaster management, and I
23 think everything that Florida does really, is at a more
24 advanced stage. The -- we saw a, a significant time lag
25 between where crews were housed and where the work sites

1 were. We don't see that issue as being a problem here
2 in Florida, and, and we also saw time delays between
3 jobs. Crews would get jobs or they'd finish with a job
4 at midday and couldn't get another assignment until the
5 next day. So they were -- it was difficult, difficult
6 logistics.

7 The -- but again we don't see those issues
8 that we would have to address here because, mostly
9 because at least the municipal utilities, their systems
10 are fairly compact and we don't have significant travel
11 times in our utilities.

12 Those are the utilities listed that traveled
13 to the northeast. We did go to Pennsylvania, New York,
14 and Virginia. And at this time, because of that
15 experience, we don't have plans to modify our storm
16 preparedness.

17 We do provide public outreach in the May/June
18 time frame. Many of our members have hurricane guides
19 that they issue and make available to their customers
20 both in grocery stores and available in public places.
21 So it's available in print. It's also available on
22 their website, and they send out materials in their bill
23 stuffers and so on.

24 We also make pre-storm presentations to
25 community groups, Kiwanis clubs, Rotary clubs and so on,

1 and we emphasize personal responsibility. We focus on a
2 three-day disaster plan for individuals to try to have
3 enough food and water to live without power for three
4 days, if necessary.

5 We don't have any critical infrastructure
6 areas that we would identify at this time as needing
7 improvement. What I alluded to earlier about the 10%
8 pole replacement is that in three of our cities, Starke,
9 Green Cove Springs, and Blountstown, within the past
10 five years they've completed a full system upgrade.
11 They reviewed their system. I mean, these are utilities
12 with about 5,000 customers, and they've undergone a
13 complete reengineering of their utilities and then a
14 complete full system replacement of, of poles and wires,
15 conductors, transformers that, that need to be replaced.
16 So they've -- the -- there are several benefits. One
17 clearly is storm hardening, but the other too is that
18 they've reduced system losses significantly. So they're
19 seeing financial savings as well. Our plans clearly are
20 for continuous improvement.

21 We do have two communities that are, that are
22 making regular advancements on overhead to underground
23 conversions. Winter Park is, is converting its entire
24 system from overhead to underground, and that plan
25 originally was to take place before 2020. It looks like

1 they're ahead of schedule now and they may be completing
2 that by 2018. And I hadn't really thought about it
3 until preparing the slides for this presentation and
4 this is the first time I've said it out loud, but it, it
5 may be an opportunity for us to examine or study the
6 impact of overhead to underground, reliability changes
7 and so on. We -- because we do have reliability data
8 from overhead, from when they had the overhead system,
9 for example, in Winter Park to what they will see as,
10 you know, as underground. The -- but we haven't engaged
11 with Winter Park to do that but it remains an
12 opportunity.

13 Jacksonville Beach is, is in a more, a slower
14 fashion. They're moving from the, from the ocean inland
15 toward undergrounding streets more for storm hardening.
16 They don't plan to do the entire town, but they are
17 doing it at a more gradual pace. They don't -- there's
18 no plan there to do 100% of their town, but they
19 nevertheless are moving fairly steadily in that regard.
20 So I make that suggestion. I'm happy to follow up and
21 look at the opportunity to study that in the future.

22 So that concludes my presentation, and I look
23 forward to your questions or comments.

24 **MS. L'AMOREAUX:** It doesn't look like we have
25 any questions.

1 **MR. MOLINE:** Thank you.

2 **MS. L'AMOREAUX:** Thank you.

3 And last, but not least, the Florida Electric
4 Co-ops. I think there's a couple of presenters.

5 **MR. PRIM:** Good morning. My name is Howard
6 Prim from Withlacoochee River Electric Cooperative, and
7 I'm Manager of Engineering and Technical Services. I
8 appreciate the opportunity to speak with you on behalf
9 of Withlacoochee as well as, in general, the co-ops
10 across the state.

11 As you can see, that's basically our -- the
12 co-ops in the State of Florida. We're located just
13 north of Tampa, at that yellow one right there in the
14 center of the state.

