Subject: RE: Secondary Standard Workshop

To all,

I want to reiterate our appreciation for having the opportunity to provide input on this topic.

In response to the discussion about sample costs, I solicited a quote from a commercial lab regarding the cost to analyze the full set of secondary parameters. The quoted price was \$150, which appears to be a standard rate, not a preferred customer rate. Therefore, it provides an accurate basis for understanding what the cost per system might be.

In my view, all utilities, and therefore all its customers, would be well served by the utility sampling from each distribution system annually to provide data that may inform the utility (and indirectly its customers) of whether water quality is degraded between the Point of Entry and the distribution system sample site. This is not a panacea for answering all complaints, but it shifts the discussion a bit to a more objective understanding. It may indicate issues arise from the source water, the piping system, or both, but in many cases it may clarify or separate perceived issues from factual ones. There may also be benefits in terms of enhancing system management, optimizing existing treatment methods, and focusing flushing or other maintenance efforts more effectively. As Marty mentioned, information is power.

The \$150/sample is not an onerous cost to the utility, especially if it was passed through as an ongoing annual cost. At that rate, there is minimal impact to a monthly water bill. I believe the benefits would be significant, especially by offering data year over year to see how or if water quality is changing within the piping network. I appreciate Gary Williams' concern about impacts to Class C water systems, but in reality, customers in those system ought to have their concerns addressed no less ably than customers in Class A and B systems. Class C

systems by virtue of having small customer bases in which to spread costs inherently have big challenges to meet customer and regulatory expectations while also maintaining a healthy financial structure. It seems to me the bar for water quality expectations should not be lowered simply because the system is small in size.

I look forward to further discussion on this matter.

Regards,
Patrick Flynn
