Supreme Court of the United States

FEDERAL POWER COMMISSION et al.

v.

HOPE NATURAL GAS CO.  
CITY OF CLEVELAND

v.

SAME.

Nos. 34 and 35. | Argued Oct. 20,  
21, 1943. | Decided Jan. 3, 1944.

Separate proceedings before the Federal Power Commission by such Commission, by the City of Cleveland and the City of Akron, and by Pennsylvania Public Utility Commission wherein the State of West Virginia and its Public Service Commission were permitted to intervene concerning rates charged by Hope Natural Gas Company which were consolidated for hearing. An order fixing rates was reversed and remanded with directions by the Circuit Court of Appeals, 134 F.2d 287, and Federal Power Commission, City of Akron and Pennsylvania Public Utility Commission in one case and the City of Cleveland in another bring certiorari.

Reversed.

Mr. Justice REED, Mr. Justice FRANKFURTER and Mr. Justice JACKSON, dissenting.

On Writs of Certiorari to the United States Circuit Court of Appeals for the Fourth Circuit.

West Headnotes (26)

[1] **Public Utilities**

🔑 Nature and extent in general

Rate-making is only one species of price-fixing which, like other applications of the police power, may reduce the value of the property regulated, but that does not render the regulation invalid.

25 Cases that cite this headnote

[2] **Public Utilities**

🔑 Reasonableness of charges in general

Rates cannot be made to depend upon fair value, which is the end product of the process of rate-making and not the starting point, when the value of the going enterprise depends on earnings under whatever rates may be anticipated.

101 Cases that cite this headnote

[3] **Gas**

🔑 Federal Power Commission

The rate-making function of the Federal Power Commission under the Natural Gas Act involves the making of pragmatic adjustments, and the Commission is not bound to the use of any single formula or combination of formulae in determining rates. Natural Gas Act, §§ 4(a), 5(a), 6, 15 U.S.C.A. §§ 717c(a), 717d(a), 717e.

46 Cases that cite this headnote

[4] **Gas**

🔑 Scope of review and trial de novo

When order of Federal Power Commission fixing natural gas rates is challenged in the courts, the question is whether order viewed in its entirety meets the requirements of the Natural Gas Act. Natural Gas Act, §§ 4(a), 5(a), 6, 19(b), 15 U.S.C.A. §§ 717c(a), 717d(a), 717e, 717r(b).

8 Cases that cite this headnote

[5] **Gas**

🔑 Reasonableness of Charges

Under the statutory standard that natural gas rates shall be "just and reasonable" it is the result reached and not the method employed that is controlling. Natural Gas Act §§ 4(a), 5(a), 15 U.S.C.A. §§ 717c(a), 717d(a).

69 Cases that cite this headnote

[6] **Gas**

🔑 Scope of review and trial de novo

If the total effect of natural gas rates fixed by Federal Power Commission cannot be said to be unjust and unreasonable, judicial inquiry under

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

the Natural Gas Act is at an end. Natural Gas Act, §§ 4(a), 5(a), 6, 19(b), 15 U.S.C.A. §§ 717c(a), 717d(a), 717e, 717r(b).

[74 Cases that cite this headnote](#)

[7] **Gas**  
🔑 Presumptions

An order of the Federal Power Commission fixing rates for natural gas is the product of expert judgment, which carries a presumption of validity, and one who would upset the rate must make a convincing showing that it is invalid because it is unjust and unreasonable in its consequences. Natural Gas Act, §§ 4(a), 5(a), 6, 19(b), 15 U.S.C.A. §§ 717c(a), 717d(a), 717e, 717r(b).

[118 Cases that cite this headnote](#)

[8] **Gas**  
🔑 Reasonableness of Charges

The fixing of just and reasonable rates for natural gas by the Federal Power Commission involves a balancing of the investor and the consumer interests. Natural Gas Act, §§ 4(a), 5(a), 15 U.S.C.A. §§ 717c(a), 717d(a).

[52 Cases that cite this headnote](#)

[9] **Gas**  
🔑 Depreciation and depletion

As respects rates for natural gas, from the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business, which includes service on the debt and dividends on stock, and by such standard the return to the equity owner should be commensurate with the terms on investments in other enterprises having corresponding risks, and such returns should be sufficient to assure confidence in the financial integrity of the enterprise so as to maintain its credit and to attract capital. Natural Gas Act, §§ 4(a), 5(a), 15 U.S.C.A. §§ 717c(a), 717d(a).

[265 Cases that cite this headnote](#)

[10] **Gas**  
🔑 Depreciation and depletion

The fixing by the Federal Power Commission of a rate of return that permitted a natural gas company to earn \$2,191,314 annually was supported by substantial evidence. Natural Gas Act, §§ 4(a), 5(a), 6, 19(b), 15 U.S.C.A. §§ 717c(a), 717d(a), 717e, 717r(b).

[3 Cases that cite this headnote](#)

[11] **Gas**  
🔑 Depreciation and depletion

Rates which enable a natural gas company to operate successfully, to maintain its financial integrity, to attract capital and to compensate its investors for the risks assumed cannot be condemned as invalid, even though they might produce only a meager return on the so-called "fair value" rate base. Natural Gas Act, §§ 4(a), 5(a), 6, 19(b), 15 U.S.C.A. §§ 717c(a), 717d(a), 717e, 717r(b).

[155 Cases that cite this headnote](#)

[12] **Gas**  
🔑 Method of valuation

A return of only 3 27/100 per cent. on alleged rate base computed on reproduction cost new to natural gas company earning an annual average return of about 9 per cent. on average investment and satisfied with existing gas rates suggests an inflation of the base on which the rate had been computed, and justified Federal Power Commission in rejecting reproduction cost as the measure of the rate base. Natural Gas Act, §§ 4(a), 5(a), 15 U.S.C.A. §§ 717c(a), 717d(a).

[64 Cases that cite this headnote](#)

[13] **Gas**  
🔑 Depreciation and depletion

There is no constitutional requirement that owner who engages in a wasting-asset business of limited life shall receive at the end more than he has put into it, and such rule is applicable to a natural gas company since the ultimate

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

exhaustion of its supply of gas is inevitable. Natural Gas Act, §§ 4(a), 5(a), 6, 19(b), 15 U.S.C.A. §§ 717c(a), 717d(a), 717e, 717r(b).

1 Cases that cite this headnote

[14] Gas

🔑 Depreciation and depletion

In fixing natural gas rate the basing of annual depreciation on cost is proper since by such procedure the utility is made whole and the integrity of its investment is maintained, and no more is required. Natural Gas Act, §§ 4(a), 5(a), 6, 19(b), 15 U.S.C.A. §§ 717c(a), 717d(a), 717e, 717r(b).

13 Cases that cite this headnote

[15] Gas

🔑 Findings and orders

There are no constitutional requirements more exacting than the standards of the Natural Gas Act which are that gas rates shall be just and reasonable, and a rate order which conforms with the act is valid. Natural Gas Act, §§ 4(a), 5(a), 6, 19(b), 15 U.S.C.A. §§ 717c(a), 717d(a), 717e, 717r(b).

13 Cases that cite this headnote

[16] Commerce

🔑 Gas

The purpose of the Natural Gas Act was to provide through the exercise of the national power over interstate commerce an agency for regulating the wholesale distribution to public service companies of natural gas moving in interstate commerce not subject to certain types of state regulation, and the act was not intended to take any authority from state commissions or to usurp state regulatory authority. Natural Gas Act, § 1 et seq., 15 U.S.C.A. § 717 et seq.

25 Cases that cite this headnote

[17] Mines and Minerals

🔑 Oil and gas

Under the Natural Gas Act, the Federal Power Commission has no authority over the production or gathering of natural gas. Natural Gas Act, § 1(b), 15 U.S.C.A. § 717(b).

8 Cases that cite this headnote

[18] Gas

🔑 In general; amount and regulation

The primary aim of the Natural Gas Act was to protect consumers against exploitation at the hands of natural gas companies and holding companies owning a majority of the pipeline mileage which moved gas in interstate commerce and against which state commissions, independent producers and communities were growing quite helpless. Natural Gas Act, §§ 4, 6–10, 14, 15 U.S.C.A. §§ 717c, 717e–717i, 717m.

59 Cases that cite this headnote

[19] Gas

🔑 In general; amount and regulation

Apart from the express exemptions contained in § 7 of the Natural Gas Act considerations of conservation are material where abandonment or extensions of facilities or service by natural gas companies are involved, but exploitation of consumers by private operators through maintenance of high rates cannot be continued because of the indirect benefits derived therefrom by a state containing natural gas deposits. Natural Gas Act, §§ 4, 5, and § 7 as amended 15 U.S.C.A. §§ 717c, 717d, 717f.

19 Cases that cite this headnote

[20] Commerce

🔑 Gas

A limitation on the net earnings of a natural gas company from its interstate business is not a limitation on the power of the producing state, either to safeguard its tax revenues from such industry, or to protect the interests of those who sell their gas to the interstate operator, particularly where the return allowed the company by the Federal Power Commission was a net return after all such charges. Natural

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

Gas Act, §§ 4, 5, and § 7, as amended, 15 U.S.C.A. §§ 717c, 717d, 717f.

10 Cases that cite this headnote

[21] Gas

Reasonableness of Charges

The Natural Gas Act granting Federal Power Commission power to fix “just and reasonable rates” does not include the power to fix rates which will disallow or discourage resales for industrial use. Natural Gas Act, §§ 4(a), 5(a), 15 U.S.C.A. §§ 717c(a), 717d(a).

73 Cases that cite this headnote

[22] Gas

Reasonableness of Charges

The wasting-asset nature of the natural gas industry does not require the maintenance of the level of rates so that natural gas companies can make a greater profit on each unit of gas sold. Natural Gas Act, §§ 4(a), 5(a), 15 U.S.C.A. §§ 717c(a), 717d(a).

1 Cases that cite this headnote

[23] Federal Courts

Presentation of Questions Below or on Review; Record; Waiver

Federal Courts

Scope and Extent of Review

Where the Federal Power Commission made no findings as to any discrimination or unreasonable differences in rates, and its failure was not challenged in the petition to review, and had not been raised or argued by any party, the problem of discrimination was not open to review by the Supreme Court on certiorari. Natural Gas Act, § 4(b), 15 U.S.C.A. § 717c(b).

18 Cases that cite this headnote

[24] Constitutional Law

Judicial encroachment on executive acts taken under statutory authority

Gas

Power to control and regulate

Congress has entrusted the administration of the Natural Gas Act to the Federal Power Commission and not to the courts, and apart from the requirements of judicial review, it is not for the Supreme Court to advise the Commission how to discharge its functions. Natural Gas Act, §§ 1 et seq., 19(b), 15 U.S.C.A. §§ 717 et seq., 717r(b).

13 Cases that cite this headnote

[25] Gas

Decisions reviewable

Under the Natural Gas Act, where order sought to be reviewed does not of itself adversely affect complainant but only affects his rights adversely on the contingency of future administrative action, the order is not reviewable, and resort to the courts in such situation is either premature or wholly beyond the province of such courts. Natural Gas Act, § 19(b), 15 U.S.C.A. § 717r(b).

8 Cases that cite this headnote

[26] Gas

Persons entitled to relief; parties

Findings of the Federal Power Commission on lawfulness of past natural gas rates, which the Commission was without power to enforce, were not reviewable under the Natural Gas Act giving any “party aggrieved” by an order of the Commission the right of review. Natural Gas Act, § 19(b), 15 U.S.C.A. § 717r(b).

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

Mr. M. M. Neeley, of Charleston, W. Va., for State of West Virginia, as amicus curiae by special leave of Court.

**Opinion**

Mr. Justice DOUGLAS delivered the opinion of the Court.

The primary issue in these cases concerns the validity under the Natural Gas Act of 1938, 52 Stat. 821, [15 U.S.C. s 717 et seq.](#), [15 U.S.C.A. s 717 et seq.](#), of a rate order issued by the Federal Power Commission reducing the rates chargeable by Hope Natural Gas Co., 44 P.U.R.,N.S., 1. On a petition for review of the order made pursuant to s 19(b) of the Act, the **\*594** Circuit Court of Appeals set it aside, one judge dissenting. [4 Cir., 134 F.2d 287](#). The cases **\*\*284** are here on petitions for writs of certiorari which we granted because of the public importance of the questions presented. [City of Cleveland v. Hope Natural Gas Co., 319 U.S. 735, 63 S.Ct. 1165](#).

Hope is a West Virginia corporation organized in 1898. It is a wholly owned subsidiary of Standard Oil Co. (N.J.). Since the date of its organization, it has been in the business of producing, purchasing and marketing natural gas in that state.<sup>1</sup> It sells some of that gas to local consumers in West Virginia. But the great bulk of it goes to five customer companies which receive it at the West Virginia line and distribute it in Ohio and in Pennsylvania.<sup>2</sup> In July, 1938, the cities of Cleveland and Akron filed complaints with the Commission charging that the rates collected by Hope from East Ohio Gas Co. (an affiliate of Hope which distributes gas in Ohio) were excessive and unreasonable. Later in 1938 the Commission on its own motion instituted an investigation to determine the reasonableness of all of Hope's interstate rates. In March **\*595** 1939 the Public Utility Commission of Pennsylvania filed a complaint with the Commission charging that the rates collected by Hope from Peoples Natural Gas Co. (an affiliate of Hope distributing gas in Pennsylvania) and two non-affiliated companies were unreasonable. The City of Cleveland asked that the challenged rates be declared unlawful and that just and reasonable rates be determined from June 30, 1939 to the date of the Commission's order. The latter finding was requested in aid of state regulation and to afford the Public Utilities Commission of Ohio a proper basis for disposition of a fund collected by East Ohio under bond from Ohio consumers since June 30, 1939. The cases were consolidated and hearings were held.

On May 26, 1942, the Commission entered its order and made its findings. Its order required Hope to decrease its future interstate rates so as to reflect a reduction, on an annual basis of not less than \$3,609,857 in operating revenues. And it established 'just and reasonable' average rates per m.c.f. for each of the five customer companies.<sup>3</sup> In response to the prayer of the City of Cleveland the Commission also made findings as to the lawfulness of past rates, although concededly it had no authority under the Act to fix past rates or to award reparations. 44 P.U.R.,U.S., at page 34. It found that the rates collected by Hope from East Ohio were unjust, unreasonable, excessive and therefore unlawful, by \$830,892 during 1939, \$3,219,551 during 1940, and \$2,815,789 on an annual basis since 1940. It further found that just, reasonable, and lawful rates for gas sold by Hope to East Ohio for resale for ultimate public consumption were those required **\*596** to produce \$11,528,608 for 1939, \$11,507,185 for 1940 and \$11,910,947 annually since 1940.

The Commission established an interstate rate base of \$33,712,526 which, it found, represented the 'actual legitimate cost' of the company's interstate property less depletion and depreciation and plus unoperated acreage, working capital and future net capital additions. The Commission, beginning with book cost, made **\*\*285** certain adjustments not necessary to relate here and found the 'actual legitimate cost' of the plant in interstate service to be \$51,957,416, as of December 31, 1940. It deducted accrued depletion and depreciation, which it found to be \$22,328,016 on an 'economic-service-life' basis. And it added \$1,392,021 for future net capital additions, \$566,105 for useful unoperated acreage, and \$2,125,000 for working capital. It used 1940 as a test year to estimate future revenues and expenses. It allowed over \$16,000,000 as annual operating expenses—about \$1,300,000 for taxes, \$1,460,000 for depletion and depreciation, \$600,000 for exploration and development costs, \$8,500,000 for gas purchased. The Commission allowed a net increase of \$421,160 over 1940 operating expenses, which amount was to take care of future increase in wages, in West Virginia property taxes, and in exploration and development costs. The total amount of deductions allowed from interstate revenues was \$13,495,584.

Hope introduced evidence from which it estimated reproduction cost of the property at \$97,000,000. It also presented a so-called trended 'original cost' estimate which exceeded \$105,000,000. The latter was designed 'to indicate what the original cost of the property would have been if

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

1938 material and labor prices had prevailed throughout the whole period of the piece-meal construction of the company's property since 1898.' 44 P.U.R.,N.S., at pages 8, 9. Hope estimated by the 'percent condition' method accrued depreciation at about 35% of \*597 reproduction cost new. On that basis Hope contended for a rate base of \$66,000,000. The Commission refused to place any reliance on reproduction cost new, saying that it was 'not predicated upon facts' and was 'too conjectural and illusory to be given any weight in these proceedings.' Id., 44 P.U.R.,U.S., at page 8. It likewise refused to give any 'probative value' to trended 'original cost' since it was 'not founded in fact' but was 'basically erroneous' and produced 'irrational results.' Id., 44 P.U.R., N.S., at page 9. In determining the amount of accrued depletion and depreciation the Commission, following [Lindheimer v. Illinois Bell Telephone Co., 292 U.S. 151, 167-169, 54 S.Ct. 658, 664—666, 78 L.Ed. 1182; Federal Power Commission v. Natural Gas Pipeline Co., 315 U.S. 575, 592, 593, 62 S.Ct. 736, 745, 746, 86 L.Ed. 1037](#), based its computation on 'actual legitimate cost'. It found that Hope during the years when its business was not under regulation did not observe 'sound depreciation and depletion practices' but 'actually accumulated an excessive reserve'<sup>4</sup> of about \$46,000,000. Id., 44 P.U.R.,N.S., at page 18. One member of the Commission thought that the entire amount of the reserve should be deducted from 'actual legitimate cost' in determining the rate base.<sup>5</sup> The majority of the \*598 Commission concluded, however, that where, as here, a business is brought under regulation for the first time and where incorrect depreciation and depletion practices have prevailed, the deduction of the reserve requirement (actual existing depreciation and depletion) rather than the excessive reserve should be made so as to \*\*286 lay 'a sound basis for future regulation and control of rates.' Id., 44 P.U.R.,N.S., at page 18. As we have pointed out, it determined accrued depletion and depreciation to be \$22,328,016; and it allowed approximately \$1,460,000 as the annual operating expense for depletion and depreciation.<sup>6</sup>

Hope's estimate of original cost was about \$69,735,000—approximately \$17,000,000 more than the amount found by the Commission. The item of \$17,000,000 was made up largely of expenditures which prior to December 31, 1938, were charged to operating expenses. Chief among those expenditures was some \$12,600,000 expended \*599 in well-drilling prior to 1923. Most of that sum was expended by Hope for labor, use of drilling-rigs, hauling, and similar costs of well-drilling. Prior to 1923 Hope followed the general practice of the natural gas industry and charged the cost

of drilling wells to operating expenses. Hope continued that practice until the Public Service Commission of West Virginia in 1923 required it to capitalize such expenditures, as does the Commission under its present Uniform System of Accounts.<sup>7</sup> The Commission refused to add such items to the rate base stating that 'No greater injustice to consumers could be done than to allow items as operating expenses and at a later date include them in the rate base, thereby placing multiple charges upon the consumers.' Id., 44 P.U.R.,N.S., at page 12. For the same reason the Commission excluded from the rate base about \$1,600,000 of expenditures on properties which Hope acquired from other utilities, the latter having charged those payments to operating expenses. The Commission disallowed certain other overhead items amounting to over \$3,000,000 which also had been previously charged to operating expenses. And it refused to add some \$632,000 as interest during construction since no interest was in fact paid.

Hope contended that it should be allowed a return of not less than 8%. The Commission found that an 8% return would be unreasonable but that 6 1/2% was a fair rate of return. That rate of return, applied to the rate base of \$33,712,526, would produce \$2,191,314 annually, as compared with the present income of not less than \$5,801,171.

The Circuit Court of Appeals set aside the order of the Commission for the following reasons. (1) It held that the rate base should reflect the 'present fair value' of the \*600 property, that the Commission in determining the 'value' should have considered reproduction cost and trended original cost, and that 'actual legitimate cost' (prudent investment) was not the proper measure of 'fair value' where price levels had changed since the investment. (2) It concluded that the well-drilling costs and overhead items in the amount of some \$17,000,000 should have been included in the rate base. (3) It held that accrued depletion and depreciation and the annual allowance for that expense should be computed on the basis of 'present fair value' of the property not on the basis of 'actual legitimate cost'.

\*\*287 The Circuit Court of Appeals also held that the Commission had no power to make findings as to past rates in aid of state regulation. But it concluded that those findings were proper as a step in the process of fixing future rates. Viewed in that light, however, the findings were deemed to be invalidated by the same errors which vitiated the findings on which the rate order was based.

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

Order Reducing Rates. Congress has provided in s 4(a) of the Natural Gas Act that all natural gas rates subject to the jurisdiction of the Commission 'shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful.' *Sec. 5(a)* gives the Commission the power, after hearing, to determine the 'just and reasonable rate' to be thereafter observed and to fix the rate by order. *Sec. 5(a)* also empowers the Commission to order a 'decrease where existing rates are unjust \* \* \* unlawful, or are not the lowest reasonable rates.' And Congress has provided in s 19(b) that on review of these rate orders the 'finding of the Commission as to the facts, if supported by substantial evidence, shall be conclusive.' Congress, however, has provided no formula by which the 'just and reasonable' rate is to be determined. It has not filled in the \*601 details of the general prescription<sup>8</sup> of s 4(a) and s 5(a). It has not expressed in a specific rule the fixed principle of 'just and reasonable'.

[1] [2] When we sustained the constitutionality of the Natural Gas Act in the Natural Gas Pipeline Co. case, we stated that the 'authority of Congress to regulate the prices of commodities in interstate commerce is at least as great under the Fifth Amendment as is that of the states under the Fourteenth to regulate the prices of commodities in intrastate commerce.' 315 U.S. at page 582, 62 S.Ct. at page 741, 86 L.Ed. 1037. Rate-making is indeed but one species of price-fixing. *Munn v. Illinois*, 94 U.S. 113, 134, 24 L.Ed. 77. The fixing of prices, like other applications of the police power, may reduce the value of the property which is being regulated. But the fact that the value is reduced does not mean that the regulation is invalid. *Block v. Hirsh*, 256 U.S. 135, 155—157, 41 S.Ct. 458, 459, 460, 65 L.Ed. 865, 16 A.L.R. 165; *Nebbia v. New York*, 291 U.S. 502, 523—539, 54 S.Ct. 505, 509—517, 78 L.Ed. 940, 89 A.L.R. 1469, and cases cited. It does, however, indicate that 'fair value' is the end product of the process of rate-making not the starting point as the Circuit Court of Appeals held. The heart of the matter is that rates cannot be made to depend upon 'fair value' when the value of the going enterprise depends on earnings under whatever rates may be anticipated.<sup>9</sup>

\*602 [3] [4] [5] [6] [7] We held in *Federal Power Commission v. Natural Gas Pipeline Co.*, supra, that the Commission was not bound to the use of any single formula or combination of formulae in determining rates. Its rate-making function, moreover, involves the making of 'pragmatic adjustments.' *Id.*, 315 U.S. at page 586, 62 S.Ct. at page 743, 86 L.Ed. 1037. And when the Commission's order is

challenged in the courts, the question is whether that order 'viewed in its entirety' meets the requirements of the Act. *Id.*, 315 U.S. at page 586, 62 S.Ct. at page 743, 86 L.Ed. 1037. Under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling. Cf. \*\*288 *Los Angeles Gas & Electric Corp. v. Railroad Commission*, 289 U.S. 287, 304, 305, 314, 53 S.Ct. 637, 643, 644, 647, 77 L.Ed. 1180; *West Ohio Gas Co. v. Public Utilities Commission (No. 1)*, 294 U.S. 63, 70, 55 S.Ct. 316, 320, 79 L.Ed. 761; *West v. Chesapeake & Potomac Tel. Co.*, 295 U.S. 662, 692, 693, 55 S.Ct. 894, 906, 907, 79 L.Ed. 1640 (dissenting opinion). It is not theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust and unreasonable, judicial inquiry under the Act is at an end. The fact that the method employed to reach that result may contain infirmities is not then important. Moreover, the Commission's order does not become suspect by reason of the fact that it is challenged. It is the product of expert judgment which carries a presumption of validity. And he who would upset the rate order under the Act carries the heavy burden of making a convincing showing that it is invalid because it is unjust and unreasonable in its consequences. Cf. *Railroad Commission v. Cumberland Tel. & T. Co.*, 212 U.S. 414, 29 S.Ct. 357, 53 L.Ed. 577; *Lindheimer v. Illinois Bell Tel. Co.*, supra, 292 U.S. at pages 164, 169, 54 S.Ct. at pages 663, 665, 78 L.Ed. 1182; *Railroad Commission v. Pacific Gas & E. Co.*, 302 U.S. 388, 401, 58 S.Ct. 334, 341, 82 L.Ed. 319.

\*603 [8] [9] The rate-making process under the Act, i.e., the fixing of 'just and reasonable' rates, involves a balancing of the investor and the consumer interests. Thus we stated in the Natural Gas Pipeline Co. case that 'regulation does not insure that the business shall produce net revenues.' 315 U.S. at page 590, 62 S.Ct. at page 745, 86 L.Ed. 1037. But such considerations aside, the investor interest has a legitimate concern with the financial integrity of the company whose rates are being regulated. From the investor or company point of view it is important that there be enough revenue not only for operating expenses but also for the capital costs of the business. These include service on the debt and dividends on the stock. Cf. *Chicago & Grand Trunk R. Co. v. Wellman*, 143 U.S. 339, 345, 346, 12 S.Ct. 400, 402, 36 L.Ed. 176. By that standard the return to the equity owner should be commensurate with returns on investments in other enterprises having corresponding risks. That return, moreover, should be sufficient to assure confidence in the financial integrity of the enterprise, so as to maintain its credit and to attract capital. See *State of Missouri ex rel. South-*

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

[western Bell Tel. Co. v. Public Service Commission](#), 262 U.S. 276, 291, 43 S.Ct. 544, 547, 67 L.Ed. 981, 31 A.L.R. 807 (Mr. Justice Brandeis concurring). The conditions under which more or less might be allowed are not important here. Nor is it important to this case to determine the various permissible ways in which any rate base on which the return is computed might be arrived at. For we are of the view that the end result in this case cannot be condemned under the Act as unjust and unreasonable from the investor or company viewpoint.

We have already noted that Hope is a wholly owned subsidiary of the Standard Oil Co. (N.J.). It has no securities outstanding except stock. All of that stock has been owned by Standard since 1908. The par amount presently outstanding is approximately \$28,000,000 as compared with the rate base of \$33,712,526 established by \*604 the Commission. Of the total outstanding stock \$11,000,000 was issued in stock dividends. The balance, or about \$17,000,000, was issued for cash or other assets. During the four decades of its operations Hope has paid over \$97,000,000 in cash dividends. It had, moreover, accumulated by 1940 an earned surplus of about \$8,000,000. It had thus earned the total investment in the company nearly seven times. Down to 1940 it earned over 20% per year on the average annual amount of its capital stock issued for cash or other assets. On an average invested capital of some \$23,000,000 Hope's average earnings have been about 12% a year. And during this period it had accumulated in addition reserves for depletion and depreciation of about \$46,000,000. Furthermore, during 1939, 1940 and 1941, Hope paid dividends of 10% on its stock. And in the year 1942, during about half of which the lower rates were in effect, it paid dividends of 7 1/2%. From 1939-1942 its earned surplus increased from \$5,250,000 to about \$13,700,000, i.e., to almost half the par value of its outstanding stock.

As we have noted, the Commission fixed a rate of return which permits Hope to earn \$2,191,314 annually. In determining that amount it stressed the importance of maintaining the financial integrity of the \*\*289 company. It considered the financial history of Hope and a vast array of data bearing on the natural gas industry, related businesses, and general economic conditions. It noted that the yields on better issues of bonds of natural gas companies sold in the last few years were 'close to 3 per cent', 44 P.U.R.,N.S., at page 33. It stated that the company was a 'seasoned enterprise whose risks have been minimized' by adequate provisions for depletion and depreciation (past and present) with 'concurrent high profits', by 'protected established markets, through affiliated distribution companies, in populous and

industrialized areas', and by a supply of gas locally to meet all requirements, \*605 'except on certain peak days in the winter, which it is feasible to supplement in the future with gas from other sources.' Id., 44 P.U.R.,N.S., at page 33. The Commission concluded, 'The company's efficient management, established markets, financial record, affiliations, and its prospective business place it in a strong position to attract capital upon favorable terms when it is required.' Id., 44 P.U.R.,N.S., at page 33.

[10] [11] [12] In view of these various considerations we cannot say that an annual return of \$2,191,314 is not 'just and reasonable' within the meaning of the Act. Rates which enable the company to operate successfully, to maintain its financial integrity, to attract capital, and to compensate its investors for the risks assumed certainly cannot be condemned as invalid, even though they might produce only a meager return on the so-called 'fair value' rate base. In that connection it will be recalled that Hope contended for a rate base of \$66,000,000 computed on reproduction cost new. The Commission points out that if that rate base were accepted, Hope's average rate of return for the four-year period from 1937-1940 would amount to 3.27%. During that period Hope earned an annual average return of about 9% on the average investment. It asked for no rate increases. Its properties were well maintained and operated. As the Commission says such a modest rate of 3.27% suggests an 'inflation of the base on which the rate has been computed.' [Dayton Power & Light Co. v. Public Utilities Commission](#), 292 U.S. 290, 312, 54 S.Ct. 647, 657, 78 L.Ed. 1267. Cf. [Lindheimer v. Illinois Bell Tel. Co.](#), supra, 292 U.S. at page 164, 54 S.Ct. at page 663, 78 L.Ed. 1182. The incongruity between the actual operations and the return computed on the basis of reproduction cost suggests that the Commission was wholly justified in rejecting the latter as the measure of the rate base.

In view of this disposition of the controversy we need not stop to inquire whether the failure of the Commission to add the \$17,000,000 of well-drilling and other costs to \*606 the rate base was consistent with the prudent investment theory as developed and applied in particular cases.

[13] [14] [15] Only a word need be added respecting depletion and depreciation. We held in the [Natural Gas Pipeline Co.](#) case that there was no constitutional requirement 'that the owner who embarks in a wasting-asset business of limited life shall receive at the end more than he has put into it.' 315 U.S. at page 593, 62 S.Ct. at page 746, 86 L.Ed. 1037. The Circuit Court of Appeals did not think that that rule was applicable here because Hope was a utility required to continue its service to the public and not scheduled to

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

end its business on a day certain as was stipulated to be true of the Natural Gas Pipeline Co. But that distinction is quite immaterial. The ultimate exhaustion of the supply is inevitable in the case of all natural gas companies. Moreover, this Court recognized in *Lindheimer v. Illinois Bell Tel. Co.*, supra, the propriety of basing annual depreciation on cost.<sup>10</sup> By such a procedure the \*\*290 utility is made whole and the integrity of its investment maintained.<sup>11</sup> No more is required.<sup>12</sup> We cannot approve the contrary holding \*607 of *United Railways & Electric Co. v. West*, 280 U.S. 234, 253, 254, 50 S.Ct. 123, 126, 127, 74 L.Ed. 390. Since there are no constitutional requirements more exacting than the standards of the Act, a rate order which conforms to the latter does not run afoul of the former.

The Position of West Virginia. The State of West Virginia, as well as its Public Service Commission, intervened in the proceedings before the Commission and participated in the hearings before it. They have also filed a brief amicus curiae here and have participated in the argument at the bar. Their contention is that the result achieved by the rate order 'brings consequences which are unjust to West Virginia and its citizens' and which 'unfairly depress the value of gas, gas lands and gas leaseholds, unduly restrict development of their natural resources, and arbitrarily transfer their properties to the residents of other states without just compensation therefor.'

West Virginia points out that the Hope Natural Gas Co. holds a large number of leases on both producing and unoperated properties. The owner or grantor receives from the operator or grantee delay rentals as compensation for postponed drilling. When a producing well is successfully brought in, the gas lease customarily continues indefinitely for the life of the field. In that case the operator pays a stipulated gas-well rental or in some cases a gas royalty equivalent to one-eighth of the gas marketed.<sup>13</sup> Both the owner and operator have valuable property interests in the gas which are separately taxable under West Virginia law. The contention is that the reversionary interests in the leaseholds should be represented in the rate proceedings since it is their gas which is being sold in interstate \*608 commerce. It is argued, moreover, that the owners of the reversionary interests should have the benefit of the 'discovery value' of the gas leaseholds, not the interstate consumers. Furthermore, West Virginia contends that the Commission in fixing a rate for natural gas produced in that State should consider the effect of the rate order on the economy of West Virginia. It is pointed

out that gas is a wasting asset with a rapidly diminishing supply. As a result West Virginia's gas deposits are becoming increasingly valuable. Nevertheless the rate fixed by the Commission reduces that value. And that reduction, it is said, has severe repercussions on the economy of the State. It is argued in the first place that as a result of this rate reduction Hope's West Virginia property taxes may be decreased in view of the relevance which earnings have under West Virginia law in the assessment of property for tax purposes.<sup>14</sup> Secondly, it is pointed out that West Virginia has a production tax<sup>15</sup> on the 'value' of the gas exported from the State. And we are told that for purposes of that tax 'value' becomes under West Virginia law 'practically the substantial equivalent of market value.' Thus West Virginia argues that undervaluation of Hope's gas leaseholds will cost the State many thousands of dollars in taxes. The effect, it is urged, is to impair West Virginia's tax structure for the benefit of Ohio and Pennsylvania consumers. West Virginia emphasizes, moreover, its deep interest in the conservation of its natural resources including its natural gas. It says that a reduction of the value of these leasehold values will jeopardize these conservation policies in three respects: (1) \*\*291 exploratory development of new fields will be discouraged; (2) abandonment of lowyield high-cost marginal wells will be hastened; and (3) secondary recovery of oil will be hampered. \*609 Furthermore, West Virginia contends that the reduced valuation will harm one of the great industries of the State and that harm to that industry must inevitably affect the welfare of the citizens of the State. It is also pointed out that West Virginia has a large interest in coal and oil as well as in gas and that these forms of fuel are competitive. When the price of gas is materially cheapened, consumers turn to that fuel in preference to the others. As a result this lowering of the price of natural gas will have the effect of depreciating the price of West Virginia coal and oil.

West Virginia insists that in neglecting this aspect of the problem the Commission failed to perform the function which Congress entrusted to it and that the case should be remanded to the Commission for a modification of its order.<sup>16</sup>

We have considered these contentions at length in view of the earnestness with which they have been urged upon us. We have searched the legislative history of the Natural Gas Act for any indication that Congress entrusted to the Commission the various considerations which West Virginia has advanced here. And our conclusion is that Congress did not.

[16] [17] We pointed out in *Illinois Natural Gas Co. v. Central Illinois Public Service Co.*, 314 U.S. 498, 506, 62

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**  
51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

S.Ct. 384, 387, 86 L.Ed. 371, that the purpose of the Natural Gas Act was to provide, 'through the exercise of the national power over interstate commerce, an agency for regulating the wholesale distribution to public service companies of natural gas moving interstate, which this Court had declared to be interstate commerce not subject to certain types of state regulation.' As stated in the House Report the 'basic purpose' of this legislation was 'to occupy' the field in which such cases as \*610 *State of Missouri v. Kansas Natural Gas Co.*, 265 U.S. 298, 44 S.Ct. 544, 68 L.Ed. 1027, and *Public Utilities Commission v. Attleboro Steam & Electric Co.*, 273 U.S. 83, 47 S.Ct. 294, 71 L.Ed. 549, had held the States might not act. H.Rep. No. 709, 75th Cong., 1st Sess., p. 2. In accomplishing that purpose the bill was designed to take 'no authority from State commissions' and was 'so drawn as to complement and in no manner usurp State regulatory authority.' Id., p. 2. And the Federal Power Commission was given no authority over the 'production or gathering of natural gas.' s 1(b).

[18] The primary aim of this legislation was to protect consumers against exploitation at the hands of natural gas companies. Due to the hiatus in regulation which resulted from the Kansas Natural Gas Co. case and related decisions state commissions found it difficult or impossible to discover what it cost interstate pipe-line companies to deliver gas within the consuming states; and thus they were thwarted in local regulation. H.Rep., No. 709, supra, p. 3. Moreover, the investigations of the Federal Trade Commission had disclosed that the majority of the pipe-line mileage in the country used to transport natural gas, together with an increasing percentage of the natural gas supply for pipe-line transportation, had been acquired by a handful of holding companies.<sup>17</sup> State commissions, independent producers, and communities having or seeking the service were growing quite helpless against these combinations.<sup>18</sup> These were the types of problems with which those participating in the hearings were pre-occupied.<sup>19</sup> Congress addressed itself to those specific evils.

\*611 The Federal Power Commission was given \*\*292 broad powers of regulation. The fixing of 'just and reasonable' rates (s 4) with the powers attendant thereto<sup>20</sup> was the heart of the new regulatory system. Moreover, the Commission was given certain authority by s 7(a), on a finding that the action was necessary or desirable 'in the public interest,' to require natural gas companies to extend or improve their transportation facilities and to sell gas to any

authorized local distributor. By s 7(b) it was given control over the abandonment of facilities or of service. And by s 7(c), as originally enacted, no natural gas company could undertake the construction or extension of any facilities for the transportation of natural gas to a market in which natural gas was already being served by another company, or sell any natural gas in such a market, without obtaining a certificate of public convenience and necessity from the Commission. In passing on such applications for certificates of convenience and necessity the Commission was told by s 7(c), as originally enacted, that it was 'the intention of Congress that natural gas shall be sold in interstate commerce for resale for ultimate public consumption for domestic, commercial, industrial, or any other use at the lowest possible reasonable rate consistent with the maintenance of adequate service in the public interest.' The latter provision was deleted from s 7(c) when that subsection was amended by the Act of February 7, 1942, 56 Stat. 83. By that amendment limited grandfather rights were granted companies desiring to extend their facilities and services over the routes or within the area which they were already serving. Moreover, s 7(c) was broadened so as to require certificates \*612 of public convenience and necessity not only where the extensions were being made to markets in which natural gas was already being sold by another company but in other situations as well.

[19] These provisions were plainly designed to protect the consumer interests against exploitation at the hands of private natural gas companies. When it comes to cases of abandonment or of extensions of facilities or service, we may assume that, apart from the express exemptions<sup>21</sup> contained in s 7, considerations of conservation are material to the issuance of certificates of public convenience and necessity. But the Commission was not asked here for a certificate of public convenience and necessity under s 7 for any proposed construction or extension. It was faced with a determination of the amount which a private operator should be allowed to earn from the sale of natural gas across state lines through an established distribution system. Secs. 4 and 5, not s 7, provide the standards for that determination. We cannot find in the words of the Act or in its history the slightest intimation or suggestion that the exploitation of consumers by private operators through the maintenance of high rates should be allowed to continue provided the producing states obtain indirect benefits from it. That apparently was the Commission's view of the matter, for the same arguments advanced here were presented to the Commission and not adopted by it.

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

We do not mean to suggest that Congress was unmindful of the interests of the producing states in their natural gas supplies when it drafted the Natural Gas Act. As we have said, the Act does not intrude on the domain traditionally reserved for control by state commissions; and the Federal Power Commission was given no authority over \*613 'the production or gathering of natural gas.' s 1(b). In addition, Congress recognized the legitimate interests of the States in the conservation of natural gas. By s 11 Congress instructed the Commission to make reports on compacts between two or more States dealing with the conservation, production and transportation of natural gas.<sup>22</sup> The Commission was also \*\*293 directed to recommend further legislation appropriate or necessary to carry out any proposed compact and 'to aid in the conservation of natural-gas resources within the United States and in the orderly, equitable, and economic production, transportation, and distribution of natural gas.' s 11(a). Thus Congress was quite aware of the interests of the producing states in their natural gas supplies.<sup>23</sup> But it left the protection of \*614 those interests to measures other than the maintenance of high rates to private companies. If the Commission is to be compelled to let the stockholders of natural gas companies have a feast so that the producing states may receive crumbs from that table, the present Act must be redesigned. Such a project raises questions of policy which go beyond our province.

[20] It is hardly necessary to add that a limitation on the net earnings of a natural gas company from its interstate business is not a limitation on the power of the producing state either to safeguard its tax revenues from that industry<sup>24</sup> or to protect the interests of those who sell their gas to the interstate operator.<sup>25</sup> The return which \*\*294 the Commission \*615 allowed was the net return after all such charges.

It is suggested that the Commission has failed to perform its duty under the Act in that it has not allowed a return for gas production that will be enough to induce private enterprise to perform completely and efficiently its functions for the public. The Commission, however, was not oblivious of those matters. It considered them. It allowed, for example, delay rentals and exploration and development costs in operating expenses.<sup>26</sup> No serious attempt has been made here to show that they are inadequate. We certainly cannot say that they are, unless we are to substitute our opinions for the expert judgment of the administrators to whom Congress entrusted the decision. Moreover, if in light of experience they turn out to be inadequate for development of new sources of

supply, the doors of the Commission are open for increased allowances. This is not an order for all time. The Act contains machinery for obtaining rate adjustments. s 4.

[21] [22] But it is said that the Commission placed too low a rate on gas for industrial purposes as compared with gas for domestic purposes and that industrial uses should be discouraged. It should be noted in the first place that the rates which the Commission has fixed are Hope's interstate wholesale rates to distributors not interstate rates to industrial users<sup>27</sup> and domestic consumers. We hardly \*616 can assume, in view of the history of the Act and its provisions, that the resales intrastate by the customer companies which distribute the gas to ultimate consumers in Ohio and Pennsylvania are subject to the rate-making powers of the Commission.<sup>28</sup> But in any event those rates are not in issue here. Moreover, we fail to find in the power to fix 'just and reasonable' rates the power to fix rates which will disallow or discourage resales for industrial use. The Committee Report stated that the Act provided 'for regulation along recognized and more or less standardized lines' and that there was 'nothing novel in its provisions'. H.Rep.No.709, supra, p. 3. Yet if we are now to tell the Commission to fix the rates so as to discourage particular uses, we would indeed be injecting into a rate case a 'novel' doctrine which has no express statutory sanction. The same would be true if we were to hold that the wasting-asset nature of the industry required the maintenance of the level of rates so that natural gas companies could make a greater profit on each unit of gas sold. Such theories of rate-making for this industry may or may not be desirable. The difficulty is that s 4(a) and s 5(a) contain only the conventional standards of rate-making for natural gas companies.<sup>29</sup> The \*617 Act of February 7, 1942, by broadening s 7 gave the Commission some additional authority to deal with the conservation aspects of the problem.<sup>30</sup> But s 4(a) and s 5(a) were not changed. If the standard \*\*295 of 'just and reasonable' is to sanction the maintenance of high rates by a natural gas company because they restrict the use of natural gas for certain purposes, the Act must be further amended.

[23] [24] It is finally suggested that the rates charged by Hope are discriminatory as against domestic users and in favor of industrial users. That charge is apparently based on s 4(b) of the Act which forbids natural gas companies from maintaining 'any unreasonable difference in rates, charges, service, facilities, or in any other respect, either as between localities or as between classes of service.' The power of the Commission to eliminate any such unreasonable differences

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

or discriminations is plain. [s 5\(a\)](#). The Commission, however, made no findings under [s 4\(b\)](#). Its failure in that regard was not challenged in the petition to review. And it has not been raised or argued here by any party. Hence the problem of discrimination has no proper place in the present decision. It will be time enough to pass on that issue when it is presented to us. Congress has entrusted the administration of the Act to the Commission not to the courts. Apart from the requirements of judicial review it is not [\\*618](#) for us to advise the Commission how to discharge its functions.

Findings as to the Lawfulness of Past Rates. As we have noted, the Commission made certain findings as to the lawfulness of past rates which Hope had charged its interstate customers. Those findings were made on the complaint of the City of Cleveland and in aid of state regulation. It is conceded that under the Act the Commission has no power to make reparation orders. And its power to fix rates admittedly is limited to those 'to be thereafter observed and in force.' [s 5\(a\)](#). But the Commission maintains that it has the power to make findings as to the lawfulness of past rates even though it has no power to fix those rates.<sup>31</sup> However that may be, we do not think that these findings were reviewable under [s 19\(b\)](#) of the Act. That section gives any party 'aggrieved by an order' of the Commission a review 'of such order' in the circuit court of appeals for the circuit where the natural gas company is located or has its principal place of business or in the United States Court of Appeals for the District of Columbia. We do not think that the findings in question fall within that category. [25] [26] The Court recently summarized the various types of administrative action or determination reviewable as orders under the Urgent Deficiencies Act of October 22, [\\*619](#) 1913, 28 U.S.C. ss 45, 47a, 28 U.S.C.A. ss 45, 47a, and kindred statutory provisions. [Rochester Tel. Corp. v. United States](#), 307 U.S. 125, 59 S.Ct. 754, 83 L.Ed. 1147. It was there pointed out that where 'the order sought to be reviewed does not of itself adversely affect complainant but only affects his rights adversely on the contingency of future administrative action', it is not reviewable. [Id.](#), 307 U.S. at page 130, 59 S.Ct. at page 757, 83 L.Ed. 1147. The Court said, 'In view of traditional conceptions of federal judicial power, resort to the courts in these situations is either premature or wholly beyond their province.' [\\*\\*296 Id.](#), 307 U.S. at page 130, 59 S.Ct. at page 757, 83 L.Ed. 1147. And see [United States v. Los Angeles S.L.R. C/O.](#), 273 U.S. 299, 309, 310, 47 S.Ct. 413, 414, 415, 71 L.Ed. 651; [SHANNAHAN V. UNITED STATES](#), 303 U.S. 596, 58 S.Ct. 732, 82 L.Ed. 1039. THESE CONSIDERATIONS

ARE APPOSITE HERE. THE COMMISSION HAS NO AUTHORITY TO ENFORCE THESE FINDINGS. THEY ARE 'THE EXERCISE SOLELY OF THE FUNCTION OF INVESTIGATION.' [UNITED STATES V. LOS ANGELES & S.L.R. CO.](#), SUPRA, 273 U.S. AT PAGE 310, 47 S.Ct. AT PAGE 414, 71 L.Ed. 651. THEY ARE ONLY A PRELIMINARY, INTERIM STEP TOWARDS POSSIBLE FUTURE ACTION—ACTION NOT BY THE COMMISSION BUT BY WHOLLY INDEPENDENT AGENCIES. THE OUTCOME OF THOSE PROCEEDINGS MAY TURN ON FACTORS OTHER THAN THESE FINDINGS. THESE FINDINGS MAY NEVER RESULT IN THE RESPONDENT FEELING THE PINCH OF ADMINISTRATIVE ACTION.

Reversed.

Mr. Justice ROBERTS took no part in the consideration or decision of this case.

Opinion of Mr. Justice BLACK and Mr. Justice MURPHY.

We agree with the Court's opinion and would add nothing to what has been said but for what is patently a wholly gratuitous assertion as to Constitutional law in the dissent of Mr. Justice FRANKFURTER. We refer to the statement that 'Congressional acquiescence to date in the doctrine of [Chicago, etc., R. Co. v. Minnesota](#), supra (134 U.S. 418, 10 S.Ct. 462, 702, 33 L.Ed. 970), may fairly be claimed.' That was the case in which a majority of this Court was finally induced to expand the meaning [\\*620](#) of 'due process' so as to give courts power to block efforts of the state and national governments to regulate economic affairs. The present case does not afford a proper occasion to discuss the soundness of that doctrine because, as stated in Mr. Justice FRANKFURTER'S dissent, 'That issue is not here in controversy.' The salutary practice whereby courts do not discuss issues in the abstract applies with peculiar force to Constitutional questions. Since, however, the dissent adverts to a highly controversial due process doctrine and implies its acceptance by Congress, we feel compelled to say that we do not understand that Congress voluntarily has acquiesced in a Constitutional principle of government that courts, rather than legislative bodies, possess final authority over regulation of economic affairs. Even this Court has not always fully embraced that principle, and we wish to repeat that we have never acquiesced in it, and do not now. See [Federal Power Commission v. Natural Gas Pipeline Co.](#), 315 U.S. 575, 599-601, 62 S.Ct. 736, 749, 750, 86 L.Ed. 1037.

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

Mr. Justice REED, dissenting.

This case involves the problem of rate making under the Natural Gas Act. Added importance arises from the obvious fact that the principles stated are generally applicable to all federal agencies which are entrusted with the determination of rates for utilities. Because my views differ somewhat from those of my brethren, it may be of some value to set them out in a summary form.

The Congress may fix utility rates in situations subject to federal control without regard to any standard except the constitutional standards of due process and for taking private property for public use without just compensation. *Wilson v. New*, 243 U.S. 332, 350, 37 S.Ct. 298, 302, 61 L.Ed. 755, L.R.A.1917E, 938, Ann.Cas.1918A, 1024. A Commission, however, does not have this freedom of action. Its powers are limited not only by the constitutional standards but also by the standards of the delegation. Here the standard added by the Natural Gas Act is that the rate be 'just \*621 and reasonable.'<sup>1</sup> Section 6<sup>2</sup> \*\*297 throws additional light on the meaning of these words.

When the phrase was used by Congress to describe allowable rates, it had relation to something ascertainable. The rates were not left to the whim of the Commission. The rates fixed would produce an annual return and that annual return was to be compared with a theoretical just and reasonable return, all risks considered, on the fair value of the property used and useful in the public service at the time of the determination.

Such an abstract test is not precise. The agency charged with its determination has a wide range before it could properly be said by a court that the agency had disregarded statutory standards or had confiscated the property of the utility for public use. Cf. *Chicago, M. & St. P.R. Co. v. Minnesota*, 134 U.S. 418, 461—466, 10 S.Ct. 462, 702, 703—705, 33 L.Ed. 970, dissent. This is as Congress intends. Rates are left to an experienced agency particularly competent by training to appraise the amount required.

The decision as to a reasonable return had not been a source of great difficulty, for borrowers and lenders reached such agreements daily in a multitude of situations; and although the determination of fair value had been troublesome, its essentials had been worked out in fairness to investor and consumer by the time of the enactment \*622 of this Act. Cf. *Los Angeles G. & E. Corp. v. Railroad Comm.*, 289 U.S. 287, 304 et seq., 53 S.Ct. 637, 643 et seq., 77 L.Ed. 1180. The results were well known to Congress and had that

body desired to depart from the traditional concepts of fair value and earnings, it would have stated its intention plainly. *Helvering v. Griffiths*, 318 U.S. 371, 63 S.Ct. 636.

It was already clear that when rates are in dispute, 'earnings produced by rates do not afford a standard for decision.' 289 U.S. at page 305, 53 S.Ct. at page 644, 77 L.Ed. 1180.

Historical cost, prudent investment and reproduction cost<sup>3</sup> were all relevant factors in determining fair value. Indeed, disregarding the pioneer investor's risk, if prudent investment and reproduction cost were not distorted by changes in price levels or technology, each of them would produce the same result. The realization from the risk of an investment in a speculative field, such as natural gas utilities, should be reflected in the present fair value.<sup>4</sup> The amount of evidence to be admitted on any point was of course in the agency's reasonable discretion, and it was free to give its own weight to these or other factors and to determine from all the evidence its own judgment as to the necessary rates.

\*623 I agree with the Court in not imposing a rule of prudent investment alone in determining the rate base. This leaves the Commission free, as I understand it, to use any available evidence for its finding of fair value, including both prudent investment and the cost of installing at the present time an efficient system for furnishing the needed utility service.

My disagreement with the Court arises primarily from its view that it makes no \*\*298 difference how the Commission reached the rate fixed so long as the result is fair and reasonable. For me the statutory command to the Commission is more explicit. Entirely aside from the constitutional problem of whether the Congress could validly delegate its rate making power to the Commission, in toto and without standards, it did legislate in the light of the relation of fair and reasonable to fair value and reasonable return. The Commission must therefore make its findings in observance of that relationship.

The Federal Power Commission did not, as I construe their action, disregard its statutory duty. They heard the evidence relating to historical and reproduction cost and to the reasonable rate of return and they appraised its weight. The evidence of reproduction cost was rejected as unpersuasive, but from the other evidence they found a rate base, which is to me a determination of fair value. On that base the earnings allowed seem fair and reasonable. So far as the Commission went in appraising the property employed in the service, I find nothing in the result which indicates confiscation, unfairness or unreasonableness. Good

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

administration of rate making agencies under this method would avoid undue delay and render revaluations unnecessary except after violent fluctuations of price levels. Rate making under this method has been subjected to criticism. But until Congress changes the standards for the agencies, these rate making bodies should continue the conventional theory of rate \*624 making. It will probably be simpler to improve present methods than to devise new ones.

But a major error, I think was committed in the disregard by the Commission of the investment in exploratory operations and other recognized capital costs. These were not considered by the Commission because they were charged to operating expenses by the company at a time when it was unregulated. Congress did not direct the Commission in rate making to deduct from the rate base capital investment which had been recovered during the unregulated period through excess earnings. In my view this part of the investment should no more have been disregarded in the rate base than any other capital investment which previously had been recovered and paid out in dividends or placed to surplus. Even if prudent investment throughout the life of the property is accepted as the formula for figuring the rate base, it seems to me illogical to throw out the admittedly prudent cost of part of the property because the earnings in the unregulated period had been sufficient to return the prudent cost to the investors over and above a reasonable return. What would the answer be under the theory of the Commission and the Court, if the only prudent investment in this utility had been the seventeen million capital charges which are now disallowed?

For the reasons heretofore stated, I should affirm the action of the Circuit Court of Appeals in returning the proceeding to the Commission for further consideration and should direct the Commission to accept the disallowed capital investment in determining the fair value for rate making purposes.

Mr. Justice FRANKFURTER, dissenting.

My brother JACKSON has analyzed with particularity the economic and social aspects of natural gas as well as \*625 the difficulties which led to the enactment of the Natural Gas Act, especially those arising out of the abortive attempts of States to regulate natural gas utilities. The Natural Gas Act of 1938 should receive application in the light of this analysis, and Mr. Justice JACKSON has, I believe, drawn relevant inferences regarding the duty of the Federal Power Commission in fixing natural gas rates. His exposition seems to me unanswered, and I shall say only a few words to emphasize my basic agreement with him.

For our society the needs that are met by public utilities are as truly public services as the traditional governmental functions of police and justice. They are not less so when these services are rendered by private enterprise under governmental regulation. Who ultimately determines the ways of regulation, is the decisive aspect in the public supervision of privately-owned utilities. Foreshadowed nearly sixty years ago, [Railroad Commission Cases \(Stone v. Farmers' Loan & Trust Co.\)](#), 116 U.S. 307, 331, 6 S.Ct. 334, 344, 388, 1191, 29 L.Ed. 636, it was decided more than fifty \*\*299 years ago that the final say under the Constitution lies with the judiciary and not the legislature. [Chicago, etc., R. Co. v. Minnesota](#), 134 U.S. 418, 10 S.Ct. 462, 702, 33 L.Ed. 970.

While legal issues touching the proper distribution of governmental powers under the Constitution may always be raised, Congressional acquiescence to date in the doctrine of [Chicago, etc., R. Co. v. Minnesota](#), supra, may fairly be claimed. But in any event that issue is not here in controversy. As pointed out in the opinions of my brethren, Congress has given only limited authority to the Federal Power Commission and made the exercise of that authority subject to judicial review. The Commission is authorized to fix rates chargeable for natural gas. But the rates that it can fix must be 'just and reasonable'. s 5 of the Natural Gas Act, [15 U.S.C. s 717d](#), [15 U.S.C.A. s 717d](#). Instead of making the Commission's rate determinations final, Congress \*626 specifically provided for court review of such orders. To be sure, 'the finding of the Commission as to the facts, if supported by substantial evidence' was made 'conclusive', s 19 of the Act, [15 U.S.C. s 717r](#); [15 U.S.C.A. s 717r](#). But obedience of the requirement of Congress that rates be 'just and reasonable' is not an issue of fact of which the Commission's own determination is conclusive. Otherwise, there would be nothing for a court to review except questions of compliance with the procedural provisions of the Natural Gas Act. Congress might have seen fit so to cast its legislation. But it has not done so. It has committed to the administration of the Federal Power Commission the duty of applying standards of fair dealing and of reasonableness relevant to the purposes expressed by the Natural Gas Act. The requirement that rates must be 'just and reasonable' means just and reasonable in relation to appropriate standards. Otherwise Congress would have directed the Commission to fix such rates as in the judgment of the Commission are just and reasonable; it would not have also provided that such determinations by the Commission are subject to court review.

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

To what sources then are the Commission and the courts to go for ascertaining the standards relevant to the regulation of natural gas rates? It is at this point that Mr. Justice JACKSON'S analysis seems to me pertinent. There appear to be two alternatives. Either the fixing of natural gas rates must be left to the unguided discretion of the Commission so long as the rates it fixes do not reveal a glaringly had prophecy of the ability of a regulated utility to continue its service in the future. Or the Commission's rate orders must be founded on due consideration of all the elements of the public interest which the production and distribution of natural gas involve just because it is natural gas. These elements are reflected in the Natural Gas Act, if that Act be applied as an entirety. See, for \*627 instance, ss 4(a)(b)(c)(d), 6, and 11, 15 U.S.C. ss 717c(a)(b)(c)(d), 717e, and 717j, 15 U.S.C.A. ss 717c(a—d), 717e, 717j. Of course the statute is not concerned with abstract theories of ratemaking. But its very foundation is the 'public interest', and the public interest is a texture of multiple strands. It includes more than contemporary investors and contemporary consumers. The needs to be served are not restricted to immediacy, and social as well as economic costs must be counted.

It will not do to say that it must all be left to the skill of experts. Expertise is a rational process and a rational process implies expressed reasons for judgment. It will little advance the public interest to substitute for the hodge-podge of the rule in *Smyth v. Ames*, 169 U.S. 466, 18 S.Ct. 418, 42 L.Ed. 819, an encouragement of conscious obscurity or confusion in reaching a result, on the assumption that so long as the result appears harmless its basis is irrelevant. That may be an appropriate attitude when state action is challenged as unconstitutional. Cf. *Driscoll v. Edison Light & Power Co.*, 307 U.S. 104, 59 S.Ct. 715, 83 L.Ed. 1134. But it is not to be assumed that it was the design of Congress to make the accommodation of the conflicting interests exposed in Mr. Justice JACKSON'S opinion the occasion for a blind clash of forces or a partial assessment of relevant factors, either before the Commission or here.

The objection to the Commission's action is not that the rates it granted were too low but that the range of its vision was too narrow. And since the issues before the Commission involved no less than the \*\*300 total public interest, the proceedings before it should not be judged by narrow conceptions of common law pleading. And so I conclude that the case should be returned to the Commission. In order to enable this Court to discharge its duty of reviewing the Commission's order, the Commission should set forth with explicitness the criteria by

which it is guided \*628 in determining that rates are 'just and reasonable', and it should determine the public interest that is in its keeping in the perspective of the considerations set forth by Mr. Justice JACKSON.

By Mr. Justice JACKSON.

Certainly the theory of the court below that ties rate-making to the fair-value-reproduction-cost formula should be overruled as in conflict with *Federal Power Commission v. Natural Gas Pipeline Co.*<sup>1</sup> But the case should, I think, be the occasion for reconsideration of our rate-making doctrine as applied to natural gas and should be returned to the Commission for further consideration in the light thereof.

The Commission appears to have understood the effect of the two opinions in the Pipeline case to be at least authority and perhaps direction to fix natural gas rates by exclusive application of the 'prudent investment' rate base theory. This has no warrant in the opinion of the Chief Justice for the Court, however, which released the Commission from subservience to 'any single formula or combination of formulas' provided its order, 'viewed in its entirety, produces no arbitrary result.' 315 U.S. at page 586, 62 S.Ct. at page 743, 86 L.Ed. 1037. The minority opinion I understood to advocate the 'prudent investment' theory as a sufficient guide in a natural gas case. The view was expressed in the court below that since this opinion was not expressly controverted it must have been approved.<sup>2</sup> I disclaim this imputed \*629 approval with some particularity, because I attach importance at the very beginning of federal regulation of the natural gas industry to approaching it as the performance of economic functions, not as the performance of legalistic rituals.

## I.

Solutions of these cases must consider eccentricities of the industry which gives rise to them and also to the Act of Congress by which they are governed.

The heart of this problem is the elusive, exhaustible, and irreplaceable nature of natural gas itself. Given sufficient money, we can produce any desired amount of railroad, bus, or steamship transportation, or communications facilities, or capacity for generation of electric energy, or for the manufacture of gas of a kind. In the service of such utilities one customer has little concern with the amount taken by another, one's waste will not deprive another, a volume of service and be created equal to demand, and today's demands will not exhaust or lessen capacity to serve tomorrow. But

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

the wealth of Midas and the wit of man cannot produce or reproduce a natural gas field. We cannot even reproduce the gas, for our manufactured product has only about half the heating value per unit of nature's own.<sup>3</sup>

**\*\*301** Natural gas in some quantity is produced in twenty-four states. It is consumed in only thirty-five states, and is **\*630** available only to about 7,600,000 consumers.<sup>4</sup> Its availability has been more localized than that of any other utility service because it has depended more on the caprice of nature.

The supply of the Hope Company is drawn from that old and rich and vanishing field that flanks the Appalachian mountains. Its center of production is Pennsylvania and West Virginia, with a fringe of lesser production in New York, Ohio, Kentucky, Tennessee, and the north end of Alabama. Oil was discovered in commercial quantities at a depth of only 69 1/2 feet near Titusville, Pennsylvania, in 1859. Its value then was about \$16 per barrel.<sup>5</sup> The oil branch of the petroleum industry went forward at once, and with unprecedented speed. The area productive of oil and gas was roughed out by the drilling of over 19,000 'wildcat' wells, estimated to have cost over \$222,000,000. Of these, over 18,000 or 94.9 per cent, were 'dry holes.' About five per cent, or 990 wells, made discoveries of commercial importance, 767 of them resulting chiefly in oil and 223 in gas only.<sup>6</sup> Prospecting for many years was a search for oil, and to strike gas was a misfortune. Waste during this period and even later is appalling. Gas was regarded as having no commercial value until about 1882, in which year the total yield was valued only at about \$75,000.<sup>7</sup> Since then, contrary to oil, which has become cheaper gas in this field has pretty steadily advanced in price.

While for many years natural gas had been distributed on a small scale for lighting,<sup>8</sup> its acceptance was slow, **\*631** facilities for its utilization were primitive, and not until 1885 did it take on the appearance of a substantial industry.<sup>9</sup> Soon monopoly of production or markets developed.<sup>10</sup> To get gas from the mountain country, where it was largely found, to centers of population, where it was in demand, required very large investment. By ownership of such facilities a few corporate systems, each including several companies, controlled access to markets. Their purchases became the dominating factor in giving a market value to gas produced by many small operators. Hope is the market for over 300 such operators. By 1928 natural gas in the Appalachian

field commanded an average price of 21.1 cents per m.c.f. at points of production and was bringing 45.7 cents at points of consumption.<sup>11</sup> The companies which controlled markets, however, did not rely on gas purchases alone. They acquired and held in fee or leasehold great acreage in territory proved by 'wildcat' drilling. These large marketing system companies as well as many small independent owners and operators have carried on the commercial development of proved territory. The development risks appear from the estimate that up to 1928, 312,318 proved area wells had been sunk in the Appalachian field of which 48,962, or 15.7 per cent, failed to produce oil or gas in commercial quantity.<sup>12</sup>

**\*632** With the source of supply thus tapped to serve centers of large demand, like Pittsburgh, Buffalo, Cleveland, Youngstown, Akron, and other industrial communities, the distribution of natural gas fast became big business. Its advantages as a **\*\*302** fuel and its price commended it, and the business yielded a handsome return. All was merry and the goose hung high for consumers and gas companies alike until about the time of the first. World War. Almost unnoticed by the consuming public, the whole Appalachian field passed its peak of production and started to decline. Pennsylvania, which to 1928 had given off about 38 per cent of the natural gas from this field, had its peak in 1905; Ohio, which had produced 14 per cent, had its peak in 1915; and West Virginia, greatest producer of all, with 45 per cent to its credit, reached its peak in 1917.<sup>13</sup>

Western New York and Eastern Ohio, on the fringe of the field, had some production but relied heavily on imports from Pennsylvania and West Virginia. Pennsylvania, a producing and exporting state, was a heavy consumer and supplemented her production with imports from West Virginia. West Virginia was a consuming state, but the lion's share of her production was exported. Thus the interest of the states in the North Appalachian supply was in conflict.

Competition among localities to share in the failing supply and the helplessness of state and local authorities in the presence of state lines and corporate complexities is a part of the background of federal intervention in the industry.<sup>14</sup> West Virginia took the boldest measure. It legislated a priority in its entire production in favor of its own inhabitants. That was frustrated by an injunction **\*633** from this Court.<sup>15</sup> Throughout the region clashes in the courts and conflicting decisions evidenced public anxiety and confusion. It was held that the New York Public Service Commission did not have power to classify consumers and restrict their use of

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

gas.<sup>16</sup> That Commission held that a company could not abandon a part of its territory and still serve the rest.<sup>17</sup> Some courts admonished the companies to take action to protect consumers.<sup>18</sup> Several courts held that companies, regardless of failing supply, must continue to take on customers, but such compulsory additions were finally held to be within the Public Service Commission's discretion.<sup>19</sup> There were attempts to throw up franchises and quit the service, and municipalities resorted to the courts with conflicting results.<sup>20</sup> Public service commissions of consuming states were handicapped, for they had no control of the supply.<sup>21</sup>

**\*\*303 \*634** Shortages during World War I occasioned the first intervention in the natural gas industry by the Federal Government. Under Proclamation of President Wilson the United States Fuel Administrator took control, stopped extensions, classified consumers and established a priority for domestic over industrial use.<sup>22</sup> After the war federal control was abandoned. Some cities once served with natural gas became dependent upon mixed gas of reduced heating value and relatively higher price.<sup>23</sup>

Utilization of natural gas of highest social as well as economic return is domestic use for cooking and water **\*635** heating, followed closely by use for space heating in homes. This is the true public utility aspect of the enterprise, and its preservation should be the first concern of regulation. Gas does the family cooking cheaper than any other fuel.<sup>24</sup> But its advantages do not end with dollars and cents cost. It is delivered without interruption at the meter as needed and is paid for after it is used. No money is tied up in a supply, and no space is used for storage. It requires no handling, creates no dust, and leaves no ash. It responds to thermostatic control. It ignites easily and immediately develops its maximum heating capacity. These incidental advantages make domestic life more liveable.

Industrial use is induced less by these qualities than by low cost in competition with other fuels. Of the gas exported from West Virginia by the Hope Company a very substantial part is used by industries. This wholesale use speeds exhaustion of supply and displaces other fuels. Coal miners and the coal industry, a large part of whose costs are wages, have complained of unfair competition from low-priced industrial gas produced with relatively little labor cost.<sup>25</sup>

Gas rate structures generally have favored industrial users. In 1932, in Ohio, the average yield on gas for domestic consumption was 62.1 cents per m.c.f. and on industrial,

**\*636** 38.7. In Pennsylvania, the figures were 62.9 against 31.7. West Virginia showed the least spread, domestic consumers paying 36.6 cents; and industrial, 27.7.<sup>26</sup> Although this spread is less than **\*\*304** in other parts of the United States,<sup>27</sup> it can hardly be said to be self-justifying. It certainly is a very great factor in hastening decline of the natural gas supply.

About the time of World War I there were occasional and short-lived efforts by some hard-pressed companies to reverse this discrimination and adopt graduated rates, giving a low rate to quantities adequate for domestic use and graduating it upward to discourage industrial use.<sup>28</sup>

**\*637** These rates met opposition from industrial sources, of course, and since diminished revenues from industrial sources tended to increase the domestic price, they met little popular or commission favor. The fact is that neither the gas companies nor the consumers nor local regulatory bodies can be depended upon to conserve gas. Unless federal regulation will take account of conservation, its efforts seem, as in this case, actually to constitute a new threat to the life of the Appalachian supply.

## II.

Congress in 1938 decided upon federal regulation of the industry. It did so after an exhaustive investigation of all aspects including failing supply and competition for the use of natural gas intensified by growing scarcity.<sup>29</sup> Pipelines from the Appalachian area to markets were in the control of a handful of holding company systems.<sup>30</sup> This created a highly concentrated control of the producers' market and of the consumers' supplies. While holding companies dominated both production and distribution they segregated those activities in separate **\*638** subsidiaries,<sup>31</sup> the effect of which, if not the purpose, was to isolate **\*\*305** some end of the business from the reach of any one state commission. The cost of natural gas to consumers moved steadily upwards over the years, out of proportion to prices of oil, which, except for the element of competition, is produced under somewhat comparable conditions. The public came to feel that the companies were exploiting the growing scarcity of local gas. The problems of this region had much to do with creating the demand for federal regulation.

The Natural Gas Act declared the natural gas business to be 'affected with a public interest,' and its regulation 'necessary in the public interest.'<sup>32</sup> Originally, and at the

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

time this proceeding was commenced and tried, it also declared 'the intention of Congress that natural gas shall be sold in interstate commerce for resale for ultimate public consumption for domestic, commercial, industrial, or any other use at the lowest possible reasonable rate consistent with the maintenance of adequate service in the public interest.'<sup>33</sup> While this was later dropped, there is nothing to indicate that it was not and is not still an accurate statement of purpose of the Act. Extension or improvement of facilities may be ordered when 'necessary or desirable in the public interest,' abandonment of facilities may be ordered when the supply is 'depleted to the extent that the continuance of service is unwarranted, or that the present or future public convenience or necessity \*639 permit' abandonment and certain extensions can only be made on finding of 'the present or future public convenience and necessity.'<sup>34</sup> The Commission is required to take account of the ultimate use of the gas. Thus it is given power to suspend new schedules as to rates, charges, and classification of services except where the schedules are for the sale of gas 'for resale for industrial use only,'<sup>35</sup> which gives the companies greater freedom to increase rates on industrial gas than on domestic gas. More particularly, the Act expressly forbids any undue preference or advantage to any person or 'any unreasonable difference in rates \* \* \* either as between localities or as between classes of service.'<sup>36</sup> And the power of the Commission expressly includes that to determine the 'just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force.'<sup>37</sup>

In view of the Court's opinion that the Commission in administering the Act may ignore discrimination, it is interesting that in reporting this Bill both the Senate and the House Committees on Interstate Commerce pointed out that in 1934, on a nationwide average the price of natural gas per m.c.f. was 74.6 cents for domestic use, 49.6 cents for commercial use, and 16.9 for industrial use.<sup>38</sup> I am not ready to think that supporters of a bill called attention to the striking fact that householders were being charged five times as much for their gas as industrial users only as a situation which the Bill would do nothing to remedy. On the other hand the Act gave to the Commission what the Court aptly describes as 'broad powers of regulation.'

**\*640 III.**

This proceeding was initiated by the Cities of Cleveland and Akron. They alleged that the price charged by Hope for

natural gas 'for resale to domestic, commercial and small industrial consumers in Cleveland and elsewhere is excessive, unjust, unreasonable, greatly in excess of the price charged by Hope to nonaffiliated companies at wholesale for resale to domestic, commercial and small industrial consumers, and greatly in excess of the price charged by Hope to East Ohio for resale to certain favored industrial consumers in Ohio, and therefore is further unduly discriminatory between consumers and between classes of service' (italics supplied). The company answered admitting differences in prices to affiliated and nonaffiliated companies and justifying them by differences in conditions of delivery. **\*\*306** As to the allegation that the contract price is 'greatly in excess of the price charged by Hope to East Ohio for resale to certain favored industrial consumers in Ohio,' Hope did not deny a price differential, but alleged that industrial gas was not sold to 'favored consumers' but was sold under contract and schedules filed with and approved by the Public Utilities Commission of Ohio, and that certain conditions of delivery made it not 'unduly discriminatory.'

The record shows that in 1940 Hope delivered for industrial consumption 36,523,792 m.c.f. and for domestic and commercial consumption, 50,343,652 m.c.f. I find no separate figure for domestic consumption. It served 43,767 domestic consumers directly, 511,521 through the East Ohio Gas Company, and 154,043 through the Peoples Natural Gas Company, both affiliates owned by the same parent. Its special contracts for industrial consumption, so far as appear, are confined to about a dozen big industries.

**\*641** Hope is responsible for discrimination as exists in favor of these few industrial consumers. It controls both the resale price and use of industrial gas by virtue of the very interstate sales contracts over which the Commission is exercising its jurisdiction.

Hope's contract with East Ohio Company is an example. Hope agrees to deliver, and the Ohio Company to take, '(a) all natural gas requisite for the supply of the domestic consumers of the Ohio Company; (b) such amounts of natural gas as may be requisite to fulfill contracts made with the consent and approval of the Hope Company by the Ohio Company, or companies which it supplies with natural gas, for the sale of gas upon special terms and conditions for manufacturing purposes.' The Ohio company is required to read domestic customers' meters once a month and meters of industrial customers daily and to furnish all meter readings to Hope. The Hope Company is to have access to meters of all consumers and to all of the Ohio Company's accounts. The domestic

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

consumers of the Ohio Company are to be fully supplied in preference to consumers purchasing for manufacturing purposes and 'Hope Company can be required to supply gas to be used for manufacturing purposes only where the same is sold under special contracts which have first been submitted to and approved in writing by the Hope Company and which expressly provide that natural gas will be supplied thereunder only in so far as the same is not necessary to meet the requirements of domestic consumers supplied through pipe lines of the Ohio Company.' This basic contract was supplemented from time to time, chiefly as to price. The last amendment was in a letter from Hope to East Ohio in 1937. It contained a special discount on industrial gas and a schedule of special industrial contracts, Hope reserving the right to make eliminations therefrom and agreeing that others might be added from time to time with its approval in writing. It said, 'It is believed that the price concessions contained in this letter, while not based on our costs, are under certain conditions, to our mutual advantage in maintaining and building up the volumes of gas sold by us (italics supplied).'<sup>39</sup>

**\*\*307** The Commission took no note of the charges of discrimination and made no disposition of the issue tendered on this point. It ordered a flat reduction in the price per m.c.f. of all gas delivered by Hope in interstate commerce. It made no limitation, condition, or provision as to what classes of consumers should get the benefit of the reduction. While the cities have accepted and are defending the reduction, it is my view that the discrimination of which they have complained is perpetuated and increased by the order of the Commission and that it violates the Act in so doing.

The Commission's opinion aptly characterizes its entire objective by saying that 'bona fide investment figures now become all-important in the regulation of rates.' It should be noted that the all-importance of this theory is not the result of any instruction from Congress. When the Bill to regulate gas was first before Congress it contained **\*643** the following: 'In determining just and reasonable rates the Commission shall fix such rate as will allow a fair return upon the actual legitimate prudent cost of the property used and useful for the service in question.' H.R. 5423, 74th Cong., 1st Sess. Title III, s 312(c). Congress rejected this language. See H.R. 5423, s 213 (211(c)), and H.R. Rep. No. 1318, 74th Cong., 1st Sess. 30.

The Commission contends nevertheless that the 'all important' formula for finding a rate base is that of prudent investment. But it excluded from the investment

base an amount actually and admittedly invested of some \$17,000,000. It did so because it says that the Company recouped these expenditures from customers before the days of regulation from earnings above a fair return. But it would not apply all of such 'excess earnings' to reduce the rate base as one of the Commissioners suggested. The reason for applying excess earnings to reduce the investment base roughly from \$69,000,000 to \$52,000,000 but refusing to apply them to reduce it from that to some \$18,000,000 is not found in a difference in the character of the earnings or in their reinvestment. The reason assigned is a difference in bookkeeping treatment many years before the Company was subject to regulation. The \$17,000,000, reinvested chiefly in well drilling, was treated on the books as expense. (The Commission now requires that drilling costs be carried to capital account.) The allowed rate base thus actually was determined by the Company's bookkeeping, not its investment. This attributes a significance to formal classification in account keeping that seems inconsistent with rational rate regulation.<sup>40</sup> Of **\*644** course, the **\*\*308** Commission would not and should not allow a rate base to be inflated by bookkeeping which had improperly capitalized expenses. I have doubts about resting public regulation upon any rule that is to be used or not depending on which side it favors.

**\*645** The Company on the other hand, has not put its gas fields into its calculations on the present-value basis, although that, it contends, is the only lawful rule for finding a rate base. To do so would result in a rate higher than it has charged or proposes as a matter of good business to charge.

The case before us demonstrates the lack of rational relationship between conventional rate-base formulas and natural gas production and the extremities to which regulating bodies are brought by the effort to rationalize them. The Commission and the Company each stands on a different theory, and neither ventures to carry its theory to logical conclusion as applied to gas fields.