15 Just as a general overview, our system, we're
16 a pretty good sized co-op. We're one of the largest --
17 we are the largest in the state, one of the largest in
18 the nation. We've got -- while Progress Energy is our
19 primary transmission provider, we do have 64 miles of
20 transmission ourselves that we own and operate and
21 maintain. Most of it's -- all of it's either 69 kV or
22 115 kV. Approximately a third of our system is
23 underground, the remainder is overhead, and we've got a
24 little over 200,000 customers.

25 Of course, like I said, we're located just

1 north of Tampa, primarily Pasco, Hernando, and Citrus
2 County. We have also a few accounts in Polk and Sumter.

3 Of course, as an electric cooperative we've
4 got a number of standards of construction that we abide
5 by, of course the National Electric Safety Code being
6 one of the largest. There's also numerous RUS
7 bulletins, specifications, drawings, standards for
8 material and such that we have to follow. We've also
9 got -- using those documents we've created our own
10 construction and operations manual as well as
11 construction drawings for our crews as well.

12 We also use a software program called Pole
13 Foreman, which we use to calculate pole strengths of
14 individual poles for loading such as for joint use,
15 guying, extreme wind, whatever we may need to. So it
16 also forms clearances for vertical clearances.

17 Of course, one of the biggest, you know, for
18 storm -- you've got two aspects of storm. For
19 underground you've got primarily flooding and storm
20 surges. We are on what is called the, I guess the
21 Nature Coast or the Sun Coast area of Florida just north
22 of Tampa. We do have quite a bit of facilities along
23 the coastline there. Some of our more denser population
24 is in that area.

25 This is in, I believe, the 2004 storms that

1 came through where we had a significant amount of
2 rainfall and we had some localized flooding, of course.
3 From lessons learned in past years we've -- for about 20
4 years now we've been using all stainless steel pad mount
5 equipment. We also, since 1988, per RUS standards,
6 we've been using jacketed strand-filled underground
7 conductor.

8 We've got -- of course, back in the '60s and
9 '70s, like many other utilities across the State of
10 Florida, whenever a developer would come in, he'd say,
11 well, we've got you a nice rear lot line easement we can
12 put -- you can put your facilities in. Of course, it
13 was completely clear, there was nothing there. It
14 looked like the obvious thing to do. So we built many
15 of our facilities on the rear lots back in those days.
16 Of course, now we're regretting that. Much of that now,
17 the trees have actually grown into those areas. Of
18 course, there's sheds, there's fences, there's pools.
19 You know, access to these facilities is near impossible.
20 So for really the past 20, 25 years we've been in the
21 process of moving those, a lot of those facilities,
22 where we can and where it's feasible, out to the front.
23 We've still got some to do but we're still working on
24 it.

25 Of course, we've got joint use agreements that

1 meet, you know, National Electric Safety Code
2 requirements and RUS requirements as well.

3 We do facility inspections, approximately
4 2,800 miles of line per year. We've got, like I said,
5 there again we've got -- as part of our rear to front
6 lot line relocation, we do a lot of inspections and
7 conversion there. We've got -- the majority of our
8 system we've got about -- 90% of our system now is
9 operating at 25 kV. We've still got about a 10%
10 operating at 12 kV, which we're in the process of
11 converting. And as part of that conversion, we do a lot
12 of maintenance as well when we do that.

13 And a lot of that area -- the remaining area
14 is in the, along the 19 corridor, U.S. 19 corridor along
15 the coastline, and a lot of that is where our higher
16 density is and where -- that's where some of our rear
17 lot line facilities are as well. So as part of our
18 conversion process we're moving it from the back to the
19 front.

20 We have a S.T.A.R. program, which we call our
21 Strategic Targeted Area Repair. It's kind of a -- we
22 analyze our system, you know, on a regular basis as far
23 as outages, customer complaints, whatever, operations,
24 and we choose the, you know, the circuits that seem to
25 need the most attention. And we put crews out there to

1 inspect pole by pole, not only the pole itself but any
2 equipment on the pole, insulators, arrestors,
3 connections, whatever, and we replace whatever has to be
4 replaced at that time. And, like I said, we do it for
5 the whole circuit and we continue on. We've got, we've
6 got crews in each one of our district offices that do
7 that.