**IV.**

This order is under judicial review not because we interpose constitutional theories between a State and the business it seeks to regulate, but because Congress put upon the federal courts a duty toward administration of a new federal regulatory Act. If we are to hold that a given rate is reasonable just because the Commission has said it was reasonable, review becomes a costly, time-consuming pageant of no

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

practical value to anyone. If on the other hand we are to bring judgment of our own to the task, we should for the guidance of the regulators and the regulated reveal something of the philosophy, be it legal or economic or social, which guides us. We need not be slaves to a formula but unless we can point out a rational way of reaching our conclusions they can only be accepted as resting on intuition or predilection. I must admit that I possess no instinct by which to know the 'reasonable' from the 'unreasonable' in prices and must seek some conscious design for decision.

The Court sustains this order as reasonable, but what makes it so or what could possibly make it otherwise, \*646 I cannot learn. It holds that: 'it is the result reached not the method employed which is controlling'; 'the fact that the method employed to reach that result may contain infirmities is not then important' and it is not 'important to this case to determine the various permissible ways in which any rate base on which the return is computed might be arrived at.' The Court does lean somewhat on considerations of capitalization and dividend history and requirements for dividends on outstanding stock. But I can give no real weight to that for it is generally and I think deservedly in discredit as any guide in rate cases.<sup>41</sup>

Our books already contain so much talk of methods of rationalizing rates that we must appear ambiguous if we announce results without our working methods. We are confronted with regulation of a unique type of enterprise which I think requires considered rejection of much conventional utility doctrine and adoption of concepts of 'just and reasonable' rates and practices and of the 'public interest' that will take account of the peculiarities of the business.

The Court rejects the suggestions of this opinion. It says that the Committees in reporting the bill which became the Act said it provided 'for regulation along recognized and more or less standardized lines' and that there was 'nothing novel in its provisions.' So saying it sustains a rate calculated on a novel variation of a rate base theory which itself had at the time of enactment of the legislation been recognized only in dissenting opinions. Our difference seems to be between unconscious innovation,<sup>42</sup> and the purposeful \*\*309 and deliberate innovation I \*647 would make to meet the necessities of regulating the industry before us.

Hope's business has two components of quite divergent character. One, while not a conventional common-carrier undertaking, is essentially a transportation enterprise consisting of conveying gas from where it is produced to point

of delivery to the buyer. This is a relatively routine operation not differing substantially from many other utility operations. The service is produced by an investment in compression and transmission facilities. Its risks are those of investing in a tested means of conveying a discovered supply of gas to a known market. A rate base calculated on the prudent investment formula would seem a reasonably satisfactory measure for fixing a return from that branch of the business whose service is roughly proportionate to the capital invested. But it has other consequences which must not be overlooked. It gives marketability and hence 'value' to gas owned by the company and gives the pipeline company a large power over the marketability and hence 'value' of the production of others.

The other part of the business—to reduce to possession an adequate supply of natural gas—is of opposite character, being more erratic and irregular and unpredictable in relation to investment than any phase of any other utility business. A thousand feet of gas captured and severed from real estate for delivery to consumers is recognized under our law as property of much the same nature as a ton of coal, a barrel of oil, or a yard of sand. The value to be allowed for it is the real battleground between the investor and consumer. It is from this part of the business that the chief difference between the parties as to a proper rate base arises.

It is necessary to a 'reasonable' price for gas that it be anchored to a rate base of any kind? Why did courts in the first place begin valuing 'rate bases' in order to 'value' something else? The method came into vogue \*648 in fixing rates for transportation service which the public obtained from common carriers. The public received none of the carriers' physical property but did make some use of it. The carriage was often a monopoly so there were no open market criteria as to reasonableness. The 'value' or 'cost' of what was put to use in the service by the carrier was not a remote or irrelevant consideration in making such rates. Moreover the difficulty of appraising an intangible service was thought to be simplified if it could be related to physical property which was visible and measurable and the items of which might have market value. The court hoped to reason from the known to the unknown. But gas fields turn this method topsy turvy. Gas itself is tangible, possessible, and does have a market and a price in the field. The value of the rate base is more elusive than that of gas. It consists of intangibles—leaseholds and freeholds—operated and unoperated—of little use in themselves except as rights to reach and capture gas. Their value lies almost wholly in predictions of discovery, and of price of gas when captured, and bears little relation to

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

cost of tools and supplies and labor to develop it. Gas is what Hope sells and it can be directly priced more reasonably and easily and accurately than the components of a rate base can be valued. Hence the reason for resort to a roundabout way of rate base price fixing does not exist in the case of gas in the field.

But if found, and by whatever method found, a rate base is little help in determining reasonableness of the price of gas. Appraisal of present value of these intangible rights to pursue fugitive gas depends on the value assigned to the gas when captured. The 'present fair value' rate base, generally in ill repute,<sup>43</sup> is not even **\*\*310** urged by the gas company for valuing its fields.

**\*649** The prudent investment theory has relative merits in fixing rates for a utility which creates its service merely by its investment. The amount and quality of service rendered by the usual utility will, at least roughly, be measured by the amount of capital it puts into the enterprise. But it has no rational application where there is no such relationship between investment and capacity to serve. There is no such relationship between investment and amount of gas produced. Let us assume that Doe and Roe each produces in West Virginia for delivery to Cleveland the same quantity of natural gas per day. Doe, however, through luck or foresight or whatever it takes, gets his gas from investing \$50,000 in leases and drilling. Roe drilled poorer territory, got smaller wells, and has invested \$250,000. Does anybody imagine that Roe can get or ought to get for his gas five times as much as Doe because he has spent five times as much? The service one renders to society in the gas business is measured by what he gets out of the ground, not by what he puts into it, and there is little more relation between the investment and the results than in a game of poker.

Two-thirds of the gas Hope handles it buys from about 340 independent producers. It is obvious that the principle of rate-making applied to Hope's own gas cannot be applied, and has not been applied, to the bulk of the gas Hope delivers. It is not probable that the investment of any two of these producers will bear the same ratio to their investments. The gas, however, all goes to the same use, has the same utilization value and the same ultimate price.

To regulate such an enterprise by indiscriminately transplanting any body of rate doctrine conceived and **\*650** adapted to the ordinary utility business can serve the 'public interest' as the Natural Gas Act requires, if at all, only by accident. Mr. Justice Brandeis, the pioneer juristic

advocate of the prudent investment theory for man-made utilities, never, so far as I am able to discover, proposed its application to a natural gas case. On the other hand, dissenting in *Commonwealth of Pennsylvania v. West Virginia*, he reviewed the problems of gas supply and said, 'In no other field of public service regulation is the controlling body confronted with factors so baffling as in the natural gas industry, and in none is continuous supervision and control required in so high a degree.' 262 U.S. 553, 621, 43 S.Ct. 658, 674, 67 L.Ed. 1117, 32 A.L.R. 300. If natural gas rates are intelligently to be regulated we must fit our legal principles to the economy of the industry and not try to fit the industry to our books.

As our decisions stand the Commission was justified in believing that it was required to proceed by the rate base method even as to gas in the field. For this reason the Court may not merely wash its hands of the method and rationale of rate making. The fact is that this Court, with no discussion of its fitness, simply transferred the rate base method to the natural gas industry. It happened in *Newark Natural Gas & Fuel Co. v. City of Newark, Ohio*, 1917, 242 U.S. 405, 37 S.Ct. 156, 157, 61 L.Ed. 393, Ann.Cas.1917B, 1025, in which the company wanted 25 cents per m.c.f., and under the Fourteenth Amendment challenged the reduction to 18 cents by ordinance. This Court sustained the reduction because the court below 'gave careful consideration to the questions of the value of the property \* \* \* at the time of the inquiry,' and whether the rate 'would be sufficient to provide a fair return on the value of the property.' The Court said this method was 'based upon principles thoroughly established by repeated decisions of this court,' citing many cases, not one of which involved natural gas or a comparable wasting natural resource. Then came issues as to state power to **\*651** regulate as affected by the commerce clause. *Public Utilities Commission v. Landon*, 1919, 249 U.S. 236, 39 S.Ct. 268, 63 L.Ed. 577; *Pennsylvania Gas Co. v. Public Service Commission*, 1920, 252 U.S. 23, 40 S.Ct. 279, 64 L.Ed. 434. These questions settled, the Court again was called upon in natural gas cases to consider state rate-making claimed to be invalid under the Fourteenth Amendment. *United Fuel Gas Co. v. Railroad Commission of Kentucky*, 1929, 278 U.S. 300, 49 S.Ct. 150, 73 L.Ed. 390; *United Fuel Gas Company v. Public Service Commission of West Virginia*, 1929, 278 U.S. 322, 49 S.Ct. 157, 73 L.Ed. 402. Then, as now, the differences were 'due **\*\*311** chiefly to the difference in value ascribed by each to the gas rights and leaseholds.' 278 U.S. 300, 311, 49 S.Ct. 150, 153, 73 L.Ed. 390. No one seems to have questioned that the rate base method must be pursued and the controversy was at what rate base must be used. Later

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

the 'value' of gas in the field was questioned in determining the amount a regulated company should be allowed to pay an affiliate therefor—a state determination also reviewed under the Fourteenth Amendment. *Dayton Power & Light Co. v. Public Utilities Commission of Ohio*, 1934, 292 U.S. 290, 54 S.Ct. 647, 78 L.Ed. 1267; *Columbus Gas & Fuel Co. v. Public Utilities Commission of Ohio*, 1934, 292 U.S. 398, 54 S.Ct. 763, 78 L.Ed. 1327, 91 A.L.R. 1403. In both cases, one of which sustained, and one of which struck down a fixed rate the Court assumed the rate base method, as the legal way of testing reasonableness of natural gas prices fixed by public authority, without examining its real relevancy to the inquiry.

Under the weight of such precedents we cannot expect the Commission to initiate economically intelligent methods of fixing gas prices. But the Court now faces a new plan of federal regulation based on the power to fix the price at which gas shall be allowed to move in interstate commerce. I should now consider whether these rules devised under the Fourteenth Amendment are the exclusive tests of a just and reasonable rate under the federal statute, inviting reargument directed to that point \*652 if necessary. As I see it now I would be prepared to hold that these rules do not apply to a natural gas case arising under the Natural Gas Act.

Such a holding would leave the Commission to fix the price of gas in the field as one would fix maximum prices of oil or milk or coal, or any other commodity. Such a price is not calculated to produce a fair return on the synthetic value of a rate base of any individual producer, and would not undertake to assure a fair return to any producer. The emphasis would shift from the producer to the product, which would be regulated with an eye to average or typical producing conditions in the field.

Such a price fixing process on economic lines would offer little temptation to the judiciary to become back seat drivers of the price fixing machine. The unfortunate effect of judicial intervention in this field is to divert the attention of those engaged in the process from what is economically wise to what is legally permissible. It is probable that price reductions would reach economically unwise and self-defeating limits before they would reach constitutional ones. Any constitutional problems growing out of price fixing are quite different than those that have heretofore been considered to inhere in rate making. A producer would have difficulty showing the invalidity of such a fixed price so long as he voluntarily continued to sell his product in interstate commerce. Should he withdraw and other authority be invoked to compel him to part with his property, a different problem would be presented.

Allowance in a rate to compensate for gas removed from gas lands, whether fixed as of point of production or as of point of delivery, probably best can be measured by a functional test applied to the whole industry. For good or ill we depend upon private enterprise to exploit these natural resources for public consumption. The function which an allowance for gas in the field should perform \*653 for society in such circumstances is to be enough and no more than enough to induce private enterprise completely and efficiently to utilize gas resources, to acquire for public service any available gas or gas rights and to deliver gas at a rate and for uses which will be in the future as well as in the present public interest.

The Court fears that 'if we are now to tell the Commission to fix the rates so as to discourage particular uses, we would indeed be injecting into a rate case a 'novel' doctrine \* \* \*.' With due deference I suggest that there is nothing novel in the idea that any change in price of a service or commodity reacts to encourage or discourage its use. The question is not whether such consequences will or will not follow; the question is whether effects must be suffered blindly or may be intelligently selected, whether price control shall have targets at which it deliberately aims or shall be handled like a gun in the hands of one who does not know it is loaded.

We should recognize 'price' for what it is—a tool, a means, an expedient. In public \*\*312 hands it has much the same economic effects as in private hands. Hope knew that a concession in industrial price would tend to build up its volume of sales. It used price as an expedient to that end. The Commission makes another cut in that same price but the Court thinks we should ignore the effect that it will have on exhaustion of supply. The fact is that in natural gas regulation price must be used to reconcile the private property right society has permitted to vest in an important natural resource with the claims of society upon it—price must draw a balance between wealth and welfare.

To carry this into techniques of inquiry is the task of the Commissioner rather than of the judge, and it certainly is no task to be solved by mere bookkeeping but requires the best economic talent available. There would doubtless be inquiry into the price gas is bringing in the \*654 field, how far that price is established by arms' length bargaining and how far it may be influenced by agreements in restraint of trade or monopolistic influences. What must Hope really pay to get and to replace gas it delivers under this order? If it should get more or less than that for its own, how much and why? How far are such prices influenced by pipe line access to markets

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

and if the consumers pay returns on the pipe lines how far should the increment they cause go to gas producers? East Ohio is itself a producer in Ohio.<sup>44</sup> What do Ohio authorities require Ohio consumers to pay for gas in the field? Perhaps these are reasons why the Federal Government should put West Virginia gas at lower or at higher rates. If so what are they? Should East Ohio be required to exploit its half million acres of unoperated reserve in Ohio before West Virginia resources shall be supplied on a devalued basis of which that State complains and for which she threatens measures of self keep? What is gas worth in terms of other fuels it displaces?

A price cannot be fixed without considering its effect on the production of gas. Is it an incentive to continue to exploit vast unoperated reserves? Is it conducive to deep drilling tests the result of which we may know only after trial? Will it induce bringing gas from afar to supplement or even to substitute for Appalachian gas?<sup>45</sup> Can it be had from distant fields as cheap or cheaper? If so, that competitive potentiality is certainly a relevant consideration. Wise regulation must also consider, as a private buyer would, what alternatives the producer has \*655 if the price is not acceptable. Hope has intrastate business and domestic and industrial customers. What can it do by way of diverting its supply to intrastate sales? What can it do by way of disposing of its operated or reserve acreage to industrial concerns or other buyers? What can West Virginia do by way of conservation laws, severance or other taxation, if the regulated rate offends? It must be borne in mind that while West Virginia was prohibited from giving her own inhabitants a priority that discriminated against interstate commerce, we have never yet held that a good faith conservation act, applicable to her own, as well as to others, is not valid. In considering alternatives, it must be noted that federal regulation is very incomplete, expressly excluding regulation of 'production or gathering of natural gas,' and that the only present way to get the gas seems to be to call it forth by price inducements. It is plain that there is a downward economic limit on a safe and wise price.

But there is nothing in the law which compels a commission to fix a price at that 'value' which a company might give to its product by taking advantage of scarcity, or monopoly of supply. The very purpose of fixing maximum prices is to take away from the seller his opportunity to get all that otherwise the market would award him for his goods. This is a constitutional use of the power to fix maximum prices, \*\*313 *Block v. Hirsh*, 256 U.S. 135, 41 S.Ct. 458, 65 L.Ed. 865, 16 A.L.R. 165; *Marcus Brown Holding Co. v. Feldman*, 256 U.S. 170, 41 S.Ct. 465, 65 L.Ed. 877; *International*

*Harvester Co. v. Kentucky*, 234 U.S. 216, 34 S.Ct. 853, 58 L.Ed. 1284; *Highland v. Russell Car & Snow Plow Co.*, 279 U.S. 253, 49 S.Ct. 314, 73 L.Ed. 688, just as the fixing of minimum prices of goods in interstate commerce is constitutional although it takes away from the buyer the advantage in bargaining which market conditions would give him. *United States v. Darby*, 312 U.S. 100, 657, 61 S.Ct. 451, 85 L.Ed. 609, 132 A.L.R. 1430; *Mulford v. Smith*, 307 U.S. 38, 59 S.Ct. 648, 83 L.Ed. 1092; *United States v. Rock Royal Co-operative, Inc.*, 307 U.S. 533, 59 S.Ct. 993, 83 L.Ed. 1446; *Sunshine Anthracite Coal Co. v. Adkins*, 310 U.S. 381, 60 S.Ct. 907, 84 L.Ed. 1263. The Commission has power to fix \*656 a price that will be both maximum and minimum and it has the incidental right, and I think the duty, to choose the economic consequences it will promote or retard in production and also more importantly in consumption, to which I now turn.

If we assume that the reduction in company revenues is warranted we then come to the question of translating the allowed return into rates for consumers or classes of consumers. Here the Commission fixed a single rate for all gas delivered irrespective of its use despite the fact that Hope has established what amounts to two rates—a high one for domestic use and a lower one for industrial contracts.<sup>46</sup> The Commission can fix two prices for interstate gas as readily as one—a price for resale to domestic users and another for resale to industrial users. This is the pattern Hope itself has established in the very contracts over which the Commission is expressly given jurisdiction. Certainly the Act is broad enough to permit two prices to be fixed instead of one, if the concept of the 'public interest' is not unduly narrowed.

The Commission's concept of the public interest in natural gas cases which is carried today into the Court's opinion was first announced in the opinion of the minority in the Pipeline case. It enumerated only two 'phases of the public interest: (1) the investor interest; (2) the consumer interest,' which it emphasized to the exclusion of all others. 315 U.S. 575, 606, 62 S.Ct. 736, 753, 86 L.Ed. 1037. This will do well enough in dealing with railroads or utilities supplying manufactured gas, electric, power, a communications service or transportation, where utilization of facilities does not impair their future usefulness. Limitation of supply, however, brings into a natural gas case another phase of the public interest that to my mind overrides both the owner \*657 and the consumer of that interest. Both producers and industrial consumers have served their immediate private interests at the expense of the long-range public interest. The public interest, of course, requires stopping unjust enrichment of the owner.

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

But it also requires stopping unjust impoverishment of future generations. The public interest in the use by Hope's half million domestic consumers is quite a different one from the public interest in use by a baker's dozen of industries.

Prudent price fixing it seems to me must at the very threshold determine whether any part of an allowed return shall be permitted to be realized from sales of gas for resale for industrial use. Such use does tend to level out daily and seasonal peaks of domestic demand and to some extent permits a lower charge for domestic service. But is that a wise way of making gas cheaper when, in comparison with any substitute, gas is already a cheap fuel? The interstate sales contracts provide that at times when demand is so great that there is not enough gas to go around domestic users shall first be served. Should the operation of this preference await the day of actual shortage? Since the propriety of a preference seems conceded, should it not operate to prevent the coming of a shortage as well as to mitigate its effects? Should industrial use jeopardize tomorrow's service to householders any more than today's? If, however, it is decided to cheapen domestic use by resort to industrial sales, should they be limited to the few uses **\*\*314** for which gas has special values or extend also to those who use it only because it is cheaper than competitive fuels?<sup>47</sup> And how much cheaper should industrial **\*658** gas sell than domestic gas, and how much advantage should it have over competitive fuels? If industrial gas is to contribute at all to lowering domestic rates, should it not be made to contribute the very maximum of which it is capable, that is, should not its price be the highest at which the desired volume of sales can be realized?

If I were to answer I should say that the household rate should be the lowest that can be fixed under commercial conditions that will conserve the supply for that use. The lowest probable rate for that purpose is not likely to speed exhaustion much, for it still will be high enough to induce economy, and use for that purpose has more nearly reached the saturation point. On the other hand the demand for industrial gas at present rates already appears to be increasing. To lower further the industrial rate is merely further to subsidize industrial consumption and speed depletion. The impact of the flat reduction **\*659** of rates ordered here admittedly will be to increase the industrial advantages of gas over competing fuels and to increase its use. I think this is not, and there is no finding by the Commission that it is, in the public interest.

There is no justification in this record for the present discrimination against domestic users of gas in favor of industrial users. It is one of the evils against which the

Natural Gas Act was aimed by Congress and one of the evils complained of here by Cleveland and Akron. If Hope's revenues should be cut by some \$3,600,000 the whole reduction is owing to domestic users. If it be considered wise to raise part of Hope's revenues by industrial purpose sales, the utmost possible revenue should be raised from the least consumption of gas. If competitive relationships to other fuels will permit, the industrial price should be substantially advanced, not for the benefit of the Company, but the increased revenues from the advance should be applied to reduce domestic rates. For in my opinion the 'public interest' requires that the great volume of gas now being put to uneconomic industrial use should either be saved for its more important future domestic use or the present domestic user should have the full benefit of its exchange value in reducing his present rates.

Of course the Commission's power directly to regulate does not extend to the fixing of rates at which the local company shall sell to consumers. Nor is such power required to accomplish the purpose. As already pointed out, the very contract the Commission is altering classifies the gas according to the purposes for which it is to be resold and provides differentials between the two classifications. It would only be necessary for the Commission to order **\*\*315** that all gas supplied under paragraph (a) of Hope's contract with the East Ohio Company shall be **\*660** at a stated price fixed to give to domestic service the entire reduction herein and any further reductions that may prove possible by increasing industrial rates. It might further provide that gas delivered under paragraph (b) of the contract for industrial purposes to those industrial customers Hope has approved in writing shall be at such other figure as might be found consistent with the public interest as herein defined. It is too late in the day to contend that the authority of a regulatory commission does not extend to a consideration of public interests which it may not directly regulate and a conditioning of its orders for their protection. [Interstate Commerce Commission v. Railway Labor Executives Ass'n](#), 315 U.S. 373, 62 S.Ct. 717, 86 L.Ed. 904; [United States v. Lowden](#), 308 U.S. 225, 60 S.Ct. 248, 84 L.Ed. 208.

Whether the Commission will assert its apparently broad statutory authorization over prices and discriminations is, of course, its own affair, not ours. It is entitled to its own notion of the 'public interest' and its judgment of policy must prevail. However, where there is ground for thinking that views of this Court may have constrained the Commission to accept the rate-base method of decision and a particular single formula as 'all important' for a rate base, it is appropriate

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**  
51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

to make clear the reasons why I, at least, would not be so understood. The Commission is free to face up realistically to the nature and peculiarity of the resources in its control, to foster their duration in fixing price, and to consider future interests in addition to those of investors and present consumers. If we return this case it may accept or decline the proffered freedom. This problem presents the Commission an unprecedented opportunity if it will boldly make sound

economic considerations, instead of legal and accounting theories, the foundation of federal policy. I would return the case to the Commission and thereby be clearly quit of what now may appear to be some responsibility for perpetrating a shortsighted pattern of natural gas regulation.

**Footnotes**

- 1 Hope produces about one-third of its annual gas requirements and purchases the rest under some 300 contracts.
- 2 These five companies are the East Ohio Gas Co., the Peoples Natural Gas Co., the River Gas Co., the Fayette County Gas Co., and the Manufacturers Light & Heat Co. The first three of these companies are, like Hope, subsidiaries of Standard Oil Co. (N.J.). East Ohio and River distribute gas in Ohio, the other three in Pennsylvania. Hope's approximate sales in m.c.f. for 1940 may be classified as follows:

Local West Virginia	
sales.....	11,000,000
East Ohio.....	40,000,000
Peoples.....	10,000,000
River.....	400,000
Fayette.....	860,000
Manufacturers.....	2,000,000

- Local West Virginia  
Hope's natural gas is processed by Hope Construction & Refining Co., an affiliate, for the extraction of gasoline and butane. Domestic Coke Corp., another affiliate, sells coke-oven gas to Hope for boiler fuel.
- 3 These required minimum reductions of 7¢ per m.c.f. from the 36.5¢ and 35.5¢ rates previously charged East Ohio and Peoples, respectively, and 3¢ per m.c.f. from the 31.5¢ rate previously charged Fayette and Manufacturers.
- 4 The book reserve for interstate plant amounted at the end of 1938 to about \$18,000,000 more than the amount determined by the Commission as the proper reserve requirement. The Commission also noted that 'twice in the past the company has transferred amounts aggregating \$7,500,000 from the depreciation and depletion reserve to surplus. When these latter adjustments are taken into account, the excess becomes \$25,500,000, which has been exacted from the ratepayers over and above the amount required to cover the consumption of property in the service rendered and thus to keep the investment unimpaired.' 44 P.U.R.,N.S., at page 22.
- 5 That contention was based on the fact that 'every single dollar in the depreciation and depletion reserves' was taken 'from gross operating revenues whose only source was the amounts charged customers in the past for natural gas. It is, therefore, a fact that the depreciation and depletion reserves have been contributed by the customers and do not represent any investment by Hope.' Id., 44 P.U.R.,N.S., at page 40. And see [Railroad Commission v. Cumberland Tel. & T. Co.](#), 212 U.S. 414, 424, 425, 29 S.Ct. 357, 361, 362, 53 L.Ed. 577; 2 Bonbright, Valuation of Property (1937), p. 1139.
- 6 The Commission noted that the case was 'free from the usual complexities involved in the estimate of gas reserves because the geologists for the company and the Commission presented estimates of the remaining recoverable gas reserves which were about one per cent apart.' 44 P.U.R.,N.S., at pages 19, 20.  
The Commission utilized the 'straight-line-basis' for determining the depreciation and depletion reserve requirements. It used estimates of the average service lives of the property by classes based in part on an inspection of the physical condition of the property. And studies were made of Hope's retirement experience and maintenance policies over the years. The average service lives of the various classes of property were converted into depreciation rates and then applied to the cost of the property to ascertain the portion of the cost which had expired in rendering the service.  
The record in the present case shows that Hope is on the lookout for new sources of supply of natural gas and is contemplating an extension of its pipe line into Louisiana for that purpose. The Commission recognized in fixing the rates of depreciation that much material may be used again when various present sources of gas supply are exhausted, thus giving that property more than scrap value at the end of its present use.
- 7 See Uniform System of Accounts prescribed for Natural Gas Companies effective January 1, 1940, Account No. 332.1.

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

- 8 Sec. 6 of the Act comes the closest to supplying any definite criteria for rate making. It provides in subsection (a) that, 'The Commission may investigate the ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property.' Subsection (b) provides that every natural-gas company on request shall file with the Commission a statement of the 'original cost' of its property and shall keep the Commission informed regarding the 'cost' of all additions, etc.
- 9 We recently stated that the meaning of the word 'value' is to be gathered 'from the purpose for which a valuation is being made. Thus the question in a valuation for rate making is how much a utility will be allowed to earn. The basic question in a valuation for reorganization purposes is how much the enterprise in all probability can earn.' [Institutional Investors v. Chicago, M., St. P. & P.R. Co.](#), 318 U.S. 523, 540, 63 S.Ct. 727, 738.
- 10 Chief Justice Hughes said in that case ([292 U.S. at pages 168, 169, 54 S.Ct. at page 665, 78 L.Ed. 1182](#)): 'If the predictions of service life were entirely accurate and retirements were made when and as these predictions were precisely fulfilled, the depreciation reserve would represent the consumption of capital, on a cost basis, according to the method which spreads that loss over the respective service periods. But if the amounts charged to operating expenses and credited to the account for depreciation reserve are excessive, to that extent subscribers for the telephone service are required to provide, in effect, capital contributions, not to make good losses incurred by the utility in the service rendered and thus to keep its investment unimpaired, but to secure additional plant and equipment upon which the utility expects a return.'
- 11 See Mr. Justice Brandeis (dissenting) in [United Railways & Electric Co. v. West](#), 280 U.S. 234, 259—288, 50 S.Ct. 123, 128—138, 74 L.Ed. 390, for an extended analysis of the problem.
- 12 It should be noted that the Act provides no specific rule governing depletion and depreciation. Sec. 9(a) merely states that the Commission 'may from time to time ascertain and determine, and by order fix, the proper and adequate rates of depreciation and amortization of the several classes of property of each natural-gas company used or useful in the production, transportation, or sale of natural gas.'
- 13 See Simonton, *The Nature of the Interest of the Grantee Under an Oil and Gas Lease* (1918), 25 W.Va.L.Quar. 295.

- 20 The power to investigate and ascertain the 'actual legitimate cost' of property (s 6), the requirement as to books and records (s 8), control over rates of depreciation (s 9), the requirements for periodic and special reports (s 10), the broad powers of investigation (s 14) are among the chief powers supporting the rate making function.
- 21 Apart from the grandfather clause contained in s 7(c), there is the provision of s 7(f) that a natural gas company may enlarge or extend its facilities with the 'service area' determined by the Commission without any further authorization.
- 22 See P.L. 117, approved July 7, 1943, 57 Stat. 383 containing an 'Interstate Compact to Conserve Oil and Gas' between Oklahoma, Texas, New Mexico, Illinois, Colorado, and Kansas.
- 23 As we have pointed out, s 7(c) was amended by the Act of February 7, 1942, 56 Stat. 83, so as to require certificates of public convenience and necessity not only where the extensions were being made to markets in which natural gas was already being sold by another company but to other situations as well. Considerations of conservation entered into the proposal to give the Act that broader scope. H.Rep.No. 1290, 77th Cong. 1st Sess., pp. 2, 3. And see Annual Report, Federal Power Commission (1940) pp. 79, 80; Baum, *The Federal Power Commission and State Utility Regulation* (1942), p. 261.
- The bill amending s 7(c) originally contained a subsection (h) reading as follows: 'Nothing contained in this section shall be construed to affect the authority of a State within which natural gas is produced to authorize or require the construction or extension of facilities for the transportation and sale of such gas within such State: Provided, however, That the Commission, after a hearing upon complaint or upon its own motion, may by order forbid any intrastate construction or extension by any natural-gas company which it shall find will prevent such company from rendering adequate service to its customers in interstate or foreign commerce in territory already being served.' See Hearings on H.R. 5249, House

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

Committee on Interstate & Foreign Commerce, 77th Cong., 1st Sess., pp. 7, 11, 21, 29, 32, 33. In explanation of its deletion the House Committee Report stated, pp. 4, 5: 'The increasingly important problems raised by the desire of several States to regulate the use of the natural gas produced therein in the interest of consumers within such States, as against the Federal power to regulate interstate commerce in the interest of both interstate and intrastate consumers, are deemed by the committee to warrant further intensive study and probably a more retailed and comprehensive plan for the handling thereof than that which would have been provided by the stricken subsection.'

24 We have noted that in the annual operating expenses of some \$16,000,000 the Commission included West Virginia and federal taxes. And in the net increase of \$421,160 over 1940 operating expenses allowed by the Commission was some \$80,000 for increased West Virginia property taxes. The adequacy of these amounts has not been challenged here.

25 The Commission included in the aggregate annual operating expenses which it allowed some \$8,500,000 for gas purchased. It also allowed about \$1,400,000 for natural gas production and about \$600,000 for exploration and development.

It is suggested, however, that the Commission in ascertaining the cost of Hope's natural gas production plant proceeded contrary to s 1(b) which provides that the Act shall not apply to 'the production or gathering of natural gas'. But such valuation, like the provisions for operating expenses, is essential to the rate-making function as customarily performed in this country. Cf. Smith, *The Control of Power Rates in the United States and England* (1932), 159 *The Annals* 101. Indeed s 14(b) of the Act gives the Commission the power to 'determine the propriety and reasonableness of the inclusion in operating expenses, capital, or surplus of all delay rentals or other forms of rental or compensation for unoperated lands and leases.'

26 See note 25, supra.

27 The Commission has expressed doubts over its power to fix rates on 'direct sales to industries' from interstate pipelines as distinguished from 'sales for resale to the industrial customers of distributing companies.' Annual Report, Federal Power Commission (1940), p. 11.

28 Sec. 1(b) of the Act provides: 'The provisions of this Act shall apply to the transportation of natural gas in interstate commerce, to the sale in interstate commerce of natural gas for resale for ultimate public consumption for domestic, commercial, industrial, or any other use, and to natural-gas companies engaged in such transportation or sale, but shall not apply to any other transportation or sale of natural gas or to the local distribution of natural gas or to the facilities used for such distribution or to the production or gathering of natural gas.' And see s 2(6), defining a 'natural-gas company', and H.Rep.No. 709, supra, pp. 2, 3.

29 The wasting-asset characteristic of the industry was recognized prior to the Act as requiring the inclusion of a depletion allowance among operating expenses. See *Columbus Gas & Fuel Co. v. Public Utilities Commission*, 292 U.S. 398, 404, 405, 54 S.Ct. 763, 766, 767, 78 L.Ed. 1327, 91 A.L.R. 1403. But no such theory of rate-making for natural gas companies as is now suggested emerged from the cases arising during the earlier period of regulation.

30 The Commission has been alert to the problems of conservation in its administration of the Act. It has indeed suggested that it might be wise to restrict the use of natural gas 'by functions rather than by areas.' Annual Report (1940) p. 79.

The Commission stated in that connection that natural gas was particularly adapted to certain industrial uses. But it added that the general use of such gas 'under boilers for the production of steam' is 'under most circumstances of very questionable social economy.' *Ibid*.

31 The argument is that s 4(a) makes 'unlawful' the charging of any rate that is not just and reasonable. And s 14(a) gives the Commission power to investigate any matter 'which it may find necessary or proper in order to determine whether any person has violated' any provision of the Act. Moreover, s 5(b) gives the Commission power to investigate and determine the cost of production or transportation of natural gas in cases where it has 'no authority to establish a rate governing the transportation or sale of such natural gas.' And s 17(c) directs the Commission to 'make available to the several State commissions such information and reports as may be of assistance in State regulation of natural-gas companies.' For a discussion of these points by the Commission see 44 P.U.R.,N.S., at pages 34, 35.

1 Natural Gas Act, s 4(a), 52 Stat. 821, 822, 15 U.S.C. s 717c(a), 15 U.S.C.A. s 717c(a).

2 52 Stat. 821, 824, 15 U.S.C. s 717e, 15 U.S.C.A. s 717e:

'(a) The Commission may investigate and ascertain the actual legitimate cost of the property of every natural-gas company, the depreciation therein, and, when found necessary for rate-making purposes, other facts which bear on the determination of such cost or depreciation and the fair value of such property.

'(b) Every natural-gas company upon request shall file with the Commission an inventory of all or any part of its property and a statement of the original cost thereof, and shall keep the Commission informed regarding the cost of all additions, betterments, extensions, and new construction.'

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

- 3 'Reproduction cost' has been variously defined, but for rate making purposes the most useful sense seems to be, the minimum amount necessary to create at the time of the inquiry a modern plant capable of rendering equivalent service. See I Bonbright, *Valuation of Property* (1937) 152. Reproduction cost as the cost of building a replica of an obsolescent plant is not of real significance.
- 'Prudent investment' is not defined by the Court. It may mean the sum originally put in the enterprise, either with or without additional amounts from excess earnings reinvested in the business.
- 4 It is of no more than bookkeeping significance whether the Commission allows a rate of return commensurate with the risk of the original investment or the lower rate based on current risk and a capitalization reflecting the established earning power of a successful company and the probable cost of duplicating its services. Cf. *American T. & T. Co. v. United States*, 299 U.S. 232, 57 S.Ct. 170, 81 L.Ed. 142. But the latter is the traditional method.
- 1 315 U.S. 575, 62 S.Ct. 736, 86 L.Ed. 1037.
- 2 Judge Dobie, dissenting below, pointed out that the majority opinion in the Pipeline case 'contains no express discussion of the Prudent Investment Theory' and that the concurring opinion contained a clear one, and said, 'It is difficult for me to believe that the majority of the Supreme Court, believing otherwise, would leave such a statement unchallenged.' (134 F.2d 287, 312.) The fact that two other Justices had as matter of record in our books long opposed the reproduction cost theory of rate bases and had commented favorably on the prudent investment theory may have influenced that conclusion. See opinion of Mr. Justice Frankfurter in *Driscoll v. Edison Light & Power Co.*, 307 U.S. 104, 122, 59 S.Ct. 715, 724, 83 L.Ed. 1134, and my brief as Solicitor General in that case. It should be noted, however, that these statements were made, not in a natural gas case, but in an electric power case—a very important distinction, as I shall try to make plain.
- 3 Natural gas from the Appalachian field averages about 1050 to 1150 B.T.U. content, while by-product manufactured gas is about 530 to 540. Moody's Manual of Public Utilities (1943) 1350; Youngberg, *Natural Gas* (1930) 7.

Railroad Commission*, 278 U.S. 300, 308, 49 S.Ct. 150, 152, 73 L.Ed. 390.
- 21 The New York Public Service Commission said: 'While the transportation of natural gas through pipe lines from one state to another state is interstate commerce \* \* \*, Congress has not taken over the regulation of that particular industry. Indeed,

Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

- it has expressly excepted it from the operation of the Interstate Commerce Commissions Law (Interstate Commerce Commissions Law, section 1). It is quite clear, therefore, that this Commission can not require a Pennsylvania corporation producing gas in Pennsylvania to transport it and deliver it in the State of New York, and that the Interstate Commerce Commission is likewise powerless. If there exists such a power, and it seems that there does, it is a power vested in Congress and by it not yet exercised. There is no available source of supply for the Crystal City Company at present except through purchasing from the Porter Gas Company. It is possible that this Commission might fix a price at which the Potter Gas Company should sell if it sold at all, but as the Commission can not require it to supply gas in the State of New York, the exercise of such a power to fix the price, if such power exists, would merely say, sell at this price or keep out of the State.' Lane v. Crystal City Gas Co., 8 New York Public Service Comm.Reports, Second District, 210, 212.
- 22 Proclamation by the President of September 16, 1918; Rules and Regulations of H. A. Garfield, Fuel Administrator, September 24, 1918.
- 23 For example, the Iroquois Gas Corporation which formerly served Buffalo, New York, with natural gas ranging from 1050 to 1150 b.t.u. per cu. ft., now mixes a by-product gas of between 530 and 540 b.t.u. in proportions to provide a mixed gas of about 900 b.t.u. per cu. ft. For space heating or water heating its charges range from 65 cents for the first m.c.f. per month to 55 cents for all above 25 m.c.f. per month. Moody's Manual of Public Utilities (1943) 1350.
- 24 The United States Fuel Administration made the following cooking value comparisons, based on tests made in the Department of Home Economics of Ohio State University:  
Natural gas at 1.12 per M. is equivalent to coal at \$6.50 per ton.  
Natural gas at 2.00 per M. is equivalent to gasoline at 27¢ per gal.  
Natural gas at 2.20 per M. is equivalent to electricity at 3¢ per k.w.h.  
Natural gas at 2.40 per M. is equivalent to coal oil at 15¢ per gal.  
Use and Conservation of Natural Gas, issued by U.S. Fuel Administration (1918) 5.
- 25 See Brief on Behalf of Legislation Imposing an Excise Tax on Natural Gas, submitted to N.R.A. by the United Mine Workers of America and the National Coal Association.

- 27 From the source quoted in the preceding note the spread elsewhere is shown to be:

State	Industrial	Domestic
Illinois.....	29.2	1.678
Louisiana.....	10.4	59.7
Oklahoma.....	11.2	41.5
Texas.....	13.1	59.7
Alabama.....	17.8	1.227
Georgia.....	22.9	1.043

- 28 In Corning, New York, rates were initiated by the Crystal City Gas Company as follows: 70¢ for the first 5,000 cu. ft. per month; 80¢ from 5,000 to 12,000; \$1 for all over 12,000. The Public Service Commission rejected these rates and fixed a flat rate of 58¢ per m.c.f. Lane v. Crystal City Gas Co., 8 New York Public Service Comm. Reports, Second District, 210. The Pennsylvania Gas Company (National Fuel Gas Company group) also attempted a sliding scale rate for New York consumers, net per month as follows: First 5,000 feet, 35¢; second 5,000 feet, 45¢; third 5,000 feet, 50¢; all above 15,000, 55¢. This was eventually abandoned, however. The company's present scale in Pennsylvania appears to be reversed to the following net monthly rate; first 3 m.c.f., 75¢; next 4 m.c.f., 60¢; next 8 m.c.f., 55¢; over 15 m.c.f., 50¢ . Moody's Manual of Public Utilities (1943) 1350. In New York it now serves a mixed gas.  
For a study of effect of sliding scale rates in reducing consumption see 11 Proceedings of Natural Gas Association of America (1919) 287.
- 29 See Report on Utility Corporations by Federal Trade Commission, Sen. Doc. 92, Pt. 84-A, 70th Cong., 1st Sess.
- 30 Four holding company systems control over 55 per cent of all natural gas transmission lines in the United States. They are Columbia Gas and Electric Corporation, Cities Service Co., Electric Bond and Share Co., and Standard Oil Co. of New Jersey. Columbia alone controls nearly 25 per cent, and fifteen companies account for over 80 per cent of the total. Report on Utility Corporations by Federal Trade Commission, Sen. Doc. 92, Pt. 84-A, 70th Cong., 1st Sess., 28.  
In 1915, so it was reported to the Governor of West Virginia, 87 per cent of the total gas production of that state was under control of eight companies. Steptoe and Hoffheimer, Legislative Regulation of Natural Gas Supply in West Virginia, 17 West Virginia Law Quarterly 257, 260. Of these, three were subsidiaries of the Columbia system and others were

39 The list of East Ohio Gas Company's special industrial contracts thus expressly under Hope's control and their demands are as follows:

40 To make a fetish of mere accounting is to shield from examination the deeper causes, forces, movements, and conditions which should govern rates. Even as a recording of current transactions, bookkeeping is hardly an exact science. As a representation of the condition and trend of a business, it uses symbols of certainty to express values that actually are in constant flux. It may be said that in commercial or investment banking or any business extending credit success depends on knowing what not to believe in accounting. Few concerns go into bankruptcy or reorganization whose books do not show them solvent and often even profitable. If one cannot rely on accountancy accurately to disclose past or current conditions of a business, the fallacy of using it as a sole guide to future price policy ought to be apparent. However, our quest for certitude is so ardent that we pay an irrational reverence to a technique which uses symbols of certainty, even though experience again and again warns us that they are delusive. Few writers have ventured to challenge this American idolatry, but see Hamilton, Cost as a standard for Price, 4 Law and Contemporary Problems 321, 323-25. He observes that 'As the apostle would put it, accountancy is all things to all men. \* \* \* Its purpose determines the character of a system of accounts.' He analyzes the hypothetical character of accounting and says 'It was no eternal mold for pecuniary verities handed down from on high. It was—like logic or algebra, or the device of analogy in the law—an ingenious contrivance of the human mind to serve a limited and practical purpose.' 'Accountancy is far from being a pecuniary expression of all that is industrial reality. It is an instrument, highly selective in its application, in the service of the institution of money making.' As to capital account he observes 'In an enterprise in lusty competition with others of its kind, survival is the thing and the system of accounts has its focus in solvency. \* \* \* Accordingly depreciation, obsolescence, and other factors which carry no immediate threat are matters of lesser concern and the capital account is likely to be regarded as a secondary phenomenon. \* \* \* But in an enterprise, such as a public utility, where continued survival seems assured, solvency is likely to be taken for granted. \* \* \* A persistent and ingenious attention is likely to be directed not so much to securing the upkeep of the physical property as to making it certain that capitalization fails in not one whit to give full recognition to every item that should go into the account.'

41 See 2 Bonbright, Valuation of Property (1937) 1112.

42 Bonbright says, '\* \* \* the vice of traditional law lies, not in its adoption of excessively rigid concepts of value and rules of valuation, but rather in its tendency to permit shifts in meaning that are inept, or else that are ill-defined because the judges that make them will not openly admit that they are doing so.' Id., 1170.

43 'The attempt to regulate rates by reference to a periodic or occasional reappraisal of the properties has now been tested long enough to confirm the worst fears of its critics. Unless its place is taken by some more promising scheme of rate control, the days of private ownership under government regulation may be numbered.' 2 Bonbright, Valuation of Property (1937) 1190.

44 East Ohio itself owns natural gas rights in 550,600 acres, 518,526 of which are reserved and 32,074 operated, by 375 wells. Moody's Manual of Public Utilities (1943) 5.

45 Hope has asked a certificate of convenience and necessity to lay 1140 miles of 22-inch pipeline from Hugoton gas fields in southwest Kansas to West Virginia to carry 285 million cu. ft. of natural gas per day. The cost was estimated at \$51,000,000. Moody's Manual of Public Utilities (1943) 1760.

46 I find little information as to the rates for industries in the record and none at all in such usual sources as Moody's Manual.

**Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591 (1944)**

51 P.U.R.(NS) 193, 64 S.Ct. 281, 88 L.Ed. 333

- 47 The Federal Power Commission has touched upon the problem of conservation in connection with an application for a certificate permitting construction of a 1500-mile pipeline from southern Texas to New York City and says: 'The Natural Gas Act as presently drafted does not enable the Commission to treat fully the serious implications of such a problem. The question should be raised as to whether the proposed use of natural gas would not result in displacing a less valuable fuel and create hardships in the industry already supplying the market, while at the same time rapidly depleting the country's natural-gas reserves. Although, for a period of perhaps 20 years, the natural gas could be so priced as to appear to offer an apparent saving in fuel costs, this would mean simply that social costs which must eventually be paid had been ignored. 'Careful study of the entire problem may lead to the conclusion that use of natural gas should be restricted by functions rather than by areas. Thus, it is especially adapted to space and water heating in urban homes and other buildings and to the various industrial heat processes which require concentration of heat, flexibility of control, and uniformity of results. Industrial uses to which it appears particularly adapted include the treating and annealing of metals, the operation of kilns in the ceramic, cement, and lime industries, the manufacture of glass in its various forms, and use as a raw material in the chemical industry. General use of natural gas under boilers for the production of steam is, however, under most circumstances of very questionable social economy.' Twentieth Annual Report of the Federal Power Commission (1940) 79.

Mr. Adam J. Teitzman  
Commission Clerk  
Florida Public Service Commission  
2540 Shumard Oak Boulevard  
Tallahassee, Florida 32399-0850

RE: Undocketed; Peoples Gas System, Inc. (formerly Peoples Gas System, a division of Tampa Electric Company)

Dear Mr. Teitzman:

In accordance with Rule 25-9.044, Florida Administrative Code, Peoples Gas System, Inc., hereby gives notice that effective January 1, 2023, the assets of Peoples Gas System, a division of Tampa Electric Company ("PGS") were transferred into a separate corporation named Peoples Gas System, Inc., which is a wholly owned subsidiary of newly formed gas operations holding company, TECO Gas Operations, Inc., which is a subsidiary of TECO Energy, Inc. TECO Energy, Inc. continues to be a wholly-owned subsidiary of Emera Incorporated.

Peoples Gas System, Inc. hereby adopts, ratifies, and makes its own all rates, rules, classifications and regulations of PGS effective as of January 1, 2023, including, but not limited to, all existing tariffs, special contracts, territorial agreements, and the Stipulation and Settlement Agreement approved by Order No. 2020-0485-FOF-GU, issued December 10, 2020, in Docket Nos. 20200051-GU, 20200166-GU, and 20200178-GU; and the 2020 Storm Agreement, approved by Order No. 2020-0103-PAA-GU, issued April 14, 2020, in Docket. No. 20190109-GU. Peoples Gas System, Inc. will issue and file in its own name the rate schedules and regulations in the PGS tariff as it existed as of December 31, 2022, by a complete reissuance within 30 days of this notice.

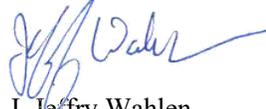

The asset transfer and technical change of control of those assets described in this notice will be seamless to customers. It will not involve substantive changes to the PGS tariff. Customer bills will still be issued in the name of Peoples Gas. The company's customer service operation will remain the same and will use the same physical and mailing addresses, phone numbers, email addresses, and remote access pathways. The company's trucks, uniforms, and signs will not change due to the transaction. Peoples Gas System, Inc. will continue to provide the same high level of award-winning natural gas service to its customers.

Mr. Adam Teitzman  
January 6, 2023  
Page 2

Peoples Gas System, Inc. requests that the Commission administratively update its records to reflect the change of name described in this letter. The persons designated for PGS to receive notices, orders, data requests, and other communications from the Commission, and their contact information (email addresses and phone numbers) will remain the same for Peoples Gas System, Inc.

Questions about this notice may be directed to the undersigned counsel for Peoples Gas System, Inc.

Sincerely,

J. Jeffrey Wahlen

### MATURITY MATCHING OR "SELF-LIQUIDATING," APPROACH

**Maturity Matching, or  
"Self-Liquidating,"  
Approach**  
A financing policy that  
matches asset and liability  
maturities. This is a  
moderate policy.

The **maturity matching**, or "**self-liquidating**," approach calls for matching asset and liability maturities as shown in Panel a of Figure 14-3. This strategy minimizes the risk that the firm will be unable to pay off its maturing obligations. To illustrate, suppose a company borrows on a one-year basis and uses the funds obtained to build and equip a plant. Cash flows from the plant (profits plus depreciation) would not be sufficient to pay off the loan at the end of only one year, so the loan would have to be renewed. If for some reason the lender refused to renew the loan, then the company would have problems. Had the plant been financed with long-term debt, however, the required loan payments would have been better matched with cash flows from profits and depreciation, and the problem of renewal would not have arisen.

At the limit, a firm could attempt to match exactly the maturity structure of its assets and liabilities. Inventory expected to be sold in 30 days could be financed with a 30-day bank loan; a machine expected to last for 5 years could be financed with a 5-year loan; a 20-year building could be financed with a 20-year mortgage bond; and so forth. Actually, of course, two factors prevent this exact maturity matching: (1) there is uncertainty about the lives of assets, and (2) some common equity must be used, and common equity has no maturity. To illustrate the uncertainty factor, a firm might finance inventories with a 30-day loan, expecting to sell the inventories and then use the cash to retire the loan. But if sales were slow, the cash would not be forthcoming, and the use of short-term credit could end up causing a problem. Still, if a firm makes an attempt to match asset and liability maturities, we would define this as a moderate current asset financing policy.

In practice, firms don't finance each specific asset with a type of capital that has a maturity equal to the asset's life. However, academic studies do show that most firms tend to finance short-term assets from short-term sources and long-term assets from long-term sources.<sup>16</sup>

### AGGRESSIVE APPROACH

 Students can access various types of historical interest rates, including fixed and variable rates, at the St. Louis Federal Reserve's FRED site. The address is <http://research.stlouisfed.org/fred/>.

Panel b of Figure 14-3 illustrates the situation for a relatively aggressive firm that finances all of its fixed assets with long-term capital and part of its permanent current assets with short-term, nonspontaneous credit. Note that we used the term "relatively" in the title for Panel b because there can be different *degrees* of aggressiveness. For example, the dashed line in Panel b could have been drawn *below* the line designating fixed assets, indicating that all of the permanent current assets and part of the fixed assets were financed with short-term credit; this would be a highly aggressive, extremely nonconservative position, and the firm would be very much subject to dangers from rising interest rates as well as to loan renewal problems. However, short-term debt is often cheaper than long-term debt, and some firms are willing to sacrifice safety for the chance of higher profits.

### CONSERVATIVE APPROACH

Panel c of Figure 14-3 has the dashed line *above* the line designating permanent current assets, indicating that long-term capital is being used to finance all permanent

DOCKET NO. 080318-GU  
PAGE 2

FINAL ORDER GRANTING IN PART AND DENYING IN PART  
PETITION FOR RATE INCREASE

BY THE COMMISSION:

BACKGROUND

This proceeding commenced on August 11, 2008, with the filing of a petition for a permanent rate increase by Peoples Gas System (Peoples, PGS, Utility or Company). The Company is engaged in business as a public utility providing gas service as defined in Section 366.02, Florida Statutes (F.S.), and is subject to the jurisdiction of the Commission. Peoples provides gas service to 338,790 customers in the following counties: Bay, Broward, Charlotte, Clay, Collier, Dade, Duval, Gilchrist, Hernando, Highlands, Hillsborough, Lafayette, Lake Lee, Levy, Liberty, Manatee, Marion, Martin, Orange, Osceola, Palm Beach, Pasco, Pinellas, Polk, Sarasota, Seminole, St. Johns, Sumter, Volusia, Wakulla, and Union. Since the last rate case, Peoples added approximately 100,000 residential and commercial customers.

Peoples requested an increase in its retail rates and charges to generate \$26,488,091 in additional gross annual revenues. This increase would allow the Company to earn an overall rate of return of 8.88 percent or an 11.50 percent return on equity (range 10.50 percent to 12.50 percent). The Company based its request on a projected test year ending December 31, 2009. Peoples stated that this test year is the appropriate period to be utilized because it represents the conditions to be faced by the Company, and is representative of the customer base, investment requirements, throughput levels, and overall cost of service to be realized for the period when the new rates will be in effect.

In Peoples last rate case, it was granted a final revenue increase of \$12,050,000 by Order No. PSC-03-0038-FOF-GU.<sup>1</sup> In that order, the Company's jurisdictional rate base was found to be \$505,441,206 for the projected test year ended December 31, 2003. The allowed rate of return was found to be 8.83 percent for the test year using an 11.25 percent return on equity.

In the instant docket, Peoples was granted an interim revenue increase of \$2,380,000 by Order No. PSC-08-0696-PCO-GU.<sup>2</sup> In that order, the Company's Jurisdictional Adjusted Rate Base was found to be \$515,212,000 for the 2008 interim test year. The allowed overall rate of return was found to be 8.31 percent for the test year using a return on equity (ROE) of 10.25 percent, which is the minimum of the authorized range for an ROE of 11.25 percent from the last rate case.

The Office of Public Counsel (OPC)<sup>3</sup> and Florida Industrial Gas Users (FIGU)<sup>4</sup> intervened in this proceeding.

<sup>1</sup> Issued January 6, 2003, in Docket No. 020384-GU, In re: Petition for rate increase by Peoples Gas System.

<sup>2</sup> Issued October 20, 2008, in Docket No. 080318-GU, In re: Petition for rate increase by Peoples Gas System.

<sup>3</sup> See Order No. PSC-08-0532-PCO-GU, issued August 18, 2008, in Docket No. 080318-GU, In re: Petition for rate increase by Peoples Gas System.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 3

Customer service hearings were held in Panama City on November 7, 2008, and in Jacksonville on November 14, 2008, and no customers attended either service hearing. Customer service hearings were also held in Orlando on January 13, 2009, Tampa and Charlotte County on January 14, 2009, and Hollywood on February 2, 2009. Ten customers presented testimony. There were no complaints related to Peoples' gas service. This order addresses Peoples' requested permanent rate increase. We have jurisdiction pursuant to Sections 366.06(2) and (4), and 366.071, F.S.

## DECISION

### I. APPROVED STIPULATIONS

We have previously approved several stipulated issues, stipulated adjustments, and partially stipulated issues. The stipulated issues are reflected below, as well as in a consolidated list attached as Appendix 1.

### II. TEST PERIOD

At the hearing, witness Cantrell read from PGS's test year letter dated June 12, 2008, that, "[t]he proposed 2009 test year will most accurately reflect the economic conditions during the first 12 months the new rate will be in effect." Witness Cantrell testified that the test year was based on the best projections at that time and not on the current economic conditions. In extensive cross examination, witness Cantrell agreed that the ratepayers throughout the PGS service area were hurting because of the downturn in economic conditions, as a result of job losses and the decline in the real estate market. Witness Cantrell explained that if the Utility filed its MFRs in the current economic climate, the Utility's requested revenue increase would be greater because of a decrease in the projected revenues from the future customers.

The test year letter stated that since the last historical base year, the Consumer Price Index (CPI) has increased more than 17 percent. During cross examination, witness Cantrell emphasized that PGS is receiving more requests for service, for example, the opportunity to extend lines to serve six or seven asphalt plants around PGS's service territory. Witness Cantrell also noted that PGS will provide gas to a steel plant that is coming online south of Ocala. Even though usage per customer has decreased in many segments, PGS sees no drop-off in the commercial sector because of the increase in customers that want natural gas service. OPC pointed out that commercial customers were using less therms of gas because of the slow down in the economic conditions for BPB Celotex, National Gypsum Co., and United States Gypsum Company-D.I.P. At the hearing, witness Cantrell stated that even though United States Gypsum Company used 3.2 million less therms, this would equate only to a \$116,000 decrease in revenues at 3.5 cents per therm.

Witness Cantrell further explained that even though the initial revenue requirement increase was \$15-20 million in the 2008 Business Plan, PGS requested \$26 million because of the economic slow down, the decrease in therm usage, and PGS's revenue forecast. Witness

---

<sup>4</sup> See Order No. PSC-08-0532-PCO-GU, issued August 18, 2008, in Docket No. 080318-GU, In re: Petition for rate increase by Peoples Gas System.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 4

Cantrell further explained that if the case were filed today, the requested revenue increase would be even higher than the \$26 million currently requested.

FIGU asserted that we should exercise caution when using a projected test year that is 18 months from the filing of the test year letter. Section 366.06, F.S., states that we shall only approve rates using the depreciated investment in utility plant that is actually in use and useful in providing service. When the time lag for a projected, test year is too far in the future from the base year, it becomes more difficult to verify the used and useful plant in service that is necessary to comply with Section 366.06, F.S.

The real estate market has deteriorated and unemployment has risen in the PGS service area since the test year letter was filed on June 12, 2008. The current economic climate may improve because of the federal economic stimulus package that will be effective in 2009 and future years.

FIGU asserted that the Florida Administrative Procedures Act requires regulatory agencies to express their governing policies by adopting rules.<sup>5</sup> FIGU further stated that the Commission has rules but their applicability is developed using common law principles on a case by case basis. The current rulings and findings set precedents for future cases with similar issues. Staff believes that the regulatory process, which includes auditing the company, issuing discovery requests, conducting depositions and holding a hearing, would uncover any consequential financial and account excesses that would be represented in the projected 2009 test year.

Based on the above, we find that the historical base year ended December 31, 2007, and the projected test year ending December 31, 2009, as adjusted, reflect the appropriate rate base, cost of capital, and net operating income. Therefore, the historical base year ended December 31, 2007, and the projected test year ending December 31, 2009, are the appropriate test years.

---

<sup>5</sup>Section 120.52(16), F.S., provides that "rule" means each agency's statement of general applicability that implements, interprets, or prescribes law or policy.

DOCKET NO. 080318-GU  
PAGE 5

### III. RATE BASE

#### A. Adjustments to Projected Plant, Accumulated Depreciation, and Depreciation Expense

The Company's MFRs indicated a 13-month average for Plant in Service and Accumulated Depreciation for the 2009 projected test year of \$989,149,922 and \$426,364,359, respectively. PGS asserted that the 2009, 13-month average net Plant in Service, should include approximately \$6.4 million in actual expenditures for 2008.

PGS witness Higgins testified that the factors which contributed to the over six years of growth in rate base included: 1) the increase of about 100,000 new residential and commercial customers, 2) the addition of over 1,500 miles of main to support growth, 3) increased need for maintenance capital expenditures, and 4) significant relocation of facilities due to the rapid expansion of highways and roads throughout the State of Florida.

##### 1. System Expansion

PGS witness Binswanger testified that PGS uses a multi-step decision process to serve new developments. He stated that the Company must first identify the development of gas load potential; secondly, design the distribution main, and finally, design the supply main. He further stated that by establishing the gas load potential, the Company is able to establish the residential and commercial mix, and the timeline for build-out. He contended that the distribution main and service lines size are based on hourly demand for gas. In addition, witness Binswanger testified that the gas load information enables the PGS engineers to properly size the distribution mains and service lines to properly transport gas to customers anytime. He also stated that the size of typical distribution mains range from two inches to four inches, and service lines range in size from three-quarters of an inch to two inches. Furthermore, he stated that the completion of the design of the distribution mains and service lines to serve a development, results in the design criteria for a natural gas distribution system and estimates of construction cost. Additionally, he stated that the natural gas supply main and associated appurtenances connects the development distribution system to the interstate transmission pipeline system or an existing Peoples supply main. In the final step, witness Binswanger further asserted that the supply main design requirements include the length of the main, hourly customer demand, and available gas pressure.

##### 2. Government-Mandated Line Relocation

Witness Binswanger testified that the Company used different government-owned public rights-of-way, including those owned or controlled by the Florida Department of Transportation. He stated that the provisions for public utilities to use the rights-of-way were established by statute, regulation, ordinance, or franchise agreements. He further stated that the Company is required to move any installed mains or service lines under or along public rights-of-way when they are ordered by a governmental entity. He contended that in "most instances" it is at the Company's expense, without reimbursement, to meet its service obligations. In addition, the Company's right to install supply and distribution mains in public rights-of-way is subject to PGS relocating any facilities if conflict develops when work is done by or for governmental entities. He further contended that once PGS receives a relocation order, it means that the

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 6

Company has been put on notice that at some point in the near future, road construction work will begin, and facilities must be relocated. He asserted that contractors/governmental entities could impose fees on the Company if it fails to relocate facilities as required, and the entity/entities miss established deadlines.

According to witness Binswanger, the Company's capital expenditures for government-mandated relocations were \$17.6 million during the period of 2004 through 2007. He contended that PGS did not receive any revenues to recover the associated depreciation and ad valorem tax expense or a return on its investment. He further contended that PGS was granted depreciation expense and a return on government-mandated relocations in its 2003 rate case. He stated the Company is proposing capital expenditures for the 2008 and 2009 projected test year for government-mandated relocations in the amount of \$6.3 million and \$3.8 million, respectively.

### 3. Capital Budget and Expenditures

PGS witness Narzissenfeld testified that the annual capital budget is determined by normal expenditures and capital projects. He stated that normal expenditures are composed of recurring costs required to provide service to new customers, and routine costs associated with the replacement and/or relocation of existing facilities and equipment. He further stated that major projects consist of expansions with cost in excess of \$500,000. He asserted that in the quantification of the annual capital budget, PGS detailed the existing revenue-producing projects that have activity in the current year. He further asserted that the information was then used in the establishment of the capital expenditures by budget category for the next fiscal year. Finally, he contended that the information obtained from the analysis enabled PGS to: 1) forecast new customers; 2) calculate blanket expenditures, such as meter sets and service lines; and 3) main expansion within a development, city, or projected new area. He stated that maintenance capital was forecasted by budget category, which consisted of known projects and historical experience.

According to witness Narzissenfeld, the capital expenditures for 2008 and 2009 are projected to be \$62 and \$60 million, respectively. He stated that for 2008, of the budgeted \$62 million, PGS would use: 1) \$39 million to construct revenue producing facilities for new and existing customers; 2) \$15 million for the replacement or removal of mains and services, improvements to the distribution systems and relocations and replacements to accommodate municipal, state and federal road construction; and 3) \$8 million for improvements to structures, replacement of vehicles, office equipment and communication systems, and other tools and equipment. He described revenue producing facilities as the construction of mains and services, together with installation of metering and pressure regulation stations, control equipment, corrosion prevention systems, and other appurtenances. He further stated that of the budgeted \$60 million for 2009, PGS would use: 1) \$42 million for facilities to serve new and existing customers; 2) \$13 million spent for replacement or removal of mains and services, improvement of the distribution systems, and relocations and replacements to accommodate municipal, state and federal road construction; and 3) \$5 million for improvements to structures, replacement of vehicles, office equipment and communication systems, and other tools and equipment.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 7

According to OPC witness Schultz, the Company overstated its 2008 and 2009 capital expenditures by 33 percent in comparison to its historical spending. He also stated that the Company's past five years' average capital expenditures were \$44,784,558. Witness Schultz acknowledged that the adjustments he proposed in his direct testimony are no longer applicable as they were based on erroneous information provided by the Company. However, he believed that the cost of spending was primarily for mains and services without showing a complementary increase in customer growth. Witness Schultz believes that when rates are set they are based on plant and operating costs that are associated with a specific level of customers. He stated that according to Company witness Richards, the average use per customer has declined. He contended that witness Richards' statement is in direct contradiction with witness Narzissenfeld's argument that the increase in plant is attributable, in part, to accommodating increased use by existing customers.

Witness Schultz stated that PGS witness William Cantrell testified that the cost of steel pipe has more than doubled and the cost of plastic pipe has increased by 45 percent. Witness Schultz used historical data provided by the Company in OPC's Exhibit 64 to confirm the figures regarding the cost of pipe. He stated that the information showed the fluctuation of cost per foot for both steel and plastic pipe for mains and services. He stated that the provided data showed the projected cost per foot for the size of mains and service lines installed more than doubled the actual cost. Witness Schultz's adjustments show a reduction to average projected plant in the amount of \$2,356,919 for steel mains, \$15,883,458 for plastic mains, and an increase to the average projected plant for plastic mains by \$2,912,691. He further stated that the adjustment for accumulated depreciation and depreciation expense should be \$369,404 and \$404,900, respectively.

OPC witness Shultz stated that the errors in the Company-provided documents caused an initial wrong turn, but it has not caused OPC to retreat from the recommendation that rate base should be reduced for excessive and unjustified capital spending. OPC believes that the customer growth does not explain nor justify the 2008 and 2009 spike in capital expenditures. OPC's post-hearing brief states that:

Regardless of whether it is by design or not, it appears that PGS is asking current customers to unfairly bear the cost of the downturn in the economy. Additionally, they are asking the current customers to shoulder the cost of extending facilities to position the company to meet or serve future demands regardless of the cost effectiveness or viability of the facilities extensions.

OPC argued that PGS Vice President of Operations, Bruce Narzissenfeld, testified on January 30, 2009, that "nothing occurred which caused the Company to believe that its 2009 projections should be changed." OPC argued that: 1) 12 projects were delayed, or cancelled between the time of filing and the hearing which caused a 43 percent or \$6,973,735 reduction in the original budgeted revenue producing category, 2) Witness Narzissenfeld testified that delays were due primarily to the real estate market, and 3) for 2009, over \$8 million of revenue-producing projects were reduced or eliminated from the initial budget included in the MFRs. OPC believes that when new last minute dollars appear in order to plug the budget so that it does not change by one single dollar, then the reliability of those new additions should be questioned. OPC asserted that in the last rate case, which was stipulated, an adjustment in the amount of

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 8

Workpaper 04  
Page 8 of 66

\$15,377,000 was made for cancelled, delayed, or under-budgeted additions. OPC recommends that we should reduce the projected rate base by \$15 million. OPC believes it would be consistent with the adjustment made in the last rate case, and would insure that revenues, and costs are appropriately matched while providing a check on excessive spending to pursue ever elusive customer growth.

In his rebuttal testimony, witness Narzissenfeld stated that OPC witness Schultz's adjustments were based on a re-estimate of the 2008 capital expenditures which were based on erroneous data received from PGS. He contended that in the process of calculating the "estimated" projected footage, the Company divided the projected spending by what it believed to be the 2007 actual costs per foot. He further contended that PGS estimated the footage because the budget system could not capture that type of data. He stated that this type of information is prepared by personnel at the project level and only the financial projections are captured in the budget system. He further stated that the Company provided OPC and staff with the corrected answers. He concluded that the information needed by witness Schultz for his adjustment methodology is not available, and the estimated footage used was inaccurate for his adjustments to capital expenditures.

PGS witness Narzissenfeld argued that there is no relationship between use per customer and capital expenditures. In addition, the use per customer can decrease while the overall system usage would increase due to an increase in the total number of customers or changes in customer mix. He further asserted that economic conditions have reduced near-term customer growth estimates, but PGS's planning cycle is much longer. Furthermore, he argued that PGS's evaluation of expansion capital is based on a four-year payback period which is reflected in PGS's 2009 budget. He believes that short-term economic conditions should not automatically reduce the Company's expansion plans and delay providing gas to areas not currently served. According to witness Narzissenfeld, the 2008 final capital expenditures are now known, validated, and exceed the level of capital spending included in the Company's filing.

We examined the Company's plant data filed in this rate proceeding. Our staff's audit of the historical test year revealed no adjustments to plant, construction work in progress (CWIP), retirements, and accumulated depreciation. We further reviewed the responses to interrogatories provided by the Company for the historical base year plus one and the projected test year. Staff received a copy of the Company's responses to OPC's interrogatories and request for documents (PODs). The Company's response to OPC POD No. 72 and its backup documentation mirrored MFR Schedule G-1, Construction Budget for the Historic Base Year Plus One and Construction Budget for the Projected Test Year, pages 23 through 28. This information was used by staff to correlate the data provided by the Company to OPC Interrogatories 70, 72, and 73, which later were revised. Accordingly, we agree with OPC that the documentation received was flawed. Also, the initial adjustments to plant were based on this information.

We reviewed the corrected data provided by the Company in response to OPC POD No. 72, and Interrogatories 70, 72, and 73. The Company's response included a breakdown of several projects listed as revenue-producing – new, ongoing, and other, and maintenance expenditures. The updated information included actual expenditures for 2008 totaling \$68.4 million. This is a \$6.4 million increase over the projected historical base year. The actual capital expenditures for 2008 validates the Company's 2008 projection. But, there existed in the revised

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 9

Workpaper 04  
Page 9 of 66

documentation for OPC POD No. 72 cancelled, delayed, cost over-runs, and new projects completed in 2008. We removed government-mandated projects totaling \$3,803,800 for 2009 since the majority of the projects were completed in 2008. Because the Company added new government-mandated projects for 2009, we believe that the projects listed in Exhibit 94 should be completed in 2009. Also, the Company projected \$3,200,042 for cost of removal for 2008, but the actual expenditure was \$1,552,481. This created an overstatement of accumulated depreciation in the amount of \$1,647,561.

Peoples is currently involved in a territorial dispute in Martin County with Florida Public Utilities Company.<sup>6</sup> This dispute is over an area located immediately west of the Florida Turnpike on SW Martin Hwy (State Hwy 714) near Stuart, Florida. Peoples extended a supply main into this area which prompted this dispute. That supply main is estimated to cost \$114,816 when complete. Peoples' witness Binswanger testified that Peoples does not serve any customers located within the disputed area, nor does the Utility have any contracts or agreements to provide service in the area. We find that while this dispute is as yet undecided by the Commission, it would be discriminatory and inappropriate to allow the cost of this supply main in rate base.

In summary, based on reductions discussed in this issue, we find that the 2009 projected test year 13-month average Projected Plant, and Depreciation Expense shall be reduced by \$1,959,308 and \$113,640, respectively, and Accumulated Depreciation shall be increased by \$795,371, resulting from 2008 and 2009 activities.

B. Adjustments to Reduce Plant, Accumulated Depreciation, Depreciation Expense, and Other Expenses to Reflect Non-Utility Operations

PGS stated that all required adjustments to remove non-utility items have been made for the 2009 test year. Moreover, the parties did not propose any adjustments to reduce plant, accumulated depreciation expense, or other expenses to reflect non-utility operations.

We find that no adjustments are necessary to Plant, Accumulated Depreciation, Depreciation Expense or other expenses to reflect non-utility operations.

C. Construction Work in Progress (CWIP)

PGS stated that the appropriate amount of CWIP for the 2009 projected test year is \$18,249,444. OPC argued that the Company's CWIP balances for 2008 and 2009 appear to be as excessive as plant. OPC argued that there were no specific adjustments to recommend to any particular CWIP project. According to OPC, the MFRs showed \$25,028,580 for the 2008 projected base year CWIP amount, but the final amount for 2008 was \$26,863,863. OPC asserted that it compares unfavorably to the 2003-2006 average CWIP balance in the amount of \$14,771,750. OPC further argued that although the 2003 final CWIP balance was \$16,685,000, the amount used for setting rates in the 2003 test year was \$21,277,545.<sup>7</sup> OPC asserted that the

<sup>6</sup> See Docket No. 080642-GU, In re: Petition of Florida Public Utilities Company to resolve a territorial dispute with Peoples Gas System.

<sup>7</sup> Order No. PSC-03-0038-GU, issued January 6, 2003, in Docket No. 020384-GU, In Re: Petition for rate increase by Peoples Gas System.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 10

Workpaper 04  
Page 10 of 66

projected CWIP for 2009 represents another opportunity for the Company to curtail costs and reduce the impact of the economy on its customers. OPC further stated that 2008 and 2009 CWIP mirror the 2008 capital budget during dire economic conditions, no growth, and a stagnant real estate market. OPC further argued that the Company failed to meet its burden of showing the projected rate base is reasonable.

During PGS witness Higgins' telephonic deposition where several questions were proposed by OPC, witness Higgins testified in the affirmative that the average CWIP for the unadjusted projected test year was lower than the originally projected 2008 average. He agreed that the actual average CWIP for 2008 was greater than the historic base year plus one average CWIP. He further stated that the amount was \$26.6 million.

In the following chart, our staff analyzed the data provided in the parties' testimonies concerning the average CWIP costs in the MFRs for 2003-2006, the 2008 base year plus one and the 2009 projected test year.

**Comparison of Construction Work in Progress (CWIP)**

2003-2006 Average CWIP Balance	\$14,771,750	
2003 Final CWIP Balance	16,685,000	12.9 percent increase over 2003-2006 average CWIP
2003 CWIP used for Setting rates	21,277,545	27.5 percent increase over 2003 Balance and a 17 percent increase over 2009 projected test year.
2008 Projected Base Year	25,028,580	17.6 percent increase over 2003 for rate setting.
2008 Final CWIP	26,863,863	7 percent increase over 2008 projected base year and 47 percent increase over 2009 Projected Test Year
2009 Projected Test Year	\$18,249,444	32 percent decrease over 2008 Final CWIP and a 14.2 percent decrease over 2003 CWIP used for setting rates 9 percent increase over 2003 final CWIP balance

As shown in the chart, the 2003 final CWIP balance increased by 12.9 percent over the 2003-2006 average. But, the 2003 CWIP used for setting rates was 27.5 percent over the 2003 final CWIP balance. PGS's last rate case included a \$15.377 million decrease to plant. Furthermore, the 2008 projected base year plus one CWIP was 17.6 percent over the 2003 CWIP used for setting rates, which entails a five-year span of time. Finally, the 2009 projected test year CWIP is 9 percent more than the 2003 final CWIP balance, but 32 percent less than the 2008 final CWIP. The balance in CWIP continually fluctuates depending on when projects are completed during the year and transferred to plant in service.

We believe that the data provided by OPC in the comparison of CWIP from 2003 through 2009 does not support its position of excessive CWIP for the projected test year. Accordingly, we find that the \$18,249,444 is appropriate for the 2009 projected test year.

**D. 2009 Projected Test Year Total Plant**

In determining the appropriate 2009 projected test year to plant, we reviewed Plant in Service documentation provided by the Company for 2008 to determine the proper 2009

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 11

Workpaper 04  
Page 11 of 66

projected test year amount. For this issue, we used the 13-month average Plant in Service balance as contained in the MFRs of \$1,009,374,293 minus Construction Work in Progress, which totaled \$991,124,849. We also made an adjustment to decrease Total Plant of \$991,124,849 by \$1,959,308 for the 13-month average to \$989,165,541. Therefore, the appropriate level of Total Plant in Service shall be \$989,165,541.

E. 2009 Projected Test Year Depreciation Reserve

In determining the 2009 projected test year total amount we examined accumulated depreciation data for 2008. Moreover, we used the 13-month average for Accumulated Provision-Depreciation and Amortization and Customer Advances For Construction contained in the MFRs of \$426,364,359 and \$7,916,127, respectively, totaling \$434,280,486. We also incorporated the adjustments made to Projected Plant, Accumulated Depreciation, and Depreciation Expense. The effect of the adjustments increases the depreciation reserve of \$434,280,486 by \$795,371 to \$435,075,857.

F. Projected Test Year Rate Base

The appropriate amount of rate base for the 2009 projected test year is \$560,844,757, as stated in the table below.

	Comparative Rate Base Projected Test Year Ending December 31, 2009		
	Per Company	OPC <sup>8</sup>	Commission
Utility Plant in Service	\$991,124,849	\$983,624,849	\$989,165,541
Accumulated Depreciation	(434,280,486)	(434,171,736)	(435,075,857)
Net Plant-In-Service	556,844,363	549,453,113	554,089,684
CWIP	18,249,444	18,249,444	18,249,444
Net Utility Plant	575,093,807	567,702,557	572,339,128
Working Capital	(11,494,371)	(11,494,371)	(11,494,371)
Total Rate Base	<u>\$563,599,436</u>	<u>\$556,208,186</u>	<u>\$560,844,757</u>

IV. COST OF CAPITAL

A. Return on Common Equity

Two witnesses testified in this proceeding regarding the appropriate return on common equity (ROE) for PGS. PGS witness Murry recommended an ROE of 11.50 percent. OPC witness Woolridge recommended an ROE of 9.25 percent. PGS's currently authorized ROE of 11.25 percent was set in 2003 in Order No. PSC-03-0415-FOF-GU.<sup>9</sup>

The statutory principles for determining the appropriate rate of return for a regulated utility were set forth by the U.S. Supreme Court in Federal Power Commission v. Hope Natural Gas Company, 320 U.S. 591 (1944) and Bluefield Waterworks & Improvement Company v.

<sup>8</sup> The calculation of OPC's position is based on the amounts contained in OPC's Brief.

<sup>9</sup> Issued March 25, 2003, in Docket No. 020384-GU, In re: Petition for rate increase by Peoples Gas System.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 12

Workpaper 04  
Page 12 of 66

Public Service Commission of West Virginia, 262 U.S. 679 (1923). These decisions define the fair and reasonable standards for determining rate of return for regulated enterprises. Namely, these decisions hold that the authorized return for a public utility should be commensurate with returns on investments in other companies of comparable risk, sufficient to maintain the financial integrity of the company, and sufficient to maintain its ability to attract capital under reasonable terms.

While the logic of the legal and economic concepts of a fair rate of return are fairly straight forward, the actual implementation of these concepts is more controversial. Unlike the cost rate on debt that is fixed and known due to its contractual terms, the cost of equity must be estimated. Financial models have been developed to estimate the investor-required ROE for a company. Market-based approaches such as the Discounted Cash Flow (DCF) model and the Capital Asset Pricing Model (CAPM) are generally recognized as being consistent with the market-based standards of a fair return enunciated in Hope, 320 U.S. 591 and Bluefield, 262 U.S. 679.

#### 1. Discounted Cash Flow Model (DCF)

Both witnesses Murry and Woolridge used the DCF model to estimate the investor-required ROE for PGS. PGS is a division of Tampa Electric Company (TECO), which is a wholly-owned subsidiary of TECO Energy, Inc. (TECO Energy). As such, its common stock is not publicly traded. To apply the DCF model, each witness had to select a group of companies with publicly traded stock to serve as a proxy for PGS.

To select his group of comparable companies, PGS witness Murry started from a group of all publicly traded local distribution companies (LDCs) followed by Value Line Investment Survey (Value Line). From this initial sample, he excluded all companies that did not pay a dividend and companies with a market capitalization greater than \$1.7 billion. Based on this selection criteria, witness Murry identified a group of six companies that he testified provided a representative sample of the financial and cost of capital information for a financially healthy gas distribution utility such as Peoples.

Witness Murry relied on stock prices and dividends for a recent two week period prior to the filing of his direct testimony in August 2008 and the high and low stock prices for the preceding 52-week period. While he reviewed dividend growth rates, his DCF analysis relied principally on forecasted earnings growth rates. In lieu of making a specific adjustment for flotation costs, witness Murry recognized the high end of the results of his DCF analysis to compensate for the price impact flotation costs and market pressure from a stock issuance have on the price of that common stock.

The various iterations of witness Murry's DCF analysis produced indicated returns ranging from a low of 6.94 percent to a high of 11.02 percent for his proxy group. Due to the recent turmoil in the debt and equity markets, he testified that the relevant DCF results from his analysis range from 10.04 percent to 11.02 percent.

To select his group of comparable companies, OPC witness Woolridge started with all publicly-held gas distribution companies followed by Value Line and AUS Utility Reports.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 13

Workpaper 04  
Page 13 of 66

From this initial sample, he removed all companies that did not have an investment grade bond rating from Moody's Investors Service (Moody's) and Standard & Poors' (S&P). He further narrowed his proxy group by focusing on companies that generate at least 50 percent of its operating income from regulated natural gas operations. Based on this selection criteria, witness Woolridge identified a group of nine comparable companies for use in his analysis.

Witness Woolridge relied on dividend yields for the six-month period ended December 2008 and for the month of December 2008. He relied on Value Line's historical and projected growth rate estimates for earnings per share (EPS), dividends per share (DPS), and book value per share (BVPS). In addition, he used the average EPS growth rate forecasts from Bloomberg and Zacks and the expected growth rate as measured by the earnings retention method. Witness Woolridge's DCF analysis did not include an adjustment for flotation costs. The indicated return from witness Woolridge's DCF analysis is 9.50 percent.

OPC witness Woolridge's direct testimony critiqued the reasonableness of certain aspects of PGS witness Murry's DCF analysis. In turn, witness Murry filed rebuttal testimony challenging the reasonableness of certain aspects of witness Woolridge's analysis. The two witnesses used very similar DCF models, similar estimates of dividend yields, and relatively similar proxy groups. The primary reasons for the difference in the witnesses' indicated DCF returns are their respective estimates of the growth rate to include in the DCF model and witness Murry's decision to rely on the high end of his indicated DCF results to account for flotation costs.

Focusing first on expected growth rates, OPC witness Woolridge used a growth rate of 5.25 percent. This growth rate is the average of the projected growth rates for EPS, DPS, BVPS, and the internal growth rate. In contrast, PGS witness Murry's relevant DCF range is based on growth rates that range from 6.50 percent to 8.06 percent. These growth rates are based exclusively on forecasted EPS growth rates.

This Commission has traditionally recognized a reasonable adjustment for flotation costs in the determination of the investor-required ROE.<sup>10</sup> However, such adjustments have typically been on the order of 25 to 35 basis points. While not making a specific adjustment for flotation costs, by going to the high end of his DCF results witness Murry has effectively incorporated an adjustment to his recommended DCF result far in excess of 25 to 35 basis points.

## 2. Capital Asset Pricing Model (CAPM)

Both witnesses relied on the CAPM approach to estimate the investor-required ROE for PGS. For the reasons discussed earlier, the witnesses used their respective proxy groups for certain inputs to their CAPM analyses.

PGS witness Murry performed two different, but complimentary, approaches to estimate a CAPM ROE for PGS. The first method compared the historical risk premium between common stocks and long-term government bonds. The second method examined the historical

<sup>10</sup> Order No. PSC-08-0327-FOF-EI, issued May 19, 2008, in Docket No. 070304-EI, In re: Petition for rate increase by Florida Public Utilities Company, p. 37.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 14

Workpaper 04  
Page 14 of 66

risk premium of common stocks over Aaa-rated corporate bonds. In both analyses, he used the average beta for his proxy group.

In PGS witness Murry's first CAPM method, he relied on Ibbotson Associates' data to compare the risk premium between the historical earned returns on common stocks and the earned returns on 20-year Treasury bonds. This method produced a CAPM result of 12.46 percent. This result included a "small size adjustment" of 165 basis points. Witness Murry testified that this adjustment is necessary to account for an empirical bias against smaller companies in the CAPM analysis.

In his second CAPM approach, witness Murry relied on Ibbotson Associates' data to compare the risk premium between the historical earned returns on common stocks and the earned returns on long-term Aaa-rated corporate bonds. This method produced a CAPM result of 13.01 percent. Witness Murry testified that this CAPM method does not require a separate recognition of the size bias because it embodies the historical relationship between common equity and debt.

OPC witness Woolridge performed an ex ante version of the CAPM analysis. As a proxy for the risk free rate, he used a composite yield of long-term U.S. Treasury bonds. He used the average beta for his proxy group. He determined an expected risk premium based on the results of various studies of historical risk premium, ex ante risk premium studies, equity risk premium surveys, and the building block approaches. Witness Woolridge's CAPM analysis indicated an ROE of 7.4 percent.

Both witness Murry and Woolridge challenged the reasonableness of certain aspects of each other's CAPM analysis. The primary reasons for the difference in their indicated CAPM results is the size of the market risk premium assumed in their respective analyses, and PGS witness Murry's decision to include a small size adjustment to the results of one of his CAPM methods. Also contributing to the difference in their respective CAPM results were differences between the risk-free rate and beta each witness used in their respective analyses.

OPC witness Woolridge used a risk premium of 4.78 percent in his CAPM analysis. PGS witness Murry used risk premiums of 7.10 percent and 8.50 percent in his CAPM analyses. Witness Woolridge relied on ex ante or forward-looking risk premiums in his analysis. In contrast, witness Murry relied on ex post or historical risk premiums in his CAPM analysis. Witness Woolridge testified that there is considerable academic research documenting that risk premiums based on historical, earned returns are poor predictors of current market expectations. PGS witness Murry used a risk-free rate of 4.60 percent and a beta of .88. In contrast, OPC witness Woolridge used a risk-free rate of 3.50 percent and a beta of .82.

OPC witness Woolridge testified that the small size adjustment proposed by PGS witness Murry in one of his CAPM approaches is not justified. Witness Murry testified that he calculated the small size adjustment consistent with the method recommended by Ibbotson Associates. However, witness Woolridge countered that the errors in using historical earned returns to measure forward-looking risk premiums also apply to this type of analysis. In addition, witness Woolridge noted that the explicit size premium in the Ibbotson study is for

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 15

Workpaper 04  
Page 15 of 66

companies with betas much greater than the betas for gas distribution companies. As such, witness Woolridge believes these size adjustments are not associated with companies in the gas distribution industry. Due to regulation, government oversight, performance review, accounting standards, and information disclosure, witness Woolridge testified that utilities are much different than industrial companies. For these reasons, witness Woolridge testified that there is no evidence of a significant size premium for utility stocks.

Based on a review of the results of all the models presented in the testimony in this proceeding, the record supports an authorized ROE within the range of 6.94 percent to 13.01 percent. Based on a more pragmatic review of the testimony, we find that the record more strongly supports an ROE for PGS within the range of 9.25 percent to 11.50 percent.

Each of the witnesses recognized that the generally accepted models used for estimating ROE are based on a number of restrictive assumptions. Under normal economic circumstances, the relaxation of these assumptions for the practical application of these models is generally understood. However, as each of the ROE witnesses have testified, the economy is not presently in a normal or stable state. This realization does not mean that the models no longer have value, rather, it is particularly important at this point in time to exercise informed judgment in the application of the models.

Due to the reliance on historical earned returns to estimate the current risk premium and the decision to include a questionable small-size adjustment in his CAPM analysis, combined with the decision to recognize the high end of his DCF results, we believe that witness Murry's recommended ROE overstates the current investor-required ROE for PGS. Conversely, recognizing that witness Woolridge's recommended ROE is only marginally greater than the current cost of utility debt, we believe returns in the single digits may understate the investor-required ROE in the current market.

PGS witness Murry testified that recently authorized returns of other natural gas companies are not relevant to this proceeding because these returns do not account for investor expectations following the recent disruption in the credit markets. However, this position is drawn into question by the fact witness Murry's recommended ROE is significantly influenced by the historical earned returns over the period 1926–2007. We do not agree that returns recently authorized in other cases are not relevant to this proceeding, but a return based on historical earned returns over the past 81 years does convey information on current investor expectations that this Commission can rely on for making its decision in this case.

There is little doubt the recent disruption in the credit markets has exerted some degree of upward pressure on the current expectations of the market risk premium. However, we believe that this incremental increase in required return, whatever the appropriate amount may be, should be applied to a contemporary estimate of the current investor-required return, not an authorized return set in 2003. Witness Murry identified a group of companies which he testified are comparable in risk to PGS. These utilities have authorized ROEs ranging from a low of 10.00 percent to a high of 10.51 percent. The average ROE for this group is 10.23 percent. We do not believe that the investor-required return for PGS is 127 basis points greater than the average

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 16

Workpaper 04  
Page 16 of 66

authorized return for the group of companies witness Murry has identified as comparable in risk to PGS.

We find that an authorized ROE of 10.75 percent is appropriate. We have taken into account PGS's proposed construction program and its need to access the capital markets during this potentially challenging period. In addition, we considered the Company's proposed equity ratio of 54.7 percent. We find that at an equity ratio of approximately 55 percent, and an authorized ROE of 10.75 percent is supported by competent, substantial evidence in the record and satisfies the standards set forth in the Hope, 320 U.S. 591 and Bluefield, 262 U.S. 679 decisions of the U.S. Supreme Court regarding a fair and reasonable return for the provision of regulated service.

#### B. Capital Structure

PGS's proposed capital structure for the projected 2009 test year reflects an equity ratio as a percentage of investor-supplied capital of 54.7 percent. PGS witness Gillette testified that the proposed 54.7 percent equity ratio is reasonable when compared to the equity ratio of 57.4 percent approved by this Commission in PGS's 2002 base rate proceeding. Witness Gillette also testified that no equity infusions were deemed necessary in 2008, and the 2009 planned equity infusion from TECO Energy to PGS is \$25 million.

OPC witness Woolridge agreed that PGS's proposed capital structure is appropriate, but with a caveat. The witness asserted that the average common equity ratio for the Gas Proxy Group in the first eleven months of 2008 was 49.9 percent. Witness Woolridge testified that PGS's proposed capital structure includes a higher common equity ratio than the average equity ratio for the Gas Proxy Group and therefore, represents lower financial risk. The witness explained that he recognized PGS's lower financial risk in his recommended cost of equity. Witness Woolridge testified that his recommended ROE of 9.25 percent is a fair return given PGS's higher common equity ratio and lower degree of financial risk.

PGS witness Murry identified a group of six natural gas companies that he testified "provide a representative sample of the financial and cost of capital information for a financially healthy gas distribution utility such as Peoples." The regulated utilities associated with the companies in witness Murry's proxy group have equity ratios that range from a low of 38.1 percent to a high of 52.7 percent. The average equity ratio for this group of utilities is 45.4 percent.

Based on the record, we find that the capital structure proposed by PGS is appropriate for rate setting purposes. This capital structure reflects an equity ratio of 54.7 percent as a percentage of investor-supplied sources of capital. While this level of equity is less than the equity ratio approved for PGS in its last rate case, it is above the range of equity ratios of the regulated utilities in witness Murry's proxy group. Neither OPC nor FIGU objected to PGS's proposed capital structure and equity ratio other than contending that this level of equity should be considered in the setting of the Company's ROE.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 17

Workpaper 04  
Page 17 of 66

While the equity ratio and authorized ROE are two separate matters, we believe that equity ratio and ROE are inextricably related. Thus, the ROE of 10.75 percent discussed above is implicitly linked to the equity ratio recommended herein.

We find that the appropriate capital structure for purposes of setting rates in this proceeding is the Company's 2009 projected test year capital structure. This capital structure reflects a projected equity ratio of 54.7 percent as a percentage of investor-supplied capital. The appropriate capital structure for the 2009 test year is shown on Schedule 2.

### C. Short Term Debt

PGS's capital structure for the projected test year reflects a short-term debt cost rate of 4.50 percent. PGS witness Higgins testified that the Company utilized an average historical London Interbank Offered Rate (LIBOR) rate in developing its proposed short-term interest rate. Witness Higgins asserted that current LIBOR rates are at historical lows due to the financial crisis and believes that rates have been extremely volatile and will continue to be volatile in the foreseeable future. Witness Higgins testified it is therefore prudent to use a historical average LIBOR rate as proposed by PGS as opposed to a rate at a particular point in time as recommended by OPC witness Woolridge.

OPC witness Woolridge recommended a short-term debt cost rate of 1.76 percent. Witness Woolridge contended that PGS's recommended rate is based on the historical LIBOR rate between 1991-2008 of 4.73 percent, plus a program financing fee. The witness asserted that the historic rate has little to do with current LIBOR rates. Witness Woolridge testified that as of December 17, 2008, the three-month LIBOR rate was 1.58 percent. Witness Woolridge explained that his recommended short-term debt cost rate consisted of the 1.58 percent LIBOR rate, plus a financing program fee of 18 basis points ( $1.59\% + 0.18\% = 1.76\%$ ).

FIGU adopted no position on the appropriate cost rate of short term debt for the projected test year.

PGS witness Gillette testified that PGS is a division of TECO and does not issue its own debt securities. Any debt is issued in TECO's name and is then allocated to PGS and Tampa Electric on an as-needed basis. The Company utilized average historical LIBOR rates, plus a program financing fee, to develop its proposed short-term interest rate of 4.50 percent. For the period 1991 through 2008, the three-month average LIBOR rate was 4.37 percent. This was the number on which PGS based its proposed short-term debt cost rate. Witness Higgins argued that OPC witness Woolridge's use of the December 17, 2008, LIBOR rate of 1.76 percent is not appropriate due to the volatility in the market.

One year ago, TECO was paying approximately 5.34 percent for its short-term credit facility due to a higher three-month LIBOR rate, which averaged about 4.5 percent over the last three years. In December 2008, PGS renewed its LIBOR-based credit facility. This credit facility included a fixed cost fee of 125 basis points, plus a fee for use of the facility of 50 basis points. Therefore, the effective cost of this credit facility is the current three-month LIBOR rate plus 175 basis points. On March 4, 2008, the three-month LIBOR rate closed at 1.27 percent.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 18

Workpaper 04  
Page 18 of 66

Accordingly, witness Gillette confirmed that if the Company were to draw on its credit facility today, its rate would be approximately 3.02 percent.

We find that a cost rate of 3.02 percent is appropriate for short-term debt. This cost rate is based on the three-month LIBOR rate at the close of the record plus 175 basis points to account for financing fees. This is the same methodology used to determine the cost rate of short-term debt recently approved by this Commission in the TECO rate case in Docket No. 080317-EI.<sup>11</sup> Based on the record in the TECO case, the Commission approved a short-term debt cost rate of 2.75 percent.

Based on the record, we find that the appropriate cost rate for short-term debt for the 2009 projected test year is 3.02 percent as shown on Schedule 2.

D. Accumulated Deferred Taxes

In its MFRs, PGS recorded a balance of accumulated deferred income taxes (ADITs) in the Company's capital structure for the projected test year of \$27,670,682. PGS witness Higgins testified that in order to comply with specific rules under the Internal Revenue Code (IRC), an adjustment was made to reduce the balance of ADITs to compensate for using a projected test year. The offset to this reduction was applied to investor-supplied sources of capital on a pro rata basis.

PGS witness Felsenthal testified that the projected 2009 MFR income tax amounts have been properly stated in accordance with Generally Accepted Accounting Principles (GAAP), and with the adjustment included in Exhibit 40, have been calculated in accordance with the requirements of the IRC and Regulations applicable to the use of a projected test period. The methodology used by witness Felsenthal to calculate the balance of ADITs for purposes of this case represents a change from the Company's prior practice. The witness, however, cited several private letter rulings (PLRs) to support his proposed adjustment to ADITs of \$205,000 that results from the Company's revised methodology. The witness stated that the methodology used to calculate the adjustment in the instant case is the same methodology used in the TECO rate case in Docket No. 080317-EI.<sup>12</sup>

OPC recognized that this issue may follow the decision in the TECO case since the two companies are part of a wholly owned subsidiary of TECO Energy. OPC questioned why PGS cannot seek a private letter ruling with the facts presented with input from Commission staff. OPC reasoned that if the Internal Revenue Service (IRS) ruled that PGS is in compliance with IRS code with respect to normalization, the associated revenue requirement benefit could be flowed through the Purchased Gas Adjustment (PGA) clause. OPC asserted that if the Commission allows the Company's proposal, it should at least follow Commission precedent and adjust the deferred tax balance by reconciling the capital structure to rate base for these dollars over investor-supplied sources of capital.

---

<sup>11</sup> Order No. PSC-09-0283-FOF-EI, issued April 30, 2009, Docket No. 080317-EI, In re: Petition for rate increase by Tampa Electric Company.

<sup>12</sup> Id.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 19

Workpaper 04  
Page 19 of 66

FIGU adopted no position on the appropriate amount of accumulated deferred taxes to be included in the capital structure for the projected test year.

ADITs represent taxes that are expected to be paid in the future based on transactions recorded in the financial statements in the current period. These amounts are sometimes referred to as "interest free loans" from the U.S. Treasury. Accelerated depreciation is the major component of deferred taxes and is intended to lower the cost of financing assets by providing a utility an interest free loan. When Congress changed the IRC to permit the use of accelerated depreciation, it intended that, by being allowed to accelerate depreciation deductions (and thereby reduce current income tax payments), companies would lower the financing costs of their investment in capital assets and would be incented to incur such expenditures. The ADIT balance is a zero cost source of capital in the cost of capital computation thereby sharing the benefit of the reduced financing costs with ratepayers.

ADITs are recognized as a liability for future taxes due when the book depreciation of an asset exceeds the tax depreciation of the asset. This is referred to as a temporary book/tax difference. In the regulatory environment, the process of recording deferred income taxes on temporary differences is often referred to as normalization. Witness Felsenthal testified the pro rata adjustment of \$205,000 is required for accumulated deferred income taxes recorded in Account 282, net of the Financial Accounting Standard 109 component, because this account includes the deferred taxes governed by the IRS normalization rules. In this case, the future portion of the test period subject to the pro rata adjustment necessary to comply with the normalization requirement is the period from May 2009 (the expected effective date of the rate change) to December 31, 2009. The IRC rules are set forth in Treasury Regulation Section 1.167(1)-1(h)(6) which addresses forecast net periods and the appropriate amount of ADIT used to be treated as a zero cost of capital in the determination of cost of capital for a forecast test period. The penalty for violating the normalization requirements is the loss of the ability to claim accelerated depreciation on public utility property.

We find that PGS has reasonably relied on PLRs which, while not binding on the IRS, are indicative of the IRS's position on this issue. In reconciling rate base and capital structure, PGS followed Commission precedent and made a pro rata adjustment over investor-supplied sources of capital. Further, PGS used the same methodology to calculate the required normalization adjustment of the ADITs that was approved by this Commission in the TECO rate case. PGS is a division of TECO, and as a matter of consistency, we believe that the same methodology should be utilized. Therefore, we find that the Company's change in methodology is appropriate. Moreover, we find that the appropriate amount of accumulated deferred taxes to include in PGS's capital structure for the 2009 projected test year is \$27,670,682 as shown on Schedule 2.

E. Weighted Average Cost of Capital

Based upon the decisions in preceding issues and the proper components, amounts, and cost rates associated with the capital structure, we calculated a weighted average cost of capital of 8.50 percent.

As discussed previously, we find that 10.75 percent is the appropriate mid-point return on common equity. Moreover, as stipulated to by the parties, the appropriate cost rate for long-term debt is 7.20 percent. As discussed above, we find that 3.02 percent is the appropriate cost rate

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 20

Workpaper 04  
Page 20 of 66

for short-term debt. Further, the appropriate balance of accumulated deferred income taxes (ADIT) is \$27,670,682. As stipulated to by the parties, the appropriate amount and cost rate of unamortized investment tax credits (ITCs) are \$7,862 and 0 percent, respectively.

In reconciling rate base and capital structure, PGS made a pro rata adjustment over investor-supplied sources of capital only. This treatment is consistent with past Commission practice.<sup>13</sup>

The net effect of these adjustments is a decrease in the overall cost of capital from the 8.88 percent return requested by PGS to a return of 8.50 percent approved herein. Schedule 2 shows the approved test year capital structure. Based upon the proper components, amounts, and cost rates associated with the capital structure for the test year ending December 31, 2009, we find that the appropriate weighted average cost of capital for PGS for purposes of setting rates in this proceeding is 8.50 percent.

## V. REVENUES

### A. Off-System Sales

PGS witness Higgins testified that the Commission ruled in PGS's last rate case<sup>14</sup> that, "for the purpose of setting rates in this docket, operating revenues should be increased by \$500,000 in the projected test year" for off-system sales ("OSS"). According to witness Higgins, the Company did not include any amount for OSS in the last rate case, and the \$500,000 was set as an annual base level for the purpose of setting rates. He further testified that we changed the sharing mechanism where the Company would retain 25 percent of all net revenues and 75 percent of the net revenues were to be used to reduce the Company's cost of gas recovered through the Purchased Gas Adjustment Clause (PGA). For this proceeding, the Company only included the base level of \$500,000 of OSS net revenues. He further testified that the Company intends to maintain the current sharing mechanism on a going-forward basis.

Witness Higgins argued that the Company has been successful in generating net revenues for OSS in excess of \$500,000 annually. He further asserted that we were clear in the last order that the base level of sales was "for purposes of setting rates." Witness Higgins testified that this was not presented as the Company's expected level of future OSS revenues. He believes that the \$500,000 represents a significant reduction to revenue requirements in this proceeding without excessively burdening the Company with an unreasonably high "hurdle" in future years. He stated that "sales are sporadic, opportunistic transactions that are highly dependent on market conditions, sale agreements which are short-term, or spot market type transactions that are non-recurring in nature." In addition, market conditions drive the opportunities for OSS, and PGS has noticed a decline in the market, as 2007 sales are below the 2006 level. Finally, he stated that the Company expects continuing decline in the market.

<sup>13</sup> Order No. PSC-03-0038-FOF-GU, issued January 6, 2003, in Docket No. 020384-GU, In re: Petition for rate increase by Peoples Gas System.

<sup>14</sup> Id.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 21

Workpaper 04  
Page 21 of 66

OPC witness Schultz stated that the Company wants to keep OSS shared and to continue the sharing based on any sales in excess of \$500,000. He also stated "there is no reason that the Company will not earn in excess of the \$500,000 revenue base currently used to trigger the sharing mechanism." He argued that the Company has averaged \$2,258,556 a year from 2003 through 2007. He stated that if the 2008 actual to date was annualized it would be \$2,170,781. He believes the sharing should continue but should be on revenue in excess of \$2,000,000. He further believes that the Company's shareholders receive the benefit, especially when the trigger point is lower, the earlier the revenue sharing takes place.

OPC argued that PGS tracks and budgets OSS at the very highest levels of the Company. OPC further added that this was admitted by PGS President William Cantrell while on the stand at the hearing, and that he regularly reports on OSS sales at the TECO Energy Board of Director's meeting and has described them in glowing terms: "strong" and "ahead of plan." OPC believes that recent history has shown that the \$2 million sales level is achievable, measurable, and known. OPC argued that PGS made significant capital expenditures in 2008 which are included in rate base to serve affiliate TECO's Bayside Power Station and for facilitating OSS.

We agree with OPC witness Schultz's adjustments to increase OSS by \$1,500,000. In response to Staff's Interrogatory No. 129, the Company provided actual OSS for 2003 through 2008. The 2008 OSS Gross Margin was \$8,255,652. The PGA portion was \$6,191,739, and the OSS net revenue was \$2,063,913. In its response to Interrogatory No. 129c, the Company stated that:

PGS did not use the \$500,000 in the calculation of the sharing amount for the 2009 projected test year. The \$500,000 amount included in revenues for the projected test year is, in part, the result of PGS's applying the 75/25 percent sharing mechanism to reasonably attainable OSS Gross Margins for 2009 of \$2 million to obtain the amounts which would be credited to the PGA (\$1.5 Million) and included in revenues for this case. The \$500,000 is also, the amount of OSS that was included in the last base rate proceeding.

Although the Company used \$2 million as its OSS gross margin to apply the 75/25 sharing mechanism for 2009, the amount has never been below \$3 million since 2003.

Therefore, we find that OSS shall be increased by \$1,500,000 for the projected test year and taxes other than income shall be increased by \$7,500 for the related regulatory assessment fee.

#### B. Projected Test Year Total Operating Revenues

Based on our finding above, the requested Operating Revenues of \$169,906,126 shall be increased by \$1,500,000 resulting in an adjusted total of \$171,406,126 for the 2009 projected test year. See Schedule 3.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 22

Workpaper 04  
Page 22 of 66

VI. EXPENSES

A. Trend Rates Used to Calculate Projected Operation & Maintenance Expenses

In its filing, the Company utilized three different projection factors in its calculation of the projected test year ending December 31, 2009. The three factors that the Company used were a payroll factor, inflation factor, and customer growth factor. For items that the Company expected to increase at a greater rate than the projection factors, the Company projected the expenses based on estimated expenses for the twelve-month period ending December 31, 2009.

The Company separated operating and maintenance (O&M) expenses into payroll expenses and other expenses in each account. The Company applied the payroll factor to six payroll accounts, as of December 31, 2007, and payroll times the customer growth factor to the remaining payroll accounts. The 2008 and 2009 payroll factor is 3.5 and 4.0 percent, respectively. These payroll increase percentages were taken from the WorldatWork Annual Salary Budget Survey and were appropriately used by Peoples.

PGS witness Higgins used Moody's Economy.com forecasts for the inflation trend factor for 2008 and 2009. The estimates of the Consumer Price Index – All Urban (CPI-U) inflation for 2008 and 2009 were 2.9 percent and 2.1 percent, respectively. OPC asserted that a more recent forecast for the 2009 inflation factor was -1.1 percent, and asked witness Higgins why PGS does not feel it's appropriate to use a lower inflation factor for 2009. Witness Higgins testified that looking at 2008, the forecast was for a 2.9 percent increase with an actual 3.8 percent increase. Witness Higgins also testified that the forecast data can change dramatically, decreasing from 2.4 percent in September, four months before the testimony, to 1.2 percent in November, two months before the testimony. Witness Higgins further testified "that it is somewhat of a crap shoot in terms of what you pick in 2009 . . . there's a lot of stimulus dollars placed in the economy. I don't know how fast that's going to factor in, but I think the longer term expectation is that that could have inflationary pressures on the economy." In addition, page 2 of witness Higgins Late Filed Deposition Exhibit No. 9 contains Moody's Economy.com January 2009 CPI-U forecasts, which has a 2.1 percent inflation rate for the out years.

We find that the appropriate trend factors to be used in deriving projected expenses in the projected test year are as follows:

<b>Trend Factors</b>	<b>Historic Base Year +1 12/31/2008</b>	<b>Projected Test Year 12/31/2009</b>
Payroll Only	3.50%	4.00%
Customer Growth & Payroll	4.37%	4.51%
Customer Growth & Inflation	3.76%	2.60%
Inflation Only	2.90%	2.10%
Customer Growth	0.84%	0.49%

These are the same factors that were used by the Company in its filing.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 23

Workpaper 04  
Page 23 of 66

Peoples' payroll increases were based on actual merit increases for 2008 of 3.5 percent overall and a projected increase of 4.0 percent for 2009 provided by compensation professional in the TECO Human Resources department.

OPC is correct that the CPI has fallen since 2008. However, during periods of recession this decline is but with the economy in a recession that is not typical. The State's National Economic Estimating Conference in February 2009 forecast that the CPI will reach 2.6 percent in 2010, and afterwards will not fall below 2.7 percent going out to 2019. Therefore, PGS's trend factor of 2.1 percent is reasonable for use in this docket.

B. Adjustments to the Projected Test Year O&M Expense

Based on OPC's analysis of the trend factors, OPC stated that expenses should be reduced by \$245,164. In determining the \$245,164, OPC included the impact of modifying the trend factors that were applied to each expense account.

OPC witness Schultz testified that 19 payroll accounts should not be increased by using the customer growth factor of 0.84 percent for 2008 and 0.49 percent for 2009. The customer growth factors were used to increase payroll expense for additional customers from 2007-2008 and 2008-2009. These customer growth factors were addressed below. The total customer growth expense is \$210,199. Witness Schultz believed the current employees should be able to perform the required work for the small growth in customers. In rebuttal testimony, PGS witness Higgins explained in a few isolated instances, new positions were included in the 2009 payroll budget. Witness Higgins stated that these additional new positions are limited and do not reflect a significant increase in expense.

While OPC pointed out in its brief that PGS actually lost 580 customers in 2008, the number of bills and therms for the test year ending December 21, 2009, was stipulated by the parties. As the stipulated number of bills is based on the number of customers, we find that the number of customers and customer growth factors used in this filing are appropriate. For several accounts, the amount of expense is dependent on the level of customer growth. Therefore, the customer growth factor, discussed above, shall be applied to the 19 payroll accounts identified by OPC witness Schultz.

Based on the above analysis, the payroll factor, customer growth factors and inflation factors were not changed, so no adjustments are necessary to the 2009 O&M expenses. Also, no adjustment is needed to remove the customer growth factors in the determination of the 2009 payroll expense. Therefore, we find that no adjustments are necessary to the 2009 O&M expenses.

C. Adjustments to Account 920, Administrative and General Salaries

Witness Higgins testified that PGS has an incentive program for all employees which includes a fixed base pay and a variable incentive pay mechanism which equals the market average salary. The variable pay incentive mechanism is based on the achievements of each individual against the criteria established by PGS. An incentive pay increase is based on the performance of safety goals, customer favorability goals, operational unit financial goals, and individually-determined goals. At the hearing, witness Higgins agreed that employees work harder to achieve the goals when there is incentive pay. Witness Higgins emphasized that base

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 24

Workpaper 04  
Page 24 of 66

pay and any additional pay based on meeting the various goals does not change with downturns in the economy. Meeting the goals based on certain criteria are still necessary to earn a portion of the employees' salaries which would bring his/her salary to the average market salary. The average market salary may change because of the economic conditions, but the process to determine the pay of an individual does not change when the economic conditions changes.

PGS routinely evaluates salary levels for all jobs in the Company using data from various outside expert resources such as Towers Perrin, WorldatWork, Mercer Inc., Hewitt Associates, Watson Wyatt Worldwide, and Gartner, Inc. Therefore, compensation levels, including targeted incentive compensation, reflect a market-based average necessary to attract and retain qualified employees. Witness Higgins pointed out the World at Work 2008/2009 Annual Salary Budget Survey stated that over 80 percent of the 2,375 companies surveyed use an incentive pay program. In rebuttal testimony, witness Higgins pointed out that witness Schultz's proposed adjustment to incentive compensation was not based on any studies and no alternatives were proposed to compensate PGS employees.

At the hearing, witness Higgins agreed that a downturn in the economic conditions could affect the market average and would lower salaries. In fact, witness Higgins agreed that the Mercer Study reflects that executives are less likely to get an increase than the rank and file employees. Further, PGS made an adjustment to delete the executives' 2009 salary increase and reduce the other employees' salaries for the projected test year as reflected in Higgins' Late-filed Deposition Exhibit No. 7. A World at Work article pointed out that the employers are committed to rewarding employees. Further, the survey indicates that 77 percent of employees expect a pay raise especially for high performance.

OPC Interrogatory No. 42 asked PGS to provide for each of the years 2003-2007, the respective Company and team goals and the respective actual results for each of the goals. Witness Schultz stated that PGS's response to OPC's Interrogatory No. 42 was incomplete for 2003-2007 in relation to Company and team goals and actual results for each of the goals. The specific customer service and safety goals for 2005-2008 were missing. In response to OPC POD No. 35, the Company provided a document for 2005-2008 customer service and safety goals, but this information was not given in response to OPC's Interrogatory No. 42.

In rebuttal testimony, witness Higgins testified that if the response was insufficient for Mr. Schultz's needs, OPC had another two and a half months between the date of the Company's responses to discovery and the date on which witness Schultz's direct testimony was filed to seek additional information. Witness Higgins did not know of witness Schultz's alleged incompleteness of PGS responses until the reading of the direct testimony of witness Schultz.

OPC witness Schultz believes that the incentive program is not justified because the goals are not realistic. Witness Schultz pointed out that the 2003 goal to answer a phone call within 30 seconds, 85 percent – 90 percent of the time, was not met in 1 percent of the calls. In 2004, PGS changed the goal to require that a call must be answered within 60 seconds, 80 percent of the time. The calls were answered within this new criterion 96 percent of the time. Witness Schultz stated that a goal should be set to achieve or exceed target goals to incent the employee to work at a higher level of efficiency.

Lastly, witness Schultz's explained that there was insufficient evidence to determine whether the goals were achieved or required a higher level of performance to earn the incentive

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU

Workpaper 04  
Page 25 of 66

compensation pay. Therefore, it is impossible to determine if the incentive compensation plan benefits the ratepayers.

In rebuttal testimony, PGS witness Higgins testified that OPC witness Shultz's proposed adjustment to eliminate 100 percent of the Company's targeted 2009 incentive compensation as inappropriate. Witness Higgins argued that OPC witness Schultz's recommendation removing incentive compensation based on his opinion that PGS did not provide sufficient evidence is inappropriate. Witness Higgins testified that PGS has provided at least 100,000 pages of documents of which a number of the documents related to incentive compensation, especially those produced in response to OPC's First and Second Sets of Requests for Production of Documents (Nos. 35, 59, and 60) and OPC's First and Second Sets of Interrogatories (Nos. 22, 28, 41, 42, 43, 61, and 79). Witness Higgins further testified that if this data was not sufficient for Mr. Schultz's needs, he could have asked for additional detail. There was enough time for further discovery between the date of PGS's last response to OPC's Discovery and the date Witness Schultz's testimony was filed.

Further, witness Higgins explained that all employees' compensation has two parts: a base salary, which is the fixed portion of total compensation, and a short term incentive, which is the cash portion of compensation that is "at risk." In addition, officers and key employees have a third component of compensation, long-term incentive, which is the equity portion of total compensation. Witness Higgins testified that Peoples includes health care and life insurance benefits in its total rewards plan.

Witness Higgins explained that there is a separate short-term incentive plan for an officer, a key employee, and a general employee. The short-term incentive plan for the general employee is known as "RSVP" or Rewarding Service Valuing Performance. The officer's short-term incentive plan provides a consistent framework of financial and operation goals. Each participant has a business plan goal which reflects the participant's contribution to achieving initiatives and enhancing profitability through effective management initiatives beyond the business plan. The key employees' short-term incentive plan works virtually identically to the incentive plan for officers. As with officers, key employees have both financial and operational goals.

In all incentive compensation plans for officers, key employees and general employees, the actual amount of the award depends upon the achieved results. All of the incentive plans are designed to emphasize key operational and financial goals and link pay with business performance results. Incentive plans such as these encourage cost control and resource optimization both of which will benefit customers.

In rebuttal testimony, witness Higgins asserted that we did not challenge the appropriateness of the incentive compensation plan in Peoples' last rate case.<sup>15</sup> Also, in the Gulf Power Company rate case, in Docket No. 010949-EI, we approved an incentive compensation plan that consisted of a base salary and incentive compensation to pay the Gulf employees at the 75<sup>th</sup> percentile while Peoples is targeted at the market average.<sup>16</sup>

<sup>15</sup> Order No. PSC-03-0038-FOF-GU, issued January 6, 2003, in Docket No. 020304-GU, In Re: Petition of Florida Power & Light Company for authority to increase its rates and charges.

<sup>16</sup> Order No. PSC-02-0787-FOF-EI, issued June 10, 2002, in Docket No. 010949-EI, In Re: Request for rate increase by Gulf Power Company.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 26

Workpaper 04  
Page 26 of 66

Witness Higgins stated that if the incentive compensation portion was eliminated, the base pay package would need to be redesigned because payment of base pay alone would be below the market average and would not be competitive in attracting and retaining a high quality and skilled workforce. Witness Higgins further pointed out that elimination of the incentive compensation portion of the pay package would increase the salary expense for the ratepayers because there would be no deduction when the financial and operational goals are not met by the individual employees.

In response to witness Schultz's claim that the goals set are not realistic goals, witness Higgins explained that witness Schultz does not understand "incentive compensation." Witness Higgins explains the goal-setting process includes a review of historical results and achievements, the challenges of the goal, and the applicability to the upcoming year's operational and financial objectives. Also, the goals are set to have a reasonable chance of achievement, while requiring efforts that challenge the organization's employees and balance the cost to provide targeted levels of service. PGS does not take the goal-setting process lightly and there are numerous factors that go into setting goals and targets each year, including consideration of past achievements, reorganizational changes and system enhancements.

According to OPC, payroll expense should be reduced by \$697,861 for the difference between the payroll amounts calculated from Interrogatory No. 61 and the amount shown on MFR Schedule G-2. OPC argues that this payroll expense reduction should be made for lack of justification.

PGS witness Higgins testified that Peoples prepared two O&M expense projections. The first methodology was based on the Company's annual budget process and the second methodology utilized the trend factor study contained in the MFRs. He further testified that the O&M expense in the MFRs was lower than the amount calculated through the budget process. The difference between these two amounts was approximately \$72,000, a difference of 0.1 percent. Witness Higgins pointed out that PGS was able to reconcile total O&M expenses using the two methods to within an immaterial difference.

PGS Witness Higgins testified that the Securities and Exchange Commission, Form 8K, Section 5, Item 5.02E stated that "On February 4<sup>th</sup>, 2009, the board and the compensation committee for TECO Energy, with respect to the chief executive officer's salary, decided to keep the salaries of the executive officers the same as in 2008 . . ." Witness Higgins agreed that this adjustment should be reflected in the PGS rate case by keeping the 2009 projected year test year officers' salary expense the same as the 2008 salary expense:

**Table 1**

	<u>2009 Original</u> <u>Guidelines</u>	<u>Revised</u> <u>Guidelines</u>
Officers	4.0%	0.0%
Exempt	4.0%	2.0%
Non-Exempt	4.0%	3.5%

The revised guidelines reduced PGS's projected test year salary expense by an estimated impact of \$253,300. The TECO Electric salary allocation was reduced by \$26,500.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 27

Workpaper 04  
Page 27 of 66

### 1. Incentive Compensation

An employee's salary is made up of their base pay and the incentive compensation pay. It is up to the employees to earn the incentive portion of their salary. If the employees do not meet their work goals, the employees will not be paid the additional incentive compensation. Even though the customer response goals were slightly lower in 2004, the goals were achieved at a higher percentage of responsiveness. We find that the incentive compensation has been earned not only because of the response time of calls to ratepayers is appropriate, but also because no ratepayers testified at the four customer service hearings throughout the State of Florida about any complaints about the gas service or the cost of PGS's gas service.

We believe that an incentive compensation plan is an appropriate tool to motivate employees to work efficiently and effectively. The incentive portion of salary gives the employee the opportunity to earn the market average salary. As the base pay is below the average market salary, the incentive is provided that allows the employee the opportunity to achieve a market based salary.

This Commission approved PGS's incentive program in its last rate case in 2003. The incentive program allows PGS to maintain and attract a quality workforce that provides quality gas service demonstrated by the lack of customer complaints at the service hearings. We find that an adjustment is not necessary to the incentive compensation plan. The reduction in the merit increases, as discussed above, compensates for the lowering of the 2009 average market salaries.

### 2. Other Payroll

This filing is based on a 2009 projected test year. PGS witness Higgins testified that PGS's 2009 O&M expenses included in the MFRs were lower when compared to PGS's 2009 budgeted O&M expenses. An adjustment could be made to update the O&M expenses in the MFRs to reflect the budgeted expenses in OPC's Interrogatory No. 61. We believe that PGS did not request an adjustment in this issue to update its 2009 O&M expenses because the budgeted expenses were only \$72,000 more than the expenses in the MFRs. In addition, this adjustment would have been additional expense borne by the ratepayer. Thus, we find that OPC's suggested \$697,861 payroll expense reduction is not warranted.

### 3. Merit Increase Guidelines

Witness Higgins agreed that the \$253,300 adjustment should be reflected in the PGS rate case by keeping the 2009 projected test year officers' salary expense the same as the 2008 salary expense. We find that this adjustment shall be made.

In summary, we find that an adjustment to Account 920, Administrative and General Salaries, in the amount of \$253,300 to reduce the officers' payroll increases to zero and reduce the merit increase of the other employees, is warranted in this case.

### C. Rate Case Expense and Amortization Period for Rate Case Expense

OPC witness Schultz testified that PGS projected a total expenditure of \$750,000 to be amortized over a three year period at a cost to rate payers of \$250,000 per year. He testified that using the average CPI index and the inflation rates proposed on MFR Schedule G-2, page 19, the

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 28

Workpaper 04  
Page 28 of 66

benchmark costs for rate case expense should have increased by only 18.4 percent instead of 212 percent. Thus, witness Schultz concluded that the costs are excessive.

According to witness Schultz, the Company stated that its accounting staff was not capable of handling the additional workload associated with a rate proceeding. Furthermore, the Company hired seven consultants to handle the rate case. He asserted that the Company included amounts that were not supported by the contract information provided in response to OPC Interrogatory No. 65. He contended that in the filing; 1) C.H. Guernsey payment is \$3,000 less than what is in the contract, 2) AUS Consultant amount is \$6,500 higher than the contract, 3) Huron Consulting amount is \$37,000 more than what is in the contract, and 4) C. Holden's contract is on an "as required" contract basis with a fixed hourly rate without any cap. Witness Schultz believes that an adjustment should be made for the consultants' contracts in the amount of \$65,500. He further asserted that the three-year amortization period is not reasonable based on the Company's history of five years between rate cases. The Company's last rate case was in 2002. He believes that a five-year contract is more appropriate. Witness Schultz believes that the Company's amortization expense should be reduced by \$113,100, the unamortized balance in rate base should be reduced by \$8,950, and the working capital allowance should be increased by \$8,950.

In his rebuttal testimony, PGS witness Higgins testified that the Company is staffed to handle ongoing day-to-day responsibilities but additional workload of the rate filing required supplementing the existing team. He stated that the consultants were hired to assist in case preparation and to serve as expert witnesses. He argued that the adjustments proposed by witness Schultz are based on "bid" amounts in the contracts. He further argued that the \$37,000 reduction made to the Huron Consulting Group by witness Schultz was not reflective of the contract bid, "which was for professional services only, and did not reflect out of pocket expenses that are reimbursable by the Company." He testified that C. Holden was retained as a contractor on an "as needed" basis to supplement the Company's accounting staff. In addition, the related fees were paid on an hourly basis and the Company was required to estimate the total expenses expected for his work. Witness Higgins, argued that witness Schultz's reduction of C. Holden's contract by 50 percent was totally unsubstantiated. He further argued that witness Schultz's statement is not based on the understanding of the Company's size, workload, any studies of the same, or any information other than his arbitrary and conclusory statement. According to witness Higgins, to provide the detailed information required by the Company for a rate case proceeding requires quality professionals to supplement Peoples' existing staff. He asserted that C. Holden is familiar with the Company and its accounting system and also provides quality services. Witness Higgins testified that it is difficult to predict when Peoples will file its next base rate case, but he is certain it will be sooner than five years. He testified that three years is an appropriate amortization period for rate case expense, and no adjustment should be made.

We examined PGS's contracts for the rate case consultants and agrees with OPC witness Schultz's findings. A review of Huron's Consulting contract shows that the "Scope of Service" had defined costs, stated as "fixed price and budget limit." Pursuant to our analysis of this information, we believe that the burden of proof for the reasonableness of Mr. Holden's work and payment is on the Company. Also, the scope of work and directions to the consultant was to account for and maintain records as documentation, which is stated in Section 2 of the agreement

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 29

Workpaper 04  
Page 29 of 66

between the Company and Mr. Holden. Therefore, we believe that the information was readily available and should have been supplied to validate Mr. Holden's performance as it related to PGS rate case.

With respect to the amortization of rate case expense, we find that a four-year period is appropriate. We have previously approved four-year amortization periods for St. Joe Natural Gas Company, Inc. and Sebring Gas System, Inc.<sup>17</sup>

In summary, we find that rate case expense is \$684,500 and shall be amortized over 4 years. In PGS's last rate case, we approved a 4-year amortization period. In addition, we find that a reduction to amortization expense in the amount of \$78,875 is appropriate. The \$78,875 represents the difference between the Company's proposed annual amortization of \$250,000 (\$750,000/3 years) and our calculations with respect to the annual amortization of \$171,125 (\$684,500/4 years).

D. Recovery of the Gas Cost Portion of Bad Debt Expense Through the Purchased Gas Adjustment Clause

PGS witness Higgins testified that PGS made a pro forma adjustment in its filing to remove the gas cost portion (46 percent, or \$723,580) of bad debt expense and proposed to recover this cost through the Purchased Gas Adjustment Clause (PGA) instead of base rates. OPC witness Schultz argued that PGS's proposal will not benefit customers. He also testified that as a type of uncollectible expense, the gas cost portion of bad debt showed no strong correlation with the volatility of natural gas prices. This point was not contested by PGS. However, PGS contested OPC's claim that recovery through the PGA will reduce scrutiny and Company incentive to pursue collection.

PGS and OPC agreed that PGS's proposal would be a change in our practice of not using the PGA to separately recover the gas cost portion of bad debt expense. PGS has not presented any basis in the record to justify a change in our practice. Therefore, we find that the appropriate recovery mechanism for the gas cost portion of bad debt expense shall be base rates, not the PGA. Moreover, PGS's adjustment to transfer \$723,580 of the bad debt expense to the Purchased Gas Adjustment Clause shall be reversed.

E. Adjustments to Bad Debt Expense

PGS witness Higgins testified that the Company proposed to recover a portion of the Company's uncollectible accounts or bad debt expense through the PGA instead of base rates. As discussed subsequently, the Company made a pro forma adjustment in the amount of \$723,580, as reflected on MFR Schedule G-2, page 2, of bad expense from the PGA. Witness Higgins testified that to arrive at the estimate to apply to the projected test year, PGS performed

---

<sup>17</sup> See Order No. PSC-08-0436-PAA-GU, issued July 8, 2008, in Docket No. 070592-GU, In re: Petition for rate increase by St. Joe Natural Gas Company, Inc. Consummating Order No. PSC-08-0489-CO-GU, issued August 8, 2008, made Order No. PSC-08-0436-PAA-GU final and effective; and Order No. PSC-04-1260-PAA-GU, issued December 20, 2004, in Docket No. 040270-GU, In re: Application for rate increase by Sebring Gas System, Inc. Consummating Order No. PSC-05-0039-CO-GU, issued January 12, 2005, made Order No. PSC-04-1260-PAA-GU final and effective.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 30

Workpaper 04  
Page 30 of 66

an analysis of the historical write-offs for 2005, 2006, and 2007. The resulting fuel portion of the bad debt expense for each year was 40, 49, and 47 percent, respectively, was used to develop the weighted average percentage of 46 percent. Finally, the 46 percent was applied to the total calculated bad debt expense of \$1,573,000, (which was based on a four-year average factor), resulting in a \$723,580 adjustment to be used for the PGA.

OPC witness Schultz testified that the shifting of a substantial portion of the uncollectible cost to the PGA would provide the Company an automatic pass-through. He further testified that without an automatic pass-through, the Company is required to provide the effort to minimize the level of write-offs between rate cases. Witness Schultz believes that the adjustment to remove the \$723,580 from O&M expense shall be reversed.

We find that bad debt expense shall be increased by \$723,580 and shall be based on a four-year average. PGS's calculation of the total bad debt expense in the amount of \$1,573,000 was based upon a four-year average before applying the 46 percent weighted average. Therefore, we find that the bad debt expense should be increased by \$723,580, based upon a four-year average.

F. Adjustments to Account 926, Employee Pensions and Benefits

In its response to OPC Interrogatory No. 6, PGS stated that its test year amounts for pensions and post retirement benefits were \$1,735,700 and \$1,203,600, respectively. These amounts are, in combination, lower than the base year amounts provided in the same response by \$271,966, or 8.47 percent. In direct testimony, PGS witness Higgins testified that the projected test year amounts were calculated by the outside actuary firm of Towers Perrin. No other party filed testimony regarding pension and post retirement benefits. Staff has reviewed the evidence in the record and believes that pension and post retirement benefit expense are reasonable, and that no adjustment is appropriate.

In its response to OPC Interrogatory No. 6, the Company stated that its test year amounts for executive stock grants and stock option expense were \$564,200 and \$5,300 respectively for a total of \$569,500. OPC witness Schultz testified that these costs should not be paid for with ratepayer funds. Witness Schultz stated that "the addition of restricted stock grants and stock options only increases the disparity between the general employee population and the executive levels." Witness Schultz also averred that "the cost of this perk is especially excessive given the current economy and taking into consideration the fact that very few of the Company ratepayers have a similar benefit available to them."

In rebuttal testimony, PGS witness Higgins testified that OPC witness Schultz provided no analysis, benchmarks, or other data to support his recommended adjustment. Witness Higgins stated his belief that witness Schultz's general characterization of the amounts as excessive was not sufficient to remove them from the Company's O&M expense, which he noted was already below this Commission's benchmark. In response to staff Interrogatory No. 118, PGS stated that, according to the 2008 Towers Perrin General Industry and Energy Services Industry Long-Term Incentive Plan Reports, 57 percent of Energy Services Industries offer restricted stock. The Company stated that "the prevalence and utilization of these plans makes these incentives necessary to attract and retain talent."

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 31

Workpaper 04  
Page 31 of 66

After examining the evidence in the record, we find that the Company's testimony is persuasive, and we agree that OPC has not provided specific data to support its position that the stock grants and associated expense are excessive. Accordingly, we find that no adjustments to these amounts are appropriate.

In direct testimony, witness Schultz testified the 2007 Employee welfare/activity expense was \$211,374. In response to OPC Interrogatory No. 13, PGS identified an additional \$122,720 in expenses that needed to be removed as part of the ratemaking process and Witness Schultz identified a corresponding \$8,361 inflation factor that needed to be removed. In rebuttal testimony, witness Higgins agreed with the adjustment to remove \$8,361 for the approximate inflation factor. Also, witness Schultz identified \$164,600 in unjustified costs.

PGS Witness Higgins pointed out that OPC witness Schultz provided no explanation as to why he believes that the \$164,500 costs were unjustified other than the fact these expenses are new. Witness Higgins explained the \$164,500 costs were derived from the Company's budget process that requested that field and corporate managers to include any new prudent expenses anticipated in 2009. In this case, PGS's Human Resource experts provided detailed information for the additional employee costs.

We find that a portion of the \$164,500 expense shall be removed. The \$10,000 for interviews and \$37,500 for job postings expenses are self explanatory in the budget process. However, PGS has not put forth sufficient justification for the \$27,000 in wellness expenses or the \$90,000 in crucial conversation expenses to be allowed even though the expenses were requested and documented in the budget process. The budget process is a guide for future expenses, not a guarantee that the dollars will be spent for the original requested purpose. This Commission would need additional facts in order to allow the wellness and crucial conversation expenses. Therefore, we find that an adjustment shall be made to reduce Account 926, Employee Pensions and Benefits by \$125,361, which removes the \$117,000 in unjustified employee benefit expenses and the \$8,361 inflation factor that was agreed to by OPC and PGS.

#### G. Appropriate Amount of Pipeline Integrity Expense

PGS included \$751,500 in operations and maintenance (O&M) expense (Account 887 – Maintenance of Mains) for the projected test year for transmission and distribution pipeline integrity costs. A portion of the expense was included in anticipation of a new federal rule which is expected to be adopted in 2009, as well as for additional required distribution system reliability. OPC believes that the increase is not justified and recommends that PGS's request be reduced by \$250,000.

PGS's witness Higgins testified that a proposed new rule related to distribution pipeline integrity activities will require a significantly large level of expenses in 2009 and beyond. The Pipeline Inspection, Protection, Enforcement, and Safety Act of 2006 (Public Law 109-468, the PIPES Act) was passed by Congress and signed into law by President Bush. The U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration (PHMSA) has been studying the issue of distribution integrity management programs (DIMP) with the intention of promulgating new regulatory requirements in this area. PHMSA published

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 32

Workpaper 04  
Page 32 of 66

a notice of proposed rulemaking in the Federal Register for June 25, 2008. PGS's witness Binswanger testified that the federal Pipeline Safety Act of 2002 (the 2002 Act) required the implementation of integrity management activities with respect to "transmission" pipeline, and the PIPES Act required similar measures with respect to "distribution" pipelines. He stated that the 2002 Act and the resulting PHMSA's regulations were limited because of the relatively small proportion of pipelines within PGS's system that are classified as transmission pipelines. However, the PIPES Act and PHMSA's implementing regulations will much more directly affect PGS and other natural gas local distribution companies, and PGS simply has no control over the incurrence of the costs. PHMSA's proposed rule for distribution integrity, expected to be finalized in about a year, outlines seven steps that distribution companies must take, including develop and implement a written integrity management plan, know your infrastructure, identify threats, both existing and of potential future importance, assess and prioritize risks, identify and implement appropriate measures to mitigate the risks, measure performance, monitor results, and evaluate effectiveness of programs while making changes where needed, and periodically report a limited set of performance measures to regulators.

Witness Higgins indicated that the full impact of costs related to the proposed DIMP rule is not known with certainty. It is anticipated that the costs of developing a plan, preparing required documentation, and performing required risk assessments will represent approximately \$250,000 in the 2009 projected test year. This estimate, to be added to Account 887, was based on industry data included in a study completed by the American Gas Association. PGS anticipates that most, or all of this work, will be accomplished by the employment of outside contractors. According to the Utility, the 2009 projected test year expenses included in Account 887 are approximately \$250,000 more than the 2008 and 2010 through 2013 projected expenses. The increased amount for 2009 reflected a boost in transmission and distribution integrity management.

OPC argues that PGS's proposal to recover the speculative pipeline integrity expense from customers is unwarranted and unjustified. The expense level is based largely on guesswork and not even on existing rules or regulations. OPC witness Schultz testified that it is important to note that the steps required above are steps that a prudently operated distribution company should already have had in existence. Because of the unknown nature of the new distribution pipeline integrity costs that PGS proposes to include in Account 887 for 2009, witness Schultz recommended that they should not be allowed at the level requested. He points out that an adjustment of \$250,000 reduces PGS's unknown cost estimate to \$501,500. This amount is similar to the 2008 amount and slightly below the estimated costs for each of the years 2010 through 2013. It is also \$241,930 more than the 2007 base year cost, an increase of 100 percent.

In his rebuttal testimony, PGS witness Binswanger testified that pipeline integrity costs are very difficult to estimate, and disagrees with OPC's adjustments as they ignore the integrity management mandates. The witness does not believe that the federal government would have spent the last four years crafting these requirements, in addition to the time the gas industry has spent in addressing the requirements of DIMP, if prudently operated distribution companies already had them in existence as OPC witness Schultz indicated. Witness Binswanger indicated that in this case, the fact that history does not support estimates for future DIMP costs is quite understandable because the industry would not have historical expenses to justify future expenses. PGS believes that while not every item of expense is expected to occur in every year,

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 33

Workpaper 04  
Page 33 of 66

the inclusion of \$750,000 for this category of expense for the projected test year is reasonable for ratemaking purposes, and should be approved by the Commission.

We find that the Utility failed to prove that the proposed costs for system reliability are warranted. PGS's request for the inclusion of an estimated \$250,000 in Account 887 for system reliability costs relating to the proposed DIMP rule may be premature since a rule has not yet been adopted. We also note that the 2009 projected expense constitutes approximately \$250,000 in increases over the projected expenses for 2008 and the four years following 2009. We question the validity of this amount without sufficient documentation to warrant such an increase. We have concerns with the estimated costs and the lack of detailed information justifying those costs, such as supporting documentation including actual historical costs, bids or contracts. Accordingly, we find that the proposed costs are too wide-ranging in nature and the amount requested by the Utility shall not be allowed. Therefore, we find that the projected test year pipeline integrity expense shall be reduced by \$250,000.

#### H. Storm Damage Reserve

PGS witness Higgins testified that the annual accrual for the storm reserve for the projected test year should be \$100,000. He stated that the Company should be allowed to establish a storm reserve so that it would not be forced to incur large, unusual, and unpredictable costs in any particular year. He further stated that Florida Public Utilities Company,<sup>18</sup> a gas distribution Company, had received Commission approval for an unfunded storm damage reserve liability. Witness Higgins stated that the Company proposed to accrue the amount annually to reduce the liability account for storms or significant weather. He stated that PGS proposed to limit the storm reserve liability to \$1 million. When the balance is reached, PGS would stop accruing the annual expense.

According to witness Higgins, the Company provided a storm reserve analysis schedule which agreed to Exhibit 50 which was attached to his direct testimony. The storm analysis schedule included columns for the following: 1) employee expense which included employees travel, meals, or hotels; 2) outside contracted services; 3) fringes which follows PGS fringe allocation program including medical benefits, payroll taxes, and pension; 4) bonuses; and 5) other. He stated that the "other" was a catch-all category and was unsure as to the types of expenses included in this category. In addition, the calculated annual storm accrual is based on PGS expenditures for hurricanes and storms from 1998 through 2007 (10-years). He stated that the 10-year expenditures totaled \$1,056,000, of which \$900,000 were O&M expenses. Witness Higgins further stated that he abided by Commission Rule 25-6.0143, F.A.C., and removed "base pay."

In the calculation to establish a storm damage reserve, the Company used a 10-year simple average for O&M expense resulting in \$69,454. Witness Higgins contended that a 5-year average of O&M expenses of approximately \$133,000 was calculated. He further contended that this was based on 97 percent of the O&M expenses occurring in the past 5 years. The overall averaged cost for the storms was \$101,500 ( $\$69,454 + \$133,463/2$ ), but the Company proposed

<sup>18</sup> Order No. PSC-05-1040-PAA-GU, issued October 25, 2005, in Docket No. 041441-GU, In Re: Petition for approval of storm cost recovery clause to recover storm damage costs in excess of existing storm damage reserve, by Florida Public Utilities Company.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 34

Workpaper 04  
Page 34 of 66

\$100,000. Witness Higgins stated that the bulk of the storm damage expenses incurred in 2004 and 2005. He testified that the Company contemplated filing a petition with the Commission to address storm costs because the expense incurred was relatively large. He further testified that "he did not recall the details", but "was not involved in the decision directly to not come before the Commission." During his deposition, witness Higgins stated the storm damage costs, which were summarized on Exhibit 50, were revised to remove straight time payroll and bonuses because of the storm reserve rule. He then asserted that the proposed annual storm accrual was recalculated and revised from \$100,000 to \$75,000.

OPC witness Schultz testified that the Company should not be allowed to establish an annual storm reserve in rates:

First, the company assumes it will incur unusual an unpredictable costs in future in the future from storms even though there is no evidence that a significant level of storm costs will incur and produce damage. Secondly, the company is requesting that the reserve be unfunded.

OPC witness Schultz believes that an unfunded reserve would allow the Company to use it for any purpose. He asserted that the Company reviewed the storms costs, with the exclusion of straight-time payroll, for the last ten years, and averaged the costs to total \$69,454; and then averaged the storms for five years to be \$133,463. He stated the Company assumed a reasonable level of expense would be derived by averaging the totals of the 10-year and 5-year costs.

OPC argued that the Company's experience with storms does not support the need for a \$1 million reserve or an accrual to establish one. OPC argued that the initial accrual was done on guesswork and not based on actuarial or scientific studies. OPC further argued that the estimate included costs that should not have been included causing the initial \$100,000 accrual request to be trimmed to \$75,000.

We examined the data PGS provided in Exhibit 50 and the storm reserve analysis schedule. For the period of 2004 through 2005, PGS experienced storm expenditures of approximately \$961,000. For the 10-year period 1998 to 2007, the Company provided costs totaling \$1,056,310 on the storm analysis schedule for payroll, bonuses, supplies, employee expense, outside service/TECO, fringe, other, and capital. The Company excluded straight-time payroll, bonuses, and capital expenditures from its calculations. We included in our calculations the following costs: overtime payroll (\$164,674), supplies expense (\$43,515), employee expense (\$19,281), and outside services/TECO (\$155,968). The Company provided a late-filed exhibit for our review. The exhibit contained a detailed breakdown of the expenses. Since the Company could not provide a breakdown of the costs for analysis we excluded fringe and other expenses. Based upon our recalculations and applying the Company's methodology, the storm damage accrual shall be \$57,500.

We find that the Company shall be allowed to establish a storm damage reserve and the annual accrual shall be in the amount of \$57,500. As a result, the proposed annual storm damage accrual of \$100,000 shall be reduced by \$42,500. A target level of \$1,000,000 shall be established for the storm damage reserve, but no "cap" shall be imposed at this time.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 35

I. Adjustments to Account 912, Demonstrating and Selling Expenses

In his testimony, PGS witness Higgins explained that the marketing expense was needed because PGS was focusing on signings in saturated areas on existing mains. A signing is when a customer signs a letter of intent to use PGS's gas service. This type of one-on-one marketing is more labor intensive and costly than signing customers in large developments as was done in the past. In rebuttal testimony, witness Higgins explained that the contract is not simply one that reflects new sales efforts that add customers, but also a contract that supports customer retention.

PGS's marketing services are provided by its affiliate, TECO Partners, Inc. ("TPI") Witness Higgins stated that the cost of services received under the current marketing contract has declined significantly since the Company's last rate case. The marketing contract expense in the filing for 2009 is \$6.126 million, which includes variable expenses of \$2.144 million attributed to the number of signings.

Witness Higgins further testified that the benchmark analysis calculated the historical 2007 sales expense as \$12,785,270, compared to the 2007 historical sales expense of \$5,419,540 in this filing. The benchmark analysis tool determines the appropriateness of O&M expenses, because O&M expenses should generally grow at a rate similar to customer growth and inflation. The benchmark analysis shows that the 2009 sales expense of \$6,126,000 is a 52 percent reduction from the 2007 base year benchmark expense level of \$12,785,270.

Witness Schultz testified that the marketing contract with TPI was effective January 1, 2008, and consisted of a fixed amount and a variable amount that is escalated annually by CPI. Witness Schultz questioned the total cost of the contract and, in particular, the monthly installments of \$216,666 for a total of \$2.6 million per year. The total amount paid each year is adjusted to reflect the number of "New Signings" that is greater or less than the target level of 12,000. Witness Higgins agreed that this contract was not competitively bid, but testified that if the targeted goal of 12,000 signings was not reached, the payment amount would be decreased as it was in 2008.

Witness Schultz asserted that even with PGS's marketing contracts, there was only an increase of 593 customers based on a year end count or 1,298 customers based on an average basis for the year. Witness Schultz concluded that, based on the customer growth in this filing, there is no justification to compensate TPI for the unachieved 2009 increase in new customer signings. Witness Schultz also concluded that it appears that the affiliate, TPI, is being compensated based on gross additions, and not net additions, which would include customer losses. Therefore, PGS is paying TPI for keeping Peoples at a gross level of customers, and not taking into account customer losses.

In rebuttal testimony, witness Higgins explained a customer may not start using the gas service the same year of the signing. For example, the signing of a development of a housing project may happen a few years before the construction is completed or homeowners take occupancy. Therefore, a "New Signing" is not a reflection of the gross number of customers or net number of customers added, but rather the intent of the customers to use PGS's gas service

In cross-examination, Witness Higgins agreed that the definition of "New Signings" means executed Gas Service Agreements, executed Builder or Developer Agreements, or any

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 36

other form of agreements as required by Peoples to establish natural gas service. Witness Higgins stated that this definition does not identify whether the "New Signings" are gross or net customer additions, just that it relates to customers signings.

Witness Higgins explained that the 1,298 customers on an average basis for the year could have included the customer losses because the Utility usually loses 10,000 customers per year. Witness Higgins agreed that the average in new signings for 2003-2007 was 9,720.

We believe that it is necessary for the Utility to market the use of natural gas in order to inform the public and bring in additional revenues to maintain the cost of service at a reasonable level. The signing document is a useful tool to motivate customers, developers and organizations to commit to PGS gas service. In addition, a target goal of 12,000 signings is unrealistic in today's economy.

Therefore, we find that an adjustment to the target goal is warranted even if the payment to TPI can be adjusted for the number of actual signings. We find that the target goal shall be the average number of signings for 2003-2007, which is 9,720 or 81 percent of the target goal of 12,000. This average number is more realistic because of the downturn in the real estate market.

Witness Higgins stated that there were \$2.144 million in variable expenses. We find that an adjustment shall be made to reflect the reduction in signings to the five-year average. As the five-year average of signings is 81 percent of the target goal of 12,000 signings, the variable expenses shall be reduced by 19 percent or \$407,360. Therefore, we find that an adjustment to reduce Account 912, Demonstrating and Selling expenses by \$407,360 to reflect a five-year average of customer signings shall be made.

#### J. Directors and Officers Liability Insurance

In his direct testimony, OPC witness Schultz testified that Directors and Officers Liability Insurance (DOL) protects the directors and officers from personal liability for bad and/or questionable decisions, and ultimately protects the shareholders. Witness Schultz explained that in the event that litigation occurred the shareholders could make a claim against the insurance company and receive the benefit of the insurance policy. Witness Schultz explained the officers and directors are compensated for their time and their traditionally generous compensation benefit packages are considered sufficient compensation for directors, and officers. Therefore, witness Schultz states that the officers compensated should pay for the DOL Insurance, because the DOL provides no benefit and/or protection to the ratepayers. Further, witness Schultz testified that ratepayers have no say in the choice of officers and directors and insurance company.

Witness Schultz asserted that \$342,000 should be excluded from the rates. He testified that if we want to allow some of the DOL Insurance, the expense should be limited to the 2003 level of expense of \$167,955 because the cost of insurance doubles to \$386,684 in 2007. Lastly, witness Schultz stated that unless it is shown that DOL Insurance does benefit ratepayers, the escalation in costs due to general corporate misdeed should not be borne by the ratepayers

PGS witness Higgins testified that witness Schultz did not have any studies or information to support his claim that the compensation packages are sufficient compensation for directors and officers for their services absent DOL Insurance expense. Witness Higgins explained that DOL Insurance expense is required to attract and retain qualified individuals in

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 37

these valuable roles. Witness Higgins stated that corporate surveys indicate that virtually all publicly traded entities maintain DOL Insurance. Lastly, witness Higgins explained that DOL Insurance provides a significant source of balance sheet protection from losses and from lawsuits and preserves the capital for the efficient and continuous delivery of gas service to customers.

Witness Higgins explained that the DOL Insurance premiums fluctuate because of the same market forces that impact the premiums for property, liability, worker's compensation, and other insurance policies. The significant changes that influenced the price of DOL insurance premiums from 2002 to 2007 were the negative claims from the "dot com" stock market bubble, the September 11 terrorist attacks, the Enron collapse, and the Sarbanes-Oxley legislation. Witness Higgins anticipates that the premiums will increase in the future because of the negative market influences from the current financial market distress. Also, witness Higgins stated that the 2009 projected DOL Insurance expense is reasonable and prudent because this type of insurance is based on expected market conditions.

Lastly, witness Higgins stated that no DOL Insurance expense needed to be removed because all of the DOL Insurance expense of \$337,000 is included in the TECO Energy allocated expenses to Peoples. In its response to OPC's Interrogatory No. 44, Peoples submitted a schedule of Peoples' insurance premiums, not a schedule of Peoples' expenses on its books and records. In this schedule, the 2009 DOL Insurance was listed as \$342,000. Therefore, there is no direct DOL Insurance expense in the MFR filing to remove from Peoples and there is no double dipping for this expense.

DOL Insurance is a part of doing business for any company or organization. It is necessary to attract and retain competent directors and officers. Corporate surveys indicate that virtually all public entities maintain DOL Insurance including investor owned gas utilities. We do not agree with OPC that the ratepayers do not benefit from DOL Insurance. Without DOL Insurance, it is unrealistic that the Company could operate effectively. Moreover, being served by a large Company helps ratepayers in a number of ways including easier access to the capital markets for their service provider. Lastly, even though the increase more than doubled between \$167,955 in 2003 to \$386,684 in 2007, we believe that the negative claims from the "dot com" stock market bubble, the September 11 terrorist attacks, the Enron collapse, and the Sarbanes-Oxley legislation justified the increase in premiums. We find that to apply the expense incurred in 2003 for setting rates in today's market would be inappropriate. The projected DOL Insurance of \$342,000 will be difficult to maintain at the 2009 level of DOL Insurance expense because of the negative insurance market influence due to today's economic conditions.

DOL Insurance has become a necessary part of conducting business for any company or organization and it would be difficult for companies to attract and retain competent directors and officers without it. Moreover, ratepayers receive benefits from being part of a large public company, including, among other things, access to capital. In addition, DOL Insurance is necessary to protect the ratepayers from allegations of corporate misdeeds. We also believe that it would be difficult for PGS to obtain DOL Insurance at the 2003 expense level and maybe even at that the requested 2009 expense level because of the current market conditions. Therefore, DOL insurance shall be included in the projected test year and no adjustment shall be made to

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 38

reduce or remove DOL Insurance. Furthermore, the DOL Insurance recovered through the TECO allocated expenses to Peoples is also appropriate.

K. Adjustments to Costs Allocated by TECO to PGS

In his direct testimony, OPC witness Schultz stated that Account 921 included \$6,722,093 of charges from TECO Electric and \$4,671,927 of charges from TECO Energy. Witness Schultz explained that TECO Energy allocated costs to Peoples including costs for incentive compensation, restricted stock grants and stock options, and DOL insurance, for an estimated total of \$1,261,437. This estimated total of \$1,261,437 was calculated by multiplying 89.75 percent (ratio of 2007 allocated costs to the 2009 allocated costs) times total costs of \$1,495,546 for incentive compensation, restricted stock grants and stock options, and DOL insurance. Witness Schultz explained that all of these costs should be removed based on OPC's recommended adjustments in the individual issues.

In rebuttal testimony, PGS witness Higgins acknowledged that OPC witness Schultz recognized that the expenses allocated from TECO Energy to PGS were lower in the 2009 projected test year than in the 2007 historical base year. Based on his recognition, witness Schultz's proposed adjustment was reduced by the percentage decrease from 2007 to 2009. An adjustment was made by PGS in Exhibit 8 to decrease TECO's allocated compensation expense by \$26,500. This decrease is necessary to reflect the appropriate 2009 merit increases.

On the basis of the foregoing, an adjustment shall be made to reduce TECO Electric's allocated payroll expense by \$26,500 to reflect the change in 2009 merit increase guidelines.

L. Taxes Other Than Income Taxes

Based on our findings above, the requested Taxes Other Than Income Taxes expense of \$10,823,933 shall be increased by \$7,500 resulting in an adjusted total of \$10,831,433 for the 2009 projected test year. See Schedule 3.

M. Parent Debt Adjustment

Rule 25-14.004, F.A.C., provides that "the income tax expense of a regulated company shall be adjusted to reflect the income tax expense of the parent debt that may be invested in the equity of the subsidiary where a parent-subsidiary relationship exists and the parties to the relationship join in the filing of a consolidated income tax return." Further, Rule 25-14.004(3), F.A.C., states that "it shall be a rebuttable presumption that a parent's investment in any subsidiary or in its own operations shall be considered to have been made in the same ratios as exist in the parent's overall capital structure." Rule 25-14.004(4), F.A.C., provides that:

The adjustment shall be made by multiplying the debt ratio of the parent by the debt cost of the parent. This product shall be multiplied by the statutory tax rate applicable to the consolidated entity. This result shall be multiplied by the equity dollars of the subsidiary, excluding its retained earnings. The resulting dollar amount shall be used to adjust the income tax expense of the utility.

In MFR Schedule C-26, PGS provided some of the information required to calculate the parent debt adjustment, but did not include an adjustment to income tax expense to reflect the

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 39

parent debt in the calculation of its requested revenue requirement. In Interrogatory No. 18, Commission staff requested that the Company provide the financial information necessary to make a parent debt adjustment in accordance with Rule 25-14.004, F.A.C. The Company provided the following information:

Debt Ratio of the parent	19.01%
Debt Cost Rate of the parent	6.90%
Consolidated Statutory Tax Rate	38.575%
Subsidiary Equity	\$167,473,246

In its response, the Company also provided an alternative set of data, which it labeled "Company Position," as follows:

Debt Ratio of the parent	0%
Debt Cost Rate of the parent	6.90%
Consolidated Statutory Tax Rate	38.575%
Subsidiary Equity	\$0 - \$108,843,000

In its response, PGS reiterated its objection to the application of the parent debt adjustment in this case, as expressed in the testimony of PGS witness Gillette.

Witness Gillette testified that TECO Energy has \$400 million of long term debt on its books. Witness Gillette also stated that this debt is related to TECO Energy's investment in its failed TPS merchant power projects, and that TECO Energy did not raise debt to invest in PGS. In its response to Interrogatory No. 18, the Company stated that between 1998 and 2003, TECO Energy raised approximately \$3.4 billion dollars of external capital, including approximately \$2.1 billion in debt. PGS asserted that the bulk of this capital was invested in TPS and other unregulated subsidiaries; however, PGS also stated that \$119 million (\$109 million if adjusted to reflect the external dividends of TECO Energy) was invested in PGS during this timeframe.

In direct testimony, OPC witness Schultz stated that the Company failed to include a detailed analysis to show how all parent debt was specifically used. Further, witness Schultz stated that, absent such a detailed analysis, the Company's statement that none of the existing debt was used to fund any equity infusions to PGS does not meet the Company's burden to rebut the presumption that a parent debt adjustment should be made, pursuant to Rule 25-14.004(3), F.A.C.

We agree with OPC that the Company has not effectively rebutted the presumption that the parent debt adjustment should be applied in this case. In ruling that a parent debt adjustment was required in a case involving Indiantown Company, Inc., this Commission stated:

Based on our analysis, the rule requires that a parent debt adjustment be made in this proceeding. Further, the rule does not allow for specific identification of debt from the parent to the subsidiary utility. Since the utility is included in the consolidated income tax returns of the parent, we believe that it would be very difficult to prove specific identification to only the utility. Rule 25-14.004(3), Florida Administrative Code, states that it shall be a rebuttable presumption that a

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 40

parent's investment in any subsidiary or in its own operations shall be considered to have been made in the same ratios as exist in the parent's overall capital structure.<sup>19</sup>

Rule 25-14.004, F.A.C., is based on the premise that debt at the parent level supports a portion of the parent's equity investment in the utility. Since the interest expense on such debt is deductible by the parent for income tax purposes, the income tax expense of the regulated subsidiary is reduced by the tax effect. Further, we find that the Company has not demonstrated that the interest on the debt on TECO Energy's books can be attributed to any source other than the general funds of the parent.