8 We do have, like I said, 62 miles of
9 transmission line. We do annual inspections, both
10 visual on the ground pole inspections as well as aerial
11 inspections. We've got about -- the majority of our
12 transmission line now is either steel or concrete
13 facilities, and we do -- any new construction is steel
14 or concrete. It is designed for, transmission is
15 designed for hurricane 130-mile-an-hour winds. And
16 we've got probably about 20 miles of wood pole line left
17 that we are hoping we can replace the majority of that
18 in the next few years. We're progressively trying to
19 replace those. We do substation inspections on a
20 monthly basis, inspect it for a variety of things.

21 We also have, like I said, pole inspections on
22 an eight-year cycle and then other inspections as well
23 as infrared inspections. We have, we have a dedicated
24 person that basically rides the line, inspects our
25 transmission, substation, as well as they tend to get

1 out in front of our S.T.A.R. program. Whenever we're
2 doing the S.T.A.R. program they'll do a -- they'll ride
3 the feeder and look for anything that, you know, appears
4 to be heating up on a feeder as well. So we, so we have
5 quite an extensive there.

6 We also are, are working on putting handheld
7 infrared guns into the hands of our actual line crews so
8 they can do inspections as well, as well as for the
9 customer as well.

10 We have started, of course, vegetation
11 management. It's probably one of our biggest enemies in
12 a storm. In fact, the recent storm Sunday two weeks ago
13 we had quite a few trees fall, and we are aggressively
14 trying to do what we can, you know -- we're trying to
15 work with the customer where we see trees that are
16 outside our right-of-way that we, that we technically
17 cannot go out and trim. But we'll work with the
18 customer to see if, you know, if it's a tree that looks
19 like it's either damaged or rotten or whatever, we'll go
20 out and try to work with the customer to, to cut it or
21 trim it or whatever we think we need to do.

22 We're currently on a three-year cycle for all
23 our transmission and we inspect and trim annually our
24 transmission. And then, of course, wherever we see
25 we've got any, any crews, operations, engineering,

1 whatever, if they see hot spots that appears to be
2 burning or trees are getting close and, you know, it's
3 about to be a potential problem, we'll bring those up
4 and, you know, consider those. We'll write service
5 orders for those and work on those as well.

6 Okay. With that, I'd like to turn things over
7 to my partner here, Joe Marina.

8 **MR. MARINA:** Thank you, Howard. Thank you to
9 the staff for this opportunity to present.

10 My name is Joe Marina. I'm the District
11 Manager for Withlacoochee Electric. We have an
12 emergency response plan. And as a matter of fact, this
13 coming week we've planned a meeting, all the key people
14 in the company, to review and update that plan.

15 We'll have a roundtable discussion. We also
16 company-wide and throughout the system participate in
17 our county EOC. We actually staff the EOCs. We
18 participate throughout the year in drills with them and
19 also with Seminole Electric.

20 All of our internal resources, our personnel,
21 we select people, we train them throughout the year.
22 They're pre-assigned; they know their duties. So in the
23 event, with the ongoing training, we can implement our
24 plan. And it's worked well in the past and hopefully,
25 as others have stated, we won't have to use any of that

1 this year.

2 Also, renewing our storm contract
3 restorations, and we also participate in mutual aid
4 agreements. We also increase our material and fuel
5 inventory. That's ongoing right now in preparation for
6 the upcoming storm season.

7 As we said before, we assign our key personnel
8 to the EOCs. We just recently have sent those lists
9 over. We have a web-based graphical outage map that can
10 be accessed by our customers. We perform daily updates.
11 We have a regular schedule to meet at certain times,
12 very early. We inform our public relations manager of
13 all this, and that word gets out through the entities
14 mentioned there, including local media, our website, and
15 social media.

16 Obviously, like everyone else, we have some
17 concerns. Coastal flooding. I believe Howard mentioned
18 we have gone to, and very happy we did, stainless steel
19 pad mounted equipment. We have entered the storm
20 restoration contracts that, you know, hopefully we won't
21 experience any insufficient resources there.