Accordingly, we find that the parent debt adjustment shall be applied in this case and that the elements of the computation shall be based on the projected test year capital structures of TECO Energy and PGS. Our calculation of the system income tax expense reduction is as follows:

Debt Ratio of parent		.1901
Debt Cost Rate of parent	x	<u>.069</u>
	=	.0131169
Consolidated Tax Rate	x	<u>.38575</u>
	=	.005059844
Subsidiary Equity	x	<u>\$167,473,246</u>
Parent Debt Adjustment	=	<u>\$847,389</u>

Therefore, we find that the Company has not effectively rebutted the presumption that a parent debt adjustment should be applied pursuant to Rule 14.004, F.A.C. Further, the appropriate subsidiary equity amount to be used in the calculation is the projected test year equity of \$167,473,246. Accordingly, the appropriate jurisdictional adjustment is a reduction of income tax expense in the amount of \$847,389.

N. Income Tax Expense, ITC Amortization, and Interest Synchronization

Based on our findings above, the requested total income tax expense of \$9,204,185 (current, deferred, and ITC) should be increased by \$15,901 resulting in an adjusted total of \$9,220,086 for the 2009 projected test year. (See Schedule 3).

Amount Requested	\$9,204,185
Commission Adjustments:	
Issue 39 – Parent Debt	(847,389)
Effect of Other Adjustments	809,233
Interest Synchronization	<u>54,057</u>

<sup>19</sup> See Order No. PSC-00-2054-PAA-WS, issued October 27, 2000, in Docket No. 990939-WS, In re: Application for rate increase in Martin County by Indiantown Company, Inc.

DOCKET NO. 080318-GU  
PAGE 41

Total Commission Adjustments	<u>15,901</u>
Commission Adjusted Amount	<u>\$9,220,086</u>

O. Projected Test Year O&M Expense

Based on our findings above, the appropriate level of O&M expense for the 2009 projected test year is \$72,124,723. See Schedule 3.

P. Projected Test Year Depreciation and Amortization Expense

We examined the depreciation and amortization expense of the Company for 2009 to determine the appropriate projected test year amount. We made several adjustments thereto. The effect of the adjustments is to reduce the projected depreciation and amortization expense of \$43,804,733 by \$113,640 to \$43,691,093 for the 2009 projected test year.

Q. Total Operating Expenses

The appropriate level of Total Operating Expenses for the 2009 projected test year is \$135,387,014. (See Schedule 3).

R. Net Operating Income

Based on our findings above, the appropriate Net Operating Income for the 2009 projected test year is \$36,019,112. (See Schedule 3).

VI. REVENUE REQUIREMENTS

The appropriate annual operating revenue increase for the 2009 projected test year is \$19,152,365. The following schedule shows the calculation of the revenue requirements.

<b>Calculation of Revenue Requirements December 31, 2009 Test Year</b>		
	<b>PGS</b>	<b>COMMISSION</b>
Rate Base	\$563,599,436	\$560,844,757
Rate of Return	x 8.88%	x 8.50%
Required NOI	\$50,060,255	\$47,671,804
Adjusted Achieved NOI	(33,944,697)	(36,019,112)
NOI Deficiency	\$16,115,558	\$11,652,692
Revenue Expansion Factor	x 1.6436	x 1.6436
<b>Total Revenue Increase</b>	<b>\$26,488,091</b>	<b>\$19,152,365</b>

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 42

## VII. RATES

### A. Customer Charges

The appropriate customer charges are shown in Schedule 6. The current residential customer charge is \$10. The cost of service study indicates that the customer unit cost for the residential class is \$15. Pursuant to an approved stipulation, Peoples received approval to stratify the current single residential service class into three classes (RS-1, RS-2, RS-3) depending on annual usage. For small users, such as RS-1 customers, the customer charge is a large percentage of the monthly bill. Our approved RS-1 customer charge is \$12, thus mitigating the bill impact on those small users. Our approved customer charge for the RS-2 class is \$15. The RS-3 class is available for large residential gas users, with multiple gas appliances, and the approved \$20 customer charge is a small percentage of the monthly bill. The aforementioned customer charges, in conjunction with the proposed distribution charges, result in reasonable bill impacts across the entire residential class.

The customer charge for the residential standby generator (RS-GS) rate is \$20, which is equal to the RS-3 customer charge. The RS-GS customer charge includes usage up to 20 therms. Usage above 20 therms is billed at the RS distribution charge. Similarly, the customer charge for the commercial standby generator (CS-GS) rate is set at the at the GS-1 customer charge of \$35. The \$35 customer charge includes therm usage up to 40 therms per month; usage above 40 therms is billed at the GS-1 therm charge. In addition, we grant our staff authority to administratively approve the tariffs filed to implement all Commission-approved rates and charges in this docket.

### B. Per Therm Distribution Charges

The appropriate per therm distribution charges are shown in Schedule 6. The distribution charges are set at a level which, in combination with the customer charge, will result in the recovery of the total base revenues allocated to each rate class.

### C. Gas System Reliability Rider (GSR Rider)

PGS proposed a new GSR Rider that would allows PGS to recover from its customers, through a surcharge, certain relocation and safety related costs, beginning in January 2010. Specifically, the GSR Rider is designed to recover two types of costs: revenue requirements associated with certain eligible infrastructure system replacements, and incremental O&M expenses incurred to comply with federal transmission and distribution pipeline integrity requirements.

The proposed GSR Rider tariff defines "eligible replacements" as:

1. mains, service lines, regulator stations, and other pipeline components installed to comply with state or federal safety requirements as replacements for existing facilities;

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 43

2. main and service line projects extending the useful life or enhancing the integrity of the pipeline components, undertaken to comply with state or federal safety requirements; and
3. facility relocations due to construction or improvement of a highway, road, street, public way or other public work by or on behalf of a government or other entity having the power of eminent domain, to the extent costs of the project are not reimbursed to PGS.

In addition to the eligible replacements listed above, PGS witness Binswanger testified that PGS anticipates being faced with incremental O&M expenses incurred to comply with federal transmission and distribution pipeline integrity requirements. Witness Binswanger referred to two new federal acts that could impact PGS: the Pipeline Safety Act of 2002, and the Pipeline Inspection, Protection, Enforcement, and Safety Act of 2006 (PIPES Act). The Pipeline Safety Act addresses transmission lines, and the PIPES Act addresses distribution systems. Witness Binswanger explained during the hearing that PGS is currently doing an assessment for transmission facilities in place; however, the guidelines on distribution systems have not been fully implemented yet.

In its brief, PGS asserted that a GSR Rider would be an appropriate mechanism for the recovery of revenue requirements associated with government-mandated investments for relocation of its facilities and O&M expenditures, neither of which the Company has any control over. The Company also would have no ability to recover these costs absent the filing of a petition for new base rates or for a limited proceeding. Currently, relocation costs are only recovered during a base rate proceeding. Witness Binswanger testified that for the years 2004 through 2007, there were total capital expenditures of \$17.6 million for government-mandated relocations, for which PGS received no revenues through which to recover the associated depreciation, ad valorem tax expenses, or a return on its investment in the replacement facilities.

PGS explained that it is standard practice for the Company to install facilities at the edge of public rights-of-way, which are substantially less expensive than the installation of facilities on private property. Installing in public rights-of-ways, however, subjects the Company to the requirements of federal, state, and local governmental statutes and regulations requiring the relocation of facilities when ordered to do so. For example, an entity may be re-routing or widening a road, installing water or wastewater lines, or reconfiguring an intersection, thereby necessitating the relocation of PGS facilities. PGS stated that in most instances, the Company must replace or relocate its facilities as part of the agreement to use the right-of-way without reimbursement in order to continue to meet its obligations.

PGS Witness Binswanger testified in his direct testimony that since the Company proposed that certain costs are included in the 2009 projected test year, no item would constitute an eligible replacement unless installed on or after January 1, 2010. Specifically, PGS has proposed to include in the test year \$750,000 of O&M expenses for pipeline integrity costs, which were addressed previously in this order. Witness Binswanger testified that any reduction in O&M expense for transmission and distribution pipeline integrity below what is allowed in the projected test year in this case would reduce the revenue requirement to be required through the GSR Rider. PGS also proposed to include \$3.8 million of relocation costs in the projected test

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 44

year. In his deposition, witness Binswanger clarified that there would be a similar reduction in the revenue requirement to be recovered through the GSR Rider if capital expenditures for relocations are less than what was allowed in the projected test year.

Witness Binswanger explained that if we approve the GSR Rider, PGS's first petition for GSR Rider factors would be filed late in 2009, and would be based on eligible investments projected to be placed in service and incremental expenses to be incurred by the Company during 2010. The charges resulting from the 2009 filing would be included on customers' bills commencing in January 2010. PGS would again file petitions in 2010, which would recalculate the charges to recover the revenue requirement based on eligible costs for both 2010 and 2011, as adjusted by projected true-ups of the initially projected 2010 revenue requirements.

OPC objects to the formation of the GSR Rider for several reasons. In its brief, OPC stated that it has grave concerns about whether we possess the authority from the legislature to establish a mechanism to recover non-volatile, non-fuel, base rate costs. OPC stated that at the present time there are two true capital cost recovery mechanisms that the Commission administers: the Environmental Cost Recovery Clause and the Nuclear and IGCC Cost Recovery Clause. Both those clauses were authorized and established by the Florida Legislature. OPC further stated that the other clause mechanism that we have established on our own are almost exclusively expense-related.

OPC stated that PGS has acknowledged that no other company in Florida has a rider like the GSR Rider. OPC argued in its brief that the two electric cases PGS cites as precedent were resolved by the Commission approving a stipulated settlement and thus the cases cited by PGS do not establish a precedent for the creation of the GSR Rider in the instant case.

Apart from the legal concerns, OPC also stated in its brief that there are strong policy and factual reasons not to grant the requested relief regarding the GSR Rider. OPC Witness Schultz testified in his direct testimony that he disagrees with PGS' contention that it will not recover those costs outside of base rate relief unless it receives this annual rate increase. Witness Schultz stated that as long as the Company earns sufficient net income to keep its overall rate of return within its authorized range, the Company will recover its investment in these costs.

Furthermore, OPC witness Schultz disagreed with PGS's assertion that the government-mandated relocation costs incurred by the Company have been substantial. The average capital costs for relocation projects for the years 2003-2007 was \$4.28 million, which is less than 10 percent of the Company's \$44.8 million capital cost over the same time period. With respect to the pipeline integrity costs, witness Schultz stated that PGS already petitioned to include \$750,000 in the test year, and that there is uncertainty about whether the Company would ever spend over the \$750,000. Finally, witness Schultz testified that the GSR Rider will have no positive impact on the management of the investments associated with the relocation of facilities and safety expenses. Witness Schultz expressed concern that an annual recovery mechanism will not provide management incentive to reduce costs or seek proper reimbursement of these costs because it will allow for the automatic pass-through of costs.

While FIGU did not sponsor a witness on this issue, FIGU objects to the GSR Rider in its brief. FIGU stated that line relocations have been going on since PGS began to locate its lines in

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 45

public rights-of-way at no cost. FIGU argued that line relocations do not trigger rate cases because the cost of relocations is more than offset by the money customers pay each year to cover depreciation.

We find that the adoption of a GSR Rider is not appropriate in this matter. However, we recognize that PGS may petition this Commission pursuant to 366.076, F.S., for a limited proceeding for the recovery of revenue requirements associated with government-mandated investments for relocation of PGS's facilities and O&M expenditures. Limited proceedings are narrow in scope and are designed to avoid the greater expenditure of time and resources typically associated with a full base rate proceeding. A limited proceeding is normally processed as a PAA in which a point of entry will be afforded to substantially interested persons to address concerns they may have regarding the petition. Historically, relocation costs have been recovered during full base rate proceedings. In order to mitigate regulatory lag and to ensure the timely recovery of those corporate expenditures for government-mandated relocations, in the absence of the adoption of a the GSR Rider discussed herein, we recognize that PGS may seek to recover costs expended pursuant to its compliance with government-mandated relocations via limited proceedings under 366.076, F.S.

D. Carbon Reduction Rider (CRR)

PGS has proposed a new cost recovery mechanism to collect, on a more timely basis, costs associated with extending supply mains to facilitate use of natural gas in new residential subdivisions. Extending gas lines consists of two basic operations: the extension of the supply main from the pipeline to a point close to the service location, and the installation of distribution mains and service lines necessary to provide gas to end users. The costs for distribution mains and service lines are collected through base rates, from developers, or through a Main Extension Program surcharge on bills of end users. The costs of supply mains currently is recovered only during a base rate proceeding.

The CRR "is designed to address, manage, and encourage the expansion of natural to new [residential] developments that are not located near interstate pipelines or existing Company supply mains." In determining whether serving a new area is cost effective, PGS stated that it evaluates several factors. PGS obtains information on potential load by meeting with developers, and reviewing land use maps and zoning criteria. The approximate time of build-out is also important in determining the time frame over which PGS can expect to recover the costs of extending facilities. One significant cost consideration is whether the potential end users are located near an interstate pipeline or a PGS supply main. If not, PGS must build a supply main to reach the area. PGS asserts that, unlike a distribution main and services, a supply main produces no direct revenue, but without it, potential revenue-producing customers cannot access natural gas.

PGS maintains that economically extending natural gas facilities to more areas in Florida accomplishes several goals. Witness Binswanger noted that natural gas is an extremely important source of energy for Florida because it is environmentally friendly, efficient, domestically produced, and more reliable during hurricanes. Witness Binswanger further stated that expanding natural gas availability in the state is consistent with Executive Order 07-127, and the Omnibus energy legislation contained in House Bill 7135. PGS has identified over 25 areas

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 46

in the state which it believes could be served by natural gas, if the supply mains were in place. However, financial constraints discourage extension of facilities because the recovery of those costs may be delayed over long periods due to build-out of new developments, or until the Company's next rate case.

The CRR would recover the revenue requirements<sup>20</sup> associated with supply mains installed to reach one or more new developments. Recovery under the CRR would be limited to installations of mains greater than four inches in diameter, or which are certified to operate at 60 pounds per square (psi) or greater, and which serve company distribution systems serving primarily residential customers.

CRR factors would be filed with, and approved at the same time as, other cost recovery factors each year. The costs would be allocated to rate classes consistent with the cost of service methodology approved in PGS's last rate case. Collection of the CRR for each project would continue for five years, or until PGS's next base rate case. The five year period is consistent with how costs are recovered under the existing Main Extension Program (MEP) surcharge for distribution facilities.

OPC objects to the CRR because it believes expansion revenue should be sufficient to pay for all of the facilities necessary to achieve new load. The new customers will be paying the same rates as the old customers and that, in theory, should be sufficient to cover the cost of new plant and operating expenses. The fact that Florida is not seeing the aggressive growth of prior years, plus the fact that PGS has not been in for a general rate increase since 2002, indicates that PGS is currently recovering such costs. OPC witness Schultz further stated that the average capital cost under the rider for year 2005 through 2007 cited by PGS is \$436,943, which is not significant enough to justify a new clause. In addition, OPC noted that PGS has been earning within its approved rate of return range for prior years in which PGS said it incurred similar costs of supply mains.

OPC Witness Schultz noted several drawbacks to the CRR. He believes implementation of this rider (and the GSR) constitutes single issue ratemaking without appropriate oversight. He asserted that the more certain costs are subject to recovery through some form of recovery mechanism, the less the Company is required to establish control over costs and the risk of managing costs is reduced. He also maintained that the addition of two new clauses, on top of the six existing cost recovery clauses, will create additional workload for this Commission and its staff in what was designed to be a streamlined, expedited process. In addition, Witness Schultz noted PGS has not included a reduction in ROE to recognize the reduction in risk of recovering capital costs between rate cases. Shareholder risk should be reduced because of the automatic pass-through; therefore a similar reduction would need to be made in the allowed rate of return to account for the reduced risk. OPC noted that Exhibit 92 demonstrates that PGS has been able to achieve a more favorable regulatory rating than every other member of the proxy group - many of which have cost recovery clauses.

<sup>20</sup> Revenue requirements are defined by PGS as the Company's weighted average cost of capital, depreciation expense, and ad valorem taxes, grossed up for federal and state income taxes.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 47

OPC also questions our authority to create new clauses, such as the GSR and CCR, to recover non-volatile, non-fuel, base rate costs. Other than statutorily-created environmental cost recovery mechanisms in Florida, and a statutorily created rider in Missouri, PGS has not cited any authority or precedent to support the adoption of such clauses. In addition, OPC noted that other clauses are industry specific, not utility specific, and are almost exclusively expense-related. Only after experience and familiarity have certain ad hoc capital costs been allowed for clause recovery.

FIGU took no position on the CRR in its prehearing statement because it did not believe it would be subject to the CRR. It modified its position in its post-hearing brief to oppose the CRR. Although FIGU still does not think its members are affected by the CRR, it believes adoption of such a clause is bad regulatory policy. FIGU argued that PGS competes with its parent, TECO for revenues from new subdivisions. By shifting the cost of expanding the PGS system from PGS to its existing customers, the revenue loss experienced by PGS and its parent, TECO, is mitigated at the expense of PGS customers. FIGU also noted that PGS's arguments on regulatory lag are overstated. Regulatory lag exists not only in recovery of capital expenditures, but also in recognition of depreciation, which reduces rate base and thus costs to be recovered from customers.

PGS currently has mechanisms in place to recover a portion of costs incurred as a result of requests from customers seeking service. The costs of extending distribution facilities is either recovered in base rates, or, if costs exceed estimated revenues, through a surcharge to the customers directly benefitting from the extension. The MEP provides for the collection of costs associated with dedicated residential and commercial infrastructure that exceed the amount included in base rates.<sup>21</sup> PGS maintains, however that these cost recovery mechanisms only recover distribution lines to a specific customer or development. The proposed CRR is designed to recover the cost of supply mains which may be extended to serve multiple developments within a common geographical area. The CRR would only recover costs associated with mains in excess of four inches in diameter or which are certified to operate at a maximum of sixty pounds psi. Further, the revenue for any one project would only be collected for the first five years following installation.

Absent the CRR, PGS does not directly collect any of the cost of supply mains until customers begin taking service. Witness Binswanger testified that PGS has identified over 25 projects representing over 100,000 new customers which would require extension of supply mains. PGS estimated that, had the CRR been available in 2008, approximately \$609,805 would have been eligible for collection under the CRR mechanism. Specifically, PGS cited two major projects, Ave Maria University and Town Center (total cost \$4.3 million), and Nocatee St. Johns County planned community (\$420,000), which did not go forward because of the costs. However, OPC noted in its brief that PGS filed a revised capital budget just prior to hearing, noting that Nocatee is shown as a new 2009 development project. OPC said this revision casts doubts on the Company's judgment relative to the extension of viable development, as well as demonstrating that the lack of the CCR may not be the true reason the Nocatee development did not go forward as planned.

<sup>21</sup> See Tariff Sheets 5.601 through 5.601-2 Mains and Service Extensions, and Tariff Sheets 7.101-7 through 7.101-9, Main Extension Program.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 48

Our primary concern is that PGS would be encouraged to extend facilities with only speculative prospects of customers, if it could immediately recover the revenue requirements associated with supply mains through a cost recovery clause. In discovery, OPC asked if projects recoverable through the CRR would be subject to our pre-approval. PGS's response did not answer the question directly. Instead, it said that PGS would file a petition requesting approval of the billing factors to be installed in the upcoming year. According to PGS, "the Commission would have the opportunity to thoroughly review and audit the company's filings and make necessary adjustments." This implies that this Commission could check the calculations, but that the Utility would not specifically seek Commission approval of the projects, per se. This lack of review of the prudence of the projects gives us pause in passing these costs on the ratepayers through a clause. It is also unclear whether we would have any opportunity for review and possible disallowance of projects in future rate cases, once such projects were included for cost recovery through the clause.

We do not take issue with the benefits associated with the use of natural gas cited by witness Binswanger. Nor do we disagree that expansion of natural gas availability may be consistent with state efforts to reduce green house gas emissions. However, we find that too few safeguards have been included to ensure that supply main extensions recovered through the CRR are viable, revenue-producing assets. We agree with OPC's assessment that expansion of facilities should be cost-effective at current rates. Extension of supply mains under the CRR does not require that there be any actual customers asking for gas service. Facilities may be extended to make gas available to encourage developers to install gas facilities in new developments in the future. PGS argued that developers will not even consider natural gas, if no supply main is in place.

If the expected pay-back period for a project is not sufficient for PGS to commit its internal funds, we question whether it is prudent to commit ratepayer funds to such projects. If PGS can recover the revenue requirements associated with any such investment, it has little incentive to either minimize costs, or ensure that the expansion is prudent and will generate revenue in a reasonable time frame. If there are no upfront costs to PGS for extending facilities where there are currently no customers, it might also encourage PGS to extend supply main facilities simply to claim territory for future growth, without reasonable expectations of revenue producing customers in the shorter term. The ability to claim territory by extending service mains without concern for concurrent revenue may create more territorial disputes, and disadvantage utilities which do not have the ability to immediately pass on such costs. The ability to avoid the upfront costs (and delay) of installing supply mains to serve a development makes it more attractive for developers to seek service from PGS over an adjacent utility, who does not have the ability to pass on such costs on an annual basis, even when other costs may indicate a different choice.

We also agree with OPC and FIGU that approval of the CCR may constitute imprudent regulatory policy. The purpose for all existing cost recovery clauses is to allow utilities to recover costs which are volatile and which are outside the control of the utility. Decisions on when and where to expand facilities are entirely under the control of the utility. PGS's management, not ratepayers, should bear the cost and responsibility for decision on expansion of the Utility. We also agree with OPC that we should move cautiously in approving collection of capital costs outside a rate case. OPC notes that the Legislature has already seen fit to explicitly

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 49

address other areas where capital costs have been approved for recovery outside a rate case. If expansion of gas infrastructure is necessary or desirable to meet state goals as noted by witness Binswanger, it may be more appropriate for PGS to seek legislative approval first.

For the foregoing reasons, we find that PGS has not demonstrated the need for treatment of these costs outside a rate proceeding. Further, we find that there are insufficient safeguards built into the Carbon Reduction Rider, as proposed, to adequately protect ratepayers from imprudent expenditures. PGS's request is therefore denied.

#### VIII. OTHER ISSUES

##### A. Refund of Interim Rate Increase Granted by Order No. PSC-08-0696-PCO-GU to Ratepayers

By Order No. PSC-08-0696-PCO-GU, issued October 20, 2008, we authorized the collection of interim rates, subject to refund, pursuant to Section 366.071, F.S. The approved interim revenue requirement was \$171,383,000, which represents an increase of \$2,380,000 or 1.54 percent. The interim collection period is November 2008 through June 2009.

According to Section 366.071, F.S., any refund shall be calculated to reduce the rate of return of the utility during the pendency of the proceeding to the same level within the range of the newly authorized rate of return. Adjustments made in the rate case test period that do not relate to the period interim rates are in effect shall be removed. Rate case expense is an example of an adjustment which is recovered only after final rates are established.

In this proceeding, the test period for establishment of interim is the 12-month period ending April 30, 2008. PGS's approved interim rates did not include any provisions for pro forma or projected operating expenses or plant. The interim increase was designed to allow recovery of actual interest costs, and the lower limit of the last authorized range for return on equity.

To establish the proper refund amount, we calculated a revised interim revenue requirement utilizing the same data used to establish final rates for the 2009 projected test year. Items, such as rate case expense and the storm damage accrual, were excluded because these items are prospective in nature and did not occur during the interim collection period. Using the principles discussed above, because the \$171,383,000 revenue requirement, granted in Order No. PSC-08-0696-PCO-GU, for the April 2008 interim test year, is less than the revenue requirement for the interim collection period of \$190,176,226, we find that no refund is required. Further, upon the expiration of the period for appeal, the corporate undertaking shall be released.

Based on the foregoing, it is

ORDERED by the Florida Public Service Commission that Peoples Gas System's Petition for Rate Increase is granted in part and denied in part as set forth herein. It is further

ORDERED that each of the findings made in the body of this Order are hereby approved in every respect. It is further

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU

ORDERED that Peoples Gas System is authorized to charge the new rates and charges as set forth in the body of this Order and the attachments and schedules attached hereto. It is further

ORDERED that all matters contained in the appendix, attachments, and schedules appended hereto are incorporated herein by reference. It is further

ORDERED that Peoples Gas System's request for the establishment of a Gas System Reliability Rider is hereby denied. It is further

ORDERED that Peoples Gas System's request for the establishment of a Carbon Reduction Rider is hereby denied. It is further

ORDERED that no refund of the interim increase approved by Order No. PSC-08-0696-PCO-GU, issued October 20, 2008, shall be required. It is further

ORDERED that the rates and charges approved in this Order shall become effective for meter readings made on or after June 18, 2009, which is 30 days from the date of the final Commission vote approving the rates and charges. It is further

ORDERED that Peoples Gas System shall submit, within 90 days of the issuance date of this Order, a description of all entries or adjustments to its annual report, rate of return reports, and books and records which will be required as a result of the Commission's findings in this rate case. It is further

ORDERED that upon expiration of the period for appeal this docket shall be closed.

By ORDER of the Florida Public Service Commission this 9th day of June, 2009.

ANN COLE  
Commission Clerk

NOTICE OF FURTHER PROCEEDINGS OR JUDICIAL REVIEW

The Florida Public Service Commission is required by Section 120.569(1), Florida Statutes, to notify parties of any administrative hearing or judicial review of Commission orders that is available under Sections 120.57 or 120.68, Florida Statutes, as well as the procedures and time limits that apply. This notice should not be construed to mean all requests for an administrative hearing or judicial review will be granted or result in the relief sought.

Any party adversely affected by the Commission's final action in this matter may request: 1) reconsideration of the decision by filing a motion for reconsideration with the Office of Commission Clerk, 2540 Shumard Oak Boulevard, Tallahassee, Florida 32399-0850, within fifteen (15) days of the issuance of this order in the form prescribed by Rule 25-22.060, Florida Administrative Code; or 2) judicial review by the Florida Supreme Court in the case of an electric, gas or telephone utility or the First District Court of Appeal in the case of a water and/or wastewater utility by filing a notice of appeal with the Office of Commission Clerk, and filing a copy of the notice of appeal and the filing fee with the appropriate court. This filing must be completed within thirty (30) days after the issuance of this order, pursuant to Rule 9.110, Florida Rules of Appellate Procedure. The notice of appeal must be in the form specified in Rule 9.900(a), Florida Rules of Appellate Procedure.

APPENDIX 1: STIPULATED ISSUES AND PARTIALLY STIPULATED ISSUES

The approved stipulations fall within one of two categories, as listed below. "Category 1" stipulations reflect the agreement of PGS, Staff, and at least one of the intervenors in this docket. Intervenors who have not affirmatively agreed with a particular Category 1 stipulation but otherwise take no position on the issue are identified in the proposed stipulation. "Category 2" stipulations reflect the agreement of PGS and Staff where no other party has taken a position on the issue.

**CATEGORY 1 STIPULATIONS:**

**ISSUE 12:** What is the appropriate 2009 projected test year Working Capital Allowance?

Stipulation: The appropriate 2009 projected test year Working Capital Allowance is (\$11,494,371). (FIGU does not affirmatively stipulate this issue but takes no position on the issue.)

**ISSUE 16:** What is the appropriate cost rate of long-term debt for the projected test year?

Stipulation: The appropriate cost rate of long-term debt for the projected test year is 7.20%.

**ISSUE 19:** What is the appropriate amount and cost rate of the unamortized investment tax credits to include in the capital structure for the projected test year?

Stipulation: The appropriate amount and cost rate of the unamortized investment tax credits to include in the capital structure for the projected test year are \$7,862 and 0%, respectively, as shown on MFR Schedule G-3, page 2. (FIGU does not affirmatively stipulate this issue but takes no position on the issue.)

**ISSUE 45:** What is the appropriate projected test year revenue expansion factor to be used in calculating the revenue deficiency?

Stipulation: The appropriate projected test year revenue expansion factor to be used in calculating the revenue deficiency is 1.6436. (FIGU does not affirmatively stipulate this issue but takes no position on the issue.)

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 53

**ISSUE 48:** What is the appropriate cost of service methodology to be used in allocating costs to the rate classes?

Stipulation: The appropriate methodology is contained in revised MFR Schedule H, and should reflect the Commission-approved adjustments to rate base, expenses, rate of return, and net operating income. (OPC does not affirmatively stipulate this issue but takes no position on the issue.)

**ISSUE 58:** Should PGS be required to file, within 90 days after the date of the final order in this docket, a description of all entries or adjustments to its annual report, earnings surveillance reports, and books and records which will be required as a result of the Commission's findings in this docket?

Stipulation: Yes. PGS should be required to file, within 90 days after the date of the final order in this docket, a description of all entries or adjustments to its annual report, rate of return reports, and books and records which will be required as a result of the Commission's findings in this rate case. (FIGU does not affirmatively stipulate this issue but takes no position on the issue.)

**ISSUE 59:** Should this docket be closed?

Stipulation: Yes. This docket should be closed after the Commission has issued its final order and the time for filing an appeal has expired.

**CATEGORY 2 STIPULATIONS:**

**ISSUE 2:** Are the projected bills and terms for the test year ending December 31, 2009, appropriate for use in this case?

Stipulation: Yes. The projected bills and terms for the test year ending December 31, 2009 are appropriate for use in this case.

**ISSUE 3:** Is the quality of gas service provided by PGS adequate?

Stipulation: Yes.

**ISSUE 21:** Has PGS made the appropriate test year adjustments to remove revenues and expenses recoverable through the Purchased Gas Adjustment Clause?

Stipulation: Yes.

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 54

**ISSUE 22:** Has PGS made the appropriate test year adjustments to remove conservation revenues and conservation expenses recoverable through the Conservation Cost Recovery Clause?

Stipulation: Yes.

**ISSUE 27:** Should any adjustments be made to the 2007 O&M expenses for staff Audit Finding Nos. 1 and 2, to address out-of-period expenses, reclassifications, and non-utility expenditures?

Stipulation: Yes. Adjustments should be made to the 2007 O&M expenses to remove out-of-period, reclassifications, and non-utility expenses. Based on these trended adjustments, 2009 Office Supplies and Expenses, Account 921, should be reduced by \$18,853 and Miscellaneous General Expenses, Account No. 930.2 should be reduced by \$5,007.

**ISSUE 47:** Are PGS's estimated revenues by rate class at present rates for the projected test year appropriate?

Stipulation: Yes. PGS's estimated revenues by rate class at present rates for the projected test year are appropriate.

**ISSUE 51:** What are the appropriate Miscellaneous Service Charges?

Stipulation: The appropriate revised miscellaneous service charges are as follows:

<u>Service Charge</u>	<u>Commission Approved</u>
Account Opening Charge	\$28
Service Initiation Charge - Residential	\$50 for initial meter
Service Initiation Charge - Other	\$30 for each additional meter
Reconnection Charge - Residential	\$70 for initial meter
Reconnection Charge - Other	\$20 for each additional meter
Temporary Meter Turn-off Charge	\$20
Failed Trip Charge	\$25

ORDER NO. PSC-09-0411-FOF-GU  
DOCKET NO. 080318-GU  
PAGE 55

**ISSUE 52:** Is PGS's proposal to stratify its current single residential service class into three individual classes appropriate?

**Stipulation:** Yes. The proposal allows the Company to recover a greater proportion of fixed customer-related costs indicated by the allocated cost of service study through customer charges, while at the same time managing the potential bill impacts for individual customers to reasonable levels. Absent establishing the three billing classes, the bill impacts associated with increasing fixed cost recoveries through the customer charge would be too large for smaller residential customers that use natural gas for fewer appliances. (Yardley)

**ISSUE 53:** Is PGS's proposal to reclassify certain customers appropriate?

**Stipulation:** Yes. Redefining the GS-1 class (presently 1,000-17,500 annual therms) by moving the smallest GS-1 customers (up to 1,999 annual therms) into an expanded SGS rate class and moving the largest GS-1 customers (above 10,000 annual therms) into an expanded GS-2 rate class is appropriate to provide greater homogeneity and reduce the potential for intra-class subsidies.

At present all residential customers take service under the RS rate. The reclassification of a limited number of large residential customers addresses a separate issue, which relates to common areas of condominiums. Such use is considered residential even though the characteristics of the load are similar to use by larger GS customers. By expanding the eligibility of the GS-1 through GS-5 rate schedules to include residential use, the largest residential customers are included with similarly-situated non-residential customers for pricing purposes. An additional benefit of this approach is that it clarifies the rights of condominium units to purchase their gas supply from a third-party pursuant to the Company's transportation service program. The deposit terms and conditions associated with residential service would continue to apply to condominium customers that are reclassified to a GS rate schedule.

**ISSUE 56:** What is the appropriate effective date for PGS's revised rates and charges?

**Stipulation:** The revised rates and charges should become effective for meter readings on or after 30 days following the date of the Commission vote approving the rates and charges which, under the current schedule, would mean for meter readings taken on or after June 18, 2009.

**Abstract** The regulatory process for setting public utilities' allowed rate of return on common equity has generally used the Gordon DCF, CAPM and Risk Premium specifications to estimate the cost of common equity. Despite the widely known problems with these models, there has been little movement to adopt more recently developed asset pricing models to provide additional evidence for estimating the cost of capital. This paper presents, validates empirically and applies a general yet simple consumption-based asset pricing specification to model the risk-return relationship for stocks and estimate the cost of common equity for public utilities. The model is not necessarily superior to other models in its practical results, yet these results do indicate that it should be used to provide additional estimates of the cost of common equity. Additionally, the model raises doubts as to whether assets such as utility stocks are a consumption (business cycle) hedge.

## 1 Introduction

Following electricity deregulation with the National Energy Policy Act of 1992, the estimation of the cost of common equity capital remains a critical component of the utility rate-of-return regulatory process. Since the cost of common equity is not observable in capital markets, it must be inferred from asset pricing models. The models that are commonly applied in regulatory proceedings are the [Gordon \(1974\)](#) Discounted Cash Flow (DCF), the Capital Asset Pricing (CAPM) and Risk Premium Models. There are other tools used to estimate the cost of common equity such as comparable earnings or earnings-to-price ratios, but they are not asset pricing models. The empirical literature on the CAPM is vast {[Fama and French \(2004\)](#)} and the CAPM is used by a number of US regulatory jurisdictions. The DCF model has not been empirically tested to the same extent as the CAPM, yet it is considered by many US regulatory jurisdictions.

The purpose of this paper is to present, test empirically and apply a recently developed general consumption-based asset pricing model that estimates the risk-return relationship directly from asset pricing data and, when estimated with recently developed time series methods, produces a prediction of the equity risk premium that is driven by its predicted volatility. The predicted risk premium is then added to a risk-free rate of return to provide an estimate of the cost of common equity. We predict two forms of the equity risk premium with the model, the risk premium net of the risk-free rate and the equity-to-debt risk premium (equity risk premium net of the relevant bond yield for the company's stock). Either can be applied to predict the common equity cost of capital for a public utility. Although the model is tested and applied to public utilities for rate of return regulation, it can be used to estimate the cost of capital for any stock. Section 2 reviews the asset pricing models typically used in public utility rate cases and the generalized consumption asset pricing model we propose to estimate the cost of common equity. Section 3 discusses the data and the empirical testing of the consumption asset pricing model. Section 4 reviews the application of the model and compares it with the DCF and CAPM results. Section 5 is the conclusion.

## 2 DCF, CAPM and consumption asset pricing model

### 2.1 DCF and CAPM approaches

The standard DCF model frequently used in estimate the cost rate of common equity in regulatory proceedings is defined by the following equation:

$$k = D_0 (1 + g) / P_0 + g,$$

where  $k$  is the expected return on common equity;  $D_0$  is the current dividend per share;  $g$  is the expected dividend per share growth rate; and  $P_0$  is the current market price.

The DCF was developed by [Gordon \(1974\)](#) specifically for regulatory purposes. Underlying the DCF model is the theory that the present value of an expected future stream of net cash flows during the investment holding period can be determined

by discounting those cash flows at the cost of capital, or the investors' capitalization rate. DCF theory indicates that an investor buys a stock for an expected total return rate which is derived from cash flows received in the form of dividends plus appreciation in market price (the expected growth rate) over the investment holding period. Mathematically, the expected dividend yield ( $D_0(1 + g)/P_0$ ) on market price plus an expected growth rate equals the capitalization rate, i.e., the expected return on common equity.

The standard DCF contains several restrictive assumptions, the most contentious of which during utility cost of capital proceedings is typically that dividends per share (DPS), book value per share (BVPS), earnings per share (EPS) as well as market price grow at the same rate in perpetuity. There is also considerable contention over the proper proxy for  $g$ , prospective or historical growth in DPS, BVPS, EPS and market price and over what time period. In addition, although the standard DCF described above is a single stage annual growth model, there is considerable discussion over the use of multiple stage growth models during regulatory proceedings. Some analysts use the discrete version and others use the continuous version of the DCF model. Solving these models for  $k$ , the cost of common equity, results in differing equations to solve for  $k$ . The equation above is from the discrete version. The continuous version uses the current dividend yield and is not adjusted by  $g$ , which results in a lower estimate for  $k$ . Because of these and other restrictive assumptions that require numerous subjective judgments in application, it is often difficult for regulatory commissions to reconcile the frequently large disparities in rates of return on common equity recommended by various parties in a public utility rate case.

The CAPM model is defined by the following equation:

$$k = R_f + \beta (R_m - R_f),$$

where  $k$  is the expected return on common equity;  $R_f$  is the expected risk-free rate of return;  $\beta$  is the expected beta; and  $R_m$  is the expected market return.

CAPM theory defines risk as the co-variability of a security's returns with the market's returns or  $\beta$ , also known as systematic or market risk, with the market beta being defined as 1.0. Because CAPM theory assumes that all investors hold perfectly diversified portfolios, they are presumed to be exposed only to systematic risk and the market (according to the model) will not reward them a risk premium for unsystematic or non-market risk. In other words, the CAPM presumes that investors require compensation only for systematic or market risks which are due to macroeconomic and other events that affect the returns on all assets. Mathematically, the CAPM is applied by adding a forward-looking risk-free rate of return to an expected market equity risk premium adjusted proportionately by the expected beta to reflect the systematic risk.

As with the DCF, there is considerable contention during regulatory cost of capital proceedings as to the proper proxies for all components of the CAPM: the  $R_f$ , the  $R_m$ , as well as  $\beta$ . In addition, the CAPM assumption that the market will only reward investors for systematic or market risk is extremely restrictive when estimating the expected return on common equity for a single asset such as a single jurisdictional regulated operating utility. Additionally, this assumption requires that the investor have a perfectly diversified portfolio, that is, one with no unsystematic risk. Since

this assumption is not applicable, estimating the cost of common equity capital for a single utility's common equity undoubtedly will not reflect the risk actually faced by the imperfectly diversified investor.

As will be discussed in the next section, our application of the risk premium approach, the consumption asset pricing model and GARCH<sup>1</sup> rest on minimal assumptions and restrictions and therefore requires considerably less judgment in its application.

## 2.2 Risk premium approach, consumption asset pricing models, and GARCH

A widely used model to estimate the cost of common equity capital for public utilities is the risk premium approach. This approach often estimates the expected rate of return as the long-term historic mean of the realized risk premium above an historic yield plus the current yield of the relevant bond applicable to a specific utility or peer group of utilities. Litigants in public utility rate proceedings debate the choice of inputs to estimate the risk premium as well as how far back to reach into history to collect data for calculating an average that is representative of a forward-looking premium.

It is surprising that, as popular as the risk premium method is in public utility rate cases, the intuitively appealing general consumption-based asset pricing model, with its minimal assumptions and strong theoretical foundation, has not been applied to estimate the cost of common equity capital for public utilities. The model provides projections of the conditional expected risk premium on an asset based on its relation to its predicted conditional volatility. This model generalizes the well known special case asset pricing models such as the [Merton \(1973\)](#) intertemporal capital asset pricing model, [Campbell \(1993\)](#) intertemporal asset pricing model, and the habit-persistence model of [Campbell and Cochrane \(1999\)](#), which are special cases of the general model. The relation of the model to their specialized cases can be found in [Cochrane \(2006\)](#) and [Cochrane \(2007\)](#). The approach of consumption asset pricing models is to make investment decisions that maximize investors' utility from the consumption that they ultimately desire, not returns.

Even if the model is not used to project directly the expected risk premium, it can, at a minimum, be used to verify that the risk premia data chosen for estimating the cost of capital is empirically validated by fitting the model well. The model can be used to predict the equity risk premia net of the risk-free rate (equity risk premium) or to predict the equity-to-debt risk premium for a firm. We perform both of these empirical tests in this paper. The general consumption-based asset pricing model developed in [Michelfelder and Pilotte \(2011\)](#) and based on [Cochrane \(2004\)](#) provides the relationship of the ex ante risk premium to an asset's own volatility in return:

$$E_t[R_{i,t+1}] - R_{f,t} = -\frac{vol_t[M_{t+1}]}{E_t[M_{t+1}]} vol_t[R_{i,t+1}] corr_t[M_{t+1}, R_{i,t+1}]. \quad (1)$$

<sup>1</sup> GARCH refers to the generalized autoregressive conditional heteroskedasticity regression model which is discussed below.

where  $vol_t$  is the conditional volatility,  $corr_t$  is the conditional correlation, and  $M_{t+1}$  is the stochastic discount factor (SDF).

The SDF is the intertemporal marginal rate of substitution in consumption, or,  $M_{t+1} = \beta \frac{U_{c,t+1}}{U_{c,t}}$ , where the  $U_c$ 's are the marginal utilities of consumption in the next period,  $t + 1$ , and the current period,  $t$ , and  $\beta$  is the discount factor for period  $t$  to  $t + 1$ . Equation 1 shows that the algebraic sign of the relation between the expected risk premium and the conditional volatility of an asset's risk premium is determined by the correlation between the asset's return and the SDF. That is, the direction of the relation between the asset return and the ratio of intertemporal marginal utilities in consumption inversely determines the relation between the expected risk premium and conditional volatility. When the correlation is equal to negative one, the asset's conditional expected risk premium is perfectly positively correlated with its conditional volatility. A positive relation between the conditionally expected risk premium and volatility obtains when  $-1 < corr_t < 0$ . A negative relation obtains when  $0 < corr_t < 1$ . For an asset that represents a perfect hedge against shocks to the marginal utility of consumption, with  $corr_t = 1$ , there will be a perfect negative correlation between the conditionally expected risk premium and its volatility.<sup>2</sup> Therefore, estimates of the relation between the first two conditional moments of a public utility stock's returns provide a direct test of the effectiveness of a public utility stock, or any asset, as a consumption hedging asset. In Eq. 1,  $vol_t[M_{t+1}]/E_t[M_{t+1}]$  is the slope of the mean-variance frontier. If this slope changes over time, the estimated relation between the stock's risk and return will vary over time. This model can also be viewed simplistically as the projected expected risk premium as a function of its own projected risk, given information available at time  $t$ .

Note that the model allows for the expected risk premium to be negative if the asset hedges shocks to the marginal utility of consumption. Investors are willing to accept an expected rate of return lower than the risk-free rate of return if the pattern of volatility is such that returns are expected to rise with expected reductions in consumption. Simply, investors are willing to *pay* a premium for a higher level of returns volatility that has the desired pattern of returns. These desired returns patterns have a tendency to offset drops in consumption. Therefore, this model shows that investors may not be averse to volatility, but rather to the timing of expected changes in returns.

Summarizing, several conclusions can be drawn from the general model of asset pricing. First, the sign of the relation between a stock's risk premium and conditional volatility depends on the extent to which the stock serves as an intertemporal hedge against shocks to the marginal utility of consumption. Second, the relation between stock risk and return may be time-varying depending on changes in the slope of the mean-variance frontier. Third, hedging assets have desired patterns of volatility that result in expected rates of return that are less than the risk-free rate. We do not expect

<sup>2</sup> A hedging asset is one that has a positive increase in returns that is coincident with a positive shock in the ratio of intertemporal marginal utilities of consumption. Note that if we assume a concave utility function in consumption, as consumption declines, the marginal utility of consumption rises relative to last period marginal utility. If we think of a decline in consumption as a contraction in the business cycle, the hedging asset delivers positive changes in returns when the business cycle is moving into a contraction, and therefore the asset is a business cycle hedge.

that public utility stocks serve as a hedging asset as they are not viewed as defensive stocks (they do not rise in value during downturns in the stock market) due to asymmetric regulation and returns as discussed in detail in [Kolbe and Tye \(1990\)](#). Under asymmetric regulation, utility regulators have a tendency to allow the return on equity to fall below the allowed return during downturns in the business cycle and to reduce the return should it rise above the allowed return during expansions. Therefore we expect that the parameter estimates of the return-risk relationship to be positive as utility stocks are hypothesized to not be hedges.

We use the GARCH model to estimate the general asset pricing model since the GARCH model accommodates ARCH effects that improve the efficiency of the parameter estimates. It also provides a volatility forecasting model for the conditional volatility of the asset's risk premium. The conditional volatility projection is used, in turn to predict the expected risk premium. We also use the GARCH-in-Mean model (GARCH-M) since it specifies that the conditional expected risk premium is a linear function of its conditional volatility. There is a vast body of literature that estimates asset pricing models with the GARCH and GARCH-M methods and therefore we will not attempt to summarize them here.

The GARCH-M model was initially developed and tested by [Engle et al. \(1987\)](#) to estimate the relationship between US Treasury and corporate bond risk premia and their expected volatilities. The GARCH-M model is specified as:

$$R_{t+1} - R_{f,t+1} = \alpha \sigma_{t+1}^2 + \varepsilon_{t+1} \quad (2)$$

$$\sigma_{t+1}^2 = \beta_0 + \beta_1 \sigma_t^2 + \beta_2 \varepsilon_t^2 + \eta_{t+1} \quad (3)$$

$$\varepsilon_t | \psi_{t-1} \sim T(0, \sigma_t^2) \quad (4)$$

where  $R_{t+1}$  is the expected total return on the public utility stock index or individual utility stock;  $R_{f,t+1}$  is the risk-free rate of return or the yield on an index of public utility bonds of a specified bond rating for the equity-to-debt premium;  $\sigma_{t+1}^2$  is the conditional or predicted variance of the risk premium that is conditioned on past information ( $\psi_{t-1}$ ); and  $\varepsilon_t$  is the error term that is conditional on  $\psi_{t-1}$ .

The conditional distribution of the error term is specified as the non-unitary variance T-distribution due to the thick-tailed distribution of the risk premia data. If the error distribution is thick-tailed, using an approximating distribution that accommodates thick tails improves the efficiency of the estimates. The parameter,  $\alpha$ , is the return-to-risk coefficient as specified in Eq. 1 as:

$$\alpha = -\frac{vol_t[M_{t+1}]}{E_t[M_{t+1}]} corr_t[M_{t+1}, R_{t,t+1}] \quad (5)$$

Note that the coefficient will be positive if the conditional correlation between the SDF and the asset return is negative, indicating that the stock is not a hedging asset. Recall that the SDF is the ratio of intertemporal marginal utilities. Assuming a concave utility function, an upward shock in the ratio implies falling consumption, therefore an associated rise (positive correlation) in the return ( $R_t$ ) would offset the reduction

in consumption, thereby causing the sign of  $\alpha$  to be negative. The parameter,  $\alpha$ , is also the ratio of risk premium to variance, or, the Sharpe ratio.

The intercept in Eq. 2 is restricted to zero as specified by the general asset pricing model specification. The restriction on the intercept equal to zero has been found to be robust in producing consistently positive and significant relationships between equity risk premia and risk in GARCH-M models. This is discussed in Lanne and Saikkonen (2006) and Lanne and Luoto (2007). We have found the same results in our modeling in this paper, although we have excluded these results for brevity (available upon request). Therefore we specify the prior assumption that the intercept or the “excess” return, i.e., the return not associated with risk to be equal to zero and drop the intercept from the model.

The consumption asset pricing model is estimated in the empirical section of the paper and applied in the applications section of the paper. The model is tested to (1) determine if equity-to-debt risk premium indices for utilities of differing risk specified by differing bond ratings are validated by the asset pricing model and therefore have some empirical support for risk premium prediction and application to utility cost of capital estimation, (2) determine whether equity risk premia can be predicted and fit the model and therefore be used to estimate the cost of common equity, (3) empirically test the consumption asset pricing model, and (4) ascertain whether utility stocks are assets that hedge shocks to the marginal utility of consumption.

If utility stocks are hedging assets then the cost of common equity should reflect a downward adjustment to a specified risk-free rate to reflect investors’ preferences for a hedge and the compensation that they are willing to pay for it.

### 3 Data and empirical results

We use portfolios as represented by public utility stock and bond indices to estimate the conditional return-risk relationship for the equity-to-debt premium. The equity-to-debt risk premium data employed for estimating Eq. 1 with the GARCH-M conditional return-risk regressions are monthly total returns on the Standard and Poor’s Public Utilities Stock Index (utility portfolio), and the monthly Moody’s Public Utility Aa, A, and Baa yields for the debt cost. We also obtained equity risk premia for the utility portfolio using the Fama-French specified risk-free rate of return, which is the holding period return on a 1-month US Treasury Bill. The data range from January 1928 to December 2007 with 960 observations. The return-risk relationships for the equity-to-debt premia are risk-differentiated by their own bond rating.

As a check, we also estimate Eq. 1 with the GARCH-M for large common stock returns using the monthly Ibbotson Large Company Common Stocks Portfolio total returns and the Ibbotson US Long-Term Government income returns as the risk-free rate. Additionally, as another check, we do the same for the University of Chicago’s Center for Research in Security Prices value-weighted stock index (CRSP) using the Fama-French risk-free rate. This is the Fama-French specification of the market equity risk premium. The data range from January 1926 to December 2007 with 984 observations for the Large Company Common Stock estimation and the data ranges

**Table 1** Descriptive statistics: public utility and large company common stocks equity-to-debt and equity risk premia

Utility bond rating	Mean	Std. Dev.	Skewness	Kurtosis	JB
Aa	0.0037	0.0568	0.0744	10.07	2,001.2***
A	0.0035	0.0568	0.0632	10.06	1,991.8***
Baa	0.0031	0.0568	0.0375	10.02	1,973.6***
Ibbotson					
Large common stocks	0.0054	0.0554	0.4300	12.84	3,954.7***
CRSP value-weighted stock index	0.0062	0.0544	0.2309	10.92	2,519.1***

The public utility equity-to-debt risk premia monthly time series is from January 1928 to December 2007 with 960 observations. The equity risk premium monthly time series for the Large Common Stocks and the CRSP index are January 1926 to December 2007 with 984 observations, and January 1926 to December 2007 with 984 observations, respectively. The public utility stocks equity-to-debt risk premia are calculated as the total return on the S&P Public Utilities Index of stocks minus the Moody's Public Utility Aa, A, and Baa Indices yields to maturity. The Large Company Common Stock equity risk premia are the monthly total returns on the Ibbotson Large Company Common Stocks Portfolio minus the Ibbotson Long-Term US Government Bonds Portfolio income yield. The CRSP equity risk premia, or the Fama-French market risk premia are the CRSP total returns on the value-weighted equity index minus the 1-month holding period return on a 1 month Treasury Bill. The Jarque-Bera (JB) statistic is a goodness-of-fit measure of the departure of the distribution of a data series from normality, based on the levels of skewness and excess kurtosis. The JB statistic is  $\chi^2$  distributed with 2° of freedom. \*\*\* Significant at 0.01 level, one-tailed test

from January 1928 to January 2007 with 960 observations (same as the utilities) for the CRSP estimation.

Table 1 displays the descriptive statistics for these data. We have estimated the mean, standard deviation, skewness and kurtosis parameters, as well as the Jarque-Bera (JB) statistic to test the distribution of the data. The means of the utility equity-to-debt risk premia fall as the risk (bond rating) declines. This is consistent with the notion that larger yields are subtracted from stock returns the lower the bond rating. Intertemporally, there is an inverse relationship between risk premia and interest rates (See Brigham et al. (1985) and Harris et al. (2003)). The mean for risk premia will have a tendency to be larger during low interest rate periods.

Not surprisingly, large company common stocks have the highest mean risk premia as the majority of these firms are not rate-of-return regulated firms with a ceiling on their ROE's close to their cost of capital. Interestingly, the standard deviations of the utility stock returns are similar and slightly higher than large company common stocks. Skewness coefficients are small and positive except for Ibbotson large company common stock returns and CRSP returns that have large positive skewness. This suggests that large unregulated stocks have a tendency to have more and larger positive shocks in returns than do utilities that are rate of return regulated. The kurtosis values show that all of the risk premia are thick-tail distributed. This is also found in the significant JB statistics that test the null hypothesis that the data are normally distributed. The null hypothesis is rejected for all assets. The high kurtosis, low skewness, and significant JB statistics show that the risk premia data are substantially thick-tailed, except for non-utility stocks that are both skewed and thick-tailed. Therefore, robust estimation methods are required to produce efficient regression estimates with non-normal data. Additionally, although not shown but available upon request, the serial correlation and

ARCH Lagrange Multiplier tests show that residuals from OLS regressions of risk premia on volatilities follow an ARCH process. Therefore, the GARCH-M method will improve the efficiency of the estimates. We specify the regression error distribution as a non-unitary variance T-distribution so that thick-tails could be accommodated in the estimation and therefore produce increasingly efficient parameter estimates.

We used maximum likelihood estimation with the likelihood function specified with the non-unitary-variance T-distribution as the approximating distribution of the residuals to accommodate the thick-tailed nature of the error distribution. The equations are estimated as a system using the Marquardt iterative optimization algorithm. The chosen software for estimating the model was EViews<sup>®</sup> version 6.0 (2007).

Table 2 shows the GARCH-M estimations for the consumption asset pricing Eq. 1. We have estimated Eq. 1 for the utility equity risk premia using the Fama-French risk-free rate in addition to the equity-to-debt risk premia risk-differentiated by bond ratings and the two measures of the market equity risk premium. The chosen measure of volatility is the variance of risk premium (in contrast to other such measures such as the standard deviation or the log of variance. Although these results are not shown for brevity, they are robust to these other measures of volatility). The slope, which is the predicted return-to-predicted risk coefficient and Sharpe ratio, is positive and significant at the 99% level for all assets except the utility stock returns with Baa bonds, which is significant at the 95% level. Given that all slopes are positive, public utility stocks are not found to hedge shocks to the marginal utility of consumption. Note that the reward-to-risk slope rises as bond rating rises. This suggests that lower risk utility stocks provide a higher incremental risk-premium for an increase in conditional volatility. This is consistent with other studies that find that lower risk assets, such as shorter maturity bonds, have higher Sharpe Ratios than long-term bonds and stocks. See [Pilote and Sterbenz \(2006\)](#) and [Michelfelder and Pilote \(2011\)](#).

The variance equation shows that all GARCH coefficients ( $\beta$ 's) are significant at the 1% level and the sums of  $\beta_1$  and  $\beta_2$  are close to, but less than 1.0, indicating that the residuals of the risk premium equation follow a GARCH process and that the persistence of a volatility shock on returns and stock prices for utility stocks is temporary. The estimates of the non-unitary variance T-distribution degrees of freedom parameter are low and statistically significant, indicating that the residuals are well approximated by the T. Similar values for the log-likelihood functions (Log-L) show that each of the regressions has a similar goodness-of-fit. Chi-squared distributed likelihood ratio tests (not shown but available upon request) that compare the goodness of fit among the T and normal specifications of the likelihood function of the GARCH-M regressions show that the T has a significantly better fit than the normal distribution.

The GARCH-M results for the large company common stocks portfolio are similar to those of the utility stocks. Not surprisingly, large company common stocks do not hedge shocks to the marginal utility of consumption and volatility shocks temporarily affect their valuations. The exception is that the return-risk slope is substantially higher than utility stock slopes. This is partially due to the risk-free nature of the risk-free rates used with the non-utility equity risk premia compared to the

**Table 2** Estimation of return-risk relation: public utility and large company common stocks

Utility bond rating	$\alpha$	$\beta_0$	$\beta_1$	$\beta_2$	Log-L	T dist. D.F.

A	1.4536*** (0.5308)	0.0000** (0.0000)	0.8790*** (0.0230)	0.1033*** (0.0220)	1,605.0	9.9381*** (3.0408)
Baa	1.3318** (0.5303)	0.0000** (0.0000)	0.8789*** (0.0229)	0.1040*** (0.0220)	1,605.2	10.0*** (3.0540)
Fama-French $R_f$	2.1428*** (0.5318)	0.0000** (0.0000)	0.8811*** (0.0232)	0.0979*** (0.0212)	1,601.0	9.8773*** (2.9700)
Ibbotson						
Large company common stocks	2.7753*** (0.5513)	0.0001*** (0.0000)	0.8381*** (0.0269)	0.1186*** (0.0332)	1,620.8	8.8457*** (2.1613)
CRSP value-weighted stock index	3.3873*** (0.5673)	0.0001*** (0.0000)	0.8330*** (0.0270)	0.1149*** (0.0358)	1,598.9	8.8571*** (1.9505)

The results below are the GARCH-in-Mean regressions for the risk premium ( $R_{t+1} - R_{f,t+1}$ ) on the conditional variance of the risk premium ( $\sigma_{t+1}^2$ ) in the mean equation. The intercept in the mean equation is restricted to be equal to zero. The public utility equity-to-debt risk premia monthly time series is from January 1928 to December 2007 with 960 observations. The equity risk premium monthly time series for the Large Company Common Stocks and the CRSP index are January 1926 to December 2007 with 984 observations, and January 1926 to December 2007 with 984 observations, respectively. The public utility stocks equity-to-debt risk premia are calculated as the total return on the S&P Public Utilities Index of stocks minus the Moody's Public Utility Aa, A, and Baa Indices yields to maturity. The Large Company Common Stock equity risk premia are the monthly total returns on the Ibbotson Large Company Common Stocks Portfolio minus the Ibbotson Long-Term US Government Bonds Portfolio income yield. The CRSP equity risk premium, or the Fama-French market risk premia are the CRSP total returns on the value-weighted equity index minus the 1-month holding period return on a 1 month Treasury Bill. The estimated model is:

$$R_{t+1} - R_{f,t+1} = \alpha \sigma_{t+1}^2 + \varepsilon_{t+1} \text{ where } \alpha = -\frac{vol_t[M_{t+1}]}{E_t[M_{t+1}]} corr_t[M_{t+1}, R_{i,t+1}]$$

$$\sigma_{t+1}^2 = \beta_0 + \beta_1 \sigma_t^2 + \beta_2 \varepsilon_t^2 + \eta_{t+1}$$

The conditional distribution of the error term is the non-unitary variance T-distribution to accommodate the kurtosis of the risk premia and error term. Standard errors are in parentheses. \*\*\*, \*\*, \* denote significance at the 0.01, 0.05, and 0.10 levels, respectively for two-tail tests

utility bond yields that reflect risk. The utility stocks slope value of 2.1428 using the Fama-French risk-free rate is closer to the higher CRSP value of 3.3873 that is also based on the Fama-French risk-free rate. This is inconsistent with previous results herein and in other papers that find that Sharpe Ratios are lower for higher risk assets unless this finding can be interpreted as utility stocks having more risk than non-regulated stocks. The standard deviations on Table 1 suggest that utility stock return volatilities are as high as the stock returns of non-regulated firms. However, similar model estimates of common stocks yield unstable results, such as negative as well as positive return-risk slopes when the intercept is not restricted to zero. See Campbell (1987), Glosten et al. (1993), Harvey (2001), and Whitelaw (1994).

Stock market results are highly sensitive to empirical model specification. Many studies do not consider the impact of a zero-intercept prior restriction on the stability of their results. This simple innovation has led to more consistent results in modeling stock market risk-return relationships, and therefore we have included it in this paper.

The estimation of the consumption asset pricing model for utility stock equity-debt risk premia shows that the use of bond-rating risk-differentiated risk premia are validated as their risk-return relationships are well-fitted by theoretical and empirical models of risk and return. Therefore, these data impound good representations of the risk and reward relationship.

One concern is the intertemporal stability of the alphas. Figure 1 plots the utility stock portfolio alpha (using the Fama-French  $R_f$  to calculate the premium) and its standard error for 240 month rolling regressions of the model estimated with GARCH-M in the same manner as described above to review the intertemporal stability of the alpha. A 20-year period was used for each estimation to trade off timeliness with sufficient observation of up and down stock market regimes and business cycles. This resulted in 720 estimated alphas from 1947 to 2007. The results show that the utility alpha is stable to the extent that the algebraic sign is always positive and generally significant, therefore the nature of utility stocks are assets that are not and have never been hedges during the second half of the twentieth century up to the present. The value of the alpha does change substantially. The mean of the alpha is 4.40 with a range from  $-0.11$  (insignificantly different from 0) to 11.66. As a comparison, the alpha for the CRSP value-weighted stock index was also estimated with rolling regressions in the same manner and for the same time period. Figure 2 is a plot of the CRSP alpha and standard error. Note that the general stock market alpha is similar to that of utility stocks. They are all positive and almost all statistically significant and follow a strikingly similar cycle. Figure 3 plots both the utility and stock market alphas and demonstrates the similarity. The correlation coefficient between the utility and stock market alphas is 0.88. Recalling that the alpha is a Sharpe Ratio, we see that return to risk ratio does change substantially. This is consistent with the results in [Pilotte and Sterbenz \(2006\)](#).

One other interesting observation is that the standard errors of the alphas are highly stable over the study period and are very similar in magnitude regardless of the size of the corresponding alpha. Whereas the alpha follows a cyclical pattern, the volatility in alpha is highly stationary around a constant, long-run mean.

The GARCH-M model estimations of the consumption asset pricing model were specified with variance as the measure of volatility. We also performed the same model estimations with alternative specifications of volatility such as the standard deviation and the log of variance and the results were not sensitive to this specification.

#### 4 Application

We apply the model in this section to compare the cost of common equity capital estimates with the DCF and CAPM models. Using EViews<sup>®</sup> Version 6.0, we estimated the model coefficients ( $\alpha$ ,  $\beta$ 's) over rolling 24 month periods ending December 2008.

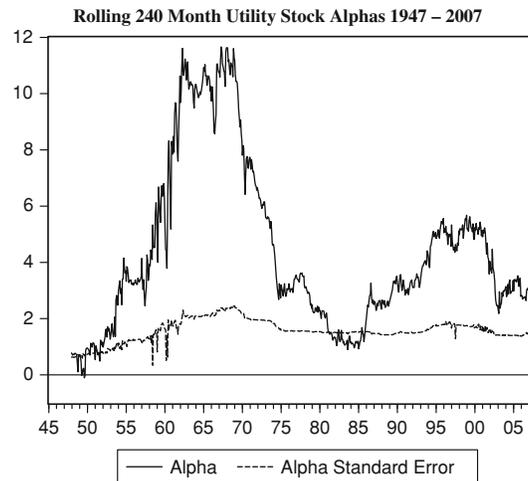

Fig. 1 Rolling 240 month utility stock alphas 1947–2007

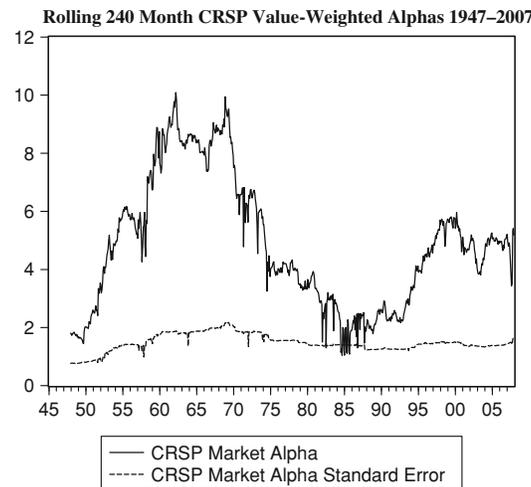

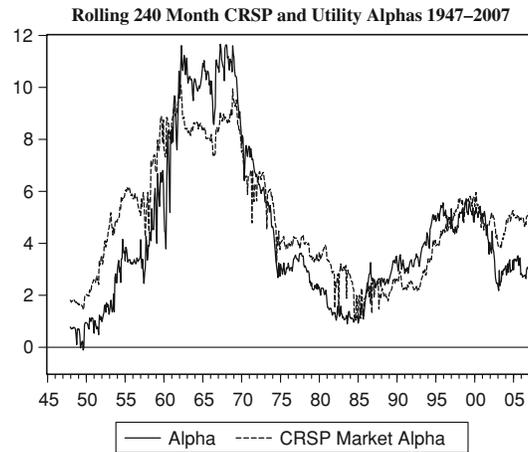

Fig. 2 Rolling 240 month CRSP value-weighted alphas 1947–2007

We repeated the estimation over 5, 10, 15, 20 and 79 year periods.<sup>3</sup> Predicted monthly variances ( $\sigma_{t+1}^2$ ) were generated from these estimations to produce predicted risk premiums that were calculated by multiplying the predicted variance by the “ $\alpha$ ” slope

<sup>3</sup> We did not include the results of the 10 and 15 year estimations to abbreviate the amount of empirical results presented since they added no material insights beyond those already presented.

20-years	3.93	3.51	2.78–5.03	2.18–6.88	0.57	1.11
5-years	31.82	326.63	7.77–156.97	6.12–6465.74	31.47	1283.51

coefficient. To test the stability of the predicted risk premia over time, the predicted risk premia were calculated using either the predicted variance over each entire time period or the last monthly (spot) predicted variance. Table 3 presents the mean predicted risk premia, the range of predicted premia and the standard deviations for each time period. It is clear from the results that the risk premia are more stable over the rolling 24 month period when calculated using the average predicted variance compared with using the spot variance. Secondly, the 20 and 79 year means are substantially more stable and reasonable in magnitude than the 5 year means.

Next, given the lessons from the analyses above, we apply the model to mechanically<sup>4</sup> estimate the cost of common equity for 8 utility companies using the model and

<sup>4</sup> The term “mechanically” in this context means that the resulting values have been developed in a consistent manner with the same inputs across all utility stocks but no subjective judgment was used to develop final values for each specific utility stock application.

the DCF and CAPM as comparisons. We also calculated the realized market return for comparison. Two publicly-traded electric, electric and gas combination, gas, and water utilities respectively were chosen for the application. The Gordon (1974) DCF and CAPM models are used in many utility regulatory jurisdictions in the US.

The DCF was applied using a dividend yield,  $D_0/P_0$ , derived by dividing the year-end indicated dividend per share ( $D_0$ ) by the year-end spot market price ( $P_0$ ). The dividend yield is grown by the year-end I/B/E/S five year projected earnings per share growth rate ( $g$ ) to derive  $D_0(1+g)/P_0$ . The one-year predicted dividend yield is then added to the I/B/E/S five-year projected EPS growth rate to obtain the DCF estimate of the cost of common equity capital,  $k$ . This study was conducted for the 5 years ending 2008.

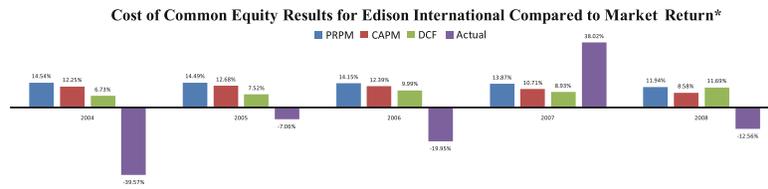

The CAPM was applied by multiplying the Value Line beta ( $\beta$ ) available at year-end for each company by the long-term historic arithmetic mean market risk premium ( $R_m - R_f$ ).  $R_m - R_f$  is derived as the spread of the total return of large company common stocks over the income return on long-term government bonds from the Ibbotson SBBi 2009 Valuation Yearbook. The resulting company-specific market equity risk premium is then added to a projected consensus estimate of the yield on 30-year U.S. Treasury rate provided by Blue Chip Financial Forecasts as the risk-free rate ( $R_f$ ) to obtain the CAPM result. This study was also conducted over the 5 years ending 2008.

Figures 4–11 show the histograms of the cost of common equity capital estimations for each of the eight public utility stocks and the realized market returns in the forthcoming year. The consumption asset pricing model appears to track more consistently with the CAPM than with the DCF which seems to produce generally lower values than the other methods. The consumption asset pricing model results are similar to the CAPM. The model and the CAPM compete as the best predictor of the rate of return on the book value of common equity (not shown but available upon request), but none of the expected returns were good predictors of market returns. That does not infer that they were not good predictors of *expected* market returns. These results are an initial indicator that the consumption asset pricing model provides reasonable and stable results. This paper does not suggest at this early juncture that the consumption asset pricing model is superior to the CAPM or DCF, although it is based on far less restrictive assumptions than these other models. For example, both the DCF and CAPM assume that markets are efficient. Many assume that the DCF requires that the market-to-book ratio to always equal one, whereas the long-term value for the Standard and Poor's 500 is equal to 2.34. The CAPM assumes that investors demand higher returns for higher volatility and that the minimum required return is the risk-free rate, whereas the consumption asset pricing model allows for investors to require returns less than the risk-free rate for stocks that may have relatively higher volatility but are hedging assets that have desirable return fluctuation patterns that offset downturns in the business cycle. Unlike the CAPM, the model prices the risk to which investors are actually exposed, whether it's systematic risk or not. Some investors are diversified and some are not; the model prices whatever risk to which the aggregate of investors of the specific stock is exposed.

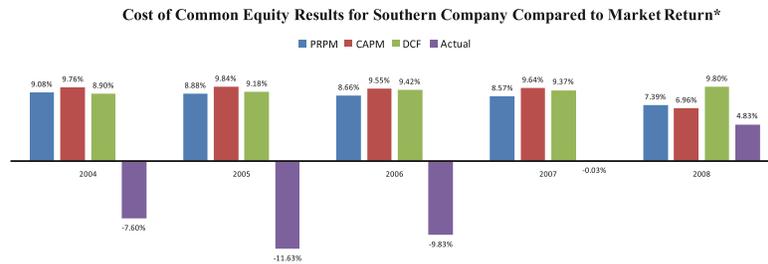

We find that the consumption asset pricing model should be used in combination with other cost of common equity pricing models as additional information in the devel-

New approach to estimating the cost of common equity capital

ing firms and financial firms. Recent Ph.D. and M.S. holding members of research departments of investment and consulting firms have ready access to the model and methods discussed in this paper, although it will require years for these tools, like any “new” technology, to diffuse into standard use. Another problem is that the model requires a substantial time series history on stock returns data to develop stable estimates of risk premia. This is problematic especially for the electric and gas utility industries that have consolidated with many mergers in the recent past. This problem can be addressed by developing and predicting the value-weighted risk premium of a portfolio of similar stocks such as electric utilities that have nuclear generating assets. The specific stock in question would be included in the returns index with a weight based on market capitalization that would go to 0 when the stock price history is no longer existent reaching back into the past.

## 5 Conclusion

The purpose of this paper is to introduce, test empirically and apply a general consumption based asset pricing model that is based on a minimum of assumptions and restrictions that can be used to predict the risk premium to be applied in estimating the cost of common equity for public utilities in regulatory proceedings. The results support the simple consumption-based asset pricing model that predicts the ex ante risk premium with a conditionally predicted volatility in risk premium. The estimates of the cost of common equity from the consumption asset pricing model compare well with rates of return on the book value of common equity and with the CAPM, although both the model and the CAPM results are substantially higher than the DCF. This is quite common in the practice of the cost of common equity in the utility industry. The results of the model are stable and consistent over time. Therefore the model should be considered as it provides additional evidence on the cost of common equity in general and specifically in public utility regulatory proceedings. Secondly, the use of bond-rated yields to predict risk differentiated equity-to-debt risk premia is supported by the empirical evidence and therefore should be applied in estimating the cost of common equity. Finally, the robust empirical evidence on the positive risk-return relationship also shows that utility stocks are not a consumption hedge and are not good hedging securities against contractions in the economy. The model and estimation methodology presented in this paper provide a relatively simple tool to determine whether any asset is a hedge to adverse changes in the business cycle through the level of consumption in the economy.

### ABSTRACT

All consumption-based models of asset pricing imply that the relation between the conditional mean and conditional volatility of any asset reflects the effectiveness of holding that asset as a hedge against intertemporal variation in the marginal utility of consumption. For Treasury Bonds of various maturities, we find significant positive relations. Our empirical findings support the conclusion that investors must sell bonds short to hedge shocks to marginal utility, because realized bond returns tend to be high (low) when investors least (most) desire an additional dollar of consumption. Implications for special cases of the general consumption-based model are also discussed.

### 1. Introduction

All consumption-based models of asset pricing imply that the relation between the conditional mean and conditional volatility of any asset reflects the effectiveness of the asset as a hedge against intertemporal variation in the marginal utility of consumption. The relation is negative if a long position in an asset hedges shocks to the marginal utility of consumption. The relation is positive if a long position adds to consumption risk. We estimate the relation between the conditional mean and conditional volatility of excess returns on U.S. Treasury securities and find evidence of significant positive relations for all maturities. Our full sample results indicate that long positions in Treasury Bonds do not hedge shocks to the marginal utility of consumption. To hedge effectively against such shocks an investor must sell short or sell futures on bonds. In terms of statistical significance and robustness

to changes in methodology, the positive relation is especially reliable for bond maturities of 5 years or less, so short positions on shorter-maturity bonds are the most statistically reliable means for an investor to hedge the marginal utility of consumption.

The general consumption-based model upon which we base our tests requires only minimal assumptions. Models such as the capital asset pricing model (CAPM), intertemporal capital asset pricing model (ICAPM) of Merton (1973), the intertemporal asset pricing model of Campbell (1993), and the habit-persistence model of Campbell and Cochrane (1999) are special cases.<sup>1</sup> Specializations of the general model add additional structure, but do not change the implications that are the focus of our empirical tests. The intuition of the general model is straightforward. A pure hedging asset has realized returns that are perfectly positively correlated with the marginal utility of wealth.<sup>2</sup> It provides high payoffs during “bad times” when the marginal utility of consuming an additional dollar of wealth is high and low payoffs during “good times” when the marginal utility of consuming an additional dollar of wealth is low. The volatility of the asset’s return is desirable and investors are willing to pay more for the asset, because holding the asset decreases intertemporal variation in the holder’s marginal utility. Thus, the key characteristics of a hedging asset are a negative risk premium and a perfect negative correlation between the conditionally expected excess return and conditional volatility of the asset. On the other hand, an asset that has returns that are perfectly negatively correlated with the marginal utility of wealth provides high payoffs when times are good and low payoffs when times are bad. The volatility of the asset’s return is undesirable because it increases intertemporal variation in the holder’s marginal utility. The expected risk premium on such an asset is positive and perfectly positively correlated with its conditional volatility. A short, rather than long, position in the asset is required to hedge consumption risk. Our empirical results for bonds are consistent with the latter case, indicating that realized returns on bonds tend to be high in good times when the marginal utility of receiving an additional dollar of wealth is low.

The beauty of the general consumption-based model is that it provides a simple and straightforward test of the hedging effectiveness of any asset that requires only modeling the first two moments of the asset’s return. The test does not require consumption data, nor does it require that the researcher choose a specific model of investor preferences. The model’s predictions regarding the first two moments of returns hold for any asset, for any two periods of a multi-period model, and require no assumptions regarding complete markets, return distributions, time- or state-separable utility, or the existence of labor income or human capital.

In addition to evidence of hedging effectiveness, our results provide evidence regarding which special cases of the consumption-based model capture key aspects of asset returns. Our full sample results are consistent with the conclusion that realized returns on Treasury Bonds are high when investors least value, and low when investors most value, the benefits of an additional dollar of consumption. Thus, for a special case of the consumption-based model to accurately reflect investor preferences, it must explain why investors associate bad times of high marginal utility with periods of low realized and high expected bond returns. Special cases that assume that the marginal utility of consumption is a function of at most wealth and investment opportunities, such as the ICAPM specializations of Merton (1973) and Campbell (1993), do not do so. Unless one assumes that the coefficient of relative risk aversion is very low (less than one), these specialized models associate bad times with low expected returns. Explaining why investors associate bad times with high expected returns requires a model that captures the fact that investors are concerned not only with the wealth effects of holding assets, but with the fact that assets do poorly at particular times or in particular states of nature (recessions). For example, Campbell and Cochrane (1999) do so by adding an argument to the utility function, habit that enters nonseparably over time

Turning to empirical results, we find that neither the sign nor the significance of the estimated relation between bond risk and return is sensitive to changes in methodology known to influence inferences in the literature on stock risk and return. Specifically, the results are similar whether

<sup>1</sup> For detailed discussion of the relation of these and other asset pricing models to the general model see Cochrane (2006, 2007).

<sup>2</sup> Once the consumer/investor has optimized, the marginal utility of an additional dollar of wealth is the same for all uses.

the conditional variance is modeled using only financial conditioning variables, a simple generalized autoregressive conditional heteroskedasticity in mean (GARCH-M) model, a GARCH-M model that incorporates financial conditioning variables in the estimation of the conditional variance, or GARCH-M models that allow for asymmetries in the conditional variance equation. While all of our empirical models provide evidence consistent with a positive risk–return relation for Treasury Bonds, the strongest results are for the model that incorporates both financial conditioning information and GARCH effects in estimating the conditional variance. Thus, combining alternative methods of estimating the conditional variance reinforces inferences regarding the sign of the risk–return relation.

The general consumption-based model permits the reward to bond volatility to vary over time, so we examine the linearity and stability of the relation between conditional mean and conditional variance. For each model of conditional variance and each bond maturity, regression analysis indicates that financial conditioning information explains variation in bond excess returns that is not related to changes in the conditional variance. The fact that a time invariant linear model of the bond risk–return relation is rejected suggests that the reward to bond volatility does change over time.

To provide evidence on the impact of changing reward to volatility on the stability of the risk–return relation, we examine rolling correlations between “best estimates” of the conditional mean excess return and conditional variance. The rolling correlations show substantial variation over time in the short-term relation between bond risk and return. The rolling correlations for all maturities tend to move together, but the range of variation increases with bond maturity. For each maturity there are periods during which the rolling correlations are negative, which suggests that the hedging effectiveness of bonds may have varied during our sample period.

The remainder of this paper is organized as follows. Section 2 reviews related literature. Section 3 provides theoretical context. Section 4 describes the data. Section 5 presents our empirical model of conditional mean excess returns and diagnostic tests of the stability of the model. Section 6 presents our empirical results. Section 7 evaluates the linearity and stability of the relation between the conditional mean and conditional variance. Section 8 concludes.

## 2. Related literature

Two studies report direct evidence regarding the intertemporal relation between the conditional mean and conditional volatility of monthly bond returns. Engle, Lilein, and Robins (1987) use an ARCH-M framework to estimate the relation between the conditional mean and conditional standard deviation of monthly excess holding period returns on two-month Treasury bills and twenty-year AAA rated corporate bonds. They find positive coefficient estimates on volatility in the expected return regressions for both return series. The coefficient for the two-month bill is significant at the 0.01 level, while that for corporate bonds is significant at the 0.10 level. Campbell (1987) estimates the conditional mean and conditional variance of monthly excess returns on two-month Treasury bills, six-month Treasury bills, and a portfolio of five-to-ten-year Treasury Bonds, where both moments are modeled as functions of financial conditioning variables. Campbell (1987) reports correlations between the fitted moments of 0.625 for the two-month bill, 0.835 for the six-month bill, and 0.029 for the long-term bond portfolio. While the evidence reported in these studies is limited in terms of the bond maturities examined, the two studies are consistent in reporting a strong positive relation between risk and return for short-term bills and a weak positive relation for long-term bonds.<sup>3</sup> No study presents a direct test of the stability of the relation between conditional expected excess returns and volatilities for bonds.

Contrary to the case of bonds, there are many studies that report estimates of the relation between the conditional mean and conditional volatility of monthly stock market returns. Results are very sensitive to changes in the methodology used to estimate the conditional volatility. Since studies by

<sup>3</sup> In related work, Fama (1976) and Klemkosky and Pilotte (1992) document positive relations between excess returns and the volatility of the one-month bill rate for a variety of bill and bond maturities. Such results imply a positive relation between a bond's excess return and own volatility when the term structure is determined by a single state variable. However, Litterman and Scheinkman (1991) find that at least three state variables are required to adequately model the term structure.

Campbell (1987), Campbell and Ammer (1993), and Fama and French (1993) find that bond and stock excess returns are related to common predictor variables, robustness may be an issue for bonds as well as stocks. On the other hand Reilly, Wright, and Chan (2000) and Jones and Wilson (2004) document differences in the time series properties of stock and bond returns, so robustness may not be an issue. As a precaution, we explore changes in methodology know to influence results in the stock literature.<sup>4</sup>

A review of studies of monthly stock returns such as French, Schwert, and Stambaugh (1987), Glosten, Jaganathan, and Runkle (1993), Campbell (1987), Whitelaw (1994) and Harvey (2001) indicates that results are sensitive to whether the conditional variance is modeled using only financial conditioning variables, a simple GARCH-M model, a GARCH-M model that incorporates financial conditioning variables in the estimation of the conditional variance, or GARCH-M models that allow positive and negative shocks to returns to have different impacts on the conditional variance. We also use monthly data, so we examine the robustness of our results to the aforementioned changes in methodology.<sup>5</sup>

### 3. Theoretical context

Consider the intertemporal choice problem of a representative investor who maximizes the conditional expectation of the utility of current and future consumption. In that case, assets can be priced as the conditional expected value of the product of their payoff and a stochastic discount factor,

$$P_{i,t} = E_t[M_{t+1}(P_{i,t+1} + I_{i,t+1})], \quad (1)$$

where  $P_{i,t}$  is the price of asset  $i$  at time  $t$ ,  $I_{i,t+1}$  is the asset's income at  $t+1$ , and  $M_{t+1}$  is the stochastic discount factor.<sup>6</sup> The discount factor is the marginal rate of substitution, defined as  $M_{t+1} \equiv \beta U_C(C_{t+1}, \mathbf{x}_{t+1})/U_C(C_t, \mathbf{x}_t)$ , where  $\beta$  is the time preference parameter and  $U(C_t, \mathbf{x}_t)$  defines utility as a function of time  $t$  consumption,  $C_t$ , and a vector,  $\mathbf{x}_t$ , of other variables that enter into the utility function. Utility is assumed to be an increasing and concave function of consumption. The additional arguments,  $\mathbf{x}_t$ , admit the possibility that utility may be a function of other variables such as state variables and may be nonseparable over time, goods, or states of nature. The  $C$  subscript denotes the first derivative of utility with respect to consumption. Eq. (1) and the equations that follow hold for both real and nominal values as long as all values, including  $M_{t+1}$ , are expressed consistently in either real terms or nominal terms. They hold for any asset for any two periods of a multi-period model and require no assumptions regarding complete markets, return distributions, time- or state-separable utility, or the existence of labor income or human capital. Making such assumptions adds additional structure to the model, but does not change any of the implications discussed here.

Defining the gross return (one plus the net return) as  $R_{i,t+1} = (P_{i,t+1} + I_{i,t+1})/P_{i,t}$ , Eq. (1) can be rewritten in terms of asset returns as

$$1 = E_t[M_{t+1}R_{i,t+1}], \quad (2)$$

or, equivalently, by applying the definition of covariance, as<sup>7</sup>

$$1 = E_t[M_{t+1}] \cdot E_t[R_{t+1}] + Cov_t[M_{t+1}, R_{t+1}] \quad (2')$$

<sup>4</sup> For the 1950–1999 period Reilly et al. (2000) find that return volatility is more stable for stocks than for bonds, the ratio of stock market to bond market volatility is not stable, and the correlation between bond and stock returns varies widely. Jones and Wilson (2004) find similar results for the period 1871–2000.

<sup>5</sup> We limit our study to parametric methods and monthly returns to keep the scope of the analysis manageable and provide a reasonably rich baseline for future study, while supplying results comparable to key findings in the stock literature. The mixed results of studies based on monthly stock return data motivated the exploration of a variety of alternative methodologies to estimate the stock risk-return relation, including the use of daily returns to estimate monthly volatility (see Ghysels, Santa-Clara, & Valkanov, 2005), the use of regime-switching models (see Whitelaw, 2000), and the use of measures of expected rather than realized return (see Jiang & Lee, 2009; Pastor, Sinha, & Swaminathan, 2008).

<sup>6</sup> Eq. (1) can also be derived from the absence of arbitrage. See chapters 2 and 4 of Cochrane (2001) for a detailed discussion of the minimum requirements for Eq. (1) to hold.

<sup>7</sup> By definition,  $Cov_t[M_{t+1}, R_{t+1}] = E_t[M_{t+1}R_{t+1}] - E_t[M_{t+1}] \cdot E_t[R_{t+1}]$ .

Eq. (2) says that expected *discounted* gross returns always equal one. The expanded expression (2') introduces the key role that the covariance between an asset's return and the discount factor plays in the risk adjustment of expected return. For a given value of  $E_t[M_{t+1}]$ , expected gross returns must be inversely related to covariances in any cross-section of assets.

Before discussing the hedging implications of the model in detail, it is useful to examine implications specific to the pricing of default-free bonds. We begin with the gross return to a default-free bond that has a one-period maturity. This risk-free gross return,  $R_{f,t}$ , is known at time  $t$ , so Eq. (2) implies that

$$R_{f,t} = E_t[M_{t+1}]^{-1}. \quad (3)$$

Substituting for future prices in Eq. (1) and using the law of iterated expectations, the price of a  $\tau$ -period-to-maturity risk-free discount (zero-coupon) bond that pays \$1 at maturity is

$$P_{\tau,t} = E_t[M_{t+1,t+\tau}], \quad (4)$$

where  $E_t[M_{t+1,t+\tau}] = E_t[M_{t+1}M_{t+2} \dots M_{t+\tau}]$ , and the one-period return to holding the  $\tau$ -period-to-maturity discount bond is:

$$R_{\tau,t+1} = \frac{P_{\tau,t+1}}{P_{\tau,t}} = \frac{E_{t+1}[M_{t+2,t+\tau}]}{E_t[M_{t+1,t+\tau}]} \quad (5)$$

Eq. (5) shows that the holding period return on a bond is a function of changes in expectations of future values of the stochastic discount factor over the bond's life. Any news or events that cause investors to adjust their expectations of future realizations of the marginal utility of consumption during the bond's life are reflected in bond returns and their volatilities. Since the price of any coupon bond can be expressed as the sum of prices of a series of discount bonds, the intuition behind Eq. (5) holds for coupon bonds as well.

To examine intertemporal hedging issues, it is useful to multiply both sides of Eq. (2') by  $E_t[M_{t+1}]^{-1}$ , substitute from Eq. (3), and rearrange terms to show that the one-period risk premium to holding *any* asset  $i$  is

$$E_t[R_{i,t+1}] - R_{f,t} = -\frac{1}{E_t[M_{t+1}]} \text{Cov}_t[M_{t+1}, R_{i,t+1}], \quad (6)$$

where  $\text{Cov}_t$  is the conditional covariance at time  $t$ . According to Eq. (6), an asset will earn a positive risk premium if its realized return is inversely related to  $M_{t+1}$ , that is, if the return is high when the marginal utility of consumption is low and low when marginal utility is high. However, a negative risk premium is indicated for hedging assets, that is, assets that have high payoffs when the marginal utility of consumption is high and low payoffs when marginal utility is low. Investors pay more for hedging assets, because hedging assets provide higher payoffs when additional consumption is most desired.

As a point of clarification, it is worth noting that the above definition of a hedging asset differs from that of a "hedge portfolio" as that term is often used in extensions and empirical tests of Merton's ICAPM. In those contexts a hedge portfolio is one that hedges against deteriorations in investment opportunities (decreases in expected future returns) by providing realized returns that are inversely related to expected returns. In the ICAPM, a long position in a hedge portfolio hedges the marginal utility of wealth only if the coefficient of relative risk aversion is greater than one.<sup>8</sup> If risk aversion is less than one, a portfolio that has realized returns that are positively related to shifts in investment opportunities is required to hedge the marginal utility of wealth. The ICAPM specializes the general

<sup>8</sup> The coefficient of relative risk aversion determines whether investors will increase or decrease consumption in response to changes in expected future returns. When risk aversion is greater than one, investors are not aggressive in seeking growth in planned consumption. They increase (decrease) both current and planned future consumption in response to an increase (decrease) in investment opportunities. In the contrary case, when risk aversion is less than one, investors are aggressive in seeking growth in planned consumption. In response to an increase in expected returns, they decrease current consumption to invest more in risky assets. Only in the high risk aversion case does an ICAPM hedging asset (one that provides high realized returns when investment opportunities are poor) do so during periods when the marginal utility of consumption is high.

consumption-based model. The ICAPM is derived with the assumption that the marginal utility of consumption is described by wealth and investment opportunities alone.

Substituting Eq. (5) into Eq. (6) produces the following expression for the excess return to the  $\tau$ -period discount bond:

$$E_t[R_{\tau,t+1}] - R_{f,t} = -\frac{1}{E_t[M_{t+1}]} \text{Cov}_t \left[ M_{t+1}, \frac{E_{t+1}[M_{t+2,t+\tau}]}{E_t[M_{t+1,t+\tau}]} \right]. \quad (7)$$

Eq. (7) demonstrates that the ex ante risk premium on a bond reflects the expected time series properties of  $M_{t+1}$  during the bond's maturity. Thus, bonds of adjacent maturities are likely to have similar return characteristics. Characteristics of short and long maturity bonds could be very different.

We follow the convention of using yield spreads as a conditioning variable in our empirical tests. Eq. (4) implies that the gross yield on a  $\tau$ -period discount bond is

$$Y_{\tau,t} = \left( \frac{1}{P_{\tau,t}} \right)^{1/\tau} = E_t[M_{t+1,t+\tau}]^{-1/\tau}. \quad (8)$$

A comparison of Eq. (7) to Eqs. (3) and (8) shows why a bond's own yield spread contains information that is a useful for predicting bond excess returns.

Using the relationship between correlation and covariance to expand Eq. (6) provides the relation of the ex ante risk premium on any asset to that asset's own volatility<sup>9</sup>

$$E_t[R_{i,t+1}] - R_{f,t} = -\frac{\text{vol}_t[M_{t+1}]}{E_t[M_{t+1}]} \text{vol}_t[R_{i,t+1}] \text{corr}_t[M_{t+1}, R_{i,t+1}], \quad (9)$$

where  $\text{vol}_t$  is the conditional standard deviation, the ratio  $\text{vol}_t[M_{t+1}]/E_t[M_{t+1}]$  is the slope of the mean-variance frontier, and  $\text{corr}_t$  is the conditional correlation. The correlation summarizes the hedging properties of an asset and determines the sign of the relation between the first and second conditional moments of the asset's excess return. Variation over time in the slope or the correlation will cause the risk-return relation to vary as well.

Summarizing, three main conclusions can be drawn from the general model of asset pricing. First, the sign of the relation between a bond's excess return and conditional volatility depends on the extent to which a long position in the bond serves as an intertemporal hedge against shocks to the marginal utility of consumption. Second, risk-return relations differ across bond maturities. The difference is likely small for adjacent maturity bonds and potentially large for short versus long-term bonds, because the holding period return for each bond depends on changes during the holding period in expected values of the stochastic discount factor over the remaining life of the bond. Third, the relation between bond risk and return may vary over time due to changes in the slope of the mean-variance frontier or changes in the correlation between the asset's return and the stochastic discount factor. In the empirical section of this paper, we focus on documenting the sign of the bond risk-return relation for the full sample period, the consistency of the relation across bond maturities, and the short-term stability of the relation.

#### 4. Data and descriptive statistics

Data are from the *Center for Research in Security Prices (CRSP)*. Returns are one-month holding period returns. Returns and yields on one-month and three-month to maturity Treasury bills are from the Fama Treasury Bill Term Structure Files. Returns on five Treasury Bond portfolios are from the Fama Maturity Portfolios Returns File with bonds grouped by maturities in one year intervals. Thus, the bond portfolios consist of bonds with maturities of less than 1, 1–2, 2–3, 3–4, and 4–5 years. Only non-callable, non-flower bonds and notes are included in the portfolios. Yields that correspond to the portfolio returns are from the Fama-Bliss Discount Bonds File. Each yield is for the discount bond at the upper bound of maturity allowed in a portfolio. We use returns and yields on the ten-year

<sup>9</sup> By definition,  $\text{corr}_t[M_{t+1}, R_{i,t+1}] = \text{cov}_t[M_{t+1}, R_{i,t+1}] / (\text{vol}_t[M_{t+1}] \text{vol}_t[R_{i,t+1}])$ .

The time series is from January 1961 to December 2009 with 588 observations. The Jarque–Bera (JB) statistic is a goodness-of-fit measure of the departure of the distribution of a data series from normality, based on the levels of skewness and excess kurtosis. The JB statistic is  $\chi^2$  distributed with 2 degrees of freedom. The Q(12) statistic tests for autocorrelation in the first 12 lags. It is  $\chi^2$  distributed with 12 degrees of freedom based on the number of lags tested. The autocorrelation coefficient is denoted by  $\rho_t$ , where  $t$  is the lag, in months. \*\*\*, \*\*, \* denote significance for the JB or Q(12) test at the 0.01, 0.05, and 0.10 levels, respectively for a one-tailed test.

and twenty-year constant maturity bonds from the CRSP Fixed Term Indices Files to represent longer maturity bonds.<sup>10</sup> Where possible, CRSP uses a non-callable, non-flower bond in constructing the Fixed Term Indices Files. The sample period is January 1961 to December 2009. We start with January 1961, because there are often substantial gaps in prior months between the desired and available maturities for the ten- and twenty-year constant maturity bonds. Eight excess return series are calculated by subtracting the return to the one-month bill from the holding period returns on the three-month bill, each of the five bond portfolios, and the ten- and twenty-year constant maturity bonds.

We report descriptive statistics for the excess return series in Panel A of Table 1. Both the mean and standard deviation of monthly excess returns tend to increase with maturity, standard deviations rise more sharply. These results are consistent with Pilotte and Sterbenz (2006), who find that bond Sharpe ratios decline with maturity.

The Jarque–Bera (JB) statistics, a goodness-of-fit test of the departure of the distribution of a data series from the normal, reject normality at the 0.01 level for each excess return series. An examination of the skewness and kurtosis of the excess return series indicates that the rejection of normality is due predominantly to excess kurtosis relative to the normal distribution. The Q(12) statistics reject the null hypothesis of no autocorrelation in the first 12 lags at the 0.01 level for six of the eight series and at the 0.10 level for one series. Reported autocorrelations indicate that these rejections are due mostly to positive first order autocorrelation in the excess returns. Higher order correlations are close to zero and the pattern of autocorrelations is consistent with stationarity of all of the excess return series.

<sup>10</sup> We use the twenty-year and not the thirty-year bond from the Fixed Term Indices File because there are several years where both series are based on the same bond and the gap between actual and desired maturity is generally smaller for the twenty-year bond. The disadvantage of using constant maturity bonds rather than portfolios is that the realized return is more sensitive to idiosyncratic variation in the price of a single bond.

To examine aspects of the volatility of excess returns, we report descriptive statistics for squared excess returns in Panel B of Table 1. Panel B shows that both the mean and standard deviation of squared excess returns increase with maturity. The  $Q(12)$  statistics and autocorrelations reported in Panel B indicate substantial positive autocorrelation in squared excess returns that is more persistent than the positive autocorrelation in excess returns. These statistics suggest the existence of autoregressive conditional heteroskedasticity in each excess return series.

## 5. Excess return model and model evaluation

In this section we present our empirical model of conditional mean excess returns and carry out diagnostic tests to evaluate the stability of the model. The residuals of this model are used in a later section of this paper to model conditional volatility using predetermined financial conditioning information as instrumental variables.

### 5.1. Estimating conditional mean excess returns

In order to estimate the conditional volatility of a bond's excess returns, it is useful to isolate the predictable and the unpredictable components of those returns. To do so, we model the conditional mean excess return by regressing excess returns on predetermined conditioning variables. An obvious choice for a conditioning variable is a bond's own yield spread, defined as the beginning of period difference between the bond's yield to maturity and the one-month T-bill rate. The yield spread has been shown to have predictive power for bond excess returns in prior studies by Campbell (1987), Fama (1990), and Pilotte and Sterbenz (2006).<sup>11</sup> Based on the positive first order autocorrelations in excess returns reported in Table 1, we also include the one-month lag of each bond's excess return as a conditioning variable. Thus, our model of excess returns is:

$$R_{\tau,t+1} - R_{f,t} = \alpha_{\tau,0} + \alpha_{\tau,1}(Y_{\tau,t} - R_{f,t}) + \alpha_{\tau,2}(R_{\tau,t} - R_{f,t-1}) + \varepsilon_{\tau,t+1} \quad (10)$$

where  $t$  subscripts denote when a variable is observed,  $R_{\tau,t+1}$  is the uncertain return from holding from time  $t$  to  $t+1$  a bond of maturity  $\tau$ ,  $R_{f,t}$  is the risk-free return known at time  $t$  and earned by holding a one-month bill from  $t$  to  $t+1$ ,  $Y_{\tau,t}$  is the yield-to-maturity observed at time  $t$  on a bond of maturity  $\tau$ , and  $\varepsilon_{\tau,t+1}$  is the error term.

Stambaugh (1999) shows that the conventional  $t$ -test of return predictability is biased when a regressor is highly persistent and its changes are highly correlated with subsequent returns. Since yield spreads are both highly persistent and their innovations are likely correlated with subsequent returns, we implement the pretest procedure developed by Campbell and Yogo (2005) and Campbell and Yogo (2006) to check on the validity of the  $t$ -statistics associated with the yield spreads in our regressions. Results of these pretests (not shown) indicate that the conventional  $t$ -test leads to valid inference in all of our regressions of bond excess returns on yield spreads. Because our excess return series are clearly stationary, as indicated by the autocorrelations reported in Table 1, conventional  $t$ -tests are valid for the lagged excess returns as well.

The results of ordinary least squares (OLS) estimation of regression Eq. (10) are reported in Table 2. The standard errors are adjusted for autocorrelation and heteroskedasticity. The yield spread is significant at the 0.01 level for three, at the 0.05 level for four, and at the 0.10 level for one of the eight bond maturities. The lagged excess return is significant at the 0.01 level for six bond maturities and the 0.10 level for one maturity. The regression  $R$ -square ranges from a low of 0.02 for the twenty-year bond to a high of 0.11 for the three-month bill. These results document predictable variation in bond excess returns for all maturities.

Table 2 also contains test statistics that examine aspects of the regression errors. The JB statistics reject normality of the residuals at the 0.01 level for every regression. The White statistics reject the

<sup>11</sup> Fama (1990) shows that the yield spread contains the market's estimate of the ex ante risk premium and should reflect variation in that premium. The idea that a bond's own term spread contains information that is useful for predicting bond excess returns also is supported by a comparison of our Eq. (7), to Eqs. (3) and (8).

The time series is from January 1961 to December 2009. Regressions of the monthly excess return ( $R_{t,t+1} - R_{ft}$ ) on the beginning-of-period yield spread ( $Y_{t,t} - R_{ft}$ ), and, the one-month lag of the excess return ( $R_{t,t} - R_{ft,t-1}$ ). The Jarque-Bera (JB) statistic is a goodness-of-fit measure of the departure of the distribution of the regression residuals from normality. The JB statistic is  $\chi^2$  distributed with 2 degrees of freedom. The White statistic is a test for heteroskedasticity that is  $\chi^2$  distributed with 6 degrees of freedom. The Breusch-Godfrey Lagrange Multiplier (LM-Serial-Corr.) statistic is a test for serial correlation that is  $\chi^2$  distributed with 12 degrees of freedom due to the test for serial correlation for up to 12 lags. Engle's Lagrange Multiplier ARCH statistic (LM-ARCH) is a test for ARCH effects in the residuals. It is  $\chi^2$  distributed with 12 degrees of freedom due to the test for ARCH effects for 12 lags. Newey-West autocorrelation and heteroskedasticity consistent standard errors are in parentheses. \*\*\*, \*\*, \* denote significance at 0.01, 0.05, and 0.10 levels, respectively for a two-tailed test; one-tailed test for JB, White, and LM tests.

null hypothesis of no heteroskedasticity at the 0.01 level for six maturities, the 0.05 level for one maturity, and at the 0.10 level for the remaining maturity. The Breusch-Godfrey Lagrange Multiplier statistics reject the null hypothesis of no serial correlation at the 0.01 level in four regressions, at the 0.05 level in one regression, and at the 0.10 level in two regressions. Engle's Lagrange Multiplier ARCH statistics reject the null hypothesis of no autoregressive conditional heteroskedasticity in the residuals at the 0.01 level in every regression. In brief, the regression residuals are non-normally distributed, heteroskedastic, autocorrelated, and show strong evidence of ARCH effects. We consider these aspects of shocks to bond excess returns in the models of the risk-return relation that appear later in this paper.

## 5.2. Evaluation of excess return model

Klemkosky and Pilotte (1992) present evidence of shifts in the stochastic process that generates Treasury Bond risk premiums around October 1979 and October 1982 changes in monetary policy.<sup>12</sup> Thus, we conduct a variety of diagnostic tests to check the specification of our model of excess returns.<sup>13</sup> Due to the large quantity of diagnostic test results, we discuss them but do not report them in tabular form.

Our first set of diagnostic tests is based on recursive least squares estimation of Eq. (10) for each bond maturity. We examine plots against time of the recursive coefficients and two standard error bands around the coefficients for each bond maturity. These plots suggest that the regression coefficients are stable over time. We also apply the CUSUM and CUSUM of squares tests (see Brown, Durbin, & Evans, 1975) that are based on plots against time of the cumulative sums of the recursive residuals and their squared values, respectively. Using the 0.05 significance level, the CUSUM

<sup>12</sup> These dates reflect changes in the Federal Reserve's focus on targeting interest rates and monetary aggregates. Specifically, during 1979–1982 the Fed experimented with using non-borrowed reserves as a target for monetary policy.

<sup>13</sup> Klemkosky and Pilotte (1992) reject the stability of a model of the relation between bond excess returns and short-rate volatility.

tests suggest model stability while the CUSUM of squares tests suggest instability. Overall, the results based on recursive estimation suggest parameter stability but changing variance over the full sample period.

Our second set of diagnostic tests is Wald tests of structural change. Model stability is tested for each bond for each of the five possible monetary regime pairs. The results of tests that assume unequal subperiod variances never reject coefficient stability at the 0.05 level and reject it at the 0.10 level in only one instance. The results of tests that assume equal subperiod variances consistently reject model stability. The Wald test results are consistent with the recursive least squares results in suggesting coefficient stability but changing variance across monetary regimes.

Overall, our specification tests support two conclusions. First, the assumption of coefficient stability over the full sample period is a reasonable one, so our method of estimating conditional mean excess returns appears adequate. Second, the volatility of return shocks varies over time, suggesting that an examination of the relation between excess returns and conditional volatility is well motivated. In the next section, we use models of conditional volatility to examine the relation between bond risk and return.

## 6. The relation between excess returns and conditional volatility

In this section, we estimate the empirical relation between bond risk and return. Since the method chosen to model conditional volatility is critical to the results of estimating the monthly risk–return relation in the stock literature, we test three specifications of the conditional variance of bond excess returns.<sup>14</sup> We pay special attention to the decision to include or exclude financial conditioning information in the model of conditional variance, because it determines the sign of the estimated risk–return relation for stocks. Our first model estimates conditional variances using predetermined financial conditioning information. Given the strong evidence of ARCH effects in excess returns reported in Table 2, our second model is a simple GARCH-M model. Our third model incorporates both financial conditioning variables and GARCH effects.

### 6.1. Instrumental variables estimation using financial conditioning information

For each bond maturity,  $\tau$ , we estimate the following instrumental variables regression:

$$R_{\tau,t+1} - R_{f,t} = \alpha_{\tau,0} + \alpha_{\tau,1}\varepsilon^2 + \mu_{\tau,t+1}, \quad (11)$$

where the  $\varepsilon_{\tau,t+1}$  are the residuals from the estimation of Eq. (10) model of excess returns, the slope coefficient  $\alpha_{\tau,1}$  is the estimate of the relation between the bond's expected excess return and conditional volatility, and  $\mu_{\tau,t+1}$  is the error term. The intercept,  $\alpha_{\tau,0}$ , provides a check on the empirical specification of the risk–return model, because Eq. (9) indicates that the intercept will equal zero if the model specification is adequate. For instruments we consider lags of the squared residuals, the conditioning variables used to estimate the excess return model, and the one-month Treasury bill return. We include the one-month T-bill rate because of the historically positive relation between interest rate volatility and the level of interest rates, and because of the common use of the short-term interest rate to model volatility in term structure models.<sup>15</sup> An initial examination of the relations between the squared residuals and the candidate instruments indicates that the one-month bill rate and six lags of the squared residuals encompass the candidates that are most useful in modeling conditional volatility. We expect shocks to bond excess returns to be correlated across maturities, so we improve the efficiency of our estimates by choosing an estimation method that takes into account the cross-equation correlations in the error terms. We use the Generalized Method of Moments (GMM) to estimate Eq. (11) simultaneously for all bond maturities. Standard errors are Newey–West heteroskedasticity and autocorrelation consistent.

<sup>14</sup> We repeat each test using the standard deviation and log of conditional variance as the volatility measures. Results for these alternative specifications are discussed in the robustness section that appears later in the paper.

<sup>15</sup> Because of concerns regarding the possible non-stationarity of the one-month rate, we repeat the estimation excluding it from the list of instruments. Results are qualitatively the same.

**Table 3**  
 Instrumental variables estimation of risk-return relation for Treasury Bonds.

Generalized method of moments (GMM) system estimation incorporates the use of instrumental variables and considers the cross-equation correlations in the error terms. The following system of equations is estimated:

$$R_{\tau,t+1} - R_{ft} = \alpha_{\tau,0} + \alpha_{\tau,1} \varepsilon_{\tau,t+1}^2 + \mu_{\tau,t+1},$$

where,  $\tau$  is the number of months of bond maturity:  $\tau \approx 3$ ,  $0 < \tau \leq 12$ ,  $0 < \tau \leq 24$ ,  $0 < \tau \leq 36$ ,  $0 < \tau \leq 48$ ,  $0 < \tau \leq 60$ ,  $\tau \approx 120$ , and  $\tau \approx 240$ , time  $t = 1$ , 588 represents the beginning of months from January 1961 to December 2009,  $\varepsilon_{\tau,t+1}$  is the residual from the OLS regressions in Table 2, and  $\mu_{\tau,t+1}$  is the error term. The instrumental variables are the one-month return on the one month T-Bill ( $R_{ft}$ ) and the first six monthly lags of the squared residuals. Engle's Lagrange Multiplier ARCH statistic (LM-ARCH) is a test for ARCH effects in the residuals. It is  $\chi^2$  distributed with 12 degrees of freedom due to the test for ARCH effects for 12 lags. The Breusch-Godfrey Lagrange Multiplier (LM-Serial-Corr.) statistic is a test for serial correlation that is  $\chi^2$  distributed with 12 degrees of freedom due to the test for serial correlation for up to 12 lags. The Jarque-Bera (JB) statistic is a goodness-of-fit measure of the departure of the distribution of the regression residuals from normality. The JB statistic is  $\chi^2$  distributed with 2 degrees of freedom. The AR(1) coefficient is the first order autoregressive coefficient for the fitted values of  $\varepsilon_{\tau,t+1}^2$ . Newey-West heteroskedasticity and autocorrelation consistent standard errors are in parentheses. \*\*\*, \*\*, \* denote significance at the 0.01, 0.05, and 0.10 levels respectively; two-tailed test for regression parameters, one-tail test for Q and JB statistics.

Results of the system estimation of Eq. (11) are reported in Table 3. The slope coefficient is significant at the 0.01 level for the 3 month bill, the four bond portfolios of maturities less than or equal to 48 months, and the 120-month bond. The slope coefficient is statistically insignificant for the 48–60-month portfolio and the 240-month bond. Thus, six of our eight maturities produce evidence of a significant positive relation between bond risk and return. In terms of statistical significance, the positive relation tends to be more reliable the shorter the bond maturity.

The intercepts reported in Table 3 are significant at the 0.01 level in six regressions and at the 0.10 level in one regression. The prevalence of significant nonzero intercepts suggests that the IV approach is not adequate for modeling the risk–return relation, as Eq. (9) predicts a zero intercept for a well specified model.

To facilitate comparison of the persistence of the conditional variance estimates across differently parameterized models, we follow Glosten et al. (1993) who regress the conditional variance estimate for each model on a constant and the lagged value of the estimate. These first order autoregressive coefficients are reported for each model that we estimate. For the results of instrumental variables estimation reported in Table 3, the first order autoregressive coefficient is estimated for the predicted values of the  $\varepsilon_{\tau,t+1}^2$  from the system estimation of Eq. (11). These AR(1) coefficients indicate that there is substantial persistence in the conditional variance estimates.

The LM-ARCH statistics reported in Table 3 reject, at the 0.01 level, the null hypothesis of no ARCH effects in the first 12 lags of the residuals of each equation. The LM-Serial Correlation and JB statistics are consistent with results reported in Table 2, rejecting the nulls of no autocorrelation and the normality of the residuals. Since GMM requires no distributional assumption, parameter estimates are consistent despite the lack of normally distributed residuals. Because the

IV approach to estimating conditional volatility does a poor job of capturing the ARCH effects in our excess return data, GARCH estimation may provide more accurate estimates of conditional volatility and improve the efficiency of estimates. We use GARCH estimation in the models that follow.

## 6.2. GARCH-M estimation

A natural way to estimate the relation between bond risk and return is with the following simple GARCH-M model of conditional variance:

$$R_{\tau,t+1} - R_{f,t} = \alpha_{\tau,0} + \alpha_{\tau,1}\sigma_{\tau,t+1}^2 + \gamma_{\tau,t+1} \quad (12)$$

$$\sigma_{\tau,t+1}^2 = \beta_{\tau,0} + \beta_{\tau,1}\sigma_{\tau,t}^2 + \beta_{\tau,2}\gamma_{\tau,t}^2 + \nu_{\tau,t+1} \quad (13)$$

Estimation is by the method of maximum likelihood. In light of the evidence in [Table 1](#) that excess returns are not normally distributed due to excess kurtosis, we estimate the GARCH-M system assuming that the conditional distribution for the error term is the Generalized Error Distribution (GED). The GED is less restrictive than the normal as it accommodates kurtosis, although it does not accommodate skewness.<sup>16</sup> The GED distribution nests the Student's *t*-distribution and normal distribution.

[Table 4](#) contains the results for GARCH-M estimation. For each maturity, the GED parameter differs significantly from 2, the value for the normal distribution, at either the 0.01 or 0.05 significance levels.<sup>17</sup> The Lagrange Multiplier ARCH statistics indicate that the model is effective at removing most of the ARCH effects from the regression residuals. The coefficient sum,  $\beta_{\tau,1} + \beta_{\tau,2}$ , is close to one in every variance equation. A sum of one is indicative of the integrated GARCH (IGARCH) process identified by [Engle and Bollerslev \(1986\)](#), which allows for shocks to have a permanent effect on the conditional variance. An IGARCH process is not covariance-stationary but is strictly stationary under conditions identified in [Nelson \(1990\)](#).<sup>18</sup> Similarly, the AR(1) coefficients for the conditional volatility estimates range from 0.93 to 0.97. This confirms the presence of substantial persistence in conditional volatility. The persistence in volatility, as measured by the AR(1) coefficient, is generally greater than that reported in [Table 3](#) for the instrumental variables estimation.

The coefficients on conditional variance in the mean equations are all positive. They are significant at either the 0.01 or 0.05 level for all maturities less than or equal to 60 months and significant at the 0.10 level for the 240-month bond. The risk–return relation is insignificant only for the 120-month bond. Thus, the GARCH-M specification of conditional variance and the IV specification based on financial conditioning information both provide evidence that there is a positive relation between bond risk and return. In terms of statistical significance, both specifications indicate that the positive relation tends to be more reliable the shorter the bond maturity.

Contrary to the case for the IV specification, the intercepts for the GARCH-M regressions generally do not differ significantly from zero. The exceptions are the regressions for the 3-month bill and the portfolio of bonds that are very close (less than 12 months remaining) to maturity. Thus, the GARCH-M approach appears to be a superior model specification.

<sup>16</sup> The GED is a restricted version of the skewed generalized error distribution (SGED). Although it may seem intuitive that a less restrictive distribution is always better, since the non-normality of the error term is not driven by skewness, a loss of efficiency would obtain from over-parameterization of the distribution if specified with the more general SGED.

<sup>17</sup> Although not shown,  $\chi^2$  distributed goodness-of-fit log-likelihood ratio tests (one degree of freedom) comparing the fits of the GED and the normal distributions for each maturity indicate that the GED provides a statistically-significantly better fit than the normal.

<sup>18</sup> Nelson shows that an IGARCH(1,1) process with a positive drift is strictly stationary and ergodic. The unconditional density for such a process is the same for all *t*.

**Table 4**  
 GARCH-M estimation of risk-return relation for Treasury Bonds

$\tau \approx 240$	-0.006 (0.011)	2.736* (1.660)	216.000 (211.000)	0.123*** (0.031)	1.425*** (0.084)	8.3	1322.8	0.968*** (0.011)

The results below are the GARCH-M regressions for the monthly excess return on the T-Bond ( $R_{t,t+1} - R_{t,t}$ ) with conditional variance in the mean equation. The estimated models are:

$$R_{t,t+1} - R_{t,t} = \alpha_{t,0} + \alpha_{t,1}\sigma_{t,t+1}^2 + \gamma_{t,t+1}$$

$$\sigma_{t,t+1}^2 = \beta_{t,0} + \beta_{t,1}\sigma_{t,t}^2 + \beta_{t,2}\gamma_{t,t}^2 + \nu_{t,t+1}$$

The time series is from January 1961 to December 2009 with 588 observations. The conditional distribution for the error term is the generalized error distribution (GED) to address non-normality of the errors, where the GED parameter ( $k$ ) is the kurtosis parameter that accommodates fat tails. The GED nests the normal distribution and becomes the normal if  $k$  is equal to 2. Engle's Lagrange Multiplier ARCH statistic (LM-ARCH) is a test for ARCH effects in the residuals. It is  $\chi^2$  distributed with 12 degrees of freedom due to the test for ARCH effects for 12 lags. Log-L is the value of the log likelihood function. The AR(1) coefficient is the first order autoregressive coefficient for the fitted values of  $\sigma_{t,t+1}^2$ . Standard errors are in parentheses. \*\*\*, \*\*, \* denote significance at the 0.01, 0.05 and 0.10 levels, respectively. two-tailed test for regression and GED parameters, one-tailed test for LM-ARCH.

### 6.3. GARCH-M estimation with financial conditioning information

Our third model of conditional volatility incorporates both financial conditioning variables and GARCH effects:

$$R_{\tau,t+1} - R_{f,t} = \alpha_{\tau,0} + \alpha_{\tau,1}\sigma_{\tau,t+1}^2 + \gamma_{\tau,t+1} \quad (14)$$

$$\sigma_{\tau,t+1}^2 = \beta_{\tau,0} + \beta_{\tau,1}\sigma_{\tau,t}^2 + \beta_{\tau,2}\gamma_{\tau,t}^2 + \beta_{\tau,3}R_{f,t} + \beta_{\tau,4}(Y_{\tau,t} - R_{f,t}) + \beta_{\tau,5}(R_{\tau,t} - R_{f,t-1}) + u_{\tau,t+1} \quad (15)$$

Results, reported in [Table 5](#), indicate that incorporating both financial conditioning variables and GARCH effects in the model of conditional variance provides stronger evidence of a positive relation between bond risk and return than does the simple GARCH-M estimation of [Table 4](#). In the mean equation, the coefficient on the variance term is positive and significant at the 0.01 level for four bond maturities and at the 0.05 level for three bond maturities. Moreover, as is the case for the simple GARCH-M regressions, the intercepts for the GARCH-M regressions that incorporate financial conditioning variables in the variance equation generally do not differ significantly from zero. The model seems well specified for all but the shortest-term bonds.

An examination of the results for the variance equation indicates that the one-month rate is significant (0.05 level or lower) in explaining the conditional variance of every bond maturity. The significance of the yield spread (0.01 level) in explaining conditional variance is limited to the 3-month bill. The lagged excess return is significant (0.05 level) only for the 120-month bond.

In [Table 5](#), the GED parameters differ significantly from the value for the normal distribution (0.01 level) in every regression. The Lagrange Multiplier ARCH statistics indicate that the model is effective at removing most of the ARCH effects from the regression residuals. For each maturity, the inclusion of financial conditioning information in the variance equation increases the value of the log-likelihood function relative to the value reported in [Table 4](#) for simple GARCH-M estimation. The persistence in conditional volatility, as measured by the AR(1) coefficient, is usually close to that reported in [Table 4](#) for the simple GARCH model.

### 6.4. Additional robustness tests

As a robustness check, all three models are estimated using the conditional standard deviation and the log of conditional variance rather than the conditional variance to estimate the risk–return relation. While these changes do not materially alter our conclusions, there are systematic effects on the *p*-values for the coefficient on the conditional volatility measure. For instrumental variables estimation using financial conditioning information, using the conditional standard deviation tends to raise *p*-values slightly. For GARCH-M estimation, both with and without conditioning variables, using the conditional standard deviation tends to lower *p*-values slightly. The preponderance of results remains consistent with a positive risk–return relation.

We also check the robustness of our results to the use of asymmetric GARCH-M models that allow positive and negative shocks to returns to have different impacts on the conditional volatility. Contrary to the existing evidence for stocks, for which asymmetries are significant determinants of conditional volatility that cause the sign of the risk–return relation to reverse, we find that these asymmetries are insignificant in determining the conditional volatilities of bonds.

We also explore the use of alternatives to the GED distribution for estimating GARCH models when regression residuals are not conditionally normally distributed. We repeat estimation of all GARCH models using the Student's *t*-distribution and using the quasi-maximum likelihood method of [Bollerslev and Wooldridge \(1992\)](#). Our conclusions are robust to these changes in the specification of the conditional distribution for errors.

We use GMM system estimation of [Eq. \(11\)](#) to produce our estimates of the risk–return relation that are based on modeling the conditional variance using only financial conditioning information. Advantages of the GMM estimator are that it takes into account the cross-equation correlations in the error terms and is robust to heteroskedasticity and autocorrelation of unknown form. As a check on the importance of these advantages we also estimate [Eq. \(11\)](#) using three-stage least squares (3SLS) and single-equation estimation. 3SLS accounts for the cross-equation correlations in the error term and

**Table 5**

$\tau \approx 240$	-11.140 (9.53)	3.061** (1.605)	-42.600* (23.200)	0.871*** (0.041)	0.112*** (0.033)	129.590** (70.100)	137.51 (93.12)	-11.450 (8.110)	1.459*** (0.088)	1328.9 (0.010)	0.968*** (0.010)

The following GARCH-M models are estimated:

$$R_{t+1} - R_{t-1} = \alpha_{\tau,0} + \alpha_{\tau,1} \sigma_{\epsilon,t+1}^2 + \gamma_{\tau,t+1}$$

$$\sigma_{\epsilon,t+1}^2 = \beta_{\tau,0} + \beta_{\tau,1} \sigma_{\epsilon,t}^2 + \beta_{\tau,2} \gamma_{\tau,t}^2 + \beta_{\tau,3} R_{t-1} + \beta_{\tau,4} (Y_{t-1} - R_{t-1}) + \beta_{\tau,5} (R_{t-1} - R_{t-2}) + \nu_{\tau,t+1}$$

The time series is from January 1961 to December 2009 with 588 observations. These regression models estimate the relation between the excess return ( $R_{t+1} - R_{t-1}$ ) and its conditional variance, where the conditioning variables include the beginning of period monthly return on the 1-month T-Bill ( $R_{t-1}$ ), the beginning of period yield spread ( $Y_{t-1} - R_{t-1}$ ), and the one-month lag of excess return ( $R_{t-1} - R_{t-2}$ ). The conditional distribution for the error term is the generalized error distribution (GED) to address non-normality of the errors, where the GED parameter ( $k$ ) is the kurtosis parameter that accommodates fat tails. The GED nests the normal distribution and becomes the normal if  $k = 2$ . Engle's Lagrange Multiplier ARCH statistic (LM-ARCH) is a test for ARCH effects in the residuals. It is  $\chi^2$  distributed with 12 degrees of freedom due to the test for ARCH effects for 12 lags. Log-L is the value of the log likelihood function. AR(1) is the first order autoregressive coefficient for the fitted values of  $\sigma_{\epsilon,t+1}^2$ . Standard errors are in parentheses. \*\*\*, \*\*, \* denote significance at the 0.01, 0.05 and 0.10 levels, respectively. The regression and GED parameters are two-tailed tests. The LM-ARCH is a one-tail test.

heteroskedasticity, but does not account for autocorrelation in the errors. Single-equation estimation accounts for heteroskedasticity and autocorrelation of unknown form, but not the cross-equation correlations in the error terms. Results for 3SLS are similar, but slightly weaker than GMM estimation. Results for single-equation estimation are substantially weaker than both 3SLS and GMM estimation. Thus, accounting for the cross-equation correlations in the errors produces efficiency gains that have an important impact on the statistical significance of the estimated relation between bond risk and return.

#### 6.5. Discussion of implications for asset pricing models

Our findings have implications for the modeling of investor preferences and asset returns that support the conclusions of [Cochrane \(2001, 2006\)](#). Our finding of a positive relation between the first two moments of bond returns is evidence that bond realized returns tend to be high during good times of low marginal utility and low during bad times of high marginal utility. The inverse relation between a fixed income security's price and discount rate, implies the opposite relation for expected bond returns and marginal utility. Thus, a challenge for asset-pricing models is to capture the fact that investors associate periods of high expected (low realized) bond returns with bad times. A well known result from the prediction literature is that expected returns on stocks and bonds are higher near the troughs of recessions than at the peaks.<sup>19</sup> Thus, our results support Cochrane's conclusion that theoretical models need to explain, and empirical models need to capture, the fact that investors fear recessions.

The existing ICAPM specializations of the consumption-based model are ill-suited to explain our results.<sup>20</sup> The ICAPM approach assumes that the marginal utility of consumption is a function only of wealth and state variables that describe the conditional distribution of expected future returns. Unless the coefficient of relative risk aversion is very low (less than one), the ICAPM associates good times with high, and bad times with low, expected returns.<sup>21</sup> If one believes that risk aversion is reasonably high, our results support the conclusion that investor preferences are not adequately modeled by wealth and investment opportunities alone.

Our results are consistent with [Cochrane's \(2001, 2006\)](#) conclusion that asset pricing models must capture the fact that investors are concerned not only with the wealth effects of holding assets, but of the fact that assets do poorly at particular times or in particular states of nature (recessions). Cochrane suggests that this can be done in a utility framework by adding arguments into the utility function that enter nonseparably either over time or over states of nature. For example, [Campbell and Cochrane \(1999\)](#) associate high expected returns with bad times by adding an argument, habit, that enters the utility function nonseparably over time. For the ICAPM framework, Cochrane recommends adding a recession state variable to the value function.

### 7. Stability of the risk–return relation

The regression models reported in [Tables 3–5](#) assume a time invariant linear relation between the expected excess return and conditional variance. The theoretical model of Section II does not restrict

<sup>19</sup> [Fama and French \(1989\)](#) find that risk premiums on stocks and long-term corporate bonds are related to variables that track business conditions. They conclude that excess returns are high when economic conditions are weak and low when economic conditions are strong. [Pilotte and Sterbenz \(2006\)](#) report similar findings for Treasury bonds and stocks. They find that conditional mean excess returns on Treasury bond portfolios of maturities of one to five years peak near the troughs of recessions, while conditional means of shorter maturity bonds and bills peak during recessions prior to the trough (see their [Table 5](#)).

<sup>20</sup> Two excellent sources of discussion of the relation of the ICAPM to the general model are [Cochrane \(2006, 2007\)](#).

<sup>21</sup> The coefficient of relative risk aversion determines whether investors will increase or decrease consumption in response to changes in expected future returns. When risk aversion is greater than one, investors increase both current and planned future consumption in response to an increase in expected returns. When risk aversion is less than one, investors are more aggressive in seeking growth in planned consumption. In response to an increase in expected returns, they decrease current consumption to invest more in risky assets.

the risk–return relation to a stable linear relation. In this section, we evaluate the linearity and stability of the relation between bond risk and return.

### 7.1. Analysis of excess return model residuals

A straightforward way to check the linear restriction for any of our models is to examine the relation between the regression error and financial conditioning information. If conditioning information explains variability in excess returns that is not related to conditional volatility, a linear relation between the conditional mean and conditional variance is rejected. Such a finding suggests that the reward to volatility changes over time.

Table 6 reports the results of OLS regressions of residuals from our models on financial conditioning information. For all three models, conditioning variables have explanatory power beyond that of the conditional variance. The explanatory power is greatest for the model where the conditional variance is based only on financial conditioning information. The explanatory power is lower in models where the conditional variance estimates incorporate GARCH effects. At least one conditioning variable is significant in most of the residual regressions. Clearly, the conditioning variables capture variation in excess returns that is not related to our estimates of the conditional variance. A time invariant linear specification of the relation between the conditional mean and conditional volatility is rejected, which suggests that the reward to volatility changes over time.<sup>22,23</sup>

### 7.2. Rolling correlations between conditional means and conditional variances

To provide evidence on the impact of changing reward to volatility on the stability of the risk–return relation we examine the relation between estimates of the conditional mean and conditional variance. We calculate contemporaneous correlations between estimates of conditional means and conditional variances for each bond maturity over 17-month rolling periods.<sup>24</sup>

To get a time series of fitted values, we estimate final models of conditional means and variances for Treasury Bond excess returns. Our final model incorporates all aspects of our prior models. The conditional mean is modeled as a function of both the conditional variance and financial conditioning information. The conditional variance incorporates both GARCH effects and financial conditioning information. We first estimate the following GARCH-M model:

$$R_{\tau,t+1} - R_{f,t} = \alpha_{\tau,0} + \alpha_{\tau,1}\sigma_{\tau,t+1}^2 + \alpha_{\tau,2}(Y_{\tau,t} - R_{f,t}) + \alpha_{\tau,3}(R_{\tau,t} - R_{f,t-1}) + \gamma_{\tau,t+1} \quad (16)$$

$$\sigma_{\tau,t+1}^2 = \beta_{\tau,0} + \beta_{\tau,1}\sigma_{\tau,t}^2 + \beta_{\tau,2}\gamma_{\tau,t}^2 + \beta_{\tau,3}R_{f,t} + \beta_{\tau,4}(Y_{\tau,t} - R_{f,t}) + \beta_{\tau,5}(R_{\tau,t} - R_{f,t-1}) + \nu_{\tau,t+1} \quad (17)$$

After the initial estimation, we drop explanatory variables that are not significant at the 0.10 level and re-estimate the model. The final models with only variables that are statistically significant in explaining the conditional mean or conditional variance are reported in Table 7.

An interesting aspect of Table 7 is that the GARCH in mean term is significant for only two bond maturities. Results of omitted variable tests (not reported) confirm this conclusion. The effect of the conditional variance on the conditional mean is generally subsumed by the financial conditioning information. The yield spread is always significant in explaining the excess return and the lagged excess return is significant in explaining the excess return for all but the 240-month bond. In the variance equation, the GARCH terms and the one-month rate are always significant in explaining the

<sup>22</sup> Pilotte and Sterbenz (2006) find that Sharpe ratios on long-term bonds, but not short-term bonds, vary over the business cycle. Our results differ in indicating that there is time variation in the reward to volatility for all bond maturities. A potential explanation for the difference in results is that our tests are not tied to the business cycle.

<sup>23</sup> The results for bonds reported in Table 7 are consistent with results that Harvey (2001) reports for stocks. Harvey finds that the rejection of a linear risk–return relation for stocks is robust to changes in the method used to estimate the conditional variance. He also presents graphic evidence that the ratio of conditional mean to conditional volatility for stocks has a distinct business cycle pattern.

<sup>24</sup> In his examination of the stability of the risk–return relation for common stocks, Whitelaw (1994) chooses a 17-month window to balance the need for reasonably accurate estimates with the need for a period that is short enough to pick up variation over the length of a business cycle. We follow his approach to facilitate a comparison with existing results for stocks.

**Table 6**  
 Analysis of residuals from models of the bond risk-return relation.

Residuals are from the excess return regressions reported in Tables 3–5, where the conditional volatility is modeled using financial conditioning information in Table 3 a simple GARCH-M model in Table 4 and a GARCH-M model with financial conditioning information included in the conditional variance equation in Table 5. The residuals from each model of the risk-return relation are regressed on the beginning-of-period yield spread ( $Y_{t,t} - R_{t,t}$ ), and, the one-month lag of the excess return ( $R_t - R_{t-1}$ ). Results are for OLS estimation with Newey–West autocorrelation and heteroskedasticity consistent standard errors reported in parentheses. \*\*\*, \*\*, \* denote significance at the 0.01, 0.05, and 0.10 levels, respectively.

The initial estimated models are:

$$R_{\tau,t+1} - R_{f,t} = \alpha_{\tau,0} + \alpha_{\tau,1}\sigma_{\tau,t+1}^2 + \alpha_{\tau,2}(Y_{\tau,t} - R_{f,t-1}) + \alpha_{\tau,3}(R_{\tau,t} - R_{f,t-1}) + Y_{\tau,t+1}$$

$$\sigma_{\tau,t+1}^2 = \beta_{\tau,0} + \beta_{\tau,1}\sigma_{\tau,t}^2 + \beta_{\tau,2}Y_{\tau,t}^2 + \beta_{\tau,3}R_{\tau,t} + \beta_{\tau,4}(Y_{\tau,t} - R_{f,t}) + \beta_{\tau,5}(R_{\tau,t} - R_{f,t-1}) + v_{\tau,t+1}$$

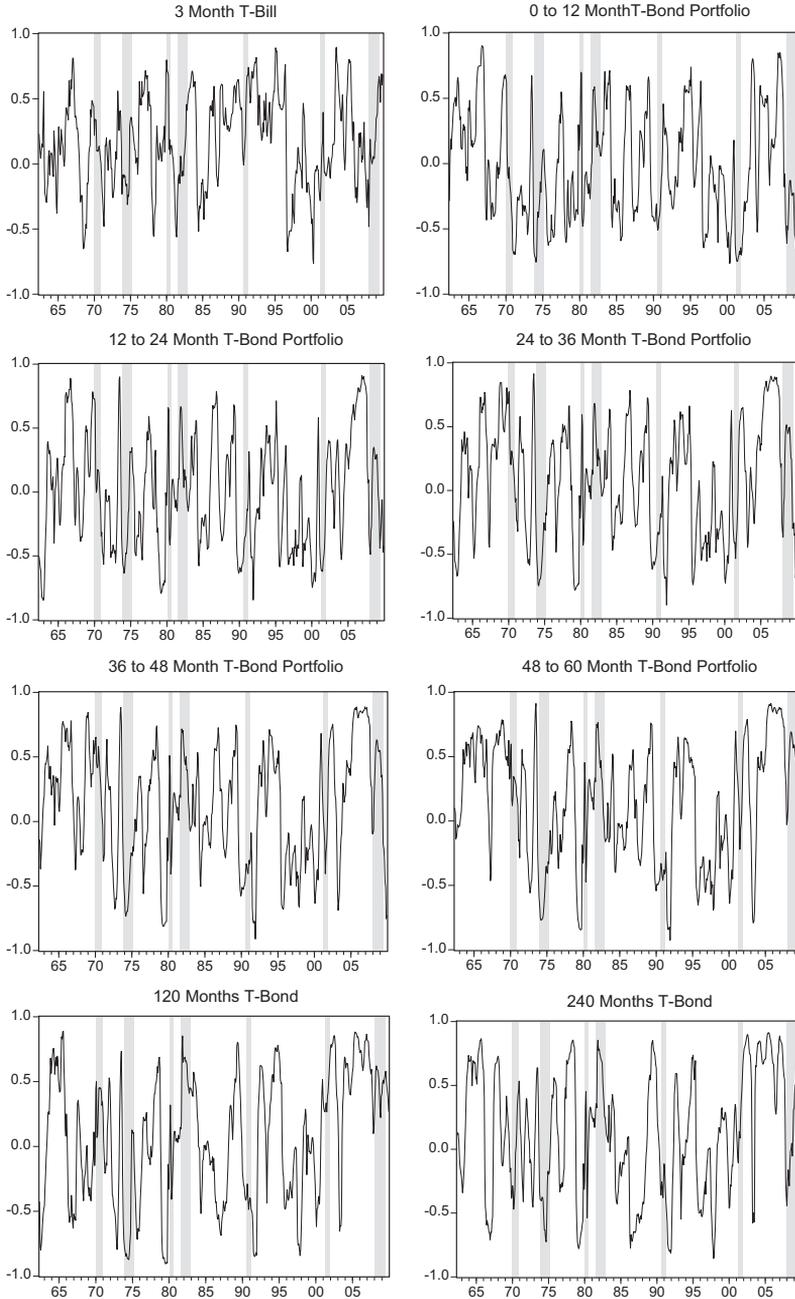

The time series is from January 1961 to December 2009 with 588 observations. The insignificant explanatory variables were dropped to obtain the final estimated models reported below. The initial regression models include the conditional variance in the mean equation, and the mean and variance equations initially includes the beginning of period yield spread ( $Y_{\tau,t} - R_{f,t}$ ), and the one-month lag of excess return ( $R_{\tau,t} - R_{f,t-1}$ ) as conditioning variables. The conditional variance also includes the beginning of period monthly return on the 1-month T-Bill ( $R_{f,t}$ ). The conditional distribution for the error term for the estimations is the generalized error distribution (GED) to address non-normality of the errors. The GED parameter ( $k$ ) is the kurtosis parameter that accommodates fat tails and becomes the normal distribution if  $k=2$ . Engle's Lagrange Multiplier ARCH statistic (LM-ARCH) is a test for ARCH effects in the residuals. It is distributed with 12 degrees of freedom due to the test for ARCH effects for 12 lags. Log-L is the value of the loglikelihood function. AR(1) is the first order coefficient for the fitted values of  $\sigma_{\tau,t+1}^2$ . Standard errors are in parentheses. \*\*\*, \*\*, \* denote significance at the 0.01, 0.05, and 0.10 levels, respectively. The regression and GED parameters are two-tailed tests. The LM-ARCH is a one-tail test.

$36 < \tau \leq 48$	0.03	0.44	0.79	0.91	1.00			
$48 < \tau \leq 60$	-0.02	0.35	0.70	0.87	0.93	1.00		
$\tau \approx 120$	0.11	0.22	0.46	0.55	0.67	0.74	1.00	
$\tau \approx 240$	0.03	0.13	0.31	0.47	0.54	0.67	0.79	1.00

The following are correlations between rolling estimates of correlations between the fitted values of the conditional mean and conditional variance of excess returns on bonds of different maturities. The 17-month rolling correlation for each bond maturity is between the conditional excess return and conditional variance as shown in Fig. 1. The model used to estimate the conditional excess returns and variances is shown in Table 7 for each maturity. Using all of the time series from January 1961 to December 2009, the correlation coefficients begin in May 1962 and end in December 2009.

conditional volatility. The yield spread is never significant in the variance equation and the lagged excess return is significant only for the 3-month bill and 120 month bond. Viewed overall, the results reported in Table 7 indicate that the yield spread and lagged excess return are generally important in predicting conditional means, while the one-month rate and GARCH effects are important in predicting the conditional variances.

Fig. 1 presents graphs of the rolling estimates of correlations between the fitted series of conditional excess returns and conditional variances for each bond maturity. The graphs show substantial variation over time in the short-term relation between bond risk and return. For longer maturities, both the range of correlations and incidence of negative correlations are similar to those reported by Whitelaw (1994) for stocks. For the shortest maturities, the range of correlations is diminished somewhat, but there remains substantial variation over time and numerous negative correlations.

The graphs in Fig. 1 are shaded to show business cycle expansions and contractions. The correlations vary substantially within both expansions and contractions. The graphs show no obvious business cycle pattern in the relation between bond risk and return, though there appears to be some tendency for the estimated relation to decrease either prior to or early in recessions. Our ability to draw firm conclusions regarding business cycle patterns is limited by the fact that our sample contains only seven measured contractions.

To illustrate the co-movement in the risk–return relation across bond maturities, in Table 8 we report correlations between the rolling correlations of each maturity pair. The correlations in Table 8 indicate that time variation in the risk–return relation is similar for adjacent maturities, but differs substantially when the difference in maturity is large. Nevertheless, correlations are positive for all but one pair of bond maturities.

Overall, our examination of rolling correlations shows instability in the short-term relation between bond risk and return. The relation is often negative for each bond maturity. For longer maturities, both the range of correlations and incidence of negative correlations are similar to those reported previously for common stocks. For shorter maturities the range is diminished somewhat; however, the rolling correlations for all bond maturities do tend to move together. Negative rolling correlations suggest there may be specific time periods in which bonds were effective hedging assets. Further study is required to draw any definitive conclusions regarding this possibility.

**Fig. 1.** Rolling estimates of correlations between the conditional moments of bond excess returns The graphs above plot the 17-month rolling estimates of the correlation between the fitted values of the conditional mean excess return and conditional variance for each bond maturity. The models used to predict the excess returns and variances are reported in Table 7. Using all of the time series from January 1961 to December 2009, the correlation coefficients begin in May 1962 and end in December 2009. Shaded areas represent business cycle contractions as defined by the National Bureau of Economic Research with the beginning month defined as the first trough month and the ending month defined as the last trough month. Non-shaded areas are business cycle expansions.

## 8. Conclusions

Our full sample estimation of the linear relation between the conditional mean and conditional volatility of U.S. Treasury Bonds documents a significant positive relation between bond risk and return for maturities of 3 months to 20 years. This finding is not very sensitive to the method used to estimate conditional volatility and is especially reliable for bond maturities of 5 years or less. A positive, rather than negative, risk–return relation indicates that Treasury Bonds are not a hedging asset as that concept is defined in consumption-based models of intertemporal choice. Rather, an effective hedging asset has the return characteristics of a short position in Treasury Bonds. Short positions on shorter-maturity bonds appear to be the most statistically reliable means for an investor to hedge the marginal utility of consumption.

Our full sample results are consistent with the conclusion that realized returns on Treasury Bonds are high when investors least value, and low when investors most value, the benefits of an additional dollar of consumption. Thus, for a special case of the consumption-based model to accurately reflect investor preferences, it must explain why investors associate bad times of high marginal utility with periods of low realized and high expected bond returns. Special cases that assume that the marginal utility of consumption is a function of at most wealth and investment opportunities, such as the ICAPM specializations of Merton (1973) and Campbell (1993), do not do so. Unless one assumes that risk aversion is very low, those models associate bad times with low expected returns. Explaining why investors associate bad times with high expected returns requires a model that captures the fact that investors are concerned not only with the wealth effects of holding assets, but with the fact that assets do poorly at particular times or in particular states of nature (recessions). Campbell and Cochrane (1999) do so by adding an argument to the utility function, habit that enters nonseparably over time.

Our analysis of the linearity and stability of the risk–return relation produces evidence that the reward to volatility and the short-term relation between bond risk and return may vary over time. The fact that rolling correlations between estimates of the conditional mean and conditional volatility are often negative suggests that there may be specific time periods in which bonds were effective hedging assets. Further study is required to draw any definitive conclusions regarding this possibility.

## ABSTRACT

Other than the problematic discounted cash flow and capital asset pricing models that have been used for decades, no other asset pricing models have generally been adopted for estimating the cost of common equity capital. A recently developed and promising general consumption asset pricing model for estimating costs of common equity is successful in empirical tests and applied for estimating the cost of common equity. This research presents an empirical investigation of the model for application to the regulation of public utilities and stock market and compares the cost of capital results with the CAPM. The model is applicable for estimating the cost of common equity capital for any stock. The paper recommends that the GCAPM be considered as an additional asset model with the others that are typically used as additional information in estimating the cost of common equity capital.

## 1. Introduction

The state of cost of common equity estimation and modeling has become stale. The only asset pricing models typically used by firms for estimating their cost of common equity are mainly the

capital asset pricing model (CAPM) with a few firms using the dividend discount cash flow (DCF) and the arbitrage pricing (APM) models, all of which were developed in the 60s and 70s. A survey conducted by the [Association for Financial Professionals \(2011\)](#) on the use of asset pricing models for estimating the cost of capital found that 87% of all firms and 91% of publicly traded firms use the CAPM, 3% of all firms and 2% of publicly traded firms use the DCF model and 1% for both types use the APM. Whereas most firms and much academic research<sup>1</sup> still use the CAPM for cost of capital estimations, the literature on the problems with the empirical evaluation and theoretical foundations of the CAPM is vast and conclusively negative. [Fama and French \(2004\)](#) summarize the literature and conclude that “. . . In the end, we argue that whether the model's problems reflect weaknesses in the theory or in its empirical implementation, the failure of the CAPM in empirical tests implies that most applications of the model are invalid.” This paper does not recommend that the CAPM be discarded or substituted with the GCAPM discussed and tested in this paper. No information should be ignored for estimating the cost of common equity.

[Michelfelder and Pilotte \(2011\)](#) introduced a new asset pricing model for estimating the cost of common equity capital based on the intertemporal asset pricing model literature (discussed below). The generalized consumption asset pricing model requires a minimum of assumptions in its theoretical development. It also is applied with a minimum of subjectivity. [Ahern, Hanley, and Michelfelder \(2011\)](#) performed some cursory preliminary empirical tests and applied the GCAPM to model the risk–return relationship for stocks and estimate the cost of common equity. They used a few public utility stocks to estimate and apply the GCAPM. Public utility applications are important as public utilities are regulated primarily by the allowed rate of return which is supposed to reflect the cost of capital. It is so important to the public utility industries that the initial academic literature on cost of capital estimation and application was based to a major extent on public utility industry studies. See references in [Morin \(2006\)](#).

[Ahern et al. \(2011\)](#) found the GCAPM to be promising in cursory empirical testing and in generating reasonable, mechanically (without subjective judgment) developed estimates of the cost of common equity capital for a small sample of public utilities, consisting of a few electric, electric and gas, natural gas, and water utilities.

Although the model can be used for estimating the cost of capital for any firm, this investigation also focuses on public utility regulation and applications since it is likely to be the most contested issue in a public utility rate proceeding (see [Bonbright, Danielsen, & Kamerschen, 1988](#); [McDermott, 2012](#); [Phillips, 1993](#)).<sup>2</sup> Additionally, the practice of public utility regulation has not adopted other models other than DCF and the CAPM ([Ahern et al., 2011](#)). These models have numerous strong assumptions and require many subjective judgments in application that leads to highly contested rate of return recommendations in public utility proceedings. The application of these models is highly questionable and the estimates subject to many vagaries due to choices of inputs.

This paper performs an empirical investigation of the GCAPM for public utility cost of common equity estimation.

## 2. The model

The literature on the traditional CAPM and consumption asset pricing models is vast so that literature is briefly discussed that summarizes the work leading to the model used in this research.

The GCAPM has been recently derived and empirically tested for US Treasury Bonds and Bills and stock market returns in [Michelfelder and Pilotte \(2011\)](#) and preliminarily applied and tested for public

<sup>1</sup> A recent variant of the DCF model has emerged in the academic literature for estimating the cost of common equity capital for other research, the implicit cost of capital. It is essentially the expected book value of a firm plus the capitalized value of the infinite stream of the conditionally expected net income minus the required net income to earn its cost of capital equated to the current stock price. The capitalization rate is the cost of common equity and the same rate implied in the required net income. See [Pastor, Sinha, and Swaminathan \(2008\)](#) and [Molina-Ortiz and Phillips \(2014\)](#).

<sup>2</sup> [McDermott \(2012\)](#) on pp.13–14 states: “While determining the operating costs and rate base is not without controversy, the calculation of the firm's cost of capital is generally one of the most contentious issues in a rate case. . . .” The cost of equity is an expectation held by the “marketplace” and is therefore not directly observable. As a result it must be estimated and the question of what is a correct assessment of the market's true value is partly what makes this issue so contentious.

utility stocks and stock markets in [Ahern et al. \(2011\)](#). There are many restrictive versions of the model that led to the derivation of the GCAPM. The main asset pricing models used as foundations to develop the GCAPM include the intertemporal capital asset pricing model in [Merton \(1973\)](#), models in [Cochrane \(2004\)](#), the intertemporal asset pricing model of [Campbell \(1993\)](#), and the habit-persistence model of [Campbell and Cochrane \(1999\)](#).

Some GCAPM highlights are that it (1) makes no assumptions about the efficiency of the asset market, (2) has no constraints on the investor's degree of risk aversion or limits on the magnitude of coefficient of risk aversion, (3) prices the risk that the investor is actually exposed to rather than the nonrealistic systematic risk that assumes that the investor has diversified away all nonsystematic risk. That is, the GCAPM does not assume that the investor has a perfectly diversified portfolio that eliminates all unique risk. The GCAPM even allows for the possibility of a negative relation between return and volatility where other asset pricing models do not. Investors are willing to pay (give up return or accept returns less than the risk free rate) to be exposed to patterns of volatility that hedge against downturns in business cycle levels of consumption. This property will be discussed below and considered in the empirical analysis.

[Michelfelder and Pilotte \(2011\)](#) specify the GCAPM as the *ex ante* risk premium of an asset *i* as a function of the volatility of the asset *i ex ante* return:

$$E_t [R_{i,t+1}] - R_{f,t} = - \frac{vol_t [M_{t+1}]}{E_t [M_{t+1}]} vol_t [R_{i,t+1}] corr_t [M_{t+1}, R_{i,t+1}], \quad (1)$$

where  $R_{i,t+1}$  is the *ex ante* return on asset *i*,  $R_{f,t}$  is the risk free rate of return at time *t*,  $M_{t+1}$  is the stochastic discount factor (SDF),  $vol_t$  is the volatility of the variable conditioned on information available in time *t*,  $E_t$  is the expectations operator conditional on information available in time *t*, and,  $corr_t$  is the correlation conditioned on information available in time *t*. The SDF is the intertemporal marginal rate of substitution in consumption:

$$M_{t+1} = \left( \frac{1}{1+k} \right) \frac{U_{c,t+1}}{U_{c,t}}, \quad (2)$$

where the  $U_c$ 's are the marginal utilities of consumption for the differing time periods and *k* is the discount rate for the period from *t* to *t* + 1. The ratio of the marginal utilities of consumption for two time periods,  $U_{c,t+1}/U_{c,t}$ , rises if the expected future dollar value of consumption falls below current consumption. This property is due to the concave shape of the investor's utility function and diminishing marginal utility and generates the specification of the model to identify the business cycle (represented by consumption expenditures) hedging property (if any) of an asset.

The ratio,  $vol_t [M_{t+1}]/E_t [M_{t+1}]$ , is the slope of the mean-variance frontier and reflects the expected volatility of utility from consumption relative to expected utility, which is the conditional coefficient of variation in utility. If conditional volatility rises relative to expected value, investors require a greater risk premium as compensation. The algebraic sign of the relation (slope) between the expected risk premium and its conditional volatility is determined by the conditional correlation ( $corr_t$ ) of the expected risk premium and the SDF. The sign of this slope has the opposite sign of the correlation of the asset return and the ratio of intertemporal marginal utilities in consumption. When the correlation is positive (negative), the asset will have a negative (positive) relation with its risk. Since a decline in consumption in an economy is a component of a business cycle contraction, assuming investors have a concave utility function of consumption, a decline in expected consumption increases marginal utility as the investor's consumption moves left on the utility function. The hedging asset generates positive changes in asset returns when the business cycle is in a contraction and therefore the asset is a business cycle and consumption hedge.

Therefore, if the estimated return/risk coefficient is negative, the asset is a business cycle/consumption hedge. Under these circumstances, it is conceivable that an investor may accept a return less than the risk-free rate as she is willing to pay (give up return) to be exposed to this specific pattern of higher volatility. This asset delivers rising returns when the investor needs it most – during a business cycle downturn. A hedging asset pays more during business cycle contractions and less during expansions and therefore plays the role of insurance, paying to avoid hardship.

The slope of the relation between the return and risk is very rich in insight and structure. The slope of the return and volatility relationship is a function of the volatility of the return, the independent variable. As the volatility changes, it affects the  $corr_t$  as correlation equals covariance of the two variables divided by the product of the volatility of the two variables.

### 3. The data

The company stocks in the rate of return regulated electric, electric and gas distribution (combination), natural gas distribution (sometimes referred to as local distribution companies or “LDC’s”), and water utility industries are defined by the AUS Utility Reports<sup>3</sup>, a national public utilities financial consulting firm and database company established in 1968 ([www.aus.com](http://www.aus.com)). These include all 77 public utility stocks that are publicly traded in the US. The monthly stock total returns for each public utility begin with the first available monthly data observation for each individual utility company stock in the University of Chicago’s Booth School of Business Center for Research in Security Prices (CRSP<sup>®</sup>) database. The data available from CRSP<sup>®</sup> begins no earlier than January 1926 for stock data in general and ends for this study at December 2011. CRSP<sup>®</sup> faculty and staff determine how far back to go to obtain accurate stock price and returns data on every stock. Monthly returns observations range from the earliest available date in CRSP<sup>®</sup> for each stock to December 2011. The risk free rate is the monthly long-term US Treasury bond yields from [Morningstar \(2012\)](#). The US stock market data is the CRSP<sup>®</sup> Fama–French monthly returns risk premium based on the CRSP<sup>®</sup> value-weighted stock market index that includes most stocks on the NYSE, NASDAQ, and AMEX and includes approximately 11,000 stocks. This data is publicly available at no cost from Professor Kenneth French’s data website ([French, 2012](#)).

[Table 1](#) shows descriptive statistics for the monthly risk premium data for each stock and the data observation range for each stock by industry. The annualized compound annual return premia based on the monthly means range from approximately 5% to 7.5%. Standard deviations are about 10–20 times the mean risk premiums (coefficients of variation).

The greatest number of observations are obtained for each stock as more data history capture a longer period of the fundamental nature of asset pricing volatility clustering patterns, whether the patterns are recent or many years old. The nature of autoregressive conditional heteroskedasticity (ARCH) models is based on the fundamental nature of financial markets volatility clustering patterns.

### 4. Empirical results

An obvious method to estimate Eq. (1), the relation between risk and return, is the generalized autoregressive conditional heteroskedasticity in mean (GARCH-M) model. The GARCH-M model was developed specifically for estimating asset return and volatility relations. GARCH-M is used since it specifies the conditional expected risk premium as a linear function of its conditional volatility, which is the theoretical specification of Eq. (1). Due to the high likelihood of ARCH effects in asset returns the use of GARCH methods will improve the efficiency of the estimates if ARCH effects should be present in the data. The GARCH-M model adopted herein was initially developed and tested by [Engle, Lilein, and Robins \(1987\)](#) to estimate the relationship between US Treasury and corporate bond risk premiums and their expected volatilities. The GARCH-M model is specified (without an intercept in the return equation) as:

$$R_{i,t+1} - R_{f,t} = \alpha_{i,t} \sigma_{i,t+1}^2 + \varepsilon_{i,t+1}, \quad (3)$$

$$\sigma_{i,t+1}^2 = \beta_0 + \beta_1 \sigma_{i,t}^2 + \beta_2 \varepsilon_{i,t}^2 + \eta_{i,t+1}, \quad (4)$$

where  $R_{i,t+1}$  is the expected total return on asset  $i$ ,  $R_{f,t}$  is the risk-free rate of return,  $\sigma_{i,t+1}^2$  is the conditional or predicted variance of the risk premium for asset  $i$  that is conditioned on past information,

The mean RP is the mean of the monthly risk premium returns data for each stock used to estimate the GCAPM with the GARCH models. The mean is calculated from the beginning period and ending in December 2011.

and,  $\varepsilon_{i,t}$  and  $\eta_{i,t+1}$  are the error terms for the mean and volatility equations, respectively. The parameter,  $\alpha_i$ , or “alpha” is the return-to-risk coefficient as specified in Eq. (1) as:

$$\alpha_{i,t} = -\frac{vol_t [M_{t+1}]}{E_t [M_{t+1}]} corr_t [M_{t+1}, R_{i,t+1}] \quad (5)$$

This parameter represents the relation between risk premium and volatility and its algebraic sign indicates whether the asset is a business cycle hedge. The parameter itself is a function of the independent variable, the conditional variance, and is time varying as the conditional standard deviation of the return is included in the conditional correlation,  $corr_t [M_{t+1}, R_{i,t+1}]$ , of the stochastic discount factor and the return. The theoretical model, Eq. (1), is specified without an intercept, therefore it is estimated the model without the intercept, but robustness tests are done to evaluate the model with intercepts. Intuitively the intercept should be zero. Otherwise would indicate evidence of an excess return premium or payment (if negative) that is not associated with volatility. The “no-intercept” specification has been found to be robust in producing consistently positive and significant relationships between common stock risk premiums and risk in GARCH-M models. These findings are discussed in Lanne and Saikkonen (2006) and Lanne and Luoto (2007).