22 This heavy right-of-way, of course, we serve a
23 lot of dense areas, densely populated areas, but, in
24 addition, some very rural areas. And we have moved
25 several years ago to an aggressive vegetation management

1 program which increases our clearances, and we're about,
2 on a four-year completion cycle now, about 80, 80% or so
3 complete.

4 In addition to that, if we had multiple storms
5 that affected a certain geographical area, one of our
6 plans that we've been fairly successful at is increasing
7 our feeder and substation capabilities so we can back
8 feed from multiple substations.

9 That's a picture that I'm not sure none of us
10 wants to see again.

11 Our emergency response plan, the primary,
12 primary objective of the plan is to, first of all, is to
13 ensure public safety. That's what we, we all strive to
14 do. We will evacuate our employees and equipment from
15 areas that are subject to storm surge, which we have
16 experienced in the past, and we have learned some good
17 lessons from enduring some storms.

18 Obviously to protect the public. And we will
19 make the call to deenergize along coastal or flooded
20 areas in advance of any safety concerns.

21 We'll also limit the damage to our property:
22 Feeders, substations, et cetera. And we will ensure the
23 orderly restoration and repair of our transmission and
24 distribution system.

25 The objective of our restoration is to

1 establish a uniform method of as rapid a response to
2 restoration, while obviously maintaining the highest
3 level of safety.

4 We'll do damage assessments. Remember, one of
5 the utilities previously mentioned assessments, ballpark
6 assessments initially, get a general sense. Those are
7 reported back to our control center, and the management
8 team will make decisions on where to send resources and
9 materials, where to have staging areas. And all of our
10 teams that do this are pre-identified.

11 And in addition to our district offices where
12 a lot of this goes on or headquarters, Howard's staff of
13 engineers, they'll be assigned to us as additional
14 resources. All of our district offices are full
15 service. We do everything: Customer service,
16 operations, maintenance repair, engineering, and
17 obviously management.

18 All of our priority accounts are identified in
19 advance by location, physical location, circuit,
20 ownership of those, and you can see some of them up
21 there, and they will take priority in restoration.

22 I mentioned earlier we will hold crew
23 briefings. We have communication. We, we own and
24 operate our own, of course, radio system. But we have
25 our own fiber optic system throughout the counties we

1 serve and we have redundant systems for communication,
2 which has really paid off in the past.

3 We'll hold crew briefings first thing in the
4 morning. We will go over work hours, safety hazard,
5 progression, all of the work assignments for the day,
6 materials all set up in advance. And the slide says
7 "Invite general foremen," but the general foremen are
8 always at our crew meetings for the outside foreign
9 crews, and this way we can all leave from the site and
10 have a productive workday.

11 We also hold obviously safety meetings. A
12 general one is held before everyone leaves and at the
13 staging or the site of the work. An additional tailgate
14 or safety meeting is held this way. We ensure all the
15 crews on-site are aware of what each one's plans are,
16 and we ensure that the line is safely handled, proper
17 clearances and all are taken out.

18 Also provide circuit maps to all of our
19 outside crews due to the unfamiliarity of our system.
20 That's just an example of one of, one of the maps there.
21 We'll provide circuit maps substation to substation.
22 And then if they're assigned individual areas, they'll
23 get more detailed maps showing feeders, open points, et
24 cetera.

25 We -- our policy is any transmission

1 distribution, any line feeder will be thoroughly
2 inspected, every, every square inch of it, before we
3 energize it.

4 We incorporate and have for several -- I don't
5 know how many years it is now, five, six, seven years.
6 We have a new outage management system. It ties into
7 the customer side. It can predict outages -- or excuse
8 me -- predict the most likely, most likely area of
9 restoration so we can identify and send crews to those
10 spots early on. We -- staff operate and maintain a
11 control center. They'll work throughout the night. And
12 their primary objective is to update our outage
13 management system for us and help with the planning and
14 the prioritization for the next morning's assignments.