Table 2a–d shows the GARCH model estimates for all publicly traded US electric, electric and gas, gas, and water company stocks as well as the US stock market for comparison. The list of utility stocks and their categorization in each industry are defined by AUS Utility Reports® (2012) that is available upon request. The AUS Utility Reports® tracks all US publicly traded electric, gas and water utility stocks. The results show that the model fits almost all of the public utility stock returns and the US stock market returns well as almost all estimated parameters are significant, generally at  $p$ -values of 0.01 or less, except for water company stocks that have some  $p$  values that are generally less than 0.10, especially for the alpha slope that is used to estimate the cost of capital. Generally, water utility stocks have substantially less stock returns data for modeling.

All but seven of the Lagrange Multiplier ARCH statistics (LM-ARCH), a test for ARCH effects in the residuals, are not significant, indicating that the GARCH-M model is effective at removing most of the ARCH effects from the regression residuals. The sum of the slopes in the variance equation ( $\beta_1 + \beta_2$ ) is close to one for all stocks and the stock market. A value of one or greater indicates the presence of an integrated GARCH process (IGARCH) (Engle & Bollerslev, 1986). Shocks in returns that have an IGARCH process have a permanent effect on the conditional variance and therefore the asset's value.

The slopes on conditional variance, the alphas, are positive and significant for most of the utility stocks (all but seven) and the US stock market. Those that are not significant have alpha estimates that are in a reasonable range of values. These results are evidence that there is a long-term positive relation between risk and return and that none of the assets in this investigation are business cycle consumption hedges as none are negative in algebraic sign. Since utility sales, especially electricity usage and therefore cash flows are generally highly correlated with GDP, positive values were expected for the alpha estimates as utility stocks are not expected to be a business cycle hedge. Fig. 1 from the US Energy Information Administration's 2013 Annual Energy Outlook shows the close association between GDP and electricity use growth rates. As the energy intensity of GDP continues to decline

The results are for all publicly traded electric utility stocks. The results are the GARCH-M regressions for the monthly risk premium on the asset ( $R_{i,t+1} - R_{f,t}$ ) with conditional variance in the mean equation. The estimated model is:

$$R_{i,t+1} - R_{f,t} = \alpha_{i,t} \sigma_{i,t+1}^2 + \varepsilon_{i,t+1}, \text{ where } \alpha_{i,t} = -(vol_t[M_{t+1}]/E_t[M_{t+1}])corr_t[M_{t+1}, R_{i,t+1}]$$

$$\sigma_{i,t+1}^2 = \beta_0 + \beta_1 \sigma_{i,t}^2 + \beta_2 \varepsilon_{i,t}^2 + \eta_{i,t+1}$$

The monthly data ranges from the earliest returns data available for each asset in the CRSP database (earliest returns data available is January 1926) and ends at December 2011. The return variable for US Stocks is the monthly risk premium on the value weighted CRSP stock returns from the Fama–French CRSP database. Engle's Lagrange Multiplier ARCH statistic (LM-ARCH) is a test for ARCH effects in the residuals for 12 lags. It is  $\chi^2$  distributed with 12 degrees of freedom where the degrees of freedom are driven by the number of lags tested. Standard errors are in parentheses. \*\*\*, \*\*, \* denote  $p$ -values equal to less than 0.01, 0.05, and 0.10 levels, respectively, with two-tailed tests for regression coefficients and one-tailed test for LM-ARCH.

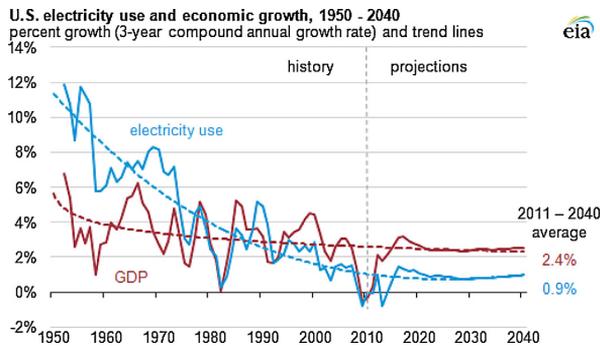

Fig. 1. Relation between GDP and electricity use.

due to the adoption of energy efficiency technologies, the growth rates of GDP and electricity use in recent years have started to moderately decouple and is expected to continue to do so.

Fig. 2 plots the average of the rolling estimated alpha for each utility industry group for each month from January 2006 to December 2011 to review the stability and trends in the alphas. Although not shown for each stock, the alphas range in value from about 0.5 to almost 3.0 and are relatively stable across all stocks used in obtaining the averages. They do not become negative (switch to temporary business cycle hedges) at any point during the study period. Note that all of the stocks' alphas in all of the industries are quite similar in pattern and stability. All of them drop as the US business cycle enters

the great recession from the December 2007 peak to the June 2009 trough and the only recession during the study period (National Bureau of Economic Research, 2015). An increasing (decreasing) alpha indicates that the price of risk has increased (decreased). These alphas are Sharpe ratios (Sharpe, 1994), the ratio of the expected risk premium to conditional volatility. Higher alphas should not be interpreted as higher risk and therefore higher expected rates of return on common equity. A higher price of risk can be associated with lower volatility and lower rather than higher costs of common equity. Alpha is inversely related to the volatility in return in the theoretical development of the model. Therefore a higher volatility is combined with a lower alpha so the overall impact of a higher alpha on the expected rate of return is not clear. It is possible that the drop in alphas approaching and during the recession may be due to investors' flight to quality to assets with lower risk and lower but acceptable return.

Fig. 3 shows the GCAPM cost of common equity results and their trends for each of the public utility industries. The alpha coefficients and predicted monthly volatilities used to estimate the cost of common equity for each public utility stock are estimated using a series of estimated GARCH models for each utility as discussed above. Consistent with Ahern et al. (2011), the *ex ante* common equity risk

premiums were calculated using the average of predicted volatilities (variances) over the entire time period for which CRSP data were available for each utility and then multiplied by  $\alpha_i$ 's. The GCAPM cost of common equity for each utility was estimated by adding the average predicted utility's common equity risk premium for each month starting in January 2006 through December 2011 to the predicted risk free rate, which is the consensus forecast of the 30 year US Treasury Bonds yield for the next 6 quarters from Blue Chip Financial Forecasts. Fig. 3 shows that the predicted cost of common equity capital results generated by the GCAPM was stable for all utility industries except for the recession and associated global financial market crisis of 2008 and 2009. During that period, predicted GCAPM costs of capital declined. This may have been due to investors' flight to quality to less risk and an acceptable lower return. The GCAPM predicted costs of capital for all of the utility industry groups follow a similar trend except for the water utilities, which had a similar path but much more volatility. Contrasting with the CAPM that uses only one estimated parameter, beta, to establish the uniqueness among each stock, the GCAPM uses two estimated parameters to predict the expected returns, the alpha and the specific stock predicted conditional volatility and three more parameters in the variance prediction model for predicting volatility. Since it is investors' behaviors that cause the level of volatility and due to the fact that the GCAPM uses predicted volatilities to predict the cost of capital, the GCAPM is more

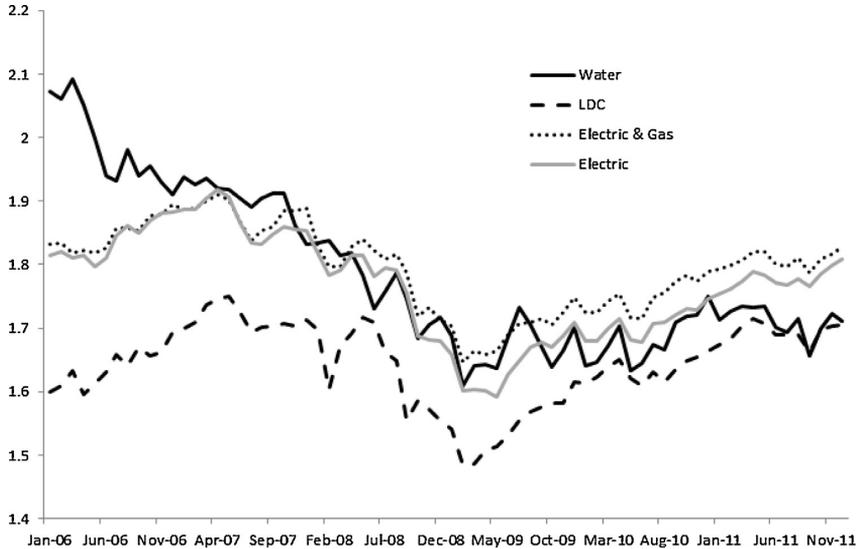

Fig. 2. Alphas (slope on  $\sigma^2_{i,t+1}$ ) from 1/2006 to 12/2011 for electric, electric and gas, gas (local distribution companies or LDC) and water utility stocks. The stocks in each industry are those as defined by AUS Utility Reports® (AUS, 2012). See Table 1 for individual stocks.

intuitive appealing than the CAPM. The CAPM is not a forward-looking model and beta is not a pure measure of risk. It is a mixture of correlation and risk.<sup>4</sup>

Fig. 4 shows the plots the averages of the costs of common equity for each stock estimated with the GCAPM and the CAPM for each of the utility industries. The plots consistently show that the GCAPM generates a substantially higher cost of capital than the CAPM. This may be due to the fact that the GCAPM prices the risk which investors actually face whereas the CAPM prices systematic risk, the only risk that the investor would be exposed if they had a perfectly diversified portfolio, which does not exist in practice. Based on the well-established observation of low  $R^2$ 's of CAPM regressions, a substantial majority of a stock return's volatility is not explained by the CAPM (Fama & French, 2004) and therefore not priced by the CAPM.

The only recession that occurred during the period shown on the graphs is the great recession that started with the peak at December 2007 and the trough at June 2009 (National Bureau of Economic Research, 2015) as mentioned above. As investors anticipated the future of the business cycle, both the alphas and the costs of common equity peaked as shown in Figs. 2–4 then declined and reached the trough a few months before the business cycle. Note (Fig. 4) that the GCAPM costs of capital peaks and troughs precede those of the CAPM by somewhat less than a year. This suggests that the GCAPM is a forward looking model more than the CAPM as it leads CAPM peaks and troughs in the cost of capital and is able to anticipate CAPM generated trends in the cost of capital. This evidence is not meant to conclude that the CAPM should be replaced by the GCAPM. Until one model un-equivocally produces results deemed to be closer to the true cost of common equity, no information should be ignored for consideration in estimating the cost of common equity. This investigation suggests that the GCAPM

<sup>4</sup> The CAPM beta is defined as  $\beta_i = \rho_{i,m} \sigma_i \sigma_m / \sigma_m^2$  where  $\rho_{i,m}$  is the correlation between the returns on stock  $i$  and the market, and the  $\sigma$ 's are the standard deviations on stock  $i$  and market returns ( $m$ ). Since the expression can be simplified to  $\beta_i = \rho_{i,m} (\sigma_i / \sigma_m)$ , only the ratio of standard deviation of the stock to the market return represents volatility and therefore risk. So the CAPM beta is a mixture of correlation and risk. A high ratio of volatility of a stock's return relative to the market combined with a low correlation can result in a low beta, reflecting low risk.

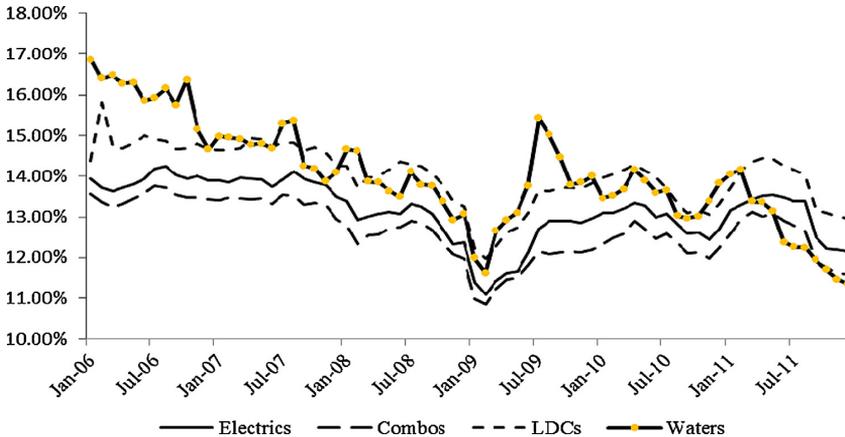

Fig. 3. GCAPM cost of common equity estimates for US publicly traded public utilities.

model contributes additional information that should be considered in the process for estimating the costs of common equity. Hopefully, additional information and technologies will diffuse into the process rather than almost sole reliance on the CAPM.

Michelfelder, Ahern, D'Ascendis, and Hanley (2013) show the trends in the cost of common equity estimates by each asset model for each industry. They perform a comparison of the results of the two typical used asset pricing models, the DCF and CAPM with the GCAPM. The GCAPM generally produces higher predicted ROE's than either the DCF or CAPM. Since the GCAPM prices the actual risk faced by the investor rather than the lower, unrealistic ideal (perfectly diversified portfolio) level assumed by the CAPM, this result is not surprising. Public utilities are not investing the level of capital investment necessary to maintain the current level of service, much lesser than the capital needed for growth in their service areas. Regulated allowed rates of return on common equity lower than the costs of common equity may be the cause of public utilities lack of investment that is expected to generate deterioration of service and inhibit economic growth if it does not change soon. For example, the Brattle Group, Fox-Penner, Chupka, and Earle (2008) estimates that the US electric power industry will have to invest \$1.5 trillion to \$2.0 trillion by 2030 to maintain the current level of reliability. Brennan (2008) shows that electricity transmission capacity peaked in 1982 and that both capacity and investment has been on a long-term declining trend. According to the US EPA's 2011 Drinking Water Infrastructure Needs Survey and Assessment (EPA, 2011), by 2030 the industry will require \$384.2 billion in 2011 dollars in system upgrades to maintain safe drinking water service. Such a huge level of investment will cause water rates and bills to rise to levels similar to electricity bills.

## 5. Robustness tests

Robustness tests are performed with the inclusion of an intercept, differing specifications of conditional volatility, and the use of the Fama–French risk-free rate for generating risk premia. The estimation results are poor with the inclusion of an intercept therefore the model is well specified. All of the model estimations are robust to changes in specifications of the conditional volatility using standard deviation and the natural log of variance as other measures. Similarly, the estimations are robust to choice of risk-free rate.

One concern is the intertemporal stability of the alphas. The alpha in the model is a function of conditional variance and is time varying as the conditional standard deviation of the return is included in the conditional correlation of the stochastic discount factor and the return. The averages of the alpha estimates are plotted over time for each utility to review stability of the hedging property of the assets

Fig. 4. Plots of GCAPM and CAPM costs of common equity estimates for electric, electric and gas, gas, and water utility stocks.

over time. Fig. 2, as already discussed, plots the updated monthly alphas over 72 months (January 2006 to December 2011). The alpha values are highly stable and never get close to zero and, generally, there are no discontinuous spikes in alpha in either direction for each utility stock.

## 6. Conclusion

Based on the results of this empirical study, Ahern et al. (2011), Michelfelder et al. (2013), and Michelfelder and Pilotte (2011), a literature is beginning to emerge that supports the GCAPM as additional evidence for estimating the cost of common equity capital. This study found that the model fits the data well across all US publicly traded utility stocks and the US stock market as a single portfolio. The estimates are consistent, stable, and show that utility stocks are not a business cycle hedge. There would be a stability concern if some utility stocks were hedges and others were not or if stocks temporarily switched to hedging assets.

The GCAPM has been successfully empirically tested for public utilities and the US stock market in this study and preliminarily in Ahern et al. (2011), and for US Treasury Bills and Bonds in Michelfelder and Pilotte (2011). However, a comprehensive study across a spectrum of common equity assets, at least for non-public-utility individual stocks, is needed as an important next step to consider the widespread adoption of the GCAPM as a method to estimate the cost of common equity capital for stocks in general. This paper is a component of a research program toward that goal. The motivation was to empirically test and discuss the results in sufficient technical detail to assess the relevance of the model for public utility cost of common equity capital estimation and the cost of capital for any firm. Secondly, the motivation was to build a platform for further research of the GCAPM for estimating the rate of return for any stock, as stated above. Finally, the GCAPM was tested as a potential cost of capital model to help update and improve on the cost of capital technology by providing additional information. This paper does not suggest that the GCAPM supplant any other cost of capital pricing model. It does recommend that it be considered as an additional model for developing the cost of capital estimates.

**Richard A. Michelfelder** is Clinical Associate Professor of Finance at Rutgers University, School of Business, Camden, New Jersey. He earlier held a number of entrepreneurial and executive positions in the public utility industry, some of them involving the application of renewable and energy efficiency resources in utility planning and regulation. He was CEO and chairperson of the board of Quantum Consulting, Inc., a national energy efficiency and utility consulting firm, and Quantum Energy Services and Technologies, LLC, an energy services company that he co-founded. He also helped to co-found and build Converge, Inc., currently one of the largest demand-response firms in the world that went public in 2006 on the NASDAQ. He was also an executive at Atlantic Energy, Inc. and Chief Economist at Associated Utilities Services, where he testified on the cost of capital for public utilities in a number of state jurisdictions and before the Federal Energy Regulatory Commission. He holds a Ph.D. in Economics from Fordham University and has published numerous articles in academic journals.

**Pauline M. Ahern** is a Principal and with AUS Consultants located in Mount Laurel, New Jersey. She has served investor-owned and municipal utilities and authorities for nearly 25 years. A Certified Rate of Return Analyst (CRRRA), she is responsible for the development of rate-of-return analyses, including the development of ratemaking capital structure ratios, senior capital cost rates, and the cost rate of common equity and related issues for regulated public utilities. She has testified as an expert witness before 29 regulatory commissions in the U.S. and Canada. In addition, she supervises the production of the various AUS Utility Reports publications and maintains the benchmark index against which the American Gas Association's Mutual Fund performance is measured. She holds an M.B.A. in finance from Rutgers University and a Bachelor of Arts Degree in Economics/Econometrics from Clark University.

**Dylan W. D'Ascendis** is Principal at AUS Consultants, located in Mt. Laurel, New Jersey. He is responsible for preparing fair-rate-of-return studies for AUS Consultants' rate-of-return expert witnesses and assists in every aspect of the rate case procedural process. He is also a Certified Rate of Return Analyst. He is the Editor of AUS Utility Reports and is responsible for the data collection and production of the AUS Monthly Utility Report. He also assists in the calculation and production of the AGA Index, a market capitalization weighted index of the common stocks of the approximately 70 corporate members of the American Gas Association. Mr. D'Ascendis holds an M.B.A. in both Finance and International Business from Rutgers University and a Bachelor of Arts Degree in Economic History from the University of Pennsylvania.

**Frank J. Hanley** is a Principal of AUS Consultants located in Mt. Laurel, New Jersey. He joined the firm in 1971 as Vice President, was elected Senior Vice President in 1975, and President of the Utility Services Group in 1989. Mr. Hanley has testified on cost-of-capital and related financial issues in more than 300 cases before 33 state regulatory commissions, the District of Columbia Public Service Commission, the Public Services Commission of the U.S. Virgin Islands, the Federal Energy Regulatory Commission, a U.S. District Court, a U.S. Bankruptcy Court and the U.S. Tax Court. He is a graduate of Drexel University and is a Certified Rate of Return Analyst. He is an Associate Member of the American Gas Association as well as a member of its Rate Committee. Also, he is a member of the Executive Advisory Council of the Rutgers University School of Business at Camden as well as a member of the Advisory Council of New Mexico State University's Center for Public Utilities.

## Comparative Evaluation of the Predictive Risk Premium Model, the Discounted Cash Flow Model and the Capital Asset Pricing Model for Estimating the Cost of Common Equity

*The regulatory process for setting a utility's allowed rate of return on common equity has generally relied upon the Gordon Discounted Cash Flow Model and Capital Asset Pricing Model. The Predictive Risk Premium Model, introduced a year ago, resolves several of the widely known problems with these models. Further testing since its introduction a year ago suggests that it produces stable results which are consistent over time.*

### I. Introduction

The lead article in the July 2008 issue of this *Journal*, "Integrating Renewables into the US Grid: Is it Sustainable," by Professors Peter Mark Jansson and Richard A. Michelfelder,<sup>1</sup> called for the

reregulation of the electric utility industry and putting the planning of generation assets, whether renewable or not, back in the hands of the experts and those ultimately responsible for reliability, the electric utilities. During the last 10 years or so,

OFFICIAL COPY  
Dec 13 2019

states have been backpedaling on deregulation and therefore methods for estimating the cost of common equity and the allowed rate of return have generated new interest as regulating rate of return is not going away as once thought.

The regulatory process for setting a public utility's allowed rate of return on common equity has generally relied upon the familiar Gordon Discounted Cash Flow Model (DCF) and Capital Asset Pricing Model (CAPM). Despite the widely known problems with these models, there has been little initiative to adopt more recently developed asset pricing models with fewer limiting assumptions and requiring less subjective judgment than these traditional models. In December 2011, the article "New Approach to Estimating the Cost of Common Equity Capital for Public Utilities,"<sup>12</sup> published in *The Journal of Regulatory Economics*, introduced the Predictive Risk Premium Model (PRPM). The PRPM trademark refers to a general, yet simple, consumption-based asset pricing model of the risk/return relationship for common stocks which can be used to estimate the cost rate of common equity (ROE). The stability and consistency of the results of PRPM and the ex ante, i.e., expectational, nature of those results indicate that the model should be used to provide additional input into the process of determining an allowed rate of return on common equity for public utilities.

Since publication, more exhaustive empirical testing of the PRPM was conducted for the four utility industry groups which comprise the AUS Utility Reports<sup>3</sup> universe of publicly traded utilities: an electric utility group; a combination electric and natural gas distribution utility group; a natural gas distribution utility group, and a water utility group. The empirical testing confirms the conclusion of the

---

original *Journal of Regulatory Economics* article: the PRPM produces stable results which are consistent over time.

## II. Development of the PRPM

The cost rate of common equity is not directly observable in the capital markets and must be inferred using various financial models. The most commonly used cost of common equity models in the regulatory arena are the aforementioned DCF and the CAPM. Since these models are based upon many restrictive

assumptions, they involve a significant amount of analyst subjectivity in their application, resulting in much debate over the application and results of these models.

The empirical approach to the PRPM is based upon the work of Robert F. Engle, Ph.D.,<sup>4</sup> who shared the Nobel Prize in Economics in 2003 "for methods of analyzing economic *time series* with time-varying volatility (ARCH),"<sup>5</sup> with "ARCH" standing for autoregressive conditional heteroskedasticity. In other words, volatility (variance) changes over time and is related to itself from one period to the next, especially in financial markets. Engle discovered that the volatility (usually measured by variance) in prices and returns clusters over time. Therefore, volatility is highly predictable and can be used to predict future levels of risk. The theoretical asset pricing model was recently developed in the *Journal of Economics and Business* in December 2011 by Rutgers University professors Richard Michelfelder and Eugene Pilotte.<sup>6</sup>

In this study, the PRPM estimates the risk/return relationship directly using the outcomes of investors' historical pricing decisions and actual long-term U.S. Treasury security yields, with the predicted equity risk premium generated by the prediction of volatility, i.e., the risk, based upon the volatility of past equity risk premiums for the AUS Utility Reports universe of companies.

 Dec 13 2019

### III. Estimation Method

The statistical details of the estimation method of the PRPM can be found in the original article in the *Journal of Regulatory Economics*, "New Approach to Estimating the Cost of Common Equity Capital for Public Utilities." Essentially, there are two steps to the application of the PRPM. First, predicted volatility, i.e., risk, is derived based upon previous volatility plus previous prediction error, because volatility is highly predictable and correlated over time. Second, the predicted volatility can then be used to generate the predicted equity risk premium (ERP) by multiplying it by the GARCH coefficient, i.e., the slope of the predicted volatility. A risk-free rate is then added to the ERP to estimate the ROE, i.e., the market based cost of common equity.

### IV. Application of the PRPM to Publicly Traded Utility Companies

The PRPM was applied to the companies comprising the AUS Utility Reports' utility industry groups: the electric, combination electric and natural gas distribution, natural gas distribution, and water groups. The PRPM variances were calculated monthly for each individual utility beginning with the first available monthly data included for each individual utility in the University of Chicago Booth School of Business'

Center for Research in Security Prices (CRSP) and corresponding monthly long-term U.S. Treasury bond yields from Morningstar's *Ibbotson SBBI - 2012 Valuation Yearbook - Market Results for Stocks, Bonds, Bills and Inflation - 1926-2011 (SBBI)* through 72-month ending periods, i.e., January 2006 through December 2011.

Using EViews Version 7.2, the PRPM coefficients and predicted monthly variances were estimated as described in the *JRE* article for each time series of equity risk premiums. Consistent with the conclusion drawn in the *JRE* article, the predicted equity risk premiums were calculated using the averaged predicted volatilities (variances) over the entire time period for which CRSP data were available for each utility, multiplied by the GARCH, or slope, coefficient generated through EViews for each time series. To calculate the PRPM cost

rate of common equity for each utility, the average predicted utility specific equity risk premium through each month ending from January 2006 through December 2011 was then added to the projected consensus forecast of the expected yields on 30-year U.S. Treasury bonds for the next six quarters by the reporting economists in the concurrent *Blue Chip Financial Forecasts (Blue Chip)*.

The DCF was applied in a simple manner, using a dividend yield,  $D_0/P_0$ , derived by dividing the month-end indicated dividend per share ( $D_0$ ) by the month-end closing market price ( $P_0$ ) for each utility. The dividend yield was then grown by the month-end I/B/E/S consensus five-year projected earnings per share (EPS) growth rate ( $g$ ) to derive  $(D_0(1+g)/P_0)$ . The one-month predicted dividend yield was then added to the concurrent month's I/B/E/S consensus

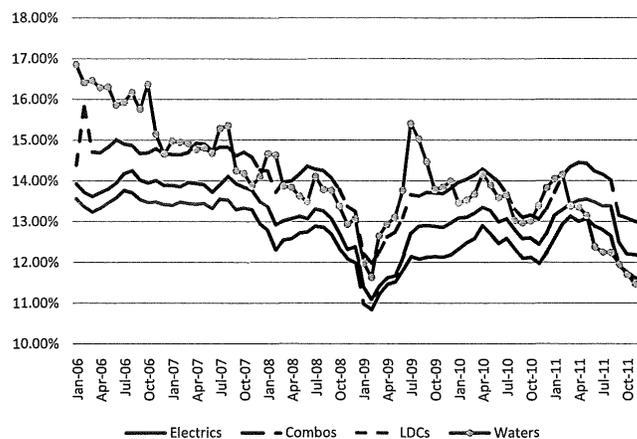

Figure 1: Indicated Return on Common Equity Based upon the PRPM for the AUS Utility Reports Companies

five-year average projected EPS growth rate to obtain the DCF estimate of the cost of common equity capital,  $k$ . The DCF estimates were also calculated for each month from January 2006 through December 2011.

The CAPM was applied by multiplying Value Line Inc.'s beta ( $\beta$ ),<sup>7</sup> for each utility, by the long-term historical arithmetic mean market equity risk premium ( $R_m - R_f$ ) through the previous year. ( $R_m - R_f$ ) was derived as the spread of the total return of large company common stocks over the income return on long-term government bonds from the annual *S&P 500 Valuation Yearbooks* for the years ending 2005 through 2010. The resulting utility-specific equity risk premium was then added to the same projected consensus forecast of the expected yields on 30-year U.S. Treasury bonds for the next six quarters by the reporting economists in the concurrent *Blue Chip* discussed above, to obtain the CAPM estimate of the cost of common equity capital,  $k$ . The CAPM estimates were also calculated for each month from January 2006 through December 2011.

Finally, the results for each of the models, the PRPM, DCF, and CAPM, were averaged for each utility group.<sup>8</sup> Figure 1 presents the average PRPM results for each of the AUS Utility Reports utility groups for each month from January 2006 through December 2011.

Figure 1 shows that indicated ROEs derived from the PRPM

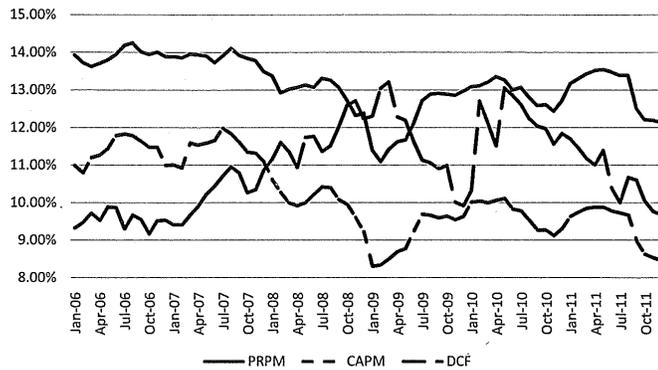

Figure 2: Indicated Return on Common Equity Based upon the PRPM, CAPM and DCF Methodologies for the AUS Utility Reports Electric Companies

were stable for all utility groups until the global financial crisis of 2008–2009. During 2008 and 2009, the PRPM-derived ROEs decline, which in the authors' opinion, was a result of a "flight to quality" by investors, i.e., the willingness of an investor to accept a lower, but more certain, return during financial downturns. Figure 1 also indicates that the PRPM-derived ROEs for the electric, combination

electric and natural gas distribution, and natural gas distribution utility groups follow a nearly identical pattern throughout the 72-month period, with the water utility group following a similar, but more volatile pattern.

Figures 2–5 present a comparison of the average PRPM, DCF, and CAPM cost of common equity estimates for each AUS

**Figure 4:** Indicated Return on Common Equity Based upon the PRPM, CAPM and DCF Methodologies for the AUS Utility Reports Gas Companies

**Figure 5:** Indicated Return on Common Equity Based upon the PRPM, CAPM and DCF Methodologies for the AUS Utility Reports Water Companies

Utility Reports utility industry group, i.e., the electric utility group; the combination electric and natural gas distribution utility group; the natural gas distribution utility group; and, the water utility group for each month from January 2006 through December 2011.

Figures 2-5 clearly show that, for the most part, the PRPM produces a higher average indicated ROE than both the DCF and CAPM. This is due to the fact that the PRPM prices *all* of the risk that investors actually face collectively. In contrast, the CAPM prices systematic risk (that

investors face only if they have a perfectly diversified portfolio, which does not exist) and the DCF uses accounting-based, not market-based, I/B/E/S consensus five-year projected EPS growth rates.

### V. Conclusion

In the authors' opinion, the PRPM benefits ratemaking with an additional model to estimate ROE. To that end, the authors have been including the PRPM in their rate-of-return testimonies and the model has been presented publicly in several venues.<sup>9</sup>

**I**t's results are stable and consistent over time. It is not based upon restrictive assumptions, as are the DCF and CAPM. The PRPM is also not based upon an *estimate* of investor behavior, but rather, upon a statistical analysis of *actual* investor behavior by evaluating the results of that behavior, i.e., the volatility (variance) of historical equity risk premiums. In contrast, subjective decisions surround the choice of the inputs to both the DCF and CAPM, from the choice of the time period over which to measure the dividend yield for the DCF, the choice of the DCF growth rate (e.g., historical or projected, earnings per share or dividends per share, and the like), to the selection of the appropriate beta (e.g., adjusted or unadjusted), market equity risk premium (e.g., historical or projected) and the appropriate

risk-free rate (e.g., historical or projected and/or long vs. short term) for the CAPM. In addition, as previously discussed, the CAPM exclusively prices systematic risk. In contrast, the PRPM prices *all* of the risk actually faced collectively by investors, because the model does not assume that investors' portfolios are perfectly diversified containing no unsystematic risk.

In addition, the inputs to the PRPM are widely available. The GARCH coefficient is calculated with the relatively inexpensive EViews, or other statistical, software, based upon the realized ERP, i.e., total returns minus the risk-free rate. The only subjective decisions to be made when applying the PRPM relate to which risk-free rate to use, e.g., long-term or short-term, and over what time period to estimate the PRPM-derived ROEs.

For all of these reasons, the authors conclude that the PRPM should be considered as appropriate additional evidence

to measure the cost of common equity in regulatory rate setting for public utilities. ■

End-use efficiency

### ABSTRACT

Public utilities and regulators are decoupling revenues from sales to remove a disincentive for utilities to invest in end-use electricity, natural gas and water efficiency. Decoupling is primarily a US ratemaking policy for energy and water utilities as are price caps in Europe. Empirical testing consistently demonstrates that decoupling has no statistically measurable impact on risk and the cost of common equity, yet policy is moving ahead without consideration of that empirical evidence.

### 1. Introduction

In the late 1970s, US policymakers, legislators, regulators and public utilities began focusing on reducing consumers' demand for energy rather than increasing supply. This was mainly a reaction to the oil supply shock in the US in the early 1970s, beginning with the National Energy Conservation Act of 1978. Europe was already much more efficient in the use of energy by the 1970s as the BTU content of GDP for many European countries was a substantially small fraction relative to the US.

More recently in the US, regulatory policy has required water utilities to encourage the reduction in water use by their consumers. The US and European utility industries seem to observe each other's experiments in decoupling and price caps before adopting such alternative ratemaking policy movements. Price cap regulation, where utility prices are allowed to rise to a cap set by an inflation index minus a total productivity factor offset that reflects potential cost savings, was implemented decades ago for British utilities. Later it was adopted by many other utilities in Europe (EU). However, in the US, very few utilities are under price cap regulation except for telecommunications local exchange carriers. In contrast, decoupling, which effectively disassociates revenue levels from commodity (electric, gas or water) sales has been sweeping across the US in the

last two decades for energy and water utilities, while not being adopted in Europe.

Campini and Rondi<sup>1</sup> show that alternative rate mechanisms in the EU have been in the form of price caps to promote efficient investment and operating expenditures without mentioning decoupling. They note that since many utilities in the EU are government owned, there has not been any major adoption of alternative regulatory rate making methods across the utility industry as EU utility rates are not regulated. Therefore, this study is limited to analyzing decoupling in the US, as it is still almost exclusively a regulatory tool implemented in the US.

The profit disincentive associated with revenue and profit reductions is a major financial impediment preventing investor-owned utilities from encouraging the conservation of energy and water usage and sales. In response, various regulatory policy mechanisms have been developed to provide utilities with a financial incentive, or, at least, remove the disincentive, to utilities to encourage energy and water efficiency. One such mechanism is the inclusion of conservation expenditures in rate base so that such expenditures earn a return. Other mechanisms allow for a profit incentive equal to a proportion of the life cycle of net benefits, as well as rate of return premiums for meeting or exceeding conservation goals. Increasingly, revenues are being decoupled from sales volumes so that reductions in sales volumes will

potentially stabilize profits rather than reduce them.<sup>2</sup> Decoupling revenues from sales volumes was first implemented in California and New York in the 1980s. Decoupling did not gain momentum outside of California and New York for decades and only recently implemented in various other state regulatory jurisdictions across the US for electric, natural gas, and water public utilities. Fig. 1 is a map depicting the extent of decoupling across the US developed by the National Resources Defense Council<sup>3</sup>. While Fig. 1 shows the extent of decoupling across the US for electricity and natural gas utility industries, it does not show the same for water / wastewater utility industries. Fig. 1 shows that as of August 2018, 26 states have adopted gas decoupling (compared with 14 in 2013) and 17 have adopted electricity decoupling (compared with 14 in 2013).

The types of decoupling generally fall into three categories: fixed and variable rate mechanisms; lost revenue recovery from commodity sales reductions due specifically to energy or water efficiency programs; and fixed revenue true-up mechanisms. Fixed and variable rate mechanisms have a high fixed rate component that may or may not include a set maximum commodity volume included in the fixed rate with the variable rate being the rate for partial or all volume use. The fixed rate is intended to cover all or most fixed costs. Fixed rates are rarely used in the electric or gas utility industries but are frequently used for water utilities. Lost revenue recovery mechanisms allow the utility to collect the revenue lost directly from specific sales reductions due to energy or water efficiency programs. True-up mechanisms set a fixed overall level of revenues with the utility allowed to recover a shortfall in revenues from the fixed level in higher rates. Nadel and Herndon<sup>4</sup> discuss the future of the energy utilities industries and the role that decoupling as a form of alternative ratemaking may play in that future. Also, see Carter<sup>5</sup>, Cavanaugh<sup>6</sup>, Eto, Stoft, and Belden<sup>7</sup> and the American Council for an Energy Efficient Economy and Natural Resource Defense Council websites for discussion on the trends, theory and implementation of

decoupling and various decoupling mechanisms.

One key consideration in many US regulatory rate proceedings and policy discussions is the impact of decoupling on the investment risk of a public utility and, subsequently, its cost of common equity (and therefore the allowed rate of return set by regulators). Since decoupling disassociates revenues from sales volumes, the intended impact is that it generates an increasingly stable and non-declining level of revenues and net income if sales do decline. Therefore, the public utility is expected to be perceived by investors as having lower investment risk, which would lead to a lower cost of common equity capital, that is, the investor required return.

Decoupling can also be viewed as exacerbating investment risk rather than decreasing it. To the extent that investors are concerned about a changing regulatory regime, uncertainty about the measurement of the savings impacts of conservation programs may exacerbate investors' perceived risk and the cost of common equity.

Decoupling is implemented with the intention of reducing or eliminating volume risk and therefore potentially affects the cost of common equity as stated above. If the utility hedges volume risk due to weather, which is the most likely cause of demand shocks to electric, gas or water commodities, hedging derivatives<sup>8</sup> allow the utility to insure such risk. If the utility hedges most of the commodity demand risk while meeting demand regardless of compensation mechanisms, the risk may fall or may not fall depending on the degree of diversification in the investor portfolio. For example, weather risk may or may not affect all common stocks in an investor's portfolio. Should a utility incur costs to hedge risks that do not materialize into an adverse effect, the hedges may not payoff. Therefore, volume risk is not always alleviated with decoupling. Essentially, the question is that although the risk of the business is not changed by reward mechanisms, as demand shocks (positive or negative) still occur, do investors perceive, as do some regulators and utility management, that decoupling reduces risk? While a change in the reward structure does not change the fundamental riskiness of a firm, it is the investors' perceived risk that affects the cost of common equity. While this is not likely to occur in an efficient market, it is not so obvious that financial markets are efficient. The existence of an efficient market is one of a number of assumptions that has been relaxed in the derivation of the recently developed financial model used in this paper. It is commonly known as the predictive risk premium model and technically known as the generalized consumption asset pricing model (GCAPM).<sup>9</sup>

The topic of this paper has been the subject of only a few empirical investigations so far by Wharton and Vilbert<sup>10</sup> and Vilbert, Wharton, Zhang and Hall<sup>11</sup> (collectively referred to as Wharton, et al. (2015, 2016)). Moody's<sup>12</sup> has estimated the change in business risk and credit metrics due to decoupling, but not the impacts on the cost of capital.

<sup>2</sup> In response to the challenges to achieving the allowed return on common equity due to expected significant capital expenditures to repair and replace utility infrastructure, as well as declining per capita commodity consumption, the National Association of Regulatory Utility Commissioners (NARUC) recommends that regulators carefully consider and implement appropriate rate-making measures so that water and sewer utilities have a reasonable opportunity to earn their allowed rate of return on common equity. Decoupling, or revenue adjustment stabilization mechanisms (RAM) separate rates / revenues from electricity, gas or water volumes sold. Such mechanisms address the effects of the more efficient use of the commodity and declining per capita consumption, for water, and to a lesser extent, electricity, while maintaining the financial soundness and viability of the utilities. With RAMs, utilities are made whole for revenue shortfalls from allowed revenues used to design rates, which generally result from weather and conservation efforts by customers. RAMs allow for the recovery / crediting of differences between actual and allowed quantity charge revenues. RAMs seem to be effective in mitigating the effects of regulatory lag and improving utilities' opportunities to earn their allowed returns on common equity while upgrading infrastructure, ensuring safe and reliable service, removing the incentive to sell more commodity, and helping to protect valuable natural resources. However, in base rate cases for utilities that have such mechanisms, the question often arises as to whether and to what extent the presence of such mechanisms reduces the utility's investment risk as well and to what extent such a perceived or actual reduction in risk should be reflected in the allowed return on common equity.

<sup>8</sup> Water derivatives, although not traded in markets as are gas and electricity futures and forwards, are created through private contracts. Some water distribution systems are interconnected to others and have various contracting structures for buying water if a demand shock should cause the need for more water that the incumbent system cannot supply. Some sewer systems have similar contracts to transfer excessive wastewater flows to another utility's treatment plant if their own capacity reaches its limit.

### Electric and Gas Decoupling in the U.S. August 2018

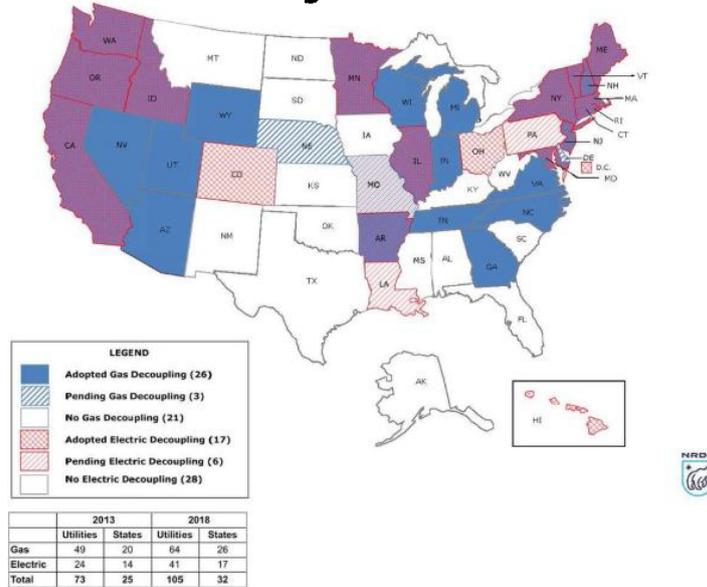

Fig. 1. Electric and Gas Decoupling in the U.S. August 2018.  
 Source: <https://www.nrdc.org/resources/gas-and-electric-decoupling>, accessed March 31, 2019.

There are no empirical studies on water utilities such as those performed in this study.

Wharton, et al. (2015, 2016) concluded that decoupling has no statistically significant measurable impact on the public utility cost of common equity. They found that while decoupling may reduce revenue volatility, it may not reduce investment risk. In fact, they find that it may actually exacerbate risk as decoupling regulatory policy is viewed as a new and uncertain regime and may be used to promote other regulatory policy goals and create regulatory risk.<sup>13</sup> Reductions in peak loads and the commodity sales impacts of consumer energy or water efficiency measures are difficult and expensive to estimate. This difficulty introduces an additional regulatory risk that may result in exposure to regulatory financial penalties due to the uncertainties associated with such efficiency estimation. Thus, Wharton, et al. (2015, 2016) concluded that on a net basis, decoupling may increase the investment risk of utilities.

Chu and Sappington<sup>14</sup> developed an economic model that investigated under what conditions a utility would provide an economic value maximizing level of energy efficiency services to its consumers. Their investigation is important to our discussion as decoupling is implemented as a tool to incent (or remove the disincentive) utilities to encourage consumers to invest in the optimal level of end-use efficiency resources. In considering the use of decoupling, they found that, generally, decoupling alone is not sufficient to induce utilities to provide the optimal level, that is, enough energy efficiency services. Khaz-

zoom<sup>15, 16</sup> found that one problem is that end-use energy efficiency resources cause a rebound effect whereby lower utility bills cause consumers to increase their energy use as they buy more comfort with their bill savings.

Depending on the specific conditions facing a utility, decoupling may not generate a profit motive for utilities to reduce sales through energy or water efficiency. Utilities could be placed in the position of delivering the predicted amount of energy or water savings expected by regulators but possibly without any profit motive other than the avoidance of regulatory penalties for not meeting a goal. This disincentive has become a major topic relative to alternative ratemaking mechanisms, as the growth in electricity sales is currently less correlated with the growth rate in the US GDP relative to the past, with such sales growing more slowly than the general economy in recent years.<sup>17</sup>

Since the US is widely adopting decoupling (revenue caps) whereas the EU is doing the same with price caps, it is an ongoing natural experiment that allows for comparisons of the consumer value and

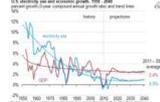

<sup>13</sup> Since multiple types of risk are discussed, we generically define risk as the chance of a disappointment in financial performance.

shareholder value performance between EU price cap utilities and US decoupled utilities. However, since the EU has not adopted decoupling, the data are not available to include EU decoupled utilities in this study.

Since decoupling, as a regulatory policy tool, is being adopted rapidly in the US, Edison Electric Institute, the US electric utility trade association {EEI(2015)}<sup>18</sup> finds that questions arise in regulatory rate proceedings regarding the impacts on the cost of common equity. Due to the importance of this issue and the lack of related literature, we investigate the impact of decoupling on the investor perceived risk of public utilities and resultant cost of common equity.

## 2. The modeling approach

This paper uses the GCAPM developed by Michelfelder and Pilotte<sup>19</sup> to estimate the impact of decoupling on the public utility cost of common equity<sup>20</sup>. The GCAPM is a financial valuation model recently developed as an alternative to the capital asset pricing model and the dividend discount model for estimating the cost of common equity. Ahern, Hanley, and Michelfelder<sup>21</sup> and as Michelfelder<sup>22</sup> review and apply the GCAPM to estimate public utilities' cost of common equity.

The GCAPM model has fewer restrictions than most financial models. Unlike the CAPM, the GCAPM prices the total risk actually faced by the investor and does not assume that all unsystematic risk is diversified away, which is a key foundation of the standard CAPM.<sup>23</sup> Thus, the priced risk in the GCAPM is based on the level of risk actually faced by the investor, not the risk theoretically imposed by the CAPM. In addition, Fama and French<sup>24</sup> find that the CAPM understates returns and risk, based on a large empirical study of portfolios of common stocks with a continuum of low to high betas. The GCAPM also does not assume or require the efficient markets assumption as does the CAPM.

In the GCAPM, the anticipated risk premium on an asset or common stock depends on the anticipated volatility of that asset's risk premium. The anticipated volatility in the risk premium is driven by current and past risk premia and shocks to the premium. The variances of rates of return are highly correlated with past such variances.

Another property of the model allows us to infer whether decoupling causes a public utility common stock to be a business cycle hedge {Michelfelder and Pilotte (2011)}. This is indicated by the sign of the slope of the risk premium and anticipated volatility. If profits rise or are flat as GDP declines with lower commodity sales and stable revenues, the common stock price could systematically rise when the business cycle is contracting.<sup>25</sup> A public utility with a strong level of decoupling

could conceivably experience stable revenues during a contraction in the business cycle. Therefore, utility profits may rise, or at least not fall, when commodity sales fall generated by consumer end-use efficiency and contracting GDP.

To calibrate the GCAPM, we perform a simple test of this property by estimating the model with the risk premium on gold (percent change in the price of gold per troy ounce minus a risk-free rate). Gold is commonly known to be a business cycle and common stock market hedging asset as noted by Hillier, Draper, and Faff<sup>26</sup>. Hillier, Draper, and Faff (2006) show that gold is a common stock market hedge, especially during abnormally high periods of common stock market volatility. Our calibration test results indicate that the GCAPM model does indeed detect a hedging asset as the slope of the risk premium on its volatility is negative.<sup>27</sup>

The GCAPM can be applied to any asset that is traded in any financial market and therefore can be applied to all traded public utility common stocks. The GCAPM has the added advantage that the decoupling impact on changes in common stock returns as well as the conditional volatility of these returns can be estimated separately within the same model.

Decoupling is expected to lower the variance of the operating cash flows of a public utility due to the increased stability of revenues. The variance of operating cash flows should be driven mainly by the variance of costs.<sup>28</sup> Since the volatility of revenues is theoretically equal to zero with decoupling, the covariance of revenues and costs is zero as revenues do not vary, and volatility of OCF is purely driven by costs only as  $VAR(R - C) = VAR(C)$ .<sup>29</sup> This is essentially the model used by Moody's (2011)<sup>30</sup> which found that utilities with decoupling experienced a reduction in business risk as measured by the change in the standard deviation of the growth rate in gross profit before and after decoupling.

We also estimate changes in systematic investment risk resulting from decoupling by analyzing the change in the short-term (12-month) CAPM beta ( $\beta$ ). This short-term beta, a measure of systematic risk, should be more sensitive to regulatory regime changes, such as, for example, decoupling, relative to the standard betas estimated with five years of data typically employed to assess investment risk. Beta is expected to decline with decoupling.<sup>31</sup>

The only other studies on the impact of decoupling on the utility cost of capital, Wharton, et al. (2015, 2016)<sup>32, 33</sup> estimated the impact of decoupling on the cost of capital for the overall electric and gas utility industries. They also addressed the issue that decoupled subsidiary utilities may represent substantially less than the entire portfolio of assets reflected in the common stock price of a holding company. Using the standard dividend discount model to estimate the cost of common equity portion of their weighted average cost of capital

estimates, they regressed this cost of capital on an intensity index of decoupling for each publicly-traded utility common stock to estimate the industry impact. They found no statistically significant impact of decoupling on the cost of capital.

The present study estimates the impact on the cost of common equity of the decoupled firm individually rather than that on an industry as a whole. We use the GCAPM and changes in beta before and after the implementation of decoupling to estimate the impact on risk and the cost of common equity.

### 3. Methodology

Two versions of the GCAPM model are estimated.<sup>34</sup> Both estimations use a binary variable to reflect the implementation of decoupling for a specific utility with a value of 1 with decoupling and 0 if otherwise.

These results provide separate empirical estimates of the impacts of decoupling on the public utility common stock returns as well as volatility of the returns (risk). As event studies, these and all financial market-based event studies face the question of when the event impacted asset prices, as they can reflect forthcoming events before they are implemented. One example that is relevant for this study is when decoupling implementation was announced in a utility's regulatory decision. We find that using the date of implementation is a conservative approach to estimating the impact as it is most likely the latest date that a decoupling impact would be detected in a common stock price with much of the impact already priced in the asset. However, if a utility's revenues have been decoupled from sales to the extent that revenues are not affected by the business cycle, then the utility's common stock as a hedging asset would be detected in a zero or negative risk-premium-to-volatility slope. Also, if a sufficiently long pre-decoupling time period for observing returns and volatility is available, the change in the post-period should be detected as all of the post-decoupling period returns and volatilities are in a different business risk regime.

### 4. Data

We perform the empirical work on US utilities only. As discussed in the Introduction, decoupling had not yet been adopted in the EU at the time of this study. The group of US public utility common stocks includes all electric as well as electric and gas combination companies that have 95 % or more of their revenues decoupled and water utility common stocks that have all of their revenues decoupled before 2014. Data for the common stock rates of return are the total monthly rates of return on the common stock of the public utilities from the Center for Research in Security Prices database (CRSP) of the University of Chicago. Data for each public utility common stock include differing pre- and post-decoupling dates and therefore differing rate of return and beta samples. The pre-decoupling data for each common stock include all available past monthly returns data in the CRSP before decoupling for that common stock. Post-decoupling rate of return data for all common stocks end at December 2014 for consistency in the post-decoupling ending period for all utility common stocks. We calculated historical monthly common stock equity risk premiums (monthly common stock returns less the monthly yields on long-term U.S. Treasury Bonds for the selected publicly traded water utilities using common stock returns data from the CRSP database and Morningstar (2015) SBBI® 2015 Market Results for Stocks, Bonds, Bill and Inflation 1926–2015<sup>35</sup> and the Federal Reserve Statistical Release H.15 for long-term Treasury bond yields. The CAPM beta data include all short-term

betas available for each public utility common stock that has been decoupled in the CRSP database and ends at 2014. They are available on an annual basis. The CAPM short-term beta is a one-year estimate of beta that approximately involves regressing daily rates of return on the public utility common stock on a market index as shown footnote 31. The standard beta available from financial firm databases such as Value Line Investment Survey or CRSP are 5-year betas based on regressing monthly or weekly common stock rates of return for the past 5 years on a market index. We find that the longer-term beta would be less sensitive to regime changes in risk such as decoupling. We restrict the sample of pre- and post-decoupling betas for each common stock so that the number of beta observations are the same before and after decoupling.

Since the number of data observations has different times series of ranges for each public utility common stock and decoupling occurred on different dates for most utilities, we have developed Table 1 to show each public utility common stock's data date range, that is, the dates and number of risk premium (rate of return minus risk-free rate) observations used to estimate the GCAPM and the total number of betas used for the pre- and post beta comparison. Table 1 also has the date of decoupling for each public utility.

### 5. Results and discussion

Table 2 presents the public utility common stocks in the study and the empirical results of the GCAPM estimates. The risk-premium-to-volatility slopes are shown along with the decoupling slope in the risk-premium and volatility equations for each electric, electric and gas combination, and water utility common stocks. The decoupling slope in the risk-premium equation will be negative (positive) if the risk premium should decline (rise) and decoupling creates a reduction (increase) in business risk. None of these slope estimates are statistically significant. The decoupling slope in the volatility equation should be negative (positive) if decoupling caused a reduction (increase) in the volatility of the profit of the utilities. Two of the slopes are negative and significant at  $p = 0.10$ , yet the magnitudes of the slopes are very small.

All of the return-volatility slopes, except for one of the energy utilities are positive and significant, yet none in the water utility group are significant. These results indicate that the energy utility common stocks are not business cycle hedging assets and that their profits are synchronized with the business cycle. The results for the water group may indicate that they are business cycle hedging assets as none are statistically significant. The zero value for the water utility slopes imply that there is no relation between water utility rates of return and the business cycle. Water utility profits are not correlated with the business cycle even in the absence of decoupling. Also, water usage attrition is occurring across the US as households (water consumption per household is declining) due to the use of water-efficient appliances (such as low-flow faucets, showerheads and efficient toilets) and the change per capita water use behaviors to conserve water.

Table 3 presents the pre- and post-decoupling changes in the systematic risk as represented by the short-term CAPM beta for all of the public utility common stocks. Although, the betas drop after the implementation of decoupling, none of the changes in beta are statistically significant using a t-statistic at a  $p = 0.05$ . Additionally, the standard errors of the betas ( $\sigma_{pre}$  and  $\sigma_{post}$ ) show no consistent pattern of increasing or decreasing after decoupling.

Our results do not show any statistically significant impacts of decoupling on the cost of common equity and risk. Therefore, we find no evidence to conclude that decoupling affects investor perceived risk or the cost of common equity. While electric and gas public utility common stocks were not found to be business cycle hedges, we do find that water utility common stocks may be business cycle hedges, or more likely, water usage and revenue simply have no relation with GDP.

Our results are based on the moderate amount of data available to date. Although we would obviously prefer more data than are available

<sup>a</sup> Beta is the annual year-ending beta from the CRSP database. The data timeframe is different for each utility with an equal number of annual pre- and post-decoupling beta data observations for the specific stock in the CRSP database and ends in 2014. Each single beta was estimated with one year of daily rate of return data. See Table 1 and footnote 32. \*\*\*, \*\*, \* refers to statistical significance at 0.01, 0.05, and 0.10 respectively.

at this juncture, there is no time to wait for a larger volume of data as regulators and utilities have been and are implementing policy now as if decoupling does reduce business risk and, thus, the costs of capital without any evidence that it does. This paper serves as an early warning signal, albeit with the limited evidence that is available.

## 6. Conclusion and policy implications

We conclude that decoupling has no statistically measurable impact on the cost of common equity or business risk based on our empirical analysis for electric, electric and gas, and water utility common stocks. Some researchers may view this result as a “non-result.” This is an important finding as it is consistent with the empirical findings of Vilbert, et al. It is also important for policy globally as decoupling is considered as a potential reducer to risk and the cost of common equity by regulators and public utilities in the US based on intuition, without any empirical evidence.

Moody’s (2011) finds a reduction in business risk as measured by the change in the variability of gross profit after decoupling but did not estimate the impact on the cost of common equity. Moody’s (2011) did find that electric utilities were somewhat reluctant to adopt decoupling as electric utility executives anticipated that growth in sales would return after the steep recession that ended with the business cycle trough in June 2009 as identified by the National Bureau of Economic Research<sup>36</sup>. Since the US business cycle expansion post-June 2009, electricity sales have remained almost flat, which may have caused the change in sentiment toward decoupling by electric utility executives. Growth in a utility’s commodity sales above the level used to design regulated rates would increase the profit and rate of return on common equity. The US investor-owned electric utility industry also expected that the adoption of decoupling would cause state public utility regulators to reduce their allowed rate of return under the notion that it reduces risk. Moody’s (2011) was written soon after the recession had ended, but the anticipated growth in sales has not materialized after more than ten years into the US business cycle expansion. A few years after the Moody’s (2011) study, in a more recent report, the EEI found a change in sentiment {EEI (2015)} that electric utilities favor decoupling and that it has become more widespread across the US.

Although we conclude that decoupling has no statistically significant impact on investor perceived risk and the cost of common equity, this does not mean necessarily that decoupling has no impact on the perceived risk and the cost of common equity of public utilities. We find that it cannot be isolated and estimated, given the many other factors affecting investor perceived risk. For many electric utilities, some current major risk drivers are flat or declining sales from customer-owned solar projects and energy efficiency resources; the

<sup>36</sup> National Bureau of Economic Research. (2018). NBER.org.

R.A. Michelfelder, et al.

The Electricity Journal 33 (2020) 106697

requirement to buy back excess customer generated electric from renewable resources at full retail rates (net metering); increasing requirements in the proportion of a utility's sales that have to be generated from renewable energy, causing larger purchases of renewable energy credits (known as renewable portfolio standards that have been adopted by many states and across Europe); increasingly stringent environmental regulations on coal plants; and the impact of falling and low natural gas prices on the competitiveness of existing coal and nuclear plants.

For water utilities, we find their common stocks to be moderate business cycle hedges (no correlation with the business cycle rather than a strong negatively correlated hedge). Since water utility sales are declining on a per capita basis and unassociated with the business cycle, decoupling may provide financial protection if water revenues decline. To the extent that there is positive growth in the number of water utility customers that offsets the declining per capita consumption, total revenues and sales may not be falling. The impact of decoupling on water utility investment risk and cost of common equity was not able to be detected in this study. This is the first study on decoupling in the water utility industry and provides an area for future research.

Another explanation for the lack of detection of a change in risk or the cost of common equity from decoupling is that risk may be created with the implementation of decoupling and the net impact may not be clear as an increase or decrease in risk as Vilbert, et al. They find that the implementation of decoupling is a new and alternative regulatory regime that may be a new source of regulatory risk for the utility. Finally, as discussed in detail in the Introduction above, volume risk, that is, the fundamental nature of the business and business risk, is not alleviated by changing the reward mechanism, and attempts to do so may increase risk and the cost of common equity. The point is that there are cogent theoretical and practical bases to expect that decoupling increases or decreases risk, so it is problematic to develop an *a priori* hypothesis to test a one-way directional impact of risk and return from decoupling.

Therefore, we do not recommend that public utility regulators in the US or elsewhere reduce common equity cost rates in the presence of decoupling mechanisms based on the assumption of reduced risk. The impact is *de minimis* and not statistically significant amongst all of the other investor perceived risk factors affecting the market prices of public utility common stocks. While an alternative research approach may attempt to isolate the impacts of other individual risk factors on the cost of common equity and risk, making for a long regression equation, we cannot detect a statistically significant signal of decoupling on the cost of common equity or volatility. As a contrast, for example, the risk and cost of common equity impact of owning nuclear power generation assets (versus no nuclear assets) has a measurable impact on investors' returns, risk and cost of common equity without attempting to isolate the myriad of other risk variable impacts. Decoupling as a regulatory policy mechanism to encourage public utilities to provide resources and funding to their consumers to conserve electricity, natural gas, and water (therefore also wastewater flows) has no *measurable* impact on the investment risk and the cost of common equity (either up or down). As a policy prescription, public utility regulators should not adjust the allowed rate of return which affects the public utility's rates as a spillover impact of using decoupling to promote environmental policy.

Finally, the US may be further ahead in adopting rate mechanisms that address energy and water efficiency due to its long-term lag relative to Europe in the efficient use of energy and water and the recent "necessity-is-the-mother-of-invention" US driver of energy and water efficiency. European and other global regulators should proceed slowly in adopting decoupling and assuming that decoupling reduces risk as there is no empirical evidence to date that it does.

An extension of this research could evaluate risk premiums or discounts in bond yields as there are many more investor-owned utilities which have outstanding bonds relative to those that have their own publicly traded common stock due to consolidation in the utility

industry in the US. For example, Exelon is the holding company of six utilities whose stocks were publicly traded on the New York Stock Exchange. They are Atlantic City Electric, Baltimore Gas and Electric, Commonwealth Edison, Delmarva Power and Light, Philadelphia Electric and Potomac Edison Power. Another future extension could focus on decoupling when some EU investor-owned utilities and regulators, inevitably, adopt decoupling should it prove to substantially encourage more conservation in the US. An investigation of hedging costs and savings, risk impacts, and effects on profits with and without decoupling may shed more light on the topic. More research is also needed on water decoupling as this is the first study known to date on the topic involving cost of capital and risk. Lastly, a comparison that separates consumer and shareholder value creation and investigating the impacts on conservation from price and revenue caps is another extension of this paper for future research.

**Dr. Richard A. Michelfelder** is clinical associate professor of finance at Rutgers University, School of Business – Camden and president of EXP 1, LLC, a public utility consulting firm. He has over 35 years of experience in the electric, gas, water and wastewater public utility industries. Previous to Rutgers, Dr. Michelfelder was CEO and Chairperson of the Board of Quantum Consulting, Inc., a national public utility consulting firm and Quantum Energy Services and Technologies, LLC, an energy and water efficiency services company that he co-founded. Both were based in Berkeley, California. Previous to Quantum, during its start-up years, as vice president, he helped to co-found and build Converge, Inc. (formerly currently traded on the NASDAQ) into one of the largest demand response firms in the world. He was vice president of Connectiv Solutions, LLC and Director of Energy Services at Atlantic Energy, Inc., which he founded and built into a highly successful energy service company as a division of Atlantic Energy, Inc. Richard has also held executive and management positions at Atlantic Energy, Inc. and was also Staff Economist at AUS Consultants. During his tenure at Atlantic, he also has been responsible for the holding company business plans reporting to the CEO, integrated resource planning, electric cost of service, load research, and demand-side management. As an executive, participated in the merger and restructuring of Atlantic Energy, Inc. and Delmarva Power and Light, Inc., two NYSE traded electric and electric, gas and water utility holding companies at the time to become Connectiv, Inc. He has testified before a number of state regulatory agencies and the FERC on issues related to the cost of capital, energy efficiency, water load research and incentive rate mechanisms that encourage energy efficiency programs by utilities. During recent years, he has focused on the water and wastewater industries, focusing on rate design, cost of service and valuations. He has published numerous articles in economics, finance, entrepreneurship and specifically in public utilities. Some journals include the *Journal of Financial and Quantitative Analysis*, *Energy Policy*, *The Electricity Journal*, the *Journal of Regulatory Economics*, the *Journal of Economics and Business*, *Multinational Finance Journal*, *Quantitative Finance*, *The Journal of Sustainable Finance and Investment*, and *Managerial Finance*. He holds a Ph.D. in economics from Fordham University.

**Pauline M. Ahern** is Executive Director at ScottMadden, Inc. She has served investor-owned and municipal utilities and authorities for over 30 years. A Certified Rate of Return Analyst (CRRA), she is responsible for the development of rate-of-return analyses, including the development of ratemaking capital structure ratios, senior capital cost rates, and the cost rate of common equity and related issues for regulated public utilities. She has testified as an expert witness before 29 regulatory commissions in the U.S. and Canada. In addition, she supervised the production of the various AUS Utility Reports publications and maintained the benchmark index against which the American Gas Association's Mutual Fund performance is measured. She holds an M.B.A. in finance from Rutgers University and a Bachelor of Arts Degree in Economics/Econometrics from Clark University.

**Dylan D'Ascendis** is a Principal at ScottMadden, Inc. He is a Certified Rate of Return Analyst (CRRA) and Certified Valuation Analyst (CVA). He has served as a consultant for investor-owned and municipal utilities and authorities for 11 years. Dylan has extensive experience in rate of return analyses, class cost of service, rate design, and valuation for regulated public utilities. He has testified as an expert witness in the subjects of rate of return, cost of service, rate design, and valuation before 18 regulatory commissions in the U.S. and an American Arbitration Association panel. He has published a number of articles including journals as *Energy Policy* and *The Electricity Journal*. He holds degrees from Rutgers University and the University of Pennsylvania.

## Decoupling impact and public utility conservation investment

### ABSTRACT

Public utilities and regulators are implementing various forms of regulatory mechanisms that decouple revenues from commodity sales to remove a disincentive or create an incentive for utilities to invest in and encourage consumers to conserve electricity, natural gas and water. A major question is whether such regulatory mechanisms affect investor-perceived risk, the cost of common equity and the utility rates of such commodities. This is an important question as regulators in the US are and have been considering the impact of decoupling on investment risk and therefore the cost of common equity in rate proceedings. This matter is also important for regulators globally as they consider decoupling as a policy initiative in setting rates and rate of return. Currently, decoupling is primarily a US ratemaking policy for energy and water utilities as are price caps in Europe. Empirical testing, based on the available data in the US, consistently demonstrates that decoupling has no statistically measurable impact on risk and the cost of common equity. Therefore, at this juncture, policy is moving ahead, at least in the US, without empirical evidence on whether it does have impact on risk and return.

### 1. Introduction

Beginning in the late 1970s, US policymakers, legislators, regulators and public utilities began to focus on reducing consumers' demand for energy rather than increasing supply. This was mainly a reaction to the oil supply shock in the US in the early 1970s, which began with the National Energy Conservation Act of 1978. Europe was already much more efficient in the use of energy by the 1970s as the BTU content of GDP of many European countries was a substantially small fraction relative to the US.

More recently in the US, regulatory policy has required water utilities to encourage the reduction in water use by their consumers. The US and European utility industries seem to observe each other's experiments in decoupling and price caps before adopting such alternative ratemaking policy movements. Price cap regulation, where utility prices are allowed to rise to a cap set by an inflation index minus a total factor productivity offset that reflects potential cost savings (known as  $RPI - X$ ), was implemented decades ago for British utilities. Only afterward was it adopted by many other utilities in Europe (EU). However, it has largely not been adopted in the US as very few utilities are under price cap regulation except for telecommunications local exchange carriers. On the other hand, decoupling, which effectively disassociates revenue levels from commodity (electric, gas or water)

sales has been sweeping across the US in the last two decades for energy and water utilities, while being not adopted in Europe.

Campini and Rondi (2010) show that alternative rate mechanisms in the EU have been in the form of price caps to promote efficient investment and operating expenditures. There is no mention in that article of decoupling. They also point out that since many utilities in the EU are government owned there has not been any major adoption of alternative regulatory rate making methods across the utility industry as government utility rates are not regulated. Therefore, this study is limited to analyzing decoupling in the US, as it is still almost exclusively a regulatory tool implemented in the US.

A major financial impediment preventing investor-owned utilities from encouraging conservation of energy and water usage and sales is the profit disincentive associated with subsequent revenue and profit reductions. Therefore, various regulatory policy mechanisms have been developed to provide utilities with a financial incentive, or, at least, remove the disincentive to utilities to encourage energy and water efficiency. Some mechanisms have been the inclusion of conservation expenditures in rate base so the such expenditures earn a return. Other mechanisms allow for a profit incentive equal to a proportion of the life cycle of net benefits, as well as rate of return premiums for meeting or exceeding conservation goals. Increasingly, revenues are being decoupled from sales volumes so that reductions in sales volumes will

potentially stabilize profits rather than reduce them.<sup>1</sup> Decoupling revenues from sales volumes was first implemented in California in 1982 and in New York in the 1980s. Although decoupling did not gain momentum outside of California and New York for decades afterward, it has recently been implemented in various state regulatory jurisdictions across the US for electric, natural gas, and water public utilities. Fig. 1 is a map depicting the extent of decoupling across the US developed by the National Resources Defense Council (2018). Although it shows the extent of decoupling across the US for electricity and natural gas utility industries, it does not show the same for water/wastewater utility industries. Fig. 1 shows that as of August 2018, 26 states have adopted gas decoupling (compared with 20 in 2013) and 17 have adopted electricity decoupling (compared with 14 in 2013).

The types of decoupling generally fall into three categories: fixed and variable mechanisms, lost revenue recovery from commodity sales reductions due specifically to energy or water efficiency programs, and fixed revenue true-up mechanisms. Fixed and variable rate mechanisms have a high fixed rate component that may or may not include a set maximum volume of the commodity included in the fixed rate and the variable component is the rate for partial or all volume use. The fixed rate is meant to cover all or most fixed costs. They are rarely used in the electric or gas utility industries but are frequently used for water utilities. Lost revenue recovery mechanisms allow the utility to collect the revenue lost directly from the specific sales reductions due to energy or water efficiency programs. True-up mechanisms set a fixed overall level of revenues and the utility can recover a shortfall in revenues from the set level in higher rates. Nadel and Herndon (2014) discuss the future of the energy utilities industries and the role that decoupling as a form of alternative ratemaking may play in that future. Also, see Carter (2001), Cavanaugh (2013), Eto et al. (1997) and the American Council for an Energy Efficient Economy and Natural Resource Defense Council websites for discussion on the trends, theory and implementation of decoupling and various decoupling mechanisms.

One key consideration in many US rate proceedings and policy discussions is the impact of decoupling on the investment risk of a public utility and its cost of common equity (and therefore the allowed rate of return set by regulators). Since decoupling disassociates revenues with sales volumes, the intended impact is that it generates an increasingly stable and non-declining level of revenues and net income if sales do decline. Therefore, the public utility is expected to be perceived by investors as having lower investment risk, which would lead to a lower cost of common equity capital, i.e., the investor required

return.

Decoupling can also be viewed as exacerbating investment risk rather than decreasing it. To the extent that investors are concerned about a changing regulatory regime, uncertainty about the measurement of the savings impacts of conservation programs, partially implemented or gamed mechanisms, to name a few potential issues associated with such an alternative ratemaking mechanism, may exacerbate investors' perceived risk and the cost of common equity.

Decoupling is implemented with the intention to reduce or eliminate volume risk and therefore potentially the cost of common equity as stated above. If the utility hedges volume risk due to weather, which is the most likely cause of demand shocks to electric, gas or water commodities, hedging derivatives<sup>2</sup> allow the utility to insure such risk. If the utility hedges most of the commodity demand risk while meeting demand regardless of compensation mechanisms, the risk may fall if the volume risk is systematic. Whether such weather risk is systematic or not is questionable as weather shocks do not affect most common stocks in a highly diversified portfolio nor the business cycle that drives the systematic risk of a market portfolio. It may not be systematic even within a utility-only portfolio as weather patterns can be diversified away with geographical diversification. If weather happens to have a systematic effect on the risk of the public utility common stock, it is conceivable that cost-effective hedges may reduce risk and the cost of common equity. Should the utility hedge risks that do not materialize into an adverse effect such as a demand shock, they incur costs to do so, and the hedges do not payoff. That is, they spend too much on hedged positions or insurance or take title to commodity that they cannot sell, such as with a take-or-pay contract, thus facing increased risk, costs and higher costs of common equity. Therefore, volume risk is not actually alleviated with decoupling. Essentially, the question is that although the risk of the business is not changed by reward mechanisms, as demand shocks (positive or negative) still occur, do investors perceive, as do some regulators and utility management, that decoupling reduces risk? A change in the reward structure does not change the fundamental riskiness of a firm. It is the investors' perceived risk that affects the cost of common equity. This would not seem to occur in an efficient market, but it is not so obvious that financial markets are efficient.

An efficient market is one of a number of assumptions that has been relaxed in the derivation of the generalized consumption asset model (GCAPM) used in this paper. As one example of inefficiency, cash flows generate the fundamental value of a firm, yet the best predictor of common stock prices statistically is earnings per share growth rates, not cash flow per share growth. Investors seem to erroneously price common stocks with earnings, not cash flow based on their perceptions of what affects common equity financial value.

The topic of this paper has been the subject of only a few empirical investigations so far by Wharton and Vilbert (2015) and Vilbert et al. (2016). Moody's (2011) has estimated the change in business risk and credit metrics due to decoupling, but not the impacts on the cost of capital. There are no empirical studies on water utilities such as those performed herein.

Wharton and Vilbert (2015) developed an index of decoupling exposure for public utility and utility holding company common stocks and estimated the after-tax weighted average cost of capital (ATWACC) using the dividend discount model to estimate the cost of common equity. They regressed the ATWACC on an index of decoupling intensity for each public utility in their sample and observed the slope to

<sup>1</sup> In response to the challenges to achieving the allowed return on common equity due to expected significant capital expenditures to repair and replace utility infrastructure, as well as declining per capita commodity consumption, the National Association of Regulatory Utility Commissioners (NARUC) recommends that regulators carefully consider and implement appropriate ratemaking measures so that water and sewer utilities have a reasonable opportunity to earn their allowed rate of return on common equity. Decoupling, or revenue adjustment stabilization mechanisms (RAM) separate rates/revenues from electricity, gas or water volumes sold. Such mechanisms address the effects of the more efficient use of the commodity and declining per capita consumption, for water, and to a lesser extent, electricity, while maintaining the financial soundness and viability of the utilities. With RAMs, utilities are made whole for revenue shortfalls from allowed revenues used to design rates, which generally result from weather and conservation efforts by customers. RAMs allow for the recovery/crediting of differences between actual and allowed quantity charge revenues. RAMs seem to be effective in mitigating the effects of regulatory lag and improving utilities' opportunities to earn their allowed returns on common equity while upgrading infrastructure, ensuring safe and reliable service, removing the incentive to sell more commodity, and helping to protect valuable natural resources. However, in base rate cases for utilities that have such mechanisms, the question often arises as to whether and to what extent the presence of such mechanisms reduces the utility's investment risk as well and to what extent such a perceived or actual reduction in risk should be reflected in the allowed return on common equity.

<sup>2</sup> Water derivatives, although not traded in markets as are gas and electricity futures and forwards, are created through private contracts. Some water distribution systems are interconnected to others and have various contracting structures for buying water if a demand shock should cause the need for more water that the incumbent system cannot supply. Some sewer systems have similar contracts to transfer excessive wastewater flows to another utility's treatment plant if their own capacity reaches its limit.

## Electric and Gas Decoupling in the U.S. August 2018

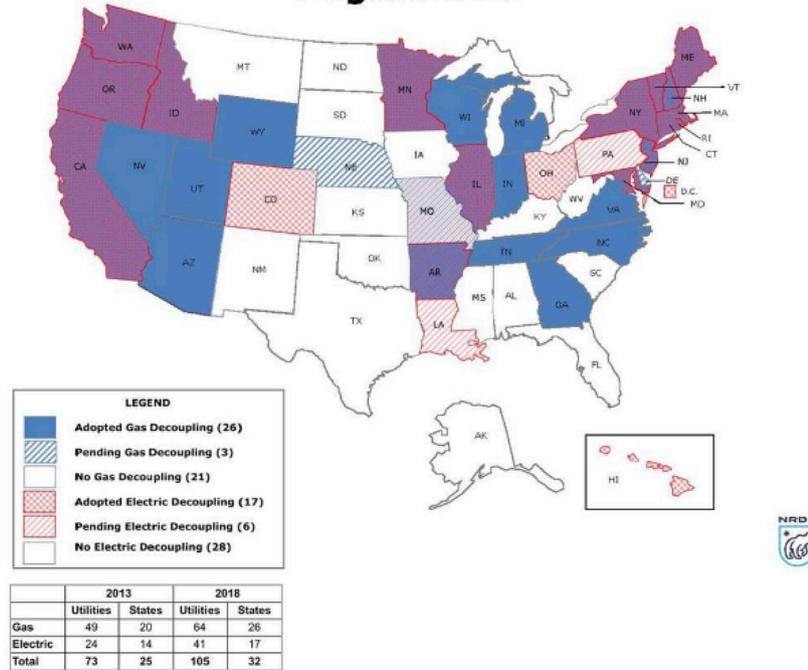

Fig. 1. Trend in Energy Utility Decoupling in the US. Source: <https://www.nrdc.org/resources/gas-and-electric-decoupling>, accessed March 31, 2019

estimate the impact. Although the slope of the regression is negative, it is not statistically significant. They concluded that decoupling has no statistically significant measurable impact on the public utility cost of common equity. They found that decoupling may reduce revenue volatility, but it may not reduce investment risk. They find that it may actually exacerbate risk as decoupling regulatory policy is viewed as a new and uncertain regime and may be used to promote other regulatory policy goals and create regulatory risk.<sup>3</sup>

Reductions in peak loads and the commodity sales impacts of consumer energy or water efficiency measures are difficult and expensive to estimate. This difficulty introduces an additional regulatory risk that may result in exposure to regulatory financial penalties due to the uncertainties associated with such efficiency estimation. Thus, Wharton and Vilbert (2015) concluded that on a net basis, decoupling may increase the investment risk of utilities.