15 We also hold drills and we had a major storm
16 recently. The system was tested. And the meeting we
17 mentioned earlier will be held next week. We also
18 identify problem trees or danger trees and remove them.
19 And we have over 200,000 poles in the system and
20 replaced 26,000 of those. And we are on goal to meet
21 our storm hardening goals.

22 Sandy caused extreme flooding to some of our
23 coastal service area. Those areas that, due to that
24 that have experienced the flooding, consequent outages,
25 and related issues, we've identified those areas and

1 made provisions to raise the equipment.

2 Also at that roundtable discussion we're going
3 to make sure all of those concerns have been identified
4 and will be answered, and plans will be made
5 accordingly.

6 And our critical infrastructure improvements
7 are identified in our work plan, and our work plan now
8 goes through 2014. And we have a work plan meeting set
9 up shortly, and we are well on our way to meeting all
10 the goals in our work plan.

11 And once again, I would just like to thank you
12 for the opportunity to present on the behalf of
13 Withlacoochee and the co-ops.

14 **MS. L'AMOREAUX:** Thank you.

15 Do you have any questions?

16 **MR. LEWIS:** Sir, I have a question.

17 **MR. MARINA:** Sure.

18 **MR. LEWIS:** My name is Clayton Lewis. I'm
19 from staff.

20 Under your bullet under vulnerability concerns
21 you were talking about the, your pad mounted
22 transformers and equipment.

23 **MR. MARINA:** Yes.

24 **MR. LEWIS:** Are you saying your problem, is it
25 the actual, the elevation of your pads or is, or is the

1 elevation of the access to the pads or strengthening of
2 the, I guess, the roadbeds to get, you know, to the
3 pads?

4 **MR. MARINA:** Yes, sir. Some of it is
5 elevation of the roads. It's actually a combination.
6 Some of the areas we've seen, even in the same
7 geographic area, some of the pad mounted equipment will
8 be outside of any flooding, some will be in the
9 flooding, some are access problems due to elevation of
10 the roadways heading in.

11 The other concern was the soft or mild steel
12 equipment that we had was rotted out, and those are
13 safety concerns for access and all also.

14 **MR. LEWIS:** Okay. And my other question is
15 also concerning access. In your partner's presentation
16 of removing or relocating facilities from backyard lots,
17 have you seen a lot of hurdles in moving that to the, I
18 guess to the front of the properties and what did you
19 have to do to mitigate that? Or -- and also in
20 correlation, did you see a positive effect as far as
21 your, your reliability as far as your, your access, you
22 know, for your crews and everything?

23 **MR. MARINA:** Yes, sir. As far as reliability,
24 absolutely. Our outage times have gone down.
25 Reliability numbers have gone up. The -- there is a

1 challenge. The public is used to having those lines in
2 the back. Those customers who have experienced
3 prolonged outages welcome the move. They'll willingly
4 work with us.

5 It depends on which county that we serve.
6 Some -- one county requires us to actually have a vote
7 of the customers and it has to be over 50%. And if
8 there's the vote, then the county stands behind our
9 move. If not, then we have to maintain the facilities
10 where we're at.

11 But we've been pretty successful. We'll hold
12 public meetings or actually knock on doors and remind
13 customers of the prolonged outages during the storms due
14 to our inability to access the facilities.

15 **MR. LEWIS:** Thank you.

16 **MR. MARINA:** Thank you.

17 **MS. L'AMOREAUX:** Thank you.

18 Before we conclude, I just want to thank
19 everybody for their detailed presentations. And we at
20 the Commission are pleased with the progress and your
21 continued support with the hurricane preparation.

22 A summary of all the presentations will be
23 addressed to all the Commissioners May 15th in Internal
24 Affairs, and everybody is welcome to come, if you would
25 like to.

1 Also, if you have any questions or concerns
2 about today or the storm hardening plans that will be
3 filed in May, please feel free to contact the Commission
4 or our section.

5 **MR. BALLINGER:** Specifically I'd say contact
6 Melissa.

7 **MS. L'AMOREAUX:** Yeah. I was trying to get
8 away with that but it didn't work. But with that, our
9 workshop is adjourned, and thank you.

10 (Workshop adjourned at 10:57 a.m.)