Chu and Sappington (2013) developed a social welfare model that investigated under what conditions a utility would provide a welfare maximizing level of energy efficiency services to its consumers. Their investigation is important to our discussion as decoupling is implemented as a tool to incent utilities to encourage consumers to invest in the optimal level of end-use efficiency resources. In considering the use of decoupling, Chu and Sappington (2013) found that, generally, decoupling alone is not sufficient to induce utilities to provide the socially optimal level, that is, enough energy efficiency services. One problem is that end-use energy efficiency resources cause a rebound effect {Khazzoom (1980, 1987)} whereby lower utility bills cause consumers to increase their energy use as they buy more comfort with

<sup>3</sup> Since multiple types of risk are discussed, we generically define risk as the chance of a disappointment in financial performance.

the savings.

Chu and Sappington (2013) also discuss that, if the price of electricity is above the private marginal cost (in contrast to social marginal cost), falling sales reduce the utility's profits.<sup>4</sup> Since public utility ratemaking uses average cost to set rates, this is a highly unlikely occurrence to find price above marginal cost. Depending on the specific conditions facing a utility, decoupling may not generate a profit motive for utilities to reduce sales through energy or water efficiency. Utilities could be placed into the position of delivering the predicted amount of energy savings expected by regulators but possibly without any profit motive other than the avoidance of regulatory penalties for not meeting a goal. This disincentive has become a major topic relative to alternative ratemaking mechanisms, as the growth in electricity sales is less correlated with the growth rate in the US GDP relative to the past, with such sales growing more slowly than the general economy has been in recent years.<sup>5</sup>

Brennan (2010) developed a social welfare model to derive conditions under which utilities would be incented to provide energy efficiency services, showing that decoupling must separate revenues from the generation of electricity and not just revenues and sales from the

<sup>4</sup> The key problem with the over-use of utility services is that public utility pricing is based on average versus marginal cost pricing. Utility services have an excess demand (over-consumed) and end-use efficiency resources have an excess supply (under-consumed) with general equilibrium not attained. The authors of this study are hard-pressed to find where the actual price of electricity is above private marginal cost.

<sup>5</sup> US electricity use is expected to experience an annual average growth rate of 0.9% compared with a 2.4% US GDP annual growth rate between 2011 and 2040, according to the US Energy Information Administration (EIA) forecast in 2013, as demonstrated in the EIA graph below.

distribution of electricity, leading to a highly complex form of electricity pricing regulation, rather than just the simpler separation of sales to the consumer and the related revenues collected. Brennan (2010a) compared incentive regulation using price caps versus decoupling. His paper analyzed the difference between separating profits from management decision-making and incentive-based regulation in the form of price caps which are meant to promote better input decision-making than rate of return regulation that provides an opportunity to earn a set rate of return, somewhat regardless of the outcomes of input choice decision-making. Brennan (2010a) concluded that utilities will encourage energy savings or more usage under price caps depending upon whether the price is below or above marginal cost, respectively.

Since the US is widely adopting decoupling (revenue caps) whereas the EU is doing the same with price caps, it is an ongoing natural experiment that allows for comparisons of the consumer surplus and shareholder value performance (collectively, social welfare) from EU price cap utilities and US decoupled utilities. Since the EU has adopted price caps and US has adopted decoupling, the data are not available to include EU decoupled utilities in this investigation.

Since decoupling, as a regulatory policy tool, is being adopted rapidly in the US (Edison Electric Institute, the US electric utility trade association, EEI (2015)), questions arise in rate proceedings regarding the impacts on the cost of common equity. Due to the importance of this issue and the lack of related literature, we investigate the impact of decoupling on the investor perceived risk of public utilities and resultant cost of common equity. The next section discusses the models that are the basis of the analysis. Section 3 discusses the empirical methodology. Section 4 describes the data. Section 5 discusses the results and Section 6 provides concluding remarks, policy recommendations and areas for future research.

## 2. The modeling approach

This paper uses the GCAPM developed by Michelfelder and Pilotte (2011) to estimate the impact of decoupling on the public utility cost of common equity. The model is based on generalizing variants of intertemporal capital asset pricing models. The literature discussing the development of the model based on more restrictive versions is voluminous and summarized by Michelfelder and Pilotte (2011) and therefore not repeated here. The GCAPM was empirically applied by Michelfelder and Pilotte (2011) to the full spectrum of assets on the US Treasury yield curve. The GCAPM is a financial valuation model recently developed as an alternative to the CAPM and the dividend discount model for estimating the cost of common equity. Ahern et al. (2011) and as Michelfelder (2015) review and apply the GCAPM to estimate public utilities' cost of common equity.

The GCAPM model has the following characteristics. It does not have restrictions on the coefficient of risk aversion in investors' utility function as do most models. It allows for a negative relation between

the rate of return and volatility.<sup>6</sup> This relation will occur for assets with prices that move in the opposite direction of the business cycle. Unlike the CAPM, the GCAPM prices the total risk actually faced by the investor and does not assume that all unsystematic risk is diversified away, which is a key foundation of the standard CAPM. There is no perfect portfolio that removes all idiosyncratic risk as assumed in the development of the CAPM. Unsystematic risk is reduced but not completely mitigated with a highly diversified portfolio and the standard CAPM understates the cost of common equity as it does not price all risk exposure. The priced risk in the GCAPM is based on the level of risk actually faced by the investor, not the risk theoretically imposed by the CAPM. Fama and French (2004) find that the CAPM understates returns and risk, based on a large empirical study of portfolios of common stocks with a continuum of low to high betas. The GCAPM also does not assume or require the efficient markets assumption as does the CAPM.

Ahern et al. (2011) find that the CAPM generates lower costs of common equity than the GCAPM. Michelfelder (2015) applied the GCAPM to estimate the cost of common equity to public utilities concluding that the CAPM does not price all risk faced by the investor and that the CAPM understates the cost of common equity for public utilities. The GCAPM is specified as:

$$E_i[R_{i,t+1}] - R_{f,t} = -\frac{vol_t[M_{t+1}]}{E_t[M_{t+1}]}vol_t[R_{i,t+1}]corr_t[M_{t+1}, R_{i,t+1}], \quad (1)$$

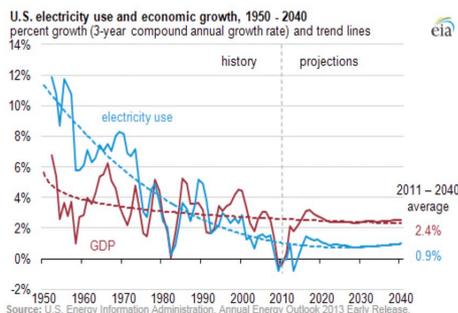

where the anticipated risk premium on an asset  $i$  depends on the conditional volatility of the asset;  $R_{i,t+1}$  is the ex ante return on asset  $i$ ;  $R_{f,t}$  is the rate of return on a risk-free asset at time  $t$ ;  $M_{t+1}$  is the stochastic discount factor (SDF);  $vol_t$  is the conditional volatility of the rate of return; and  $corr_t$  is the conditional correlation coefficient. The SDF is the intertemporal marginal rate of substitution in consumption, which is the ratio of expected future marginal utility to the current marginal utility of consumption. This is an important factor to discuss as this model specification allows for the empirical estimation to determine if decoupling results in more stable revenues for utilities relative to changes in the business cycle. If this holds true for a utility during a recession, then investment in the common stock of public utilities could be a business cycle hedge. The SDF is:

$$M_{t+1} = \left(\frac{1}{1+k}\right) \frac{U_{c,t+1}}{U_{c,t}}, \quad (2)$$

where the  $U_c$ 's are the marginal utilities of consumption and  $k$  is the discount rate for the period from  $t$  to  $t+1$ . The ratio  $M_{t+1}$  rises if expected future consumption falls below the current level due to the standard concave (to the origin) shape of investors' consumption utility function. This property allows the model to accommodate the business cycle (represented by consumption expenditures) hedging property of a given asset.

If the conditional volatility of intertemporal consumption, or consumption risk, rises, investors will price a greater risk premium into the asset. The sign of the relation between risk premium and its conditional volatility is defined by the correlation ( $corr_t$ ) of the risk premium and the SDF. The sign of the risk premium-to-volatility relation is opposite to the sign of the correlation of the asset return and the ratio of the marginal utilities. A decline in business cycle consumption increases investors' marginal utility. An asset that generates positive returns

(footnote continued)

<sup>6</sup> It seems counterintuitive, yet some investors are willing to pay (give up return) for more volatility in an asset's return rather than less, if the pattern of that volatility is desired by those investors. Some researchers confuse risk and volatility as synonymous. For example, gold returns have a tendency to spike upward during recessions and downturns in stock markets. Thus, gold can hedge the downturn in an investor's portfolio and offset the reduction in income from employment. Systematic upward spikes in gold prices increase volatility. Such increases in volatility are generally associated with reductions in the market returns to gold. Such assets with negative relations among returns and volatility are business cycle hedges.

when the business cycle is in a contraction with falling consumption, is a business cycle hedge. Therefore, a negative risk premium-to-volatility slope identifies the asset as a business cycle hedge.

This property allows us to infer whether decoupling causes a public utility common stock to be a business cycle hedge. If profits rise or are flat as GDP declines with lower commodity sales and stable revenues, the common stock price could systematically rise when the business cycle is contracting.<sup>7</sup> A public utility with a strong level of decoupling would conceivably experience stable revenues during a contraction in the business cycle. Therefore, utility profits may rise, or at least not fall, when commodity sales fall generated by consumer end-use efficiency and contracting GDP.

To calibrate the GCAPM, we perform a simple test of this property by estimating the model with the risk premium on gold (percent change in the price of gold per troy ounce minus a risk-free rate). Gold is commonly known to be a business cycle and common stock market hedging asset (Hillier et al. (2006)). The correlation coefficient between the quarterly percent changes in the price of gold and real GDP (data are publicly available from the St. Louis Federal Reserve Database) from 1968 to 2017 is  $-0.058$ . Hillier et al. (2006) show that gold is a common stock market hedge, especially during abnormally high periods of common stock market volatility. We used the daily and monthly US gold commodity cash price data and futures price data to estimate the GCAPM. The risk-premium-to-volatility slope “ $\alpha$ ” (see footnote 10) is either negative and significant or insignificant using daily and monthly data and many rolling time frames for estimation. These calibration test results for the GCAPM show that the model does detect a hedging asset.<sup>8</sup>

The GCAPM can be applied to any asset that is traded in any financial market and therefore can be applied to all traded public utility common stocks. The GCAPM has the added advantage that the decoupling impact on changes in common stock returns as well as the conditional volatility of these returns can be estimated separately within the same model using the GARCH-in-Mean (GARCH-M) method initially developed for asset model estimation. The GARCH-M method is discussed in the next section.

Decoupling is expected to lower the variance of the operating cash flows of a public utility due to the increased stability of revenues (Moody's (2011)). The variance of operating cash flows should be driven mainly by the variance of costs as follows: Operating Cash Flows (OCF) is Revenues (R) – Cost (C), therefore the variance of OCF is  $VAR(R-C) = VAR(R) + VAR(C) + 2COV(R,C)$ . Since the volatility of revenues is theoretically equal to zero with decoupling, the covariance of revenues and costs is zero as revenues do not vary, and volatility of OCF is purely driven by costs only as  $VAR(R-C) = VAR(C)$ . Therefore, in comparing the variance of operating cash flows with and without decoupling, the  $VAR(OCF \text{ with decoupling}) = VAR(C) < VAR(OCF \text{ without decoupling}) = VAR(R) + VAR(C) + 2COV(R,C)$  as  $VAR(R) = 0$  and  $COV(R,C) = 0$  with decoupling and  $VAR(R) > 0$  and  $COV(R,C) \neq 0$  without decoupling. This is essentially the model used by Moody's (2011) which found that utilities with decoupling experienced a reduction in business risk as measured by the change in the standard deviation of the growth rate in gross profit before and after decoupling.

We also estimate changes in systematic investment risk resulting from decoupling by analyzing the change in the short-term CAPM beta. This short-term beta (12-month), a measure of systematic risk, should be more sensitive to regime changes for a common stock relative to the standard betas estimated with five years of data typically employed to

assess investment risk. Beta is expected to decline with decoupling.<sup>9</sup>

The only other studies on the impact of decoupling on the utility cost of capital, Wharton and Vilbert (2015), estimated the impact of decoupling on the cost of capital for the overall electric and gas utility industries. They also addressed the issue that decoupled utilities may represent substantially less than the entire portfolio of assets reflected in the common stock price of a holding company. Using the standard dividend discount model to estimate the cost of common equity portion of their weighted average cost of capital estimates, they regressed this cost of capital on an intensity index of decoupling for each publicly-traded utility common stock with a panel-data regression to estimate the industry impact. They found no statistically significant impact of decoupling on the cost of capital.

The present study estimates the impact on the cost of common equity of the decoupled firm individually rather than that on an industry as a whole. We use the GCAPM and changes in beta before and after the implementation of decoupling to estimate the impact on risk and the cost of common equity.

### 3. Methodology

The GCAPM is estimated with the GARCH-M method.<sup>10</sup> GARCH-M specifies the conditional risk premium as a linear function of its conditional volatility, which is the specification of the GCAPM in equation (1). Since the returns data contains ARCH effects (available on request), another benefit of using GARCH-M is that it improves the efficiency of the estimates. Engle et al. (1987) developed the GARCH-M method and used it to estimate the relation between US Treasury and corporate bond yield risk premiums and their volatilities.

Two versions of the GCAPM-GARCH-M model are estimated. The first estimation includes a binary variable that reflects the implementation of decoupling for the specific utility ( $D_i = 1$  if decoupled, 0 otherwise) in the risk premium equation only and the volatility equation the same:

$$R_{i,t+1} - R_{f,t} = \alpha_{i,t} \sigma_{i,t+1}^2 + \alpha_{i,D} D_{i,t} + \varepsilon_{i,t+1} \quad (3)$$

where “ $\alpha$ , D” is an estimate of the decoupling impact on the risk premium.

The second estimation has the same variable in the volatility equation of the GARCH-M model only and the return equation does not (as shown in footnote 10 in the second set of equations):

$$\sigma_{i,t+1}^2 = \beta_0 + \beta_1 \sigma_{i,t}^2 + \beta_2 \varepsilon_{i,t}^2 + \beta_{i,D} D_{i,t} + \eta_{i,t+1} \quad (4)$$

<sup>9</sup> Systematic risk is defined as  $\beta_i = \rho_{i,m} \sigma_i / \sigma_m$ , where  $\rho_{i,m}$  is the correlation coefficient of the individual stock ( $i$ ) and the market ( $m$ ) total rates of return and  $\sigma_i$  and  $\sigma_m$  are the standard deviations of the individual stock and market returns, respectively. Defining variables with superscript “D”, to denote decoupling,  $\sigma_i^D$  and  $\rho_{i,m}^D$  should be lower as the volatility of the utility's returns are lower with decoupling and the utility's return has a lower correlation with the market return as the utility's revenues and profits are decoupled from the business cycle. Therefore systematic risk is lower with decoupling and defined as  $\beta_i^D = \rho_{i,m}^D \sigma_i^D / \sigma_m$ . Therefore,  $\beta_i^D$  is less than  $\beta_i$  as.

$$\rho_{i,m}^D \sigma_i^D / \sigma_m < \rho_{i,m} \sigma_i / \sigma_m$$

<sup>10</sup> The GCAPM was estimated with the GARCH-M method. The estimated models are.

$$R_{i,t+1} - R_{f,t} = \alpha_{i,t} \sigma_{i,t+1}^2 + \alpha_{i,D} D_{i,t} + \varepsilon_{i,t+1}$$

$$\sigma_{i,t+1}^2 = \beta_0 + \beta_1 \sigma_{i,t}^2 + \beta_2 \varepsilon_{i,t}^2 + \eta_{i,t+1},$$

$$\text{And } R_{i,t+1} - R_{f,t} = \alpha_{i,t} \sigma_{i,t+1}^2 + \varepsilon_{i,t+1}$$

$$\sigma_{i,t+1}^2 = \beta_0 + \beta_1 \sigma_{i,t}^2 + \beta_2 \varepsilon_{i,t}^2 + \beta_{i,D} D_{i,t} + \eta_{i,t+1}.$$

<sup>7</sup> One of the most effective “energy efficiency tools” to generate energy use reduction is a recession. Although the energy-use-US-GDP correlation has declined, it remains substantially positive (EIA (2013), as shown in the figure in footnote 4 above, [www.eia.gov/todayinenergy/detail.php?id=10491](http://www.eia.gov/todayinenergy/detail.php?id=10491)).

<sup>8</sup> All empirical results on gold are available on request.

where “ $\beta_i$ , D” is an estimate of the decoupling impact on the volatility of the risk premium.

These specifications provide separate empirical estimates of the impacts of decoupling on conditional public utility common stock returns and conditional volatility. As event studies, these and all financial market-based event studies face the question of when the event impacted asset prices. Asset prices can reflect forthcoming events before they are implemented. One example that is relevant for this investigation is when decoupling implementation was announced in a utility's regulatory decision. We find that using the date of implementation is a conservative approach to estimating the impact as it is most likely the latest date that a decoupling impact would be detected in a common stock price and much of the impact may already have been priced in the asset. However, if a utility's revenues have been decoupled from sales to the extent that revenues are not affected by the business cycle, then the utility's common stock as a hedging asset would be detected in a zero or negative alpha. Also, if a sufficiently long pre-decoupling time period for observing returns and volatility is obtained, the change in the post-period should be detected as all of the post-decoupling period returns and volatilities are in a different business risk regime.

#### 4. Data

We perform the empirical work on US utilities only. As discussed in the Introduction, decoupling has not been adopted in the EU. EU investor-owned utilities and their regulators have widely adopted price cap regulation, an alternative form of regulation to rate-base-rate-of-return regulation to promote expense and investment efficiency, but not necessarily to encourage utility expenditure on consumer end-use energy and water efficiency. The group of US public utility common stocks includes all electric and gas combination companies that have 95% or more of their revenues decoupled and water utility common stocks that have all of their revenues decoupled before 2014. Data for the common stock rates of return are the total monthly rates of return on the common stock of the public utilities from the Center for Research in Security Prices database (CRSP) of the University of Chicago. Data for each public utility common stock include differing pre- and post-decoupling dates and therefore differing rate of rate and beta samples. The pre-decoupling data for each common stock include all available past monthly returns data in the CRSP before decoupling for that common stock. Post-decoupling rate of returns data for all common stocks end at December 2014 for consistency in the post-decoupling ending period for all utility common stocks. We calculated historical monthly common stock equity risk premiums monthly common stock returns less the monthly yields on long-term U.S. Treasury Bonds for the selected publicly traded water utilities using common stock returns data from the CRSP database and Morningstar (2015) SBBI<sup>®</sup> 2015 Market Results for Stocks, Bonds, Bill and Inflation 1926–2015 and the Federal Reserve Statistical Release H.15 for long-term Treasury bond yields. The CAPM beta data include all short-term betas available for each public utility common stock that has been decoupled in the CRSP database and ends at 2014. They are available on an annual basis. The CAPM short-term beta<sup>11</sup> is a one-year estimate of beta that

<sup>11</sup> The CRSP short-term beta is described by CRSP as “a statistical measurement of the relationship between two time series, and has been used to compare security data with benchmark data to measure risk in financial data analysis. CRSP provides annual betas computed using the methods developed by Scholes and Williams (Myron Scholes and Joseph Williams, “Estimating Betas from Nonsynchronous Data,” *Journal of Financial Economics*, vol 5, 1977, 309–327). Beta is calculated each year as follows where.

$$\beta_i = \frac{\Sigma (ln_{i,t} * M3_t) - \left(\frac{1}{n_i}\right) * (\Sigma ln_{i,t}) * (\Sigma M3_t)}{\Sigma (IM_t * M3_t) - \left(\frac{1}{n_i}\right) * (\Sigma IM_t) * (\Sigma M3_t)}$$

approximately involves regressing daily rates of return on the public utility common stock on a market index as shown footnote 10. The standard beta available from financial firm databases such as Value Line Investment Survey or CRSP is a 5-year beta based on regressing monthly or weekly common stock rates of return for the past 5 years on a market index. We find that the longer-term beta would be less sensitive to regime changes in risk such as decoupling. We restrict the sample of pre- and post-decoupling betas for each common stock so that the number of beta observations are the same before and after decoupling.

Since the number of data observations has different times series of ranges for each public utility common stock and decoupling occurred on different dates for most utilities, we have developed Table 1 to show each public utility common stock's data date range, that is, the dates and number of risk premium (rate of return minus risk-free rate) observations used to estimate the GCAPM and the total number of betas used for the pre- and post beta comparison. Table 1 also has the date of decoupling for each public utility.

#### 5. Results and discussion

Table 2 presents the public utility common stocks in the study and the empirical results of the GCAPM estimates. The risk-premium-to-volatility slopes (“alpha”) are shown along with the decoupling slope in the risk-premium and volatility equations for each electric, electric and gas combination, and water utility common stocks. The decoupling slope in the risk-premium equation will be negative (positive) if the risk premium should decline (rise) and decoupling creates a reduction (increase) in business risk. None of these slope estimates are statistically significant. The decoupling slope in the volatility equation should be negative (positive) if decoupling caused a reduction (increase) in the volatility of the profit of the utilities. Two of the slopes are negative and significant at  $p = 0.10$ , yet the magnitudes of the slopes are very small.

All of the alphas, except for one of the energy utilities are positive and significant, yet none in the water utility group are significant. These results indicate that the energy utility common stocks are not business cycle hedging assets and that their profits are synchronized with the business cycle. The results for the water group may indicate that they are business cycle hedging assets as none are statistically significant. The zero value for alpha implies that there is no relation between the business cycle as represented by expected changes in consumption and the return on water utility common stocks. Water utility profits are not correlated with the business cycle even in the absence of decoupling. Also, water use attrition is occurring across the US as households (water consumption per household is declining) due to the use of water-efficient appliances (such as low-flow faucets, showerheads and efficient toilets) and the change per capita water use habits to conserve water.

Table 3 presents the pre- and post-decoupling changes in the systematic risk as represented by the short-term CAPM beta for all of the public utility common stocks. The betas drop after the implementation of decoupling but none of the changes in beta are statistically significant using a t-statistic at a  $p = 0.05$ . Additionally, the standard errors of the betas ( $\sigma_{pre}$  and  $\sigma_{post}$ ) show no consistent pattern of increasing or decreasing after decoupling.

Our results do not show any statistically significant impacts of decoupling on the cost of common equity and risk. Therefore, we find no evidence to conclude that decoupling affects investor perceived risk or the cost of common equity. While electric and gas public utility common stocks were not found to be business cycle hedges, we do find that water utility common stocks may be business cycle hedges.

Our results are based on the moderate amount of data available to date. Although we would obviously prefer more data than are available at this juncture, there is no time to wait for a larger volume of data. Regulators and utilities have been and are implementing policy now as if decoupling does reduce risk and the costs of capital without any

<sup>a</sup> The GCAPM was estimated with the GARCH-M method. The estimated models are.

$$R_{i,t+1} - R_{f,t} = \alpha_{i,t} \sigma_{i,t+1}^2 + \alpha_{i,D} D_{i,t} + \varepsilon_{i,t+1}$$

$$\sigma_{i,t+1}^2 = \beta_0 + \beta_1 \sigma_{i,t}^2 + \beta_2 \varepsilon_{i,t}^2 + \eta_{i,t+1}$$

$$\text{And } R_{i,t+1} - R_{f,t} = \alpha_{i,t} \sigma_{i,t+1}^2 + \varepsilon_{i,t+1}$$

$$\sigma_{i,t+1}^2 = \beta_0 + \beta_1 \sigma_{i,t}^2 + \beta_2 \varepsilon_{i,t}^2 + \beta_{i,D} D_{i,t} + \eta_{i,t+1}$$

evidence that it does. This paper serves as an early warning signal, albeit with the limited evidence that is available.

## 6. Conclusion and policy implications

We conclude that decoupling has no statistically measurable impact on the cost of common equity based on our empirical analysis for electric, electric and gas, and water utility common stocks. Some researchers may view this result as a “non-result.” This is an important finding as it is consistent with the empirical findings of [Vilbert et al. \(2016\)](#). It is also important for policy globally as decoupling is considered as a potential reducer to risk and the cost of common equity by regulators and public utilities in the US based on intuition, without any empirical evidence.

[Moody's \(2011\)](#) finds a reduction in business risk as measured by the change in the variability of gross profit after decoupling but did not estimate the impact on the cost of common equity. [Moody's \(2011\)](#) did find that electric utilities were somewhat reluctant to adopt decoupling as electric utility executives anticipated that growth in sales would return to the industry after the steep recession that ended with the business cycle trough in June 2009 ([NBER \(2018\)](#)). Since the US business cycle expansion post-June 2009, electricity sales have

<sup>a</sup> Beta is the annual year-ending beta from the CRSP database. The data timeframe is different for each utility with an equal number of annual pre- and post-decoupling beta data observations for the specific stock in the CRSP database and ends in 2014. Each single beta was estimated with one year of daily rate of return data. See [Table 1](#) and footnote 11. \*\*\*, \*\*, \* refers to statistical significance at 0.01, 0.05, and 0.10 respectively.

remained almost flat, which may have caused the change in sentiment toward decoupling by electric utility executives. Growth in a utility's commodity sales above the level used to design regulated rates would increase the profit and rate of return on common equity. The US investor-owned electric utility industry also expected that the adoption of decoupling would cause state public utility regulators to reduce their allowed rate of return under the notion that it reduces risk. [Moody's \(2011\)](#) was written soon after the recession had ended, but the anticipated growth in sales has not materialized after more than ten years into the US business cycle expansion. A few years after the [Moody's \(2011\)](#) study, the EEI found in a more recent report a change in sentiment ([EEI \(2015\)](#)) that electric utilities favor decoupling and that it has become more widespread across the US.

We conclude that decoupling has no statistically significant impact on investor perceived risk and the cost of common equity. This does not mean necessarily that decoupling has no impact on the perceived risk and the cost of common equity of public utilities. We find that it cannot be isolated and estimated, given the many other factors affecting investor perceived risk. For many electric utilities, some current major risk drivers are flat or declining sales from customer-owned solar projects and energy efficiency resources; the requirement to buy back excess customer generated electric from renewable resources at full retail

rates (net metering); increasing requirements in the proportion of a utility's sales that have to be generated from renewable energy, causing larger purchases of renewable energy credits (known as renewable portfolio standards that have been adopted by many states and across Europe); increasingly stringent environmental regulations on coal plants; and the impact of falling and low natural gas prices on the competitiveness of existing coal and nuclear plants.

For water utilities, we find their common stocks to be moderate business cycle hedges (no correlation with the business cycle rather than a strong negatively correlated hedge). Since water utility sales are declining on a per capita basis and unassociated with the business cycle, decoupling may provide financial protection if water revenues decline. To the extent that there is positive growth in the number of water utility customers that offsets the declining per capita consumption, total revenues and sales may not be falling. The impact of decoupling on water utility investment risk and cost of common equity was not able to be detected in this study. This is the first study on decoupling in the water utility industry and an area for future research.

Another explanation for the lack of detection of a change in risk or the cost of common equity from decoupling is that risk may be created with the implementation of decoupling and the net impact may not be clear as an increase or decrease in risk as [Vilbert et al. \(2016\)](#) and [Wharton and Vilbert \(2015\)](#) concludes. They find that the implementation of decoupling is a new and alternative regulatory regime that may be a new source of regulatory risk for the utility. Finally, as discussed in detail in the Introduction above, volume risk, that is, the fundamental nature of the business and business risk, is not alleviated by changing the reward mechanism, and attempts to do so may increase risk and the cost of common equity. The point is that there are cogent theoretical and practical bases to expect that decoupling increases or decreases risk, so it is problematic to develop an *a priori* hypothesis to test a one-way directional impact of risk and return from decoupling.

Therefore, we do not recommend that public utility regulators in the US or elsewhere reduce or increase authorized common equity cost rates in the presence of decoupling mechanisms based on the assumption of changed or reduced risk. The impact is *de minimis* and not statistically significant amongst all of the other investor perceived risk factors affecting the market prices of public utility common stocks. While an alternative research approach may attempt to isolate the impacts of other individual risk factors on the cost of common equity and risk, making for a long regression equation, we cannot detect a statistically significant signal of decoupling on the cost of common equity or volatility. As a contrast, for example, the risk and cost of common equity impact of owning nuclear power generation assets (versus no nuclear assets) has a measureable impact on investors' returns, risk and cost of common equity without attempting to isolate the myriad of other risk variable impacts. Decoupling as a regulatory policy

mechanism to encourage public utilities to provide resources and funding to their consumers to conserve electricity, natural gas, and water (therefore also wastewater flows) has no *measurable* impact on the investment risk and the cost of common equity (either up or down). As a policy prescription, public utility regulators should not adjust the allowed rate of return which affects the public utility's rates as a spillover impact of using decoupling to promote environmental policy.

Finally, the US may be further ahead in adopting rate mechanisms that address energy and water efficiency due to its long-term lag relative to Europe in the efficient use of energy and water and the recent "necessity-is-the-mother-of-invention" US driver of energy and water efficiency. European and regulators globally should proceed slowly in adopting decoupling and assuming that decoupling reduces risk as there is no empirical evidence to date that it does.

An extension of this research could evaluate risk premiums or discounts in bond yields as there are many more investor-owned utilities which have outstanding bonds relative to those that have their own publicly traded common stock due to consolidation in the utility industry in the US. For example, Exelon is the holding company of six utilities whose stocks were publicly traded on the New York Stock Exchange. They are Atlantic City Electric, Baltimore Gas and Electric, Commonwealth Edison, Delmarva Power and Light, Philadelphia Electric and Potomac Edison Power. Another future extension could focus on decoupling when some EU investor-owned utilities and regulators, inevitably, adopt decoupling should it prove to substantially encourage more conservation in the US. An investigation of hedging costs and savings, risk impacts, and effects on profits with and without decoupling may shed more light on the topic. There also needs more research on water/wastewater decoupling as this is the first study known to date on the topic involving cost of capital and risk. Lastly, a social welfare comparison, separating out consumer-surplus and shareholder-value creation and investigating the impacts on conservation from price and revenue caps is another extension of this paper for future research.

#### Appendix A. Supplementary data

Supplementary data to this article can be found online at <https://doi.org/10.1016/j.enpol.2019.04.006>. where  $R_i$  is the conditional total return on the stock,  $R_f$  is the risk-free rate of return,  $\sigma_{\epsilon_{i,t+1}}^2$  is the next period conditional volatility,  $D$  is the dummy variable that equals 1 when decoupling is in place, and  $\alpha_D$  and  $\beta_D$  are the slopes of the conditional returns and volatility decoupling dummy variable that represent the impact of decoupling on those variables. Monthly returns data are from the CRSP database and includes all data available from the CRSP database and ends at 12/2014. The monthly risk-free rate of return is the Ibbotson income return on Long-Term US Treasuries. \*\*\*, \*\*, \* refers to statistical significance at p values of 0.01, 0.05 and 0.10 respectively. where  $R_i$  is the conditional total return on the stock,  $R_f$  is the risk-free rate of return,  $\sigma_{\epsilon_{i,t+1}}^2$  is the next period conditional volatility of the risk premium for asset  $i$ .  $\epsilon_{i,t}$  and  $\eta_{i,t+1}$  are the error terms for the mean and volatility equations,  $D$  is the dummy variable that equals 1 when decoupling is in place for utility  $i$ , and  $\alpha_D$  and  $\beta_D$  are the slopes on the conditional returns and volatility decoupling dummy variable that represent the impact of decoupling on those variables.

The parameter,  $\alpha_i$ , is the risk-premium-to-volatility slope. It is specified from equation (1) as:

$$\alpha_{i,t} = -\frac{vol_t[M_{t+1}]}{E_t[M_{t+1}]}corr_t[M_{t+1}, R_{i,t+1}]$$

It is positive for assets that are not business cycle hedges as *corr<sub>t</sub>* is negative. A rising (falling)  $M$  and rising (falling) expected marginal utility from falling (rising) consumption in a recession is associated with a fall (rise) in returns. The above empirical model specifies a 0 intercept in the risk premium equation as does the GCAPM. The estimation results support the 0 intercept specification (results available upon request).

$\beta_i$  is the Beta for security  $i$  for the year being calculated,  $r_{i,t}$  is the return of security  $i$  at day  $t$ ,  $l r_{i,t} = \ln(1 + r_{i,t})$  is the natural log of the return of security  $i$  at time  $t+1$  or the continuously compounded return,  $M_t$  is the value-weighted market return at time  $t$ ,  $l M_t = \ln(1 + M_t)$  is the natural log of the value-weighted market return at time  $t+1$  or the continuously compounded return.

$M3_t = l M_{t-1} + l M_t + l M_{t+1}$  is the three-day moving window of the above market return,  $n_i$  is the number of non-missing returns for security  $i$  during the year, where the summations are over  $t$  and include all days on which security  $i$  traded, beginning with the first trading day of the year and ending with the last trading day of the year.”

### The Risk-Free Asset

The equity risk premium can be calculated for a variety of time horizons when given the choice of risk-free asset to be used in the calculation. The long-horizon, intermediate-horizon, and short-horizon equity risk premia calculated in Exhibit 10.8 and Exhibit 10.9 use the income return from (i) a 20-year Treasury bond, (ii) a 5-year Treasury bond, and (iii) a 30-day Treasury bill, respectively.<sup>215</sup>

### 20-Year vs. 30-Year Treasuries

The U.S. Treasury periodically changes the maturities that it issues. For example, in April 1986 the U.S. Treasury stopped issuing 20-year Treasuries, and from October 2001 through January 2006 the U.S. Treasury did not issue 30-year bonds (it resumed issuing 30-year Treasury bonds in February 2006), making the 10-year bond the longest-term Treasury security issued over the October 2001–January 2006 period. Most recently, on January 16, 2020 the U.S. Department of the Treasury announced it plans to issue a 20-year nominal coupon bond in the first half of calendar year 2020, the first time a 20-year maturity will be offered since March 1986.<sup>216,217</sup>

Our methodology for estimating the long-horizon equity risk premium makes use of the income return on a 20-year Treasury bond. While a 30-year bond is theoretically more correct when dealing with the long-term nature of business valuation,<sup>218</sup> 30-year Treasury securities have an issuance history that is on-again-off-again. Ibbotson Associates creates a series of returns using bonds on the market with approximately 20 years to maturity because Treasury bonds of this maturity are available over a long history, while Treasury bonds of 30-years are not.

### Income Return

Another point to keep in mind when calculating the equity risk premium is that the income return on the appropriate-horizon Treasury security, rather than the total return, is used in the calculation.

The total return comprises three return components: the income return, the capital appreciation return, and the reinvestment return. The income return is defined as the portion of the total return that results from a periodic cash flow or, in this case, the bond coupon payment. The capital appreciation return results from the price change of a bond over a specific period. Bond prices generally change in reaction to unexpected

<sup>215</sup> For U.S. Treasury Bills, the income return and total return are the same.

<sup>216</sup> To learn more, visit the U.S. Department of the Treasury website at: <https://home.treasury.gov/news/press-releases/sm878>.

<sup>217</sup> See Kate Davidson, "Treasury to Issue New 20-Year Bond in First Half of 2020", *The Wall Street Journal*, January 16, 2020 at: <https://www.wsj.com/articles/treasury-to-issue-new-20-year-bond-in-first-half-of-2020-11579217450>.

<sup>218</sup> An equity risk premium is an input in developing cost of capital estimates (i.e., "expected return", "required return", or "discount rate") for use in a discounted cash flow model. **Note:** The four Kroll (formerly Duff & Phelps) "Valuation Handbooks" have been transitioned from print to an online delivery platform, the "Cost of Capital Navigator". The Cost of Capital Navigator is an interactive, web-based platform that guides finance and investment professionals through the process of estimating cost of capital, globally. The Cost of Capital Navigator includes four modules: (i) the U.S. Cost of Capital Module, (ii) the U.S. Industry Benchmarking Module, (iii) the International Cost of Capital Module, and (iv) the International Industry Benchmarking Module. To learn more, visit [kroll.com/costofcapitalnavigator](http://kroll.com/costofcapitalnavigator).

fluctuations in yields. Reinvestment return is the return on a given month's investment income when reinvested into the same asset class in the subsequent months of the year. The income return is thus used in the estimation of the equity risk premium because it represents the truly riskless portion of the return.

### Arithmetic vs. Geometric Mean

The equity risk premium data presented in this book are arithmetic average risk premiums as opposed to geometric average risk premiums. The arithmetic average equity risk premium can be demonstrated to be most appropriate when discounting future cash flows. For use as the expected equity risk premium in either the CAPM or the building-block approach, the arithmetic mean or the simple difference of the arithmetic means of stock market returns and riskless rates is the relevant number.

This is because both the CAPM and the building-block approach are additive models, in which the cost of capital is the sum of its parts. The geometric average is more appropriate for reporting past performance because it represents the compound average return.

### Appropriate Historical Period

The equity risk premium can be estimated using any historical time period. For the U.S., market data exist at least as far back as the late 1800s. Therefore, it is possible to estimate the equity risk premium using data that covers roughly the past 125 years.

Our equity risk premium covers 1926 to the present. The original data source for the time series comprising the equity risk premium is the Center for Research in Security Prices. CRSP chose to begin its analysis of market returns with 1926 for two main reasons. CRSP determined that 1926 was approximately when quality financial data became available. They also made a conscious effort to include the period of extreme market volatility from the late 1920s and early 1930s; 1926 was chosen because it includes one full business cycle of data before the market crash of 1929.

Implicit in using history to forecast the future is the assumption that investors' expectations for future outcomes conform to past results. This method assumes that the price of taking on risk changes only slowly, if at all, over time. This "future equals the past" assumption is most applicable to a random time-series variable. A time-series variable is random if its value in one period is independent of its value in other periods.

### Choosing an Appropriate Historical Period

The estimate of the equity risk premium depends on the length of the data series studied. A proper estimate of the equity risk premium requires a data series long enough to give a reliable average without being unduly influenced by very good and very poor short-term returns. When calculated using a long data series, the historical equity risk premium is relatively stable. Furthermore, because an average of the realized

\*Compound Annual Return

# The Market Risk Premium: Expectational Estimates Using Analysts' Forecasts

Robert S. Harris and Felicia C. Marston

*Using expectational data from financial analysts, we estimate a market risk premium for US stocks. Using the S&P 500 as a proxy for the market portfolio, the average market risk premium is found to be 7.14% above yields on long-term US government bonds over the period 1982-1998. This risk premium varies over time; much of this variation can be explained by either the level of interest rates or readily available forward-looking proxies for risk. The market risk premium appears to move inversely with government interest rates suggesting that required returns on stocks are more stable than interest rates themselves. [JEL: G31, G12]*

■The notion of a market risk premium (the spread between investor required returns on safe and average risk assets) has long played a central role in finance. It is a key factor in asset allocation decisions to determine the portfolio mix of debt and equity instruments. Moreover, the market risk premium plays a critical role in the Capital Asset Pricing Model (CAPM), the most widely used means of estimating equity hurdle rates by practitioners. In recent years, the practical significance of estimating such a market premium has increased as firms, financial analysts, and investors employ financial frameworks to analyze corporate and investment performance. For instance, the increased use of Economic Value Added (EVA®) to assess corporate performance has provided a new impetus for estimating capital costs.

The most prevalent approach to estimating the market risk premium relies on some average of the historical spread between returns on stocks and bonds.<sup>1</sup> This

choice has some appealing characteristics but is subject to many arbitrary assumptions such as the relevant period for taking an average. Compounding the difficulty of using historical returns is the well noted fact that standard models of consumer choice would predict much lower spreads between equity and debt returns than have occurred in US markets—the so called equity risk premium puzzle (see Welch, 2000 and Siegel and Thaler, 1997). In addition, theory calls for a forward-looking risk premium that could well change over time.

This paper takes an alternate approach by using expectational data to estimate the market risk premium. The approach has two major advantages for practitioners. First, it provides an independent estimate that can be compared to historical averages. At a minimum, this can help in understanding likely ranges for risk premia. Second, expectational data allow investigation of changes in risk premia over time. Such time variations in risk premia serve as important signals from investors that should affect a host of financial decisions. This paper provides new tests of whether changes in risk premia over time are linked to forward-looking measures of risk. Specifically, we look at the

underlying dividend yield and growth components of  $k$  as Exhibit 2 illustrates. The results suggest that  $k$  is more stable than government interest rates. Such relative stability of  $k$  translates into parallel changes in the market risk premium. In a subsequent section, we examine whether changes in our market risk premium estimates appear linked to interest rate conditions and a number of proxies for risk.

We explored the sensitivity of the results to our screening procedures in selecting companies. The reported results screen out all non-dividend paying stocks on the premise that use of the DCF model is inappropriate in such cases. The dividend screen eliminates an average of 55 companies per month. In a given month, we also screen out firms with fewer than three analysts' forecasts, or if the standard deviation around the mean forecast exceeds 20%. When the analysis is repeated without any of the three screens, the average risk premium over the sample period increased by only 40 basis points, from 7.14% to 7.54%. The beta of the sample firms also was estimated and the sample average was one, suggesting that the screens do not systematically remove low or high-risk firms. (Specifically, using firms in the screened sample as of December 1997 (the last date for which we had CRSP return data), we used ordinary least squares regressions to estimate beta for each stock using the prior 60 months of data and the CRSP return (SPRTRN) as the market index. The value-weighted average of the individual betas was 1.00.)

The results reported here use firms in the S&P500 as reported by COMPUSTAT in September 1998. This could create a survivorship bias, especially in the earlier months of the sample. We compared our current results to those obtained in Harris and Marston (1992) for which there was data to update the S&P500 composition each month. For the overlapping period, January 1982-May 1991, the two procedures yield the same average market risk premium, 6.47%. This suggests that the firms departing from or entering the S&P500 index do so for a number of reasons with no discernable effect on the overall estimated S&P500 market risk premium.

**IV. Changes in the Market Risk Premium Over Time**

With changes in the economy and financial markets, equity investments may be perceived to change in risk. For instance, investor sentiment about future business conditions likely affects attitudes about the riskiness of equity investments compared to investments in the bond markets. Moreover, since bonds are risky investments themselves, equity risk premia (relative to bonds) could change due to changes in perceived riskiness of bonds, even if equities displayed no shifts in risk.

In earlier work covering the 1982-1991 period, Harris and Marston (1992) reported regression results indicating that the market premium decreased with the level of government interest rates and increased with the spread between corporate and government bond yields (BSPREAD). This bond yield spread was interpreted as a time series proxy for equity risk. In this paper, we introduce three additional *ex ante* measures of risk shown in Exhibit 1: CON, DISP, and VOL. The three measures come from three independent sets of data and are supplied by different agents in the economy (consumers, equity analysts, and investors (via option and share price data)). Exhibit 4 provides summary data on all four of these risk measures.

Exhibit 5 replicates and updates earlier analysis by Harris and Marston (1992).<sup>7</sup> The results confirm the earlier patterns. For the entire sample period, Panel A shows that risk premia are negatively related to interest rates. This negative relationship is also true for both

<sup>7</sup>OLS regressions with levels of variables generally showed severe autocorrelation. As a result, we used the Prais-Winsten method (on levels of variables) and also OLS regressions on first differences of variables. Since both methods yielded similar results and the latter had more stable coefficients across specifications, we report only the results using first differences. Tests using Durbin-Watson statistics from regressions in Exhibits 5 and 6 do not accept the hypothesis of autocorrelated errors (tests at .01 significance level, see Johnston, 1984). We also estimated the first difference model without an intercept and obtained estimates almost identical to those reported.

**Exhibit 4. Descriptive Statistics on Ex Ante Risk Measures**

Entries are based on monthly data. BSPREAD is the spread between yields on long-term corporate and government bonds. CON is the consumer confidence index. DISP measures the dispersion of analysts' forecasts of earnings growth. VOL is the volatility on the S&P500 index implied by options data. Variables are expressed in decimal form, (e.g., 12% = .12).

<i>Panel A. Variables are Monthly Levels</i>				
	Mean	Standard Deviation	Minimum	Maximum
BSPREAD	.0123	.0040	.0070	.0254

\*\*Significantly different from zero at the .05 level.

\*Significantly different from zero at the .01 level.

the 1980s and 1990s as displayed in Panels B and C. For the entire 1982 to 1998 period, the addition of the yield spread risk proxy to the regressions lowers the magnitude of the coefficient on government bond yields, as can be seen by comparing Equations (1) and (2) of Panel A. Furthermore, the coefficient of the yield spread (0.488) is itself significantly positive. This pattern suggests that a reduction in the risk differential between investment in government bonds and in corporate bonds is translated into a lower equity market risk premium.

In major respects, the results in Exhibit 5 parallel earlier findings. The market risk premium changes over time and appears inversely related to government interest rates but is positively related to the bond yield spread, which proxies for the incremental risk of

investing in equities as opposed to government bonds. One striking feature is the large negative coefficients on government bond yields. The coefficients indicate the equity risk premium declines by over 70 basis points for a 100 basis point increase in government interest rates.<sup>8</sup> This inverse relationship suggests

<sup>8</sup>The Exhibit 5 coefficients on  $i$  are significantly different from  $-1, 0$  suggesting that equity required returns do respond to interest rate changes. However, the large negative coefficients imply only minor adjustments of required returns to interest rate changes since the risk premium declines. In earlier work (Harris and Marston, 1992) the coefficient was significantly negative but not as large in absolute value. In that earlier work, we reported results using the Prais-Winsten estimators. When we use that estimation technique and recreate the second regression in Exhibit 5, the coefficient for  $i$  is  $-.584$  ( $t = -12.23$ ) for the entire sample period 1982-1998.

# **The Risk Premium Approach to Measuring a Utility's Cost of Equity**

**Eugene F. Brigham, Dilip K. Shome, and Steve R. Vinson**

*Eugene F. Brigham and Dilip K. Shome are faculty members of the University of Florida and the Virginia Polytechnic Institute and State University, respectively; Steve R. Vinson is affiliated with AT&T Communications.*

■ In the mid-1960s, Myron Gordon and others began applying the theory of finance to help estimate utilities' costs of capital. Previously, the standard approach in cost of equity studies was the "comparable earnings method," which involved selecting a sample of unregulated companies whose investment risk was judged to be comparable to that of the utility in question, calculating the average return on book equity (ROE) of these sample companies, and setting the utility's service rates at a level that would permit the utility to achieve the same ROE as comparable companies. This procedure has now been thoroughly discredited (see Robichek [15]), and it has been replaced by three market-oriented (as opposed to accounting-oriented) approaches: (i) the DCF method, (ii) the bond-yield-plus-risk-premium method, and (iii) the CAPM, which is a specific version of the generalized bond-yield-plus-risk-premium approach.

Our purpose in this paper is to discuss the risk-premium approach, including the market risk premium that is used in the CAPM. First, we critique the various procedures that have been used in the past to estimate risk premiums. Second, we present some data on esti-

mated risk premiums since 1965. Third, we examine the relationship between equity risk premiums and the level of interest rates, because it is important, for purposes of estimating the cost of capital, to know just how stable the relationship between risk premiums and interest rates is over time. If stability exists, then one can estimate the cost of equity at any point in time as a function of interest rates as reported in *The Wall Street Journal*, the *Federal Reserve Bulletin*, or some similar source.<sup>1</sup> Fourth, while we do not discuss the CAPM directly, our analysis does have some important implications for selecting a market risk premium for use in that model. Our focus is on utilities, but the methodology is applicable to the estimation of the cost of

---

<sup>1</sup>For example, the Federal Energy Regulatory Commission's Staff recently proposed that a risk premium be estimated every two years and that, between estimation dates, the last-determined risk premium be added to the current yield on ten-year Treasury bonds to obtain an estimate of the cost of equity to an average utility (Docket RM 80-36). Subsequently, the FCC made a similar proposal ("Notice of Proposed Rulemaking," August 13, 1984, Docket No. 84-800). Obviously, the validity of such procedures depends on (i) the accuracy of the risk premium estimate and (ii) the stability of the relationship between risk premiums and interest rates. Both proposals are still under review.

equity for any publicly traded firm, and also for non-traded firms for which an appropriate risk class can be assessed, including divisions of publicly traded corporations.<sup>2</sup>

### Alternative Procedures for Estimating Risk Premiums

In a review of both rate cases and the academic literature, we have identified three basic methods for estimating equity risk premiums: (i) the *ex post*, or historic, yield spread method; (ii) the survey method; and (iii) an *ex ante* yield spread method based on DCF analysis.<sup>3</sup> In this section, we briefly review these three methods.

#### Historic Risk Premiums

A number of researchers, most notably Ibbotson and Sinquefeld [12], have calculated historic holding period returns on different securities and then estimated risk premiums as follows:

$$\text{Historic Risk Premium} = \left( \begin{array}{c} \text{Average of the} \\ \text{annual returns on} \\ \text{a stock index for} \\ \text{a particular} \\ \text{past period} \end{array} \right) - \left( \begin{array}{c} \text{Average of the} \\ \text{annual returns on} \\ \text{a bond index for} \\ \text{the same} \\ \text{past period} \end{array} \right) \quad (1)$$

Ibbotson and Sinquefeld (I&S) calculated both arithmetic and geometric average returns, but most of their risk-premium discussion was in terms of the geometric averages. Also, they used both corporate and Treasury bond indices, as well as a T-bill index, and they analyzed all possible holding periods since 1926. The I&S study has been employed in numerous rate cases in two ways: (i) directly, where the I&S historic risk premium is added to a company's bond yield to obtain an esti-

<sup>2</sup>The FCC is particularly interested in risk-premium methodologies, because (i) only eighteen of the 1,400 telephone companies it regulates have publicly-traded stock, and hence offer the possibility of DCF analysis, and (ii) most of the publicly-traded telephone companies have both regulated and unregulated assets, so a corporate DCF cost might not be applicable to the regulated units of the companies.

<sup>3</sup>In rate cases, some witnesses also have calculated the differential between the yield to maturity (YTM) of a company's bonds and its concurrent ROE, and then called this differential a risk premium. In general, this procedure is unsound, because the YTM on a bond is a *future expected* return on the bond's *market value*, while the ROE is the *past realized* return on the stock's *book value*. Thus, comparing YTM's and ROE's is like comparing apples and oranges.

mate of its cost of equity, and (ii) indirectly, where I&S data are used to estimate the market risk premium in CAPM studies.

There are both conceptual and measurement problems with using I&S data for purposes of estimating the cost of capital. Conceptually, there is no compelling reason to think that investors expect the same relative returns that were earned in the past. Indeed, evidence presented in the following sections indicates that relative expected returns should, and do, vary significantly over time. Empirically, the measured historic premium is sensitive both to the choice of estimation horizon and to the end points. These choices are essentially arbitrary, yet they can result in significant differences in the final outcome. These measurement problems are common to most forecasts based on time series data.

#### The Survey Approach

One obvious way to estimate equity risk premiums is to poll investors. Charles Benore [1], the senior utility analyst for Paine Webber Mitchell Hutchins, a leading institutional brokerage house, conducts such a survey of major institutional investors annually. His 1983 results are reported in Exhibit 1.

**Exhibit 1.** Results of Risk Premium Survey, 1983\*

Assuming a double A, long-term utility bond currently yields 12½%, the common stock for the same company would be fairly priced relative to the bond if its expected return was as follows:

Total Return	Indicated Risk Premium (basis points)	Percent of Respondents
over 20½%	over 800	
20½%	800	
19½%	700	
18½%	600	10%
17½%	500	8%
16½%	400	29%
15½%	300	35%
14½%	200	16%
13½%	100	0%
under 13½%	under 100	1%
<b>Weighted average</b>	<b>358</b>	<b>100%</b>

\*Benore's questionnaire included the first two columns, while his third column provided a space for the respondents to indicate which risk premium they thought applied. We summarized Benore's responses in the frequency distribution given in Column 3. Also, in his questionnaire each year, Benore adjusts the double A bond yield and the total return (Column 1) to reflect current market conditions. Both the question above and the responses to it were taken from the survey conducted in April 1983.

Benore's results, as measured by the average risk premiums, have varied over the years as follows:

Year	Average RP (basis points)
1978	491
1979	475
1980	423
1981	349
1982	275
1983	358

The survey approach is conceptually sound in that it attempts to measure investors' expectations regarding risk premiums, and the Benore data also seem to be carefully collected and processed. Therefore, the Benore studies do provide one useful basis for estimating risk premiums. However, as with most survey results, the possibility of biased responses and/or biased sampling always exists. For example, if the responding institutions are owners of utility stocks (and many of them are), and if the respondents think that the survey results might be used in a rate case, then they might bias upward their responses to help utilities obtain higher authorized returns. Also, Benore surveys large institutional investors, whereas a high percentage of utility stocks are owned by individuals rather than institutions, so there is a question as to whether his reported risk premiums are really based on the expectations of the "representative" investor. Finally, from a pragmatic standpoint, there is a question as to how to use the Benore data for utilities that are not rated AA. The Benore premiums can be applied as an add-on to the own-company bond yields of any given utility only if it can be assumed that the premiums are constant across bond rating classes. *A priori*, there is no reason to believe that the premiums will be constant.

#### DCF-Based *Ex Ante* Risk Premiums

In a number of studies, the DCF model has been used to estimate the *ex ante* market risk premium,  $RP_M$ . Here, one estimates the average expected future return on equity for a group of stocks,  $k_M$ , and then subtracts the concurrent risk-free rate,  $R_F$ , as proxied by the yield to maturity on either corporate or Treasury securities:<sup>4</sup>

$$RP_M = k_M - R_F. \quad (2)$$

Conceptually, this procedure is exactly like the I&S approach except that one makes direct estimates of future expected returns on stocks and bonds rather than

assuming that investors expect future returns to mirror past returns.

The most difficult task, of course, is to obtain a valid estimate of  $k_M$ , the expected rate of return on the market. Several studies have attempted to estimate DCF risk premiums for the utility industry and for other stock market indices. Two of these are summarized next.

**Vandell and Kester.** In a recently published monograph, Vandell and Kester [18] estimated *ex ante* risk premiums for the period from 1944 to 1978.  $R_F$  was measured both by the yield on 90-day T-bills and by the yield on the Standard and Poor's AA Utility Bond Index. They measured  $k_M$  as the average expected return on the S&P's 500 Index, with the expected return on individual securities estimated as follows:

$$k_i = \left( \frac{D_i}{P_0} \right)_i + g_i, \quad (3)$$

where,

- $D_i$  = dividend per share expected over the next twelve months,
- $P_0$  = current stock price,
- $g$  = estimated long-term constant growth rate, and
- $i$  = the  $i^{\text{th}}$  stock.

To estimate  $g_i$ , Vandell and Kester developed fifteen forecasting models based on both exponential smoothing and trend-line forecasts of earnings and dividends, and they used historic data over several estimating horizons. Vandell and Kester themselves acknowledge that, like the Ibbotson-Sinquefeld premiums, their analysis is subject to potential errors associated with trying to estimate expected future growth purely from past data. We shall have more to say about this point later.

<sup>4</sup>In this analysis, most people have used yields on long-term bonds rather than short-term money market instruments. It is recognized that long-term bonds, even Treasury bonds, are not risk free, so an  $RP_M$  based on these debt instruments is smaller than it would be if there were some better proxy to the long-term riskless rate. People have attempted to use the T-bill rate for  $R_F$ , but the T-bill rate embodies a different average inflation premium than stocks, and it is subject to random fluctuations caused by monetary policy, international currency flows, and other factors. Thus, many people believe that for cost of capital purposes,  $R_F$  should be based on long-term securities.

We did test to see how debt maturities would affect our calculated risk premiums. If a short-term rate such as the 30-day T-bill rate is used, measured risk premiums jump around widely and, so far as we could tell, randomly. The choice of a maturity in the 10- to 30-year range has little effect, as the yield curve is generally fairly flat in that range.

**Malkiel.** Malkiel [14] estimated equity risk premiums for the Dow Jones Industrials using the DCF model. Recognizing that the constant dividend growth assumption may not be valid, Malkiel used a nonconstant version of the DCF model. Also, rather than rely exclusively on historic data, he based his growth rates on Value Line's five-year earnings growth forecasts plus the assumption that each company's growth rate would, after an initial five-year period, move toward a long-run real national growth rate of four percent. He also used ten-year maturity government bonds as a proxy for the riskless rate. Malkiel reported that he tested the sensitivity of his results against a number of different types of growth rates, but, in his words, "The results are remarkably robust, and the estimated risk premiums are all very similar." Malkiel's is, to the best of our knowledge, the first risk-premium study that uses analysts' forecasts. A discussion of analysts' forecasts follows.

#### **Security Analysts' Growth Forecasts**

*Ex ante* DCF risk premium estimates can be based either on expected growth rates developed from time series data, such as Vandell and Kester used, or on analysts' forecasts, such as Malkiel used. Although there is nothing inherently wrong with time series-based growth rates, an increasing body of evidence suggests that primary reliance should be placed on analysts' growth rates. First, we note that the observed market price of a stock reflects the consensus view of investors regarding its future growth. Second, we know that most large brokerage houses, the larger institutional investors, and many investment advisory organizations employ security analysts who forecast future EPS and DPS, and, to the extent that investors rely on analysts' forecasts, the consensus of analysts' forecasts is embodied in market prices. Third, there have been literally dozens of academic research papers dealing with the accuracy of analysts' forecasts, as well as with the extent to which investors actually use them. For example, Cragg and Malkiel [7] and Brown and Rozeff [5] determined that security analysts' forecasts are more relevant in valuing common stocks and estimating the cost of capital than are forecasts based solely on historic time series. Stanley, Lewellen, and Schlarbaum [16] and Linke [13] investigated the importance of analysts' forecasts and recommendations to the investment decisions of individual and institutional investors. Both studies indicate that investors rely heavily on analysts' reports and incorporate analysts' forecast information in the formation of their

expectations about stock returns. A representative listing of other work supporting the use of analysts' forecasts is included in the References section. Thus, evidence in the current literature indicates that (i) analysts' forecasts are superior to forecasts based solely on time series data, and (ii) investors do rely on analysts' forecasts. Accordingly, we based our cost of equity, and hence risk premium estimates, on analysts' forecast data.<sup>5</sup>

#### **Risk Premium Estimates**

For purposes of estimating the cost of capital using the risk premium approach, it is necessary either that the risk premiums be time-invariant or that there exists a predictable relationship between risk premiums and interest rates. If the premiums are constant over time, then the constant premium could be added to the prevailing interest rate. Alternatively, if there exists a stable relationship between risk premiums and interest rates, it could be used to predict the risk premium from the prevailing interest rate.

To test for stability, we obviously need to calculate risk premiums over a fairly long period of time. Prior to 1980, the only consistent set of data we could find came from Value Line, and, because of the work involved, we could develop risk premiums only once a year (on January 1). Beginning in 1980, however, we began collecting and analyzing Value Line data on a monthly basis, and in 1981 we added monthly estimates from Merrill Lynch and Salomon Brothers to our data base. Finally, in mid-1983, we expanded our analysis to include the IBES data.

#### **Annual Data and Results, 1966-1984**

Over the period 1966-1984, we used Value Line data to estimate risk premiums both for the electric utility industry and for industrial companies, using the companies included in the Dow Jones Industrial and Utility averages as representative of the two groups. Value Line makes a five-year growth rate forecast, but it also gives data from which one can develop a longer-term forecast. Since DCF theory calls for a truly long-term (infinite horizon) growth rate, we concluded that it was better to develop and use such a forecast than to

<sup>5</sup>Recently, a new type of service that summarizes the key data from most analysts' reports has become available. We are aware of two sources of such services, the Lynch, Jones, and Ryan's Institutional Brokers Estimate System (IBES) and Zack's Icarus Investment Service. IBES and the Icarus Service gather data from both buy-side and sell-side analysts and provide it to subscribers on a monthly basis in both a printed and a computer-readable format.

**Exhibit 2.** Estimated Annual Risk Premiums, Nonconstant (Value Line) Model, 1966-1984

January 1 of the Year Reported	Dow Jones Electrics			Dow Jones Industrials			(3) ÷ (6)
	k <sub>Avg</sub>	R <sub>F</sub>	RP	k <sub>Avg</sub>	R <sub>F</sub>	RP	
	(1)	(2)	(3)	(4)	(5)	(6)	(7)
1966	8.11%	4.50%	3.61%	9.56%	4.50%	5.06%	0.71
1967	9.00%	4.76%	4.24%	11.57%	4.76%	6.81%	0.62
1968	9.68%	5.59%	4.09%	10.56%	5.59%	4.97%	0.82
1969	9.34%	5.88%	3.46%	10.96%	5.88%	5.08%	0.68
1970	11.04%	6.91%	4.13%	12.22%	6.91%	5.31%	0.78
1971	10.80%	6.28%	4.52%	11.23%	6.28%	4.95%	0.91
1972	10.53%	6.00%	4.53%	11.09%	6.00%	5.09%	0.89
1973	11.37%	5.96%	5.41%	11.47%	5.96%	5.51%	0.98
1974	13.85%	7.29%	6.56%	12.38%	7.29%	5.09%	1.29
1975	16.63%	7.91%	8.72%	14.83%	7.91%	6.92%	1.26
1976	13.97%	8.23%	5.74%	13.32%	8.23%	5.09%	1.13
1977	12.96%	7.30%	5.66%	13.63%	7.30%	6.33%	0.89
1978	13.42%	7.87%	5.55%	14.75%	7.87%	6.88%	0.81
1979	14.92%	8.99%	5.93%	15.50%	8.99%	6.51%	0.91
1980	16.39%	10.18%	6.21%	16.53%	10.18%	6.35%	0.98
1981	17.61%	11.99%	5.62%	17.37%	11.99%	5.38%	1.04
1982	17.70%	14.00%	3.70%	19.30%	14.00%	5.30%	0.70
1983	16.30%	10.66%	5.64%	16.53%	10.66%	5.87%	0.96
1984	16.03%	11.97%	4.06%	15.72%	11.97%	3.75%	1.08

use the five-year prediction.<sup>6</sup> Therefore, we obtained data as of January 1 from Value Line for each of the Dow Jones companies and then solved for k, the expected rate of return, in the following equation:

$$P_0 = \sum_{t=1}^n \frac{D_t}{(1+k)^t} + \left( \frac{D_n(1+g_n)}{k-g_n} \right) \left( \frac{1}{1+k} \right)^n \quad (4)$$

Equation (4) is the standard nonconstant growth DCF model; P<sub>0</sub> is the current stock price; D<sub>t</sub> represents the forecasted dividends during the nonconstant growth period; n is the years of nonconstant growth; D<sub>n</sub> is the first constant growth dividend; and g<sub>n</sub> is the constant, long-run growth rate after year n. Value Line provides D<sub>t</sub> values for t = 1 and t = 4, and we interpolated to obtain D<sub>2</sub> and D<sub>3</sub>. Value Line also gives estimates for

ROE and for the retention rate (b) in the terminal year, n, so we can forecast the long-term growth rate as g<sub>n</sub> = b(ROE). With all the values in Equation (4) specified except k, we can solve for k, which is the DCF rate of return that would result if the Value Line forecasts were met, and, hence, the DCF rate of return implied in the Value Line forecast.<sup>7</sup>

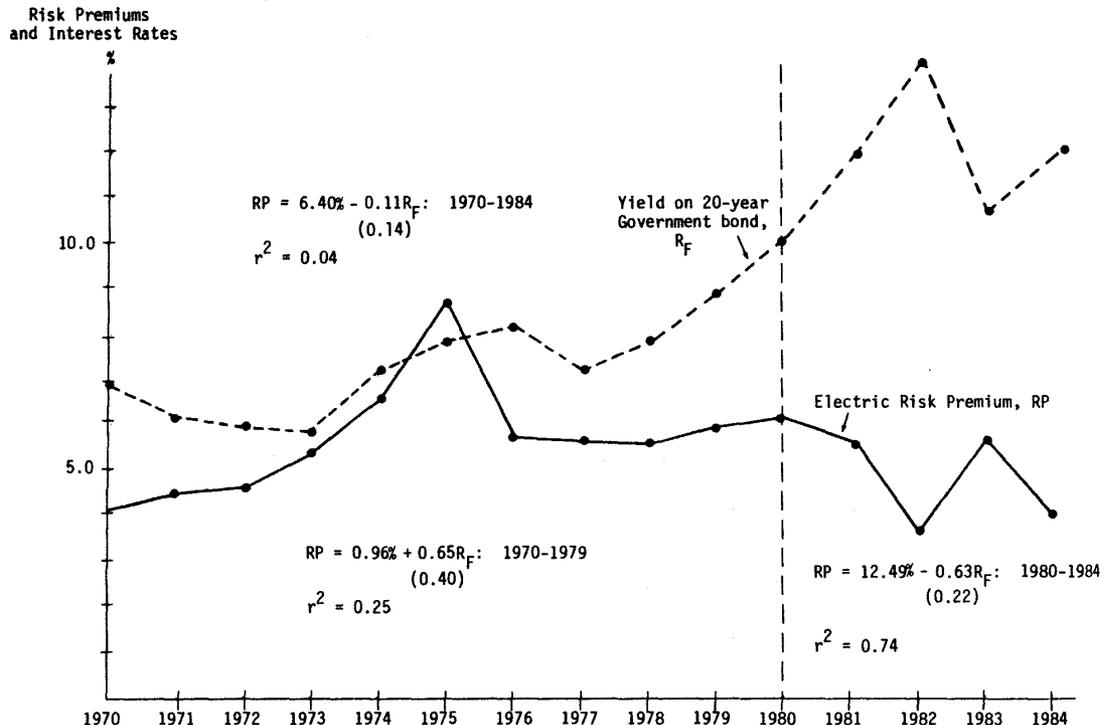

Having estimated a k value for each of the electric and industrial companies, we averaged them (using market-value weights) to obtain a k value for each group, after which we subtracted R<sub>F</sub> (taken as the December 31 yield on twenty-year constant maturity Treasury bonds) to obtain the estimated risk premiums shown in Exhibit 2. The premiums for the electrics are plotted in Exhibit 3, along with interest rates. The following points are worthy of note:

1. Risk premiums fluctuate over time. As we shall see in the next section, fluctuations are even wider when measured on a monthly basis.
2. The last column of Exhibit 2 shows that risk premi-

<sup>6</sup>This is a debatable point. Cragg and Malkiel, as well as many practicing analysts, feel that most investors actually focus on five-year forecasts. Others, however, argue that five-year forecasts are too heavily influenced by base-year conditions and/or other nonpermanent conditions for use in the DCF model. We note (i) that most published forecasts do indeed cover five years, (ii) that such forecasts are typically "normalized" in some fashion to alleviate the base-year problem, and (iii) that for relatively stable companies like those in the Dow Jones averages, it generally does not matter greatly if one uses a normalized five-year or a longer-term forecast, because these companies meet the conditions of the constant-growth DCF model rather well.

<sup>7</sup>Value Line actually makes an explicit price forecast for each stock, and one could use this price, along with the forecasted dividends, to develop an expected rate of return. However, Value Line's forecasted stock price builds in a forecasted change in k. Therefore, the forecasted price is inappropriate for use in estimating current values of k.

**Exhibit 3.** Equity Risk Premiums for Electric Utilities and Yields on 20-Year Government Bonds, 1970-1984\*

\*Standard errors of the coefficients are shown in parentheses below the coefficients.

ums for the utilities increased relative to those for the industrials from the mid-1960s to the mid-1970s. Subsequently, the perceived riskiness of the two groups has, on average, been about the same. 3. Exhibit 3 shows that, from 1970 through 1979, utility risk premiums tended to have a positive association with interest rates: when interest rates rose, so did risk premiums, and vice versa. However, beginning in 1980, an inverse relationship appeared: rising interest rates led to declining risk premiums. We shall discuss this situation further in the next section.

**Monthly Data and Results, 1980-1984**

In early 1980, we began calculating risk premiums on a monthly basis. At that time, our only source of analysts' forecasts was Value Line, but beginning in 1981 we also obtained Merrill Lynch and Salomon Brothers' data, and then, in mid-1983, we obtained

IBES data. Because our focus was on utilities, we restricted our monthly analysis to that group.

Our 1980-1984 monthly risk premium data, along with Treasury bond yields, are shown in Exhibits 4 and 5 and plotted in Exhibits 6, 7, and 8. Here are some comments on these Exhibits:

1. Risk premiums, like interest rates and stock prices, are volatile. Our data indicate that it would not be appropriate to estimate the cost of equity by adding the current cost of debt to a risk premium that had been estimated in the past. Current risk premiums should be matched with current interest rates.
2. Exhibit 6 confirms the 1980-1984 section of Exhibit 3 in that it shows a strong inverse relationship between interest rates and risk premiums; we shall discuss shortly why this relationship holds.
3. Exhibit 7 shows that while risk premiums based on Value Line, Merrill Lynch, and Salomon Brothers

**Exhibit 8. Comparative Risk Premium Data**

do differ, the differences are not large given the nature of the estimates, and the premiums follow one another closely over time. Since all of the analysts are examining essentially the same data and since utility companies are not competitive with one another, and hence have relatively few secrets, the similarity among the analysts' forecasts is not surprising.

- The IBES data, presented in Exhibit 5 and plotted in Exhibit 8, contain too few observations to enable us to draw strong conclusions, but (i) the Dow Jones Electrics risk premiums based on our three-analyst data have averaged 27 basis points above premiums based on the larger group of analysts surveyed by IBES and (ii) the premiums on the 11 Dow Jones Electrics have averaged 54 basis points higher than premiums for the entire utility industry followed by IBES. Given the variability in the data, we are, at this point, inclined to attribute these differences to random fluctuations, but as more data become available, it may turn out that the differences are statistically significant. In particular, the 11 electric utilities included in the Dow

Jones Utility Index all have large nuclear investments, and this may cause them to be regarded as riskier than the industry average, which includes both nuclear and non-nuclear companies.

**Tests of the Reasonableness of the Risk Premium Estimates**

So far our claims to the reasonableness of our risk-premium estimates have been based on the reasonableness of our variable measures, particularly the measures of expected dividend growth rates. Essentially, we have argued that since there is strong evidence in the literature in support of analysts' forecasts, risk premiums based on these forecasts are reasonable. In the spirit of positive economics, however, it is also important to demonstrate the reasonableness of our results more directly.

It is theoretically possible to test for the validity of the risk-premium estimates in a CAPM framework. In a cross-sectional estimate of the CAPM equation,

$$(k - R_F)_i = \alpha_0 + \alpha_1 \beta_i + u_i \quad (5)$$

we would expect

$$\hat{\alpha}_0 = 0 \text{ and } \hat{\alpha}_1 = k_M - R_F = \text{Market risk premium.}$$

This test, of course, would be a joint test of both the CAPM and the reasonableness of our risk-premium estimates. There is a great deal of evidence that questions the empirical validity of the CAPM, especially when applied to regulated utilities. Under these conditions, it is obvious that no unambiguous conclusion can be drawn regarding the efficacy of the premium estimates from such a test.<sup>8</sup>

A simpler and less ambiguous test is to show that the risk premiums are higher for lower rated firms than for higher rated firms. Using 1984 data, we classified the

<sup>8</sup>We carried out the test on a monthly basis for 1984 and found positive but statistically insignificant coefficients. A typical result (for April 1984) follows:

$$(k - R_F)_i = 3.1675 + 1.8031 \beta_i$$

(0.91)      (1.44)

The figures in parentheses are standard errors. Utility risk premiums do increase with betas, but the intercept term is not zero as the CAPM would predict, and  $\alpha_1$  is both less than the predicted value and not statistically significant. Again, the observation that the coefficients do not conform to CAPM predictions could be as much a problem with CAPM specification for utilities as with the risk premium estimates.

A similar test was carried out by Friend, Westerfield, and Granito [9]. They tested the CAPM using expectational (survey) data rather than *ex post* holding period returns. They actually found their coefficient of  $\beta_i$  to be negative in all their cross-sectional tests.

**Exhibit 9.** Relationship between Risk Premiums and Bond Ratings, 1984\*

Month	Aaa/AA	AA	Aa/A	A	A/BBB	BBB	Below BBB
January <sup>†</sup>	—	2.61%	3.06%	3.70%	5.07%	4.90%	9.45%
February	2.98%	3.17%	3.36%	4.03%	5.26%	5.14%	7.97%
March	2.34%	3.46%	3.29%	4.06%	5.43%	5.02%	8.28%
April	2.37%	3.03%	3.29%	3.88%	5.29%	4.97%	6.96%
May	2.00%	2.48%	3.42%	3.72%	4.72%	6.64%	8.81%
June	0.72%	2.17%	2.46%	3.16%	3.76%	5.00%	5.58%
Average	2.08%	2.82%	3.15%	3.76%	4.92%	5.28%	7.84%

\*The risk premiums are based on IBES data for the electric utilities followed by both IBES and Salomon Brothers. The number of electric utilities followed by both firms varies from month to month. For the period between January and June 1984, the number of electric utilities followed by both firms ranged from 96 to 99 utilities.

<sup>†</sup>In January, there were no Aaa/AA companies. Subsequently, four utilities were upgraded to Aaa/AA.

utility industry into risk groups based on bond ratings. For each rating group, we estimated the average risk premium. The results, presented in Exhibit 9, clearly show that the lower the bond rating, the higher the risk premiums. Our premium estimates therefore would appear to pass this simple test of reasonableness.

### Risk Premiums and Interest Rates

Traditionally, stocks have been regarded as being riskier than bonds because bondholders have a prior claim on earnings and assets. That is, stockholders stand at the end of the line and receive income and/or assets only after the claims of bondholders have been satisfied. However, if interest rates fluctuate, then the holders of long-term bonds can suffer losses (either realized or in an opportunity cost sense) even though they receive all contractually due payments. Therefore, if investors' worries about "interest rate risk" versus "earning power risk" vary over time, then perceived risk differentials between stocks and bonds, and hence risk premiums, will also vary.

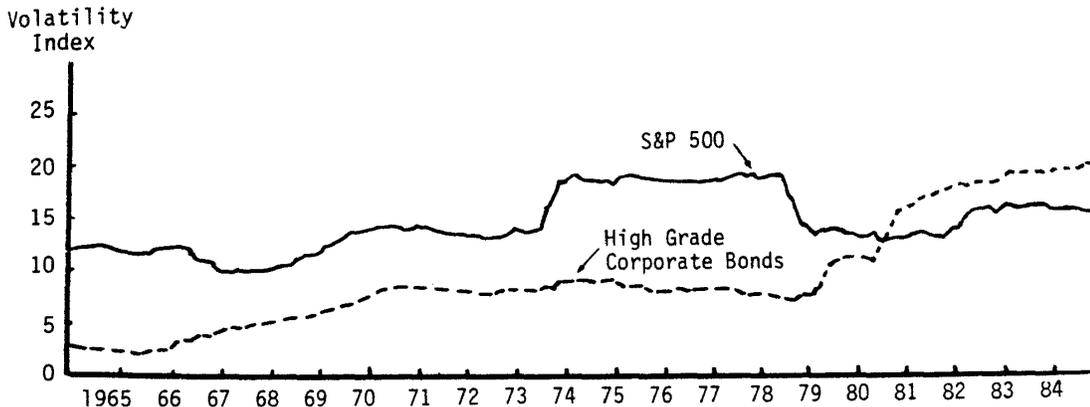

Any number of events could occur to cause the perceived riskiness of stocks versus bonds to change, but probably the most pervasive factor, over the 1966-1984 period, is related to inflation. Inflationary expectations are, of course, reflected in interest rates. Therefore, one might expect to find a relationship between risk premiums and interest rates. As we noted in our discussion of Exhibit 3, risk premiums were positively correlated with interest rates from 1966 through 1979, but, beginning in 1980, the relationship turned negative. A possible explanation for this change is given next.

**1966-1979 Period.** During this period, inflation heated up, fuel prices soared, environmental problems

surfaced, and demand for electricity slowed even as expensive new generating units were nearing completion. These cost increases required offsetting rate hikes to maintain profit levels. However, political pressure, combined with administrative procedures that were not designed to deal with a volatile economic environment, led to long periods of "regulatory lag" that caused utilities' earned ROEs to decline in absolute terms and to fall far below the cost of equity. These factors combined to cause utility stockholders to experience huge losses: S&P's Electric Index dropped from a mid-1960s high of 60.90 to a mid-1970s low of 20.41, a decrease of 66.5%. Industrial stocks also suffered losses during this period, but, on average, they were only one third as severe as the utilities' losses. Similarly, investors in long-term bonds had losses, but bond losses were less than half those of utility stocks. Note also that, during this period, (i) bond investors were able to reinvest coupons and maturity payments at rising rates, whereas the earned returns on equity did not rise, and (ii) utilities were providing a rising share of their operating income to debtholders versus stockholders (interest expense/book value of debt was rising, while net income/common equity was declining). This led to a widespread belief that utility commissions would provide enough revenues to keep utilities from going bankrupt (barring a disaster), and hence to protect the bondholders, but that they would not necessarily provide enough revenues either to permit the expected rate of dividend growth to occur or, perhaps, even to allow the dividend to be maintained.

Because of these experiences, investors came to regard inflation as having a more negative effect on utility stocks than on bonds. Therefore, when fears of inflation increased, utilities' measured risk premiums

**Exhibit 10.** Relative Volatility\* of Stocks and Bonds, 1965-1984

\*Volatility is measured as the standard deviation of total returns over the last 5 years.  
 Source: Merrill Lynch, *Quantitative Analysis*, May/June 1984.

also increased. A regression over the period 1966-1979, using our Exhibit 2 data, produced this result:

$$RP = 0.30\% + 0.73 R_f; \quad r^2 = 0.48. \\ (0.22)$$

This indicates that a one percentage point increase in the Treasury bond rate produced, on average, a 0.73 percentage point increase in the risk premium, and hence a  $1.00 + 0.73 = 1.73$  percentage point increase in the cost of equity for utilities.

**1980-1984 Period.** The situation changed dramatically in 1980 and thereafter. Except for a few companies with nuclear construction problems, the utilities' financial situations stabilized in the early 1980s, and then improved significantly from 1982 to 1984. Both the companies and their regulators were learning to live with inflation; many construction programs were completed; regulatory lags were shortened; and in general the situation was much better for utility equity investors. In the meantime, over most of the 1980-1984 period, interest rates and bond prices fluctuated violently, both in an absolute sense and relative to common stocks. Exhibit 10 shows the volatility of corporate bonds very clearly. Over most of the eighteen-year period, stock returns were much more volatile than returns on bonds. However, that situation changed in October 1979, when the Fed began to focus

on the money supply rather than on interest rates.<sup>9</sup>

In the 1980-1984 period, an increase in inflationary expectations has had a more adverse effect on bonds than on utility stocks. If the expected rate of inflation increases, then interest rates *will increase* and bond prices *will fall*. Thus, uncertainty about inflation translates directly into risk in the bond markets. The effect of inflation on stocks, including utility stocks, is less clear. If inflation increases, then utilities should, in theory, be able to obtain rate increases that would offset increases in operating costs and also compensate for the higher cost of equity. Thus, with "proper" regulation, utility stocks would provide a better hedge against unanticipated inflation than would bonds. This hedge did not work at all well during the 1966-1979 period, because inflation-induced increases in operating and capital costs were not offset by timely rate increases. However, as noted earlier, both the utilities and their regulators seem to have learned to live better with inflation during the 1980s.

Since inflation is today regarded as a major investment risk, and since utility stocks now seem to provide a better hedge against unanticipated inflation than do

<sup>9</sup>Because the standard deviations in Exhibit 10 are based on the last five years of data, even if bond returns stabilize, as they did beginning in 1982, their reported volatility will remain high for several more years. Thus, Exhibit 10 gives a rough indication of the current relative riskiness of stocks versus bonds, but the measure is by no means precise or necessarily indicative of future expectations.

bonds, the interest-rate risk inherent in bonds offsets, to a greater extent than was true earlier, the higher operating risk that is inherent in equities. Therefore, when inflationary fears rise, the perceived riskiness of bonds rises, helping to push up interest rates. However, since investors are today less concerned about inflation's impact on utility stocks than on bonds, the utilities' cost of equity does not rise as much as that of debt, so the observed risk premium tends to fall.

For the 1980-1984 period, we found the following relationship (see Exhibit 6):

$$RP = 12.53\% - 0.63 R_f; \quad r^2 = 0.73. \\ (0.05)$$

Thus, a one percentage point increase in the T-bond rate, on average, caused the risk premium to fall by 0.63%, and hence it led to a  $1.00 - 0.63 = 0.37$  percentage point increase in the cost of equity to an average utility. This contrasts sharply with the pre-1980 period, when a one percentage point increase in interest rates led, on average, to a 1.73 percentage point increase in the cost of equity.

### Summary and Implications

We began by reviewing a number of earlier studies. From them, we concluded that, for cost of capital estimation purposes, risk premiums must be based on expectations, not on past realized holding period returns. Next, we noted that expectational risk premiums may be estimated either from surveys, such as the ones Charles Benore has conducted, or by use of DCF techniques. Further, we found that, although growth rates for use in the DCF model can be either developed from time-series data or obtained from security analysts, analysts' growth forecasts are more reflective of investors' views, and, hence, in our opinion are preferable for use in risk-premium studies.

Using analysts' growth rates and the DCF model, we estimated risk premiums over several different periods. From 1966 to 1984, risk premiums for both electric utilities and industrial stocks varied widely from year to year. Also, during the first half of the period, the utilities had smaller risk premiums than the industrials, but after the mid-1970s, the risk premiums for the two groups were, on average, about equal.

The effects of changing interest rates on risk premiums shifted dramatically in 1980, at least for the utilities. From 1965 through 1979, inflation generally had a more severe adverse effect on utility stocks than on bonds, and, as a result, an increase in inflationary expectations, as reflected in interest rates, caused an

increase in equity risk premiums. However, in 1980 and thereafter, rising inflation and interest rates increased the perceived riskiness of bonds more than that of utility equities, so the relationship between interest rates and utility risk premiums shifted from positive to negative. Earlier, a 1.00 percentage point increase in interest rates had led, on average, to a 1.73% increase in the utilities' cost of equity, but after 1980 a 1.00 percentage point increase in the cost of debt was associated with an increase of only 0.37% in the cost of equity.

Our study also has implications for the use of the CAPM to estimate the cost of equity for utilities. The CAPM studies that we have seen typically use either Ibbotson-Sinquefeld or similar historic holding period returns as the basis for estimating the market risk premium. Such usage implicitly assumes (i) that *ex post* returns data can be used to proxy *ex ante* expectations and (ii) that the market risk premium is relatively stable over time. Our analysis suggests that neither of these assumptions is correct; at least for utility stocks, *ex post* returns data do not appear to be reflective of *ex ante* expectations, and risk premiums are volatile, not stable.

Unstable risk premiums also make us question the FERC and FCC proposals to estimate a risk premium for the utilities every two years and then to add this premium to a current Treasury bond rate to determine a utility's cost of equity. Administratively, this proposal would be easy to handle, but risk premiums are simply too volatile to be left in place for two years.

### CALL FOR PAPERS

American Real Estate and Urban Economics Association  
1985 Annual Meetings  
December 28-30, 1985  
New York

Papers are being solicited for presentation at the 1985 AREUEA Meetings held as part of the Allied Social Sciences Associations (ASSA) Meetings in New York. The areas of interest to AREUEA are real estate and urban economics in their broadest sense to include theoretical and applied research on real estate finance, land and housing economics, real estate investment and valuation, real estate and mortgage markets along with government policies related to these markets. Anyone wishing to present a paper should submit a completed manuscript or abstract by no later than May 15, 1985 to the Program Chairman:

Professor George W. Gau  
Faculty of Commerce and Business Administration  
University of British Columbia  
Vancouver, B.C.  
V6T 1Y8  
Canada  
604-228-5847

## Chapter 7

# Alternative Asset Pricing Models

### 7.1 Empirical Validity of the CAPM

The last chapter showed that the practical difficulties of implementing the CAPM approach are easily surmountable. Conceptual and empirical problems remain, however.

#### Returns vs Beta: Empirical Evidence

At the conceptual level, the CAPM has been submitted to criticisms by academicians and practitioners. Contrary to the core assumption of the CAPM, investors may choose not to diversify, and bear company-specific risk if abnormal returns are expected. A substantial percentage of individual investors are indeed inadequately diversified. Short selling is somewhat restricted, in violation of CAPM assumptions. Factors other than market risk (beta) may also influence investor behavior, such as taxation, company size, and restrictions on borrowing.

If we examine the empirical evidence, financial theory has generally shown that beta is a sufficient risk measure for diversified investors, and most of the empirical literature has confirmed its importance in determining expected return. There is a notable exception, a study by Fama & French (1992) questioned the importance of beta in explaining observed returns and found little explanatory power in the relationship between *realized* returns and beta.<sup>1</sup> The problem is that the CAPM specifies a relationship between *expected* returns and beta and not *realized* returns and beta.

Since the publication of the Fama & French results, there has been a deluge of academic studies published in academic journals on this subject that have provided renewed support for the CAPM and its primary risk measure (beta). In a 1993 paper, Chan and Lakonishok<sup>2</sup> found a strong relationship between beta and return for the years of their study. In a prominent paper in the same journal, Fischer Black<sup>3</sup> also refuted the conclusions of Fama and French and stated that "beta is alive and well." In March 1995, Kothari, Shanken, and Sloan<sup>4</sup> demonstrated that beta receives

Modern Regulatory Finance

---

statistically significant return compensation when betas are estimated from time-series regressions of annual portfolio returns on the annual return on an equally weighted market index. In a December 1995 paper, Kim<sup>5</sup> found that, once corrected for the errors in variables problem, there was more support for the role of beta. In yet another 1996 paper, Jagannathan & Wang<sup>6</sup> showed that when betas are allowed to vary over the business cycle, the empirical support of the CAPM is very strong. Finally, Nobel-Prize winning economist William Sharpe refuted the Fama-French criticism in "Revisiting the CAPM," *Dow Jones Asset Manager* (May-June 1998).

To sum up, at the empirical level, there have been countless tests of the CAPM to determine to what extent security returns and betas are related in the manner predicted by the CAPM. The results of the tests support the idea that beta is related to security returns, that the risk-return tradeoff is positive, and that the relationship is linear. The burning question remains as to whether the relationship between return and beta conforms to the predictions of the CAPM.

### **CAPM Understatement**

There is a fly in the ointment, however. It is well-known and generally accepted in the finance literature that the process of estimating equity betas via regression analysis and inserting those estimates into the CAPM formula produces outputs that are systematically biased. In particular, there is strong and consistent evidence that the CAPM-estimated returns with betas below 1.0 are systematically lower than the returns that are actually generated by those assets.

This evidence is generally considered to be so robust that it is now part of the standard finance curriculum and appears in the academic literature and in finance textbooks. For example, Fama & French (2004) show that this result has proven to be consistent through time – low-beta stocks generate higher returns than the CAPM would imply and high-beta stocks earn lower returns than the CAPM would imply.<sup>7</sup> With respect to the early tests of the CAPM, Fama & French summarize the state of play as:

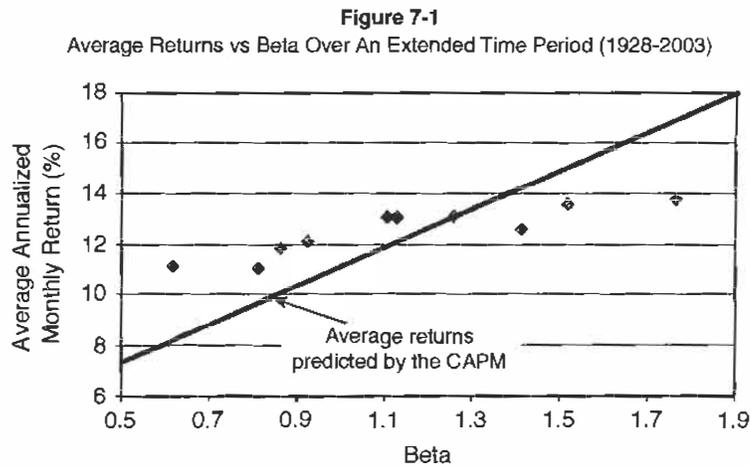

*The early tests firmly reject the Sharpe-Lintner version of the CAPM. There is a positive relation between beta and average return, but it is too "flat."*

Fama & French then provide an updated example of the evidence using monthly returns on U.S.-listed stocks over 76 years from 1928 to 2003. This analysis is summarized in Figure 7-1 below.<sup>8</sup> Consistent with the early evidence, realized returns

Chapter 7 – Alternative Asset Pricing Models

on low-beta stocks are higher than predicted by the CAPM, and realized returns on high-beta stocks are lower than predicted by the CAPM. Stocks with the lowest beta estimates had average returns of 11.1% per year, but the CAPM says the expected return was 8.3% per year. Stocks with the highest beta estimates had average returns of 13.7% per year, but the CAPM says the expected return was 16.8% per year.

Brealey, Myers, and Allen (2017), among many others,<sup>9</sup> provide more recent empirical evidence very similar to the relationship depicted in Figure 7-1. In fact, Brealey, Myers and Allen (2017) extend previous analyses to the end of 2014, and provide a similar chart to that presented by Fama and French (2004). The upward-sloping line on Figure 7-1 represents the relationship between beta and return that is implied by the CAPM and each dot represents the observed return for a particular portfolio. Clearly, the low-beta portfolios still earn higher returns than the CAPM would imply. Goyal (2011) also found a security market line flatter than that predicted by the CAPM.<sup>10</sup> With few exceptions, the empirical studies agree that the implied intercept term exceeds the risk-free rate and the slope term is less than predicted by the CAPM. That is, low-beta securities earn returns somewhat higher than the CAPM would predict, and high-beta securities earn less than predicted. This is one of the most well-known results in finance, and is particularly pertinent for public utilities whose betas are typically less than 1.00.

9. For a summary of the empirical evidence on the CAPM, see Jensen (1972) and Ross (1978). The major empirical tests of the CAPM were published by Friend and Blume (1975), Black, Jensen, and Scholes (1972), Miller and Scholes (1972), Blume and Friend (1973), Blume and Husic (1973), Fama and Macbeth (1972), Basu (1977), Reinganum (1981B), Litzemberger and Ramaswamy (1979), Banz (1981), Gibbons (1982), Stambaugh (1982), Shanken (1985), Black (1993), and Brealey, Myers, and Allen (2017). Evidence in the Canadian context is available in Morin (1980, 1981).

Modern Regulatory Finance

---

In short, the currently available empirical evidence indicates that the simple version of the CAPM does not provide a perfectly accurate description of the process determining security returns. The observed and predicted relationship between risk and return is depicted in Figure 7-2. The black line shows the predicted CAPM relationship and the gray line displays the observed relationship between return and beta. Explanations for this shortcoming include some or all of the following:

**Figure 7-2**  
Risk vs Return: Theory vs Practice

1. The CAPM excludes other important variables that are important in determining security returns, such as size, skewness, and taxes.
2. The market index used in the tests excludes important classes of securities, such as bonds, mortgages, and business investments. There is a further argument that the CAPM can never be really tested and that such a test is infeasible. This is because the market index proxy used in empirical tests of the CAPM is inadequate; since a true comprehensive market index is unavailable, such tests will be biased in the direction shown by the actual empirical results.<sup>11</sup> Moreover, the CAPM is a forward-looking expectational model and in order to test the model it is necessary to predict investor expectations correctly. Any empirical test of the CAPM is thus a test of the joint hypothesis of the model's validity and of the function used to generate expected returns from historical returns.
3. Constraints on investor borrowing exist contrary to the assumption of the CAPM.
4. Investors may value the hedging value of assets in protecting them against shifts in later investment opportunities. See Merton (1973) and Morin (1981).

Chapter 7 -- Alternative Asset Pricing Models

---

Expanded CAPM models have been proposed relaxing the above constraints, each model varying in complexity, each model attempting to inject more realism into the assumptions. Ross (1978), Tallman (1989), and Guo (2004) present excellent surveys of the various asset pricing theories and related empirical evidence. These enhanced CAPMs produce broadly similar expressions for the observed relationship between risk and return and engender a SML that is flatter than the CAPM prediction, in line with the empirical evidence.

In the remainder of this chapter, Section 7-2 focuses on the more tractable extensions of the CAPM that possess some applicability to public utility regulation. Section 7.3 discusses the Empirical CAPM. Section 7.4 describes the Arbitrage Pricing Model, a viable alternative to the CAPM. Section 7.5 discusses the Fama-French Three-Factor Model ("FF3F") and the Fama-French Five-Factor Model ("FF5F") of asset pricing. The Market-Derived Pricing Model is described in Section 7.6. Section 7.7 offers some concluding remarks.

## 7.2 CAPM Extensions

Several attempts to enrich the CAPM's conceptual validity and to ameliorate its applicability have been advanced. One popular explanation of the CAPM's inability to explain security returns satisfactorily is that beta is insufficient and other systematic risk factors affect security returns. The implication is that the effects of these other independent variables should be quantified and used in estimating the cost of equity capital. The impact of the supplementary variables<sup>12</sup> can be expressed as an additive element to the standard CAPM equation as follows:

Letting 'a' stand for these other effects on return, the CAPM equation becomes:

$$K = R_f + a + b(R_m - R_f) \quad (7-1)$$

To capture the variables' impact on the slope of the relationship, a coefficient 'b' is substituted for the market risk premium. The revised CAPM equation becomes:

$$K = R_f + a + b \times \beta \quad (7-2)$$

The constants 'a' and 'b' capture all the market-wide effects that influence security returns, and must be estimated by econometric techniques. Principal factors purported to affect security returns include dividend yield, skewness, and company size. Each factor is discussed individually below.

---

12. To illustrate, the Arbitrage Pricing Model and the Fama-French three-factor asset pricing model, discussed in a later section, include factors other than the market that explain observed security returns.

Chapter 7 — Alternative Asset Pricing Models

constant  $\alpha$ , which must be estimated econometrically from market data.<sup>21</sup> Table 7-3 drawn from Villadsen, Vilbert, et. al. (2017) summarizes the empirical evidence on the magnitude of alpha.<sup>22</sup>

For an alpha in the range of 1% – 2% and for reasonable values of the MRP and the risk-free rate, Equation 7-5 reduces to the following more pragmatic form:

$$K = R_F + 0.25 (R_M - R_F) + 0.75 b(R_M - R_F) \quad (7-6)$$

Using reasonable data inputs for the risk-free rate and the MRP, Equation 7-6 produces results that are indistinguishable from the ECAPM of Equation 7-5.<sup>23</sup>

An alpha range of 1% - 2% is somewhat lower than that estimated empirically. The use of a lower value for alpha leads to a lower estimate of the cost of capital for low-beta stocks such as regulated utilities. This is because the use of a long-term risk-free rate rather than a short-term risk-free rate already incorporates some of the desired effect of using the ECAPM. That is, the long-term risk-free rate version of the CAPM has a higher intercept and a flatter slope than the short-term risk-free version which has been tested. Thus, it is reasonable to apply a conservative alpha adjustment.

21. The technique is formally applied by Litzenberger, Ramaswamy, and Sosin (1980) to public utilities in order to rectify the CAPM's basic shortcomings. Not only do they summarize the criticisms of the CAPM insofar as they affect public utilities, but they also describe the econometric intricacies involved and the methods of circumventing the statistical problems. Essentially, the average monthly returns over a lengthy time period on a large cross-section of securities grouped into portfolios, are related to their corresponding betas by statistical regression techniques; that is, Equation 6-4 is estimated from market data. The utility's beta value is substituted into the equation to produce the cost of equity figure. Their results demonstrate how the standard CAPM underestimates the cost of equity of public utilities because of utilities' high dividend yield and return skewness.

22. Table 7-3 is drawn from Villadsen, B., Vilbert, M. J., Harris, D., and Kolbe, A. L., "Risk and Return for Regulated Industries," The Brattle Group, Elsevier Academic Press, 2017.

23. Typical of the empirical evidence on the validity of the CAPM is a study by Morin (1989) who found that the relationship between the expected return on a security and beta over the period 1926-1984 was given by:

$$\text{Return} = 0.0829 + 0.0520$$

Given that the risk-free rate over the estimation period was approximately 6% and that the MRP was 8% during the period of study, the intercept of the observed relationship between return and beta exceeds the risk-free rate by about 2%, or 1/4 of 8%, and that the slope of the relationship is close to 3/4 of 8%. Therefore, the empirical evidence suggests that the expected return on a security is related to its risk by the following approximation:

$$K = R_F + x (R_M - R_F) + (1 - x) b(R_M - R_F)$$

where x is a fraction to be determined empirically. The value of x that best explains the observed relationship  $\text{Return} = 0.0829 + 0.0520$  is between 0.25 and 0.30. If x = 0.25, the equation becomes:

$$K = R_F + 0.25 (R_M - R_F) + 0.75 b(R_M - R_F)$$

## Chapter 11

# Flotation Cost Adjustment

This chapter demonstrates that an adjustment to the market-based cost of capital is necessary for flotation costs associated with the procurement of equity capital, and discusses the mechanics and controversies involved in applying this adjustment.<sup>1</sup>

A typical utility is continuously issuing stock through its dividend reinvestment plan and employee stock option plan, and/or is selling new shares to the public on a regular basis in order to maintain its construction program and meet its mandated service requirements. The costs of issuing these securities are just as real as operating and maintenance expenses or costs incurred to build utility plants, and fair regulatory treatment must permit the recovery of these costs.

### 11.1 Flotation Cost Allowance

The simple fact of the matter is that common equity capital is not free. Flotation costs associated with common stock issues are very similar to the flotation costs associated with bonds and preferred stocks. Flotation costs are incurred, and if they are not expensed at the time of issue, they must be recovered through a rate of return adjustment. This is routinely done for bond and preferred stock issues by most regulatory commissions. To illustrate the conventional regulatory practice, consider this example. A utility company issues \$100 million of 10-year bonds at an interest rate of 5%. Flotation costs are 2% of the amount of the proceeds, \$2 million. The interest paid each year is \$100 million  $\times$  5% = \$5 million. The flotation cost of \$2 million is amortized over the 10-year life of the bond, so that the amortization each year equals \$2M/10 = \$0.2 million. The cost of debt  $K_d$  is then:

$$K_d = \frac{\text{Interest} + \text{Amortization of flotation costs}}{\text{Principal} - \text{Unamortized flotation costs}} = \frac{\$5,000,000 + \$200,000}{\$100,000,000 - \$2,000,000} = 5.31\%$$

The cost of debt needs to be increased by 31 basis points in order to allow for the recovery of flotation costs. The recovery process is very similar for preferred stock issues.

In the case of issues of new common equity, flotation costs represent the discounts that must be provided to issue the new securities. Flotation costs have three major components:

1. Vander Weide (2013) provides an excellent comprehensive treatment of the flotation cost issue in regulatory proceedings.

## Flotation Cost Application

In this section, we demonstrate: (1) why it is necessary to apply a flotation cost allowance to the dividend yield component of the DCF model in order to obtain the fair return on equity capital; (2) why the flotation adjustment is permanently required to avoid confiscation even if no further stock issues are contemplated; and (3) why flotation costs are only recovered if the rate of return is applied to total equity, including retained earnings, in all future years.

An analogy with bond issues is useful here in order to understand the treatment of issue costs in the case of common stock issues.<sup>7</sup> In the case of bonds as seen earlier in the chapter, flotation costs are recovered over the life of the bond in two steps: (1) flotation costs are amortized over the life of the bond and the annual amortization charge is incorporated into revenue requirements, in much the same way that funds invested in utility plant are recovered through depreciation charges; (2) the unamortized portion of flotation costs is included in rate base, and a return is earned on the unamortized costs, in the same way that a return is earned on the undepreciated portion of a utility's plant. The recovery continues year after year until the recovery process is terminated, regardless of whether the utility raises new debt capital. This is analogous to the process of depreciation, which allows the recovery of funds invested in utility plant. The recovery continues whether the utility constructs new facilities or not.

Since flotation costs of common stock issues cannot be amortized because they have no finite maturity, they must be recovered by way of an upward adjustment to the allowed return on equity. It would be inappropriate to amortize a company's flotation costs over a finite number of years. As such, rather than seeking a "return of" its flotation costs over some arbitrarily selected amortization period, it is more appropriate for a utility to seek a "return on" its flotation costs, as these costs constitute a permanent equity contribution by investors.

In theory, flotation costs could be expensed and recovered through rates as they are incurred. This procedure, although simple in implementation, is not considered appropriate, however, because the equity capital raised in a given stock issue remains on the utility's common equity account and continues to provide benefits to ratepayers indefinitely. As discussed earlier, it would be unfair to burden the current generation of ratepayers with the full costs of raising capital when the benefits of that capital extend indefinitely. The common practice of capitalizing rather than expensing eliminates the intergenerational transfers that would prevail if today's ratepayers were asked to bear the full burden of flotation costs of bond/stock issues in order to finance capital projects designed to serve future as well as current generations. Moreover, expensing flotation costs requires an estimate of the market pressure effect for each individual issue, which is likely to prove unreli-

7. See Brigham, Aberwald, and Gapenski (1985)

Modern Regulatory Finance

able. A more reliable approach is to estimate market pressure for a large sample of stock offerings rather than for one individual common stock issue.

An alternative regulatory treatment is to incorporate flotation costs into the rate base as an intangible asset. While this solves the intergenerational problem and compensates investors fairly for their investment, the method clashes with the "used and useful" principle of rate base inclusions. An intangible asset related to flotation costs is unlikely to be viewed as a used and useful asset in public service by regulators.

The following illustration adapted from Brigham, Aberwald, and Gapenski (1985) shows that: (a) even if no further stock issues are contemplated, the flotation adjustment is still permanently required to keep shareholders whole, and (b) flotation costs are only recovered if the rate of return is applied to total equity, including retained earnings, in all future years, even if no future financing is contemplated. The flotation cost adjustment process is shown in Tables 11-3 through 11-5 using illustrative market data.

The assumptions used in the computation are displayed in Table 11-3. The stock is selling in the market for \$100, and investors expect the firm to pay a dividend of \$4.00, which will grow at a rate of 5% thereafter. The traditional DCF cost of equity is thus  $k = D/P + g = 4/100 + 0.05 = 9\%$ , or \$9.00 in the first year. 4% of the 9%, or \$4.00, will come from dividends, so that the remaining 5%, or \$5.00, must then come from capital gains. To get a capital gain of \$5.00 from \$4.75 of retained earnings, the earnings retained must clearly earn more than 9%. Therefore, if the firm sells one share of stock, incurring a flotation cost of 5%, the traditional DCF cost of equity adjusted for flotation cost is thus  $ROE = D/P(1 - f) + g = 0.04 / 0.95 + 0.05 = 9.21\%$ .

**Table 11-3**  
Assumptions

Issue Price =	\$100.00
Flotation Cost =	5.00%
Expected Dividend Yield =	4.00%
Growth =	5.00%
Equity Return = (D/P + g)	9.00%
Allowed Return On Equity = (D/P(1-f) + g)	9.21%

As shown in Table 11-4, the initial book value (rate base) is the net proceeds from the stock issue, which are \$95, that is, the market price of \$100 less the 5% flotation cost. The table demonstrates that only if the company is allowed to earn 9.21% on rate base will investors earn their cost of equity of 9.00%. Column 1 shows the ini-

Chapter 11 — Flotation Cost Adjustment

tial common stock account, while Column 2 shows the cumulative retained earnings balance, starting at zero, and steadily increasing from the retention of earnings. Total equity in Column 3 is the sum of common stock capital and retained earnings. The stock price in Column 4 is obtained from the seminal DCF formula:  $D_1/(k - g)$ . Earnings per share in Column 6 is simply the allowed return of 9.21% times the total common equity base. Dividends start at \$4.00 and grow at 5% thereafter, which they must do if investors are to earn a 9% return. The dividend payout ratio remains constant, as per the assumption of the DCF model. All quantities, stock price, book value, earnings, and dividends grow at a 5% rate, as shown at the bottom of the relevant columns.

Only if the company is allowed to earn 9.21% on equity do investors earn 9.00%. For example, if the company is allowed only 9.00%, the stock price drops from \$105.00 to \$104.79 in the second year, inflicting a loss on shareholders. This is shown in Table 11-5. The growth rate drops from 5.0% to 4.8%. Thus, investors only earn 8.8% on their investment. It is noteworthy that the adjustment is always required each and every year, whether or not new stock issues are sold in the future, and that the allowed return on equity must be earned on total equity, including retained earnings, for investors to earn the cost of equity.

Note also that the 9.21% return must be applied to the total equity capital invested, including the retained earnings component. To see this, consider the following scenario. In year 1, investors require 9% on their \$100 investment, that is, \$9.00. But the company only earns \$8.75, of which it pays out \$4.00 in dividends and retains the balance of \$4.75. To give investors the \$5.00 change in market value (5% capital gain) needed to add to the \$4.00 dividend to produce the \$9.00 total DCF return of 9%, the \$4.75 must earn more than 9.00%, that is, it must earn 9.21%.

**Table 11-4**

## The Capital Asset Pricing Model: Theory and Evidence

Eugene F. Fama and Kenneth R. French

**T**he capital asset pricing model (CAPM) of William Sharpe (1964) and John Lintner (1965) marks the birth of asset pricing theory (resulting in a Nobel Prize for Sharpe in 1990). Four decades later, the CAPM is still widely used in applications, such as estimating the cost of capital for firms and evaluating the performance of managed portfolios. It is the centerpiece of MBA investment courses. Indeed, it is often the only asset pricing model taught in these courses.<sup>1</sup>

The attraction of the CAPM is that it offers powerful and intuitively pleasing predictions about how to measure risk and the relation between expected return and risk. Unfortunately, the empirical record of the model is poor—poor enough to invalidate the way it is used in applications. The CAPM's empirical problems may reflect theoretical failings, the result of many simplifying assumptions. But they may also be caused by difficulties in implementing valid tests of the model. For example, the CAPM says that the risk of a stock should be measured relative to a comprehensive “market portfolio” that in principle can include not just traded financial assets, but also consumer durables, real estate and human capital. Even if we take a narrow view of the model and limit its purview to traded financial assets, is it

<sup>1</sup> Although every asset pricing model is a capital asset pricing model, the finance profession reserves the acronym CAPM for the specific model of Sharpe (1964), Lintner (1965) and Black (1972) discussed here. Thus, throughout the paper we refer to the Sharpe-Lintner-Black model as the CAPM.

■ Eugene F. Fama is Robert R. McCormick Distinguished Service Professor of Finance, Graduate School of Business, University of Chicago, Chicago, Illinois. Kenneth R. French is Carl E. and Catherine M. Heidt Professor of Finance, Tuck School of Business, Dartmouth College, Hanover, New Hampshire. Their e-mail addresses are <eugene.fama@gsb.uchicago.edu> and <kfrench@dartmouth.edu>, respectively.

legitimate to limit further the market portfolio to U.S. common stocks (a typical choice), or should the market be expanded to include bonds, and other financial assets, perhaps around the world? In the end, we argue that whether the model's problems reflect weaknesses in the theory or in its empirical implementation, the failure of the CAPM in empirical tests implies that most applications of the model are invalid.

We begin by outlining the logic of the CAPM, focusing on its predictions about risk and expected return. We then review the history of empirical work and what it says about shortcomings of the CAPM that pose challenges to be explained by alternative models.

### The Logic of the CAPM

The CAPM builds on the model of portfolio choice developed by Harry Markowitz (1959). In Markowitz's model, an investor selects a portfolio at time  $t - 1$  that produces a stochastic return at  $t$ . The model assumes investors are risk averse and, when choosing among portfolios, they care only about the mean and variance of their one-period investment return. As a result, investors choose "mean-variance-efficient" portfolios, in the sense that the portfolios 1) minimize the variance of portfolio return, given expected return, and 2) maximize expected return, given variance. Thus, the Markowitz approach is often called a "mean-variance model."

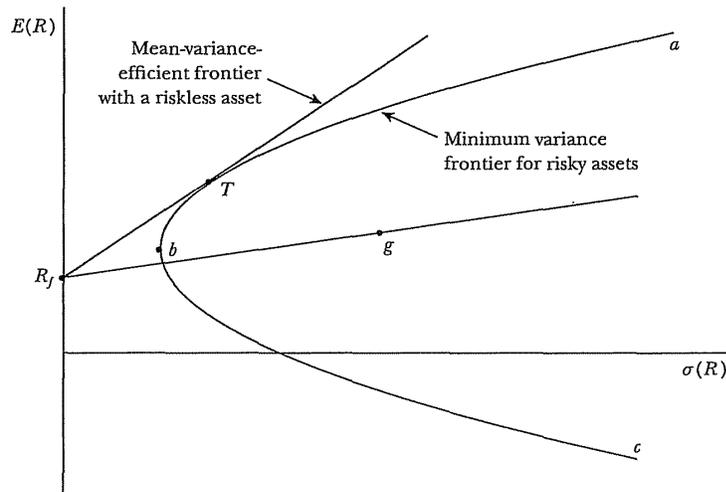

The portfolio model provides an algebraic condition on asset weights in mean-variance-efficient portfolios. The CAPM turns this algebraic statement into a testable prediction about the relation between risk and expected return by identifying a portfolio that must be efficient if asset prices are to clear the market of all assets.

Sharpe (1964) and Lintner (1965) add two key assumptions to the Markowitz model to identify a portfolio that must be mean-variance-efficient. The first assumption is *complete agreement*: given market clearing asset prices at  $t - 1$ , investors agree on the joint distribution of asset returns from  $t - 1$  to  $t$ . And this distribution is the true one—that is, it is the distribution from which the returns we use to test the model are drawn. The second assumption is that there is *borrowing and lending at a risk-free rate*, which is the same for all investors and does not depend on the amount borrowed or lent.

Figure 1 describes portfolio opportunities and tells the CAPM story. The horizontal axis shows portfolio risk, measured by the standard deviation of portfolio return; the vertical axis shows expected return. The curve *abc*, which is called the minimum variance frontier, traces combinations of expected return and risk for portfolios of risky assets that minimize return variance at different levels of expected return. (These portfolios do not include risk-free borrowing and lending.) The tradeoff between risk and expected return for minimum variance portfolios is apparent. For example, an investor who wants a high expected return, perhaps at point *a*, must accept high volatility. At point *T*, the investor can have an interme-

Eugene F. Fama and Kenneth R. French 27

Figure 1  
Investment Opportunities

diate expected return with lower volatility. If there is no risk-free borrowing or lending, only portfolios above  $b$  along  $abc$  are mean-variance-efficient, since these portfolios also maximize expected return, given their return variances.

Adding risk-free borrowing and lending turns the efficient set into a straight line. Consider a portfolio that invests the proportion  $x$  of portfolio funds in a risk-free security and  $1 - x$  in some portfolio  $g$ . If all funds are invested in the risk-free security—that is, they are loaned at the risk-free rate of interest—the result is the point  $R_f$  in Figure 1, a portfolio with zero variance and a risk-free rate of return. Combinations of risk-free lending and positive investment in  $g$  plot on the straight line between  $R_f$  and  $g$ . Points to the right of  $g$  on the line represent borrowing at the risk-free rate, with the proceeds from the borrowing used to increase investment in portfolio  $g$ . In short, portfolios that combine risk-free lending or borrowing with some risky portfolio  $g$  plot along a straight line from  $R_f$  through  $g$  in Figure 1.<sup>2</sup>

<sup>2</sup> Formally, the return, expected return and standard deviation of return on portfolios of the risk-free asset  $f$  and a risky portfolio  $g$  vary with  $x$ , the proportion of portfolio funds invested in  $f$ , as

$$R_p = xR_f + (1 - x)R_g,$$

$$E(R_p) = xR_f + (1 - x)E(R_g),$$

$$\sigma(R_p) = (1 - x)\sigma(R_g), \quad x \leq 1.0,$$

which together imply that the portfolios plot along the line from  $R_f$  through  $g$  in Figure 1.

To obtain the mean-variance-efficient portfolios available with risk-free borrowing and lending, one swings a line from  $R_f$  in Figure 1 up and to the left as far as possible, to the tangency portfolio  $T$ . We can then see that all efficient portfolios are combinations of the risk-free asset (either risk-free borrowing or lending) and a single risky tangency portfolio,  $T$ . This key result is Tobin's (1958) "separation theorem."

The punch line of the CAPM is now straightforward. With complete agreement about distributions of returns, all investors see the same opportunity set (Figure 1), and they combine the same risky tangency portfolio  $T$  with risk-free lending or borrowing. Since all investors hold the same portfolio  $T$  of risky assets, it must be the value-weight market portfolio of risky assets. Specifically, each risky asset's weight in the tangency portfolio, which we now call  $M$  (for the "market"), must be the total market value of all outstanding units of the asset divided by the total market value of all risky assets. In addition, the risk-free rate must be set (along with the prices of risky assets) to clear the market for risk-free borrowing and lending.

In short, the CAPM assumptions imply that the market portfolio  $M$  must be on the minimum variance frontier if the asset market is to clear. This means that the algebraic relation that holds for any minimum variance portfolio must hold for the market portfolio. Specifically, if there are  $N$  risky assets,

$$\begin{aligned} \text{(Minimum Variance Condition for } M) \quad E(R_i) &= E(R_{ZM}) \\ &+ [E(R_M) - E(R_{ZM})]\beta_{iM}, \quad i = 1, \dots, N. \end{aligned}$$

In this equation,  $E(R_i)$  is the expected return on asset  $i$ , and  $\beta_{iM}$ , the market beta of asset  $i$ , is the covariance of its return with the market return divided by the variance of the market return,

$$\text{(Market Beta)} \quad \beta_{iM} = \frac{\text{cov}(R_i, R_M)}{\sigma^2(R_M)}.$$

The first term on the right-hand side of the minimum variance condition,  $E(R_{ZM})$ , is the expected return on assets that have market betas equal to zero, which means their returns are uncorrelated with the market return. The second term is a risk premium—the market beta of asset  $i$ ,  $\beta_{iM}$ , times the premium per unit of beta, which is the expected market return,  $E(R_M)$ , minus  $E(R_{ZM})$ .

Since the market beta of asset  $i$  is also the slope in the regression of its return on the market return, a common (and correct) interpretation of beta is that it measures the sensitivity of the asset's return to variation in the market return. But there is another interpretation of beta more in line with the spirit of the portfolio model that underlies the CAPM. The risk of the market portfolio, as measured by the variance of its return (the denominator of  $\beta_{iM}$ ), is a weighted average of the covariance risks of the assets in  $M$  (the numerators of  $\beta_{iM}$  for different assets).

*The Capital Asset Pricing Model: Theory and Evidence* 29

Thus,  $\beta_{iM}$  is the covariance risk of asset  $i$  in  $M$  measured relative to the average covariance risk of assets, which is just the variance of the market return.<sup>3</sup> In economic terms,  $\beta_{iM}$  is proportional to the risk each dollar invested in asset  $i$  contributes to the market portfolio.

The last step in the development of the Sharpe-Lintner model is to use the assumption of risk-free borrowing and lending to nail down  $E(R_{ZM})$ , the expected return on zero-beta assets. A risky asset's return is uncorrelated with the market return—its beta is zero—when the average of the asset's covariances with the returns on other assets just offsets the variance of the asset's return. Such a risky asset is riskless in the market portfolio in the sense that it contributes nothing to the variance of the market return.

When there is risk-free borrowing and lending, the expected return on assets that are uncorrelated with the market return,  $E(R_{ZM})$ , must equal the risk-free rate,  $R_f$ . The relation between expected return and beta then becomes the familiar Sharpe-Lintner CAPM equation,

$$\text{(Sharpe-Lintner CAPM)} \quad E(R_i) = R_f + [E(R_M) - R_f]\beta_{iM}, \quad i = 1, \dots, N.$$

In words, the expected return on any asset  $i$  is the risk-free interest rate,  $R_f$ , plus a risk premium, which is the asset's market beta,  $\beta_{iM}$ , times the premium per unit of beta risk,  $E(R_M) - R_f$ .

Unrestricted risk-free borrowing and lending is an unrealistic assumption. Fischer Black (1972) develops a version of the CAPM without risk-free borrowing or lending. He shows that the CAPM's key result—that the market portfolio is mean-variance-efficient—can be obtained by instead allowing unrestricted short sales of risky assets. In brief, back in Figure 1, if there is no risk-free asset, investors select portfolios from along the mean-variance-efficient frontier from  $a$  to  $b$ . Market clearing prices imply that when one weights the efficient portfolios chosen by investors by their (positive) shares of aggregate invested wealth, the resulting portfolio is the market portfolio. The market portfolio is thus a portfolio of the efficient portfolios chosen by investors. With unrestricted short selling of risky assets, portfolios made up of efficient portfolios are themselves efficient. Thus, the market portfolio is efficient, which means that the minimum variance condition for  $M$  given above holds, and it is the expected return-risk relation of the Black CAPM.

The relations between expected return and market beta of the Black and Sharpe-Lintner versions of the CAPM differ only in terms of what each says about  $E(R_{ZM})$ , the expected return on assets uncorrelated with the market. The Black version says only that  $E(R_{ZM})$  must be less than the expected market return, so the

<sup>3</sup> Formally, if  $x_{iM}$  is the weight of asset  $i$  in the market portfolio, then the variance of the portfolio's return is

$$\sigma^2(R_M) = \text{Cov}(R_M, R_M) = \text{Cov}\left(\sum_{i=1}^N x_{iM}R_i, R_M\right) = \sum_{i=1}^N x_{iM}\text{Cov}(R_i, R_M).$$

premium for beta is positive. In contrast, in the Sharpe-Lintner version of the model,  $E(R_{ZM})$  must be the risk-free interest rate,  $R_f$ , and the premium per unit of beta risk is  $E(R_M) - R_f$ .

The assumption that short selling is unrestricted is as unrealistic as unrestricted risk-free borrowing and lending. If there is no risk-free asset and short sales of risky assets are not allowed, mean-variance investors still choose efficient portfolios—points above  $b$  on the  $abc$  curve in Figure 1. But when there is no short selling of risky assets and no risk-free asset, the algebra of portfolio efficiency says that portfolios made up of efficient portfolios are not typically efficient. This means that the market portfolio, which is a portfolio of the efficient portfolios chosen by investors, is not typically efficient. And the CAPM relation between expected return and market beta is lost. This does not rule out predictions about expected return and betas with respect to other efficient portfolios—if theory can specify portfolios that must be efficient if the market is to clear. But so far this has proven impossible.

In short, the familiar CAPM equation relating expected asset returns to their market betas is just an application to the market portfolio of the relation between expected return and portfolio beta that holds in any mean-variance-efficient portfolio. The efficiency of the market portfolio is based on many unrealistic assumptions, including complete agreement and either unrestricted risk-free borrowing and lending or unrestricted short selling of risky assets. But all interesting models involve unrealistic simplifications, which is why they must be tested against data.

### Early Empirical Tests

Tests of the CAPM are based on three implications of the relation between expected return and market beta implied by the model. First, expected returns on all assets are linearly related to their betas,<sup>4</sup> and no other variable has marginal explanatory power. Second, the beta premium is positive, meaning that the expected return on the market portfolio exceeds the expected return on assets whose returns are uncorrelated with the market return. Third, in the Sharpe-Lintner version of the model, assets uncorrelated with the market have expected returns equal to the risk-free interest rate, and the beta premium is the expected market return minus the risk-free rate. Most tests of these predictions use either cross-section or time-series regressions. Both approaches date to early tests of the model.

### Tests on Risk Premiums

The early cross-section regression tests focus on the Sharpe-Lintner model's predictions about the intercept and slope in the relation between expected return and market beta. The approach is to regress a cross-section of average asset returns on estimates of asset betas. The model predicts that the intercept in these regressions is the risk-free interest rate,  $R_f$ , and the coefficient on beta is the expected return on the market in excess of the risk-free rate,  $E(R_M) - R_f$ .

Two problems in these tests quickly became apparent. First, estimates of beta

*Eugene F. Fama and Kenneth R. French* 31

for individual assets are imprecise, creating a measurement error problem when they are used to explain average returns. Second, the regression residuals have common sources of variation, such as industry effects in average returns. Positive correlation in the residuals produces downward bias in the usual ordinary least squares estimates of the standard errors of the cross-section regression slopes.

To improve the precision of estimated betas, researchers such as Blume (1970), Friend and Blume (1970) and Black, Jensen and Scholes (1972) work with portfolios, rather than individual securities. Since expected returns and market betas combine in the same way in portfolios, if the CAPM explains security returns it also explains portfolio returns.<sup>4</sup> Estimates of beta for diversified portfolios are more precise than estimates for individual securities. Thus, using portfolios in cross-section regressions of average returns on betas reduces the critical errors in variables problem. Grouping, however, shrinks the range of betas and reduces statistical power. To mitigate this problem, researchers sort securities on beta when forming portfolios; the first portfolio contains securities with the lowest betas, and so on, up to the last portfolio with the highest beta assets. This sorting procedure is now standard in empirical tests.

Fama and MacBeth (1973) propose a method for addressing the inference problem caused by correlation of the residuals in cross-section regressions. Instead of estimating a single cross-section regression of average monthly returns on betas, they estimate month-by-month cross-section regressions of monthly returns on betas. The times-series means of the monthly slopes and intercepts, along with the standard errors of the means, are then used to test whether the average premium for beta is positive and whether the average return on assets uncorrelated with the market is equal to the average risk-free interest rate. In this approach, the standard errors of the average intercept and slope are determined by the month-to-month variation in the regression coefficients, which fully captures the effects of residual correlation on variation in the regression coefficients, but sidesteps the problem of actually estimating the correlations. The residual correlations are, in effect, captured via repeated sampling of the regression coefficients. This approach also becomes standard in the literature.

Jensen (1968) was the first to note that the Sharpe-Lintner version of the

<sup>4</sup> Formally, if  $x_{ip}$ ,  $i = 1, \dots, N$ , are the weights for assets in some portfolio  $p$ , the expected return and market beta for the portfolio are related to the expected returns and betas of assets as

$$E(R_p) = \sum_{i=1}^N x_{ip} E(R_i), \text{ and } \beta_{pM} = \sum_{i=1}^N x_{ip} \beta_{iM}.$$

Thus, the CAPM relation between expected return and beta,

$$E(R_i) = E(R_f) + [E(R_M) - E(R_f)]\beta_{iM},$$

holds when asset  $i$  is a portfolio, as well as when  $i$  is an individual security.

relation between expected return and market beta also implies a time-series regression test. The Sharpe-Lintner CAPM says that the expected value of an asset's excess return (the asset's return minus the risk-free interest rate,  $R_{it} - R_{ft}$ ) is completely explained by its expected CAPM risk premium (its beta times the expected value of  $R_{Mt} - R_{ft}$ ). This implies that "Jensen's alpha," the intercept term in the time-series regression,

$$\text{(Time-Series Regression)} \quad R_{it} - R_{ft} = \alpha_i + \beta_{iM}(R_{Mt} - R_{ft}) + \varepsilon_{it},$$

is zero for each asset.

The early tests firmly reject the Sharpe-Lintner version of the CAPM. There is a positive relation between beta and average return, but it is too "flat." Recall that, in cross-section regressions, the Sharpe-Lintner model predicts that the intercept is the risk-free rate and the coefficient on beta is the expected market return in excess of the risk-free rate,  $E(R_M) - R_f$ . The regressions consistently find that the intercept is greater than the average risk-free rate (typically proxied as the return on a one-month Treasury bill), and the coefficient on beta is less than the average excess market return (proxied as the average return on a portfolio of U.S. common stocks minus the Treasury bill rate). This is true in the early tests, such as Douglas (1968), Black, Jensen and Scholes (1972), Miller and Scholes (1972), Blume and Friend (1973) and Fama and MacBeth (1973), as well as in more recent cross-section regression tests, like Fama and French (1992).

The evidence that the relation between beta and average return is too flat is confirmed in time-series tests, such as Friend and Blume (1970), Black, Jensen and Scholes (1972) and Stambaugh (1982). The intercepts in time-series regressions of excess asset returns on the excess market return are positive for assets with low betas and negative for assets with high betas.

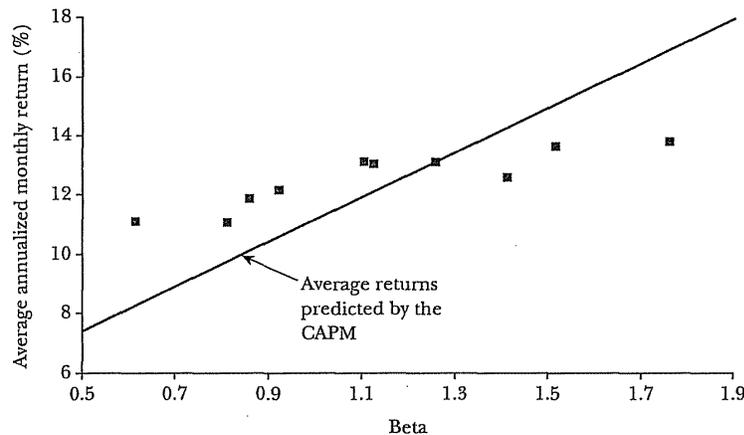

Figure 2 provides an updated example of the evidence. In December of each year, we estimate a preranking beta for every NYSE (1928–2003), AMEX (1963–2003) and NASDAQ (1972–2003) stock in the CRSP (Center for Research in Security Prices of the University of Chicago) database, using two to five years (as available) of prior monthly returns.<sup>5</sup> We then form ten value-weight portfolios based on these preranking betas and compute their returns for the next twelve months. We repeat this process for each year from 1928 to 2003. The result is 912 monthly returns on ten beta-sorted portfolios. Figure 2 plots each portfolio's average return against its postranking beta, estimated by regressing its monthly returns for 1928–2003 on the return on the CRSP value-weight portfolio of U.S. common stocks.

The Sharpe-Lintner CAPM predicts that the portfolios plot along a straight

<sup>5</sup> To be included in the sample for year  $t$ , a security must have market equity data (price times shares outstanding) for December of  $t - 1$ , and CRSP must classify it as ordinary common equity. Thus, we exclude securities such as American Depository Receipts (ADRs) and Real Estate Investment Trusts (REITs).

*The Capital Asset Pricing Model: Theory and Evidence* 33

*Figure 2*  
**Average Annualized Monthly Return versus Beta for Value Weight Portfolios Formed on Prior Beta, 1928–2003**

line, with an intercept equal to the risk-free rate,  $R_f$ , and a slope equal to the expected excess return on the market,  $E(R_M) - R_f$ . We use the average one-month Treasury bill rate and the average excess CRSP market return for 1928–2003 to estimate the predicted line in Figure 2. Confirming earlier evidence, the relation between beta and average return for the ten portfolios is much flatter than the Sharpe-Lintner CAPM predicts. The returns on the low beta portfolios are too high, and the returns on the high beta portfolios are too low. For example, the predicted return on the portfolio with the lowest beta is 8.3 percent per year; the actual return is 11.1 percent. The predicted return on the portfolio with the highest beta is 16.8 percent per year; the actual is 13.7 percent.

Although the observed premium per unit of beta is lower than the Sharpe-Lintner model predicts, the relation between average return and beta in Figure 2 is roughly linear. This is consistent with the Black version of the CAPM, which predicts only that the beta premium is positive. Even this less restrictive model, however, eventually succumbs to the data.

**Testing Whether Market Betas Explain Expected Returns**

The Sharpe-Lintner and Black versions of the CAPM share the prediction that the market portfolio is mean-variance-efficient. This implies that differences in expected return across securities and portfolios are entirely explained by differences in market beta; other variables should add nothing to the explanation of expected return. This prediction plays a prominent role in tests of the CAPM. In the early work, the weapon of choice is cross-section regressions.

In the framework of Fama and MacBeth (1973), one simply adds predetermined explanatory variables to the month-by-month cross-section regressions of

returns on beta. If all differences in expected return are explained by beta, the average slopes on the additional variables should not be reliably different from zero. Clearly, the trick in the cross-section regression approach is to choose specific additional variables likely to expose any problems of the CAPM prediction that, because the market portfolio is efficient, market betas suffice to explain expected asset returns.

For example, in Fama and MacBeth (1973) the additional variables are squared market betas (to test the prediction that the relation between expected return and beta is linear) and residual variances from regressions of returns on the market return (to test the prediction that market beta is the only measure of risk needed to explain expected returns). These variables do not add to the explanation of average returns provided by beta. Thus, the results of Fama and MacBeth (1973) are consistent with the hypothesis that their market proxy—an equal-weight portfolio of NYSE stocks—is on the minimum variance frontier.

The hypothesis that market betas completely explain expected returns can also be tested using time-series regressions. In the time-series regression described above (the excess return on asset  $i$  regressed on the excess market return), the intercept is the difference between the asset's average excess return and the excess return predicted by the Sharpe-Lintner model, that is, beta times the average excess market return. If the model holds, there is no way to group assets into portfolios whose intercepts are reliably different from zero. For example, the intercepts for a portfolio of stocks with high ratios of earnings to price and a portfolio of stocks with low earning-price ratios should both be zero. Thus, to test the hypothesis that market betas suffice to explain expected returns, one estimates the time-series regression for a set of assets (or portfolios) and then jointly tests the vector of regression intercepts against zero. The trick in this approach is to choose the left-hand-side assets (or portfolios) in a way likely to expose any shortcoming of the CAPM prediction that market betas suffice to explain expected asset returns.

In early applications, researchers use a variety of tests to determine whether the intercepts in a set of time-series regressions are all zero. The tests have the same asymptotic properties, but there is controversy about which has the best small sample properties. Gibbons, Ross and Shanken (1989) settle the debate by providing an  $F$ -test on the intercepts that has exact small-sample properties. They also show that the test has a simple economic interpretation. In effect, the test constructs a candidate for the tangency portfolio  $T$  in Figure 1 by optimally combining the market proxy and the left-hand-side assets of the time-series regressions. The estimator then tests whether the efficient set provided by the combination of this tangency portfolio and the risk-free asset is reliably superior to the one obtained by combining the risk-free asset with the market proxy alone. In other words, the Gibbons, Ross and Shanken statistic tests whether the market proxy is the tangency portfolio in the set of portfolios that can be constructed by combining the market portfolio with the specific assets used as dependent variables in the time-series regressions.

Enlightened by this insight of Gibbons, Ross and Shanken (1989), one can see

*Eugene F. Fama and Kenneth R. French* 35

a similar interpretation of the cross-section regression test of whether market betas suffice to explain expected returns. In this case, the test is whether the additional explanatory variables in a cross-section regression identify patterns in the returns on the left-hand-side assets that are not explained by the assets' market betas. This amounts to testing whether the market proxy is on the minimum variance frontier that can be constructed using the market proxy and the left-hand-side assets included in the tests.

An important lesson from this discussion is that time-series and cross-section regressions do not, strictly speaking, test the CAPM. What is literally tested is whether a specific proxy for the market portfolio (typically a portfolio of U.S. common stocks) is efficient in the set of portfolios that can be constructed from it and the left-hand-side assets used in the test. One might conclude from this that the CAPM has never been tested, and prospects for testing it are not good because 1) the set of left-hand-side assets does not include all marketable assets, and 2) data for the true market portfolio of all assets are likely beyond reach (Roll, 1977; more on this later). But this criticism can be leveled at tests of any economic model when the tests are less than exhaustive or when they use proxies for the variables called for by the model.

The bottom line from the early cross-section regression tests of the CAPM, such as Fama and MacBeth (1973), and the early time-series regression tests, like Gibbons (1982) and Stambaugh (1982), is that standard market proxies seem to be on the minimum variance frontier. That is, the central predictions of the Black version of the CAPM, that market betas suffice to explain expected returns and that the risk premium for beta is positive, seem to hold. But the more specific prediction of the Sharpe-Lintner CAPM that the premium per unit of beta is the expected market return minus the risk-free interest rate is consistently rejected.

The success of the Black version of the CAPM in early tests produced a consensus that the model is a good description of expected returns. These early results, coupled with the model's simplicity and intuitive appeal, pushed the CAPM to the forefront of finance.

## **Recent Tests**

Starting in the late 1970s, empirical work appears that challenges even the Black version of the CAPM. Specifically, evidence mounts that much of the variation in expected return is unrelated to market beta.

The first blow is Basu's (1977) evidence that when common stocks are sorted on earnings-price ratios, future returns on high E/P stocks are higher than predicted by the CAPM. Banz (1981) documents a size effect: when stocks are sorted on market capitalization (price times shares outstanding), average returns on small stocks are higher than predicted by the CAPM. Bhandari (1988) finds that high debt-equity ratios (book value of debt over the market value of equity, a measure of leverage) are associated with returns that are too high relative to their market betas.

Finally, Statman (1980) and Rosenberg, Reid and Lanstein (1985) document that stocks with high book-to-market equity ratios (B/M, the ratio of the book value of a common stock to its market value) have high average returns that are not captured by their betas.

There is a theme in the contradictions of the CAPM summarized above. Ratios involving stock prices have information about expected returns missed by market betas. On reflection, this is not surprising. A stock's price depends not only on the expected cash flows it will provide, but also on the expected returns that discount expected cash flows back to the present. Thus, in principle, the cross-section of prices has information about the cross-section of expected returns. (A high expected return implies a high discount rate and a low price.) The cross-section of stock prices is, however, arbitrarily affected by differences in scale (or units). But with a judicious choice of scaling variable  $X$ , the ratio  $X/P$  can reveal differences in the cross-section of expected stock returns. Such ratios are thus prime candidates to expose shortcomings of asset pricing models—in the case of the CAPM, shortcomings of the prediction that market betas suffice to explain expected returns (Ball, 1978). The contradictions of the CAPM summarized above suggest that earnings-price, debt-equity and book-to-market ratios indeed play this role.

Fama and French (1992) update and synthesize the evidence on the empirical failures of the CAPM. Using the cross-section regression approach, they confirm that size, earnings-price, debt-equity and book-to-market ratios add to the explanation of expected stock returns provided by market beta. Fama and French (1996) reach the same conclusion using the time-series regression approach applied to portfolios of stocks sorted on price ratios. They also find that different price ratios have much the same information about expected returns. This is not surprising given that price is the common driving force in the price ratios, and the numerators are just scaling variables used to extract the information in price about expected returns.

Fama and French (1992) also confirm the evidence (Reinganum, 1981; Stambaugh, 1982; Lakonishok and Shapiro, 1986) that the relation between average return and beta for common stocks is even flatter after the sample periods used in the early empirical work on the CAPM. The estimate of the beta premium is, however, clouded by statistical uncertainty (a large standard error). Kothari, Shanken and Sloan (1995) try to resuscitate the Sharpe-Lintner CAPM by arguing that the weak relation between average return and beta is just a chance result. But the strong evidence that other variables capture variation in expected return missed by beta makes this argument irrelevant. If betas do not suffice to explain expected returns, the market portfolio is not efficient, and the CAPM is dead in its tracks. Evidence on the size of the market premium can neither save the model nor further doom it.

The synthesis of the evidence on the empirical problems of the CAPM provided by Fama and French (1992) serves as a catalyst, marking the point when it is generally acknowledged that the CAPM has potentially fatal problems. Research then turns to explanations.

*The Capital Asset Pricing Model: Theory and Evidence* 37

One possibility is that the CAPM's problems are spurious, the result of data dredging—publication-hungry researchers scouring the data and unearthing contradictions that occur in specific samples as a result of chance. A standard response to this concern is to test for similar findings in other samples. Chan, Hamao and Lakonishok (1991) find a strong relation between book-to-market equity (B/M) and average return for Japanese stocks. Capaul, Rowley and Sharpe (1993) observe a similar B/M effect in four European stock markets and in Japan. Fama and French (1998) find that the price ratios that produce problems for the CAPM in U.S. data show up in the same way in the stock returns of twelve non-U.S. major markets, and they are present in emerging market returns. This evidence suggests that the contradictions of the CAPM associated with price ratios are not sample specific.

### **Explanations: Irrational Pricing or Risk**

Among those who conclude that the empirical failures of the CAPM are fatal, two stories emerge. On one side are the behavioralists. Their view is based on evidence that stocks with high ratios of book value to market price are typically firms that have fallen on bad times, while low B/M is associated with growth firms (Lakonishok, Shleifer and Vishny, 1994; Fama and French, 1995). The behavioralists argue that sorting firms on book-to-market ratios exposes investor overreaction to good and bad times. Investors overextrapolate past performance, resulting in stock prices that are too high for growth (low B/M) firms and too low for distressed (high B/M, so-called value) firms. When the overreaction is eventually corrected, the result is high returns for value stocks and low returns for growth stocks. Proponents of this view include DeBondt and Thaler (1987), Lakonishok, Shleifer and Vishny (1994) and Haugen (1995).

The second story for explaining the empirical contradictions of the CAPM is that they point to the need for a more complicated asset pricing model. The CAPM is based on many unrealistic assumptions. For example, the assumption that investors care only about the mean and variance of one-period portfolio returns is extreme. It is reasonable that investors also care about how their portfolio return covaries with labor income and future investment opportunities, so a portfolio's return variance misses important dimensions of risk. If so, market beta is not a complete description of an asset's risk, and we should not be surprised to find that differences in expected return are not completely explained by differences in beta. In this view, the search should turn to asset pricing models that do a better job explaining average returns.

Merton's (1973) intertemporal capital asset pricing model (ICAPM) is a natural extension of the CAPM. The ICAPM begins with a different assumption about investor objectives. In the CAPM, investors care only about the wealth their portfolio produces at the end of the current period. In the ICAPM, investors are concerned not only with their end-of-period payoff, but also with the opportunities

they will have to consume or invest the payoff. Thus, when choosing a portfolio at time  $t - 1$ , ICAPM investors consider how their wealth at  $t$  might vary with future *state variables*, including labor income, the prices of consumption goods and the nature of portfolio opportunities at  $t$ , and expectations about the labor income, consumption and investment opportunities to be available after  $t$ .

Like CAPM investors, ICAPM investors prefer high expected return and low return variance. But ICAPM investors are also concerned with the covariances of portfolio returns with state variables. As a result, optimal portfolios are “multifactor efficient,” which means they have the largest possible expected returns, given their return variances and the covariances of their returns with the relevant state variables.

Fama (1996) shows that the ICAPM generalizes the logic of the CAPM. That is, if there is risk-free borrowing and lending or if short sales of risky assets are allowed, market clearing prices imply that the market portfolio is multifactor efficient. Moreover, multifactor efficiency implies a relation between expected return and beta risks, but it requires additional betas, along with a market beta, to explain expected returns.

An ideal implementation of the ICAPM would specify the state variables that affect expected returns. Fama and French (1993) take a more indirect approach, perhaps more in the spirit of Ross’s (1976) arbitrage pricing theory. They argue that though size and book-to-market equity are not themselves state variables, the higher average returns on small stocks and high book-to-market stocks reflect unidentified state variables that produce undiversifiable risks (covariances) in returns that are not captured by the market return and are priced separately from market betas. In support of this claim, they show that the returns on the stocks of small firms covary more with one another than with returns on the stocks of large firms, and returns on high book-to-market (value) stocks covary more with one another than with returns on low book-to-market (growth) stocks. Fama and French (1995) show that there are similar size and book-to-market patterns in the covariation of fundamentals like earnings and sales.

Based on this evidence, Fama and French (1993, 1996) propose a three-factor model for expected returns,

$$\begin{aligned} \text{(Three-Factor Model)} \quad E(R_{it}) - R_{ft} = & \beta_{iM}[E(R_{Mt}) - R_{ft}] \\ & + \beta_{is}E(SMB_t) + \beta_{ih}E(HML_t). \end{aligned}$$

In this equation,  $SMB_t$  (small minus big) is the difference between the returns on diversified portfolios of small and big stocks,  $HML_t$  (high minus low) is the difference between the returns on diversified portfolios of high and low B/M stocks, and the betas are slopes in the multiple regression of  $R_{it} - R_{ft}$  on  $R_{Mt} - R_{ft}$ ,  $SMB_t$ , and  $HML_t$ .

For perspective, the average value of the market premium  $R_{Mt} - R_{ft}$  for 1927–2003 is 8.3 percent per year, which is 3.5 standard errors from zero. The

*Eugene F. Fama and Kenneth R. French* 39

average values of  $SMB_t$  and  $HML_t$  are 3.6 percent and 5.0 percent per year, and they are 2.1 and 3.1 standard errors from zero. All three premiums are volatile, with annual standard deviations of 21.0 percent ( $R_{Mt} - R_{ft}$ ), 14.6 percent ( $SMB_t$ ) and 14.2 percent ( $HML_t$ ) per year. Although the average values of the premiums are large, high volatility implies substantial uncertainty about the true expected premiums.

One implication of the expected return equation of the three-factor model is that the intercept  $\alpha_i$  in the time-series regression,

$$R_{it} - R_{ft} = \alpha_i + \beta_{iM}(R_{Mt} - R_{ft}) + \beta_{iS}SMB_t + \beta_{iH}HML_t + \varepsilon_{it},$$

is zero for all assets  $i$ . Using this criterion, Fama and French (1993, 1996) find that the model captures much of the variation in average return for portfolios formed on size, book-to-market equity and other price ratios that cause problems for the CAPM. Fama and French (1998) show that an international version of the model performs better than an international CAPM in describing average returns on portfolios formed on scaled price variables for stocks in 13 major markets.

The three-factor model is now widely used in empirical research that requires a model of expected returns. Estimates of  $\alpha_i$  from the time-series regression above are used to calibrate how rapidly stock prices respond to new information (for example, Loughran and Ritter, 1995; Mitchell and Stafford, 2000). They are also used to measure the special information of portfolio managers, for example, in Carhart's (1997) study of mutual fund performance. Among practitioners like Ibbotson Associates, the model is offered as an alternative to the CAPM for estimating the cost of equity capital.

From a theoretical perspective, the main shortcoming of the three-factor model is its empirical motivation. The small-minus-big (SMB) and high-minus-low (HML) explanatory returns are not motivated by predictions about state variables of concern to investors. Instead they are brute force constructs meant to capture the patterns uncovered by previous work on how average stock returns vary with size and the book-to-market equity ratio.

But this concern is not fatal. The ICAPM does not require that the additional portfolios used along with the market portfolio to explain expected returns "mimic" the relevant state variables. In both the ICAPM and the arbitrage pricing theory, it suffices that the additional portfolios are well diversified (in the terminology of Fama, 1996, they are multifactor minimum variance) and that they are sufficiently different from the market portfolio to capture covariation in returns and variation in expected returns missed by the market portfolio. Thus, adding diversified portfolios that capture covariation in returns and variation in average returns left unexplained by the market is in the spirit of both the ICAPM and the Ross's arbitrage pricing theory.

The behavioralists are not impressed by the evidence for a risk-based explanation of the failures of the CAPM. They typically concede that the three-factor model captures covariation in returns missed by the market return and that it picks

up much of the size and value effects in average returns left unexplained by the CAPM. But their view is that the average return premium associated with the model's book-to-market factor—which does the heavy lifting in the improvements to the CAPM—is itself the result of investor overreaction that happens to be correlated across firms in a way that just looks like a risk story. In short, in the behavioral view, the market tries to set CAPM prices, and violations of the CAPM are due to mispricing.

The conflict between the behavioral irrational pricing story and the rational risk story for the empirical failures of the CAPM leaves us at a timeworn impasse. Fama (1970) emphasizes that the hypothesis that prices properly reflect available information must be tested in the context of a model of expected returns, like the CAPM. Intuitively, to test whether prices are rational, one must take a stand on what the market is trying to do in setting prices—that is, what is risk and what is the relation between expected return and risk? When tests reject the CAPM, one cannot say whether the problem is its assumption that prices are rational (the behavioral view) or violations of other assumptions that are also necessary to produce the CAPM (our position).

Fortunately, for some applications, the way one uses the three-factor model does not depend on one's view about whether its average return premiums are the rational result of underlying state variable risks, the result of irrational investor behavior or sample specific results of chance. For example, when measuring the response of stock prices to new information or when evaluating the performance of managed portfolios, one wants to account for known patterns in returns and average returns for the period examined, whatever their source. Similarly, when estimating the cost of equity capital, one might be unconcerned with whether expected return premiums are rational or irrational since they are in either case part of the opportunity cost of equity capital (Stein, 1996). But the cost of capital is forward looking, so if the premiums are sample specific they are irrelevant.

The three-factor model is hardly a panacea. Its most serious problem is the momentum effect of Jegadeesh and Titman (1993). Stocks that do well relative to the market over the last three to twelve months tend to continue to do well for the next few months, and stocks that do poorly continue to do poorly. This momentum effect is distinct from the value effect captured by book-to-market equity and other price ratios. Moreover, the momentum effect is left unexplained by the three-factor model, as well as by the CAPM. Following Carhart (1997), one response is to add a momentum factor (the difference between the returns on diversified portfolios of short-term winners and losers) to the three-factor model. This step is again legitimate in applications where the goal is to abstract from known patterns in average returns to uncover information-specific or manager-specific effects. But since the momentum effect is short-lived, it is largely irrelevant for estimates of the cost of equity capital.

Another strand of research points to problems in both the three-factor model and the CAPM. Frankel and Lee (1998), Dechow, Hutton and Sloan (1999), Piotroski (2000) and others show that in portfolios formed on price ratios like

*The Capital Asset Pricing Model: Theory and Evidence* 41

book-to-market equity, stocks with higher expected cash flows have higher average returns that are not captured by the three-factor model or the CAPM. The authors interpret their results as evidence that stock prices are irrational, in the sense that they do not reflect available information about expected profitability.

In truth, however, one can't tell whether the problem is bad pricing or a bad asset pricing model. A stock's price can always be expressed as the present value of expected future cash flows discounted at the expected return on the stock (Campbell and Shiller, 1989; Vuolteenaho, 2002). It follows that if two stocks have the same price, the one with higher expected cash flows must have a higher expected return. This holds true whether pricing is rational or irrational. Thus, when one observes a positive relation between expected cash flows and expected returns that is left unexplained by the CAPM or the three-factor model, one can't tell whether it is the result of irrational pricing or a misspecified asset pricing model.

### **The Market Proxy Problem**

Roll (1977) argues that the CAPM has never been tested and probably never will be. The problem is that the market portfolio at the heart of the model is theoretically and empirically elusive. It is not theoretically clear which assets (for example, human capital) can legitimately be excluded from the market portfolio, and data availability substantially limits the assets that are included. As a result, tests of the CAPM are forced to use proxies for the market portfolio, in effect testing whether the proxies are on the minimum variance frontier. Roll argues that because the tests use proxies, not the true market portfolio, we learn nothing about the CAPM.

We are more pragmatic. The relation between expected return and market beta of the CAPM is just the minimum variance condition that holds in any efficient portfolio, applied to the market portfolio. Thus, if we can find a market proxy that is on the minimum variance frontier, it can be used to describe differences in expected returns, and we would be happy to use it for this purpose. The strong rejections of the CAPM described above, however, say that researchers have not uncovered a reasonable market proxy that is close to the minimum variance frontier. If researchers are constrained to reasonable proxies, we doubt they ever will.

Our pessimism is fueled by several empirical results. Stambaugh (1982) tests the CAPM using a range of market portfolios that include, in addition to U.S. common stocks, corporate and government bonds, preferred stocks, real estate and other consumer durables. He finds that tests of the CAPM are not sensitive to expanding the market proxy beyond common stocks, basically because the volatility of expanded market returns is dominated by the volatility of stock returns.

One need not be convinced by Stambaugh's (1982) results since his market proxies are limited to U.S. assets. If international capital markets are open and asset prices conform to an international version of the CAPM, the market portfolio

should include international assets. Fama and French (1998) find, however, that betas for a global stock market portfolio cannot explain the high average returns observed around the world on stocks with high book-to-market or high earnings-price ratios.

A major problem for the CAPM is that portfolios formed by sorting stocks on price ratios produce a wide range of average returns, but the average returns are not positively related to market betas (Lakonishok, Shleifer and Vishny, 1994; Fama and French, 1996, 1998). The problem is illustrated in Figure 3, which shows average returns and betas (calculated with respect to the CRSP value-weight portfolio of NYSE, AMEX and NASDAQ stocks) for July 1963 to December 2003 for ten portfolios of U.S. stocks formed annually on sorted values of the book-to-market equity ratio (B/M).<sup>6</sup>

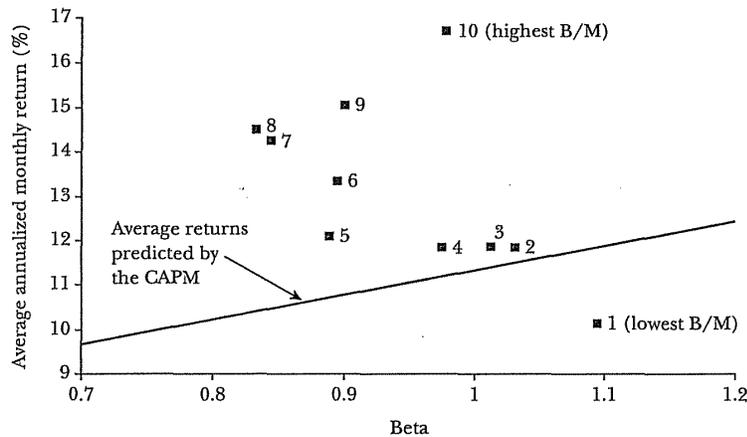

Average returns on the B/M portfolios increase almost monotonically, from 10.1 percent per year for the lowest B/M group (portfolio 1) to an impressive 16.7 percent for the highest (portfolio 10). But the positive relation between beta and average return predicted by the CAPM is notably absent. For example, the portfolio with the lowest book-to-market ratio has the highest beta but the lowest average return. The estimated beta for the portfolio with the highest book-to-market ratio and the highest average return is only 0.98. With an average annualized value of the riskfree interest rate,  $R_f$ , of 5.8 percent and an average annualized market premium,  $R_M - R_f$ , of 11.3 percent, the Sharpe-Lintner CAPM predicts an average return of 11.8 percent for the lowest B/M portfolio and 11.2 percent for the highest, far from the observed values, 10.1 and 16.7 percent. For the Sharpe-Lintner model to “work” on these portfolios, their market betas must change dramatically, from 1.09 to 0.78 for the lowest B/M portfolio and from 0.98 to 1.98 for the highest. We judge it unlikely that alternative proxies for the market portfolio will produce betas and a market premium that can explain the average returns on these portfolios.

It is always possible that researchers will redeem the CAPM by finding a reasonable proxy for the market portfolio that is on the minimum variance frontier. We emphasize, however, that this possibility cannot be used to justify the way the CAPM is currently applied. The problem is that applications typically use the same

<sup>6</sup> Stock return data are from CRSP, and book equity data are from Compustat and the Moody's Industrials, Transportation, Utilities and Financials manuals. Stocks are allocated to ten portfolios at the end of June of each year  $t$  (1963 to 2003) using the ratio of book equity for the fiscal year ending in calendar year  $t - 1$ , divided by market equity at the end of December of  $t - 1$ . Book equity is the book value of stockholders' equity, plus balance sheet deferred taxes and investment tax credit (if available), minus the book value of preferred stock. Depending on availability, we use the redemption, liquidation or par value (in that order) to estimate the book value of preferred stock. Stockholders' equity is the value reported by Moody's or Compustat, if it is available. If not, we measure stockholders' equity as the book value of common equity plus the par value of preferred stock or the book value of assets minus total liabilities (in that order). The portfolios for year  $t$  include NYSE (1963–2003), AMEX (1963–2003) and NASDAQ (1972–2003) stocks with positive book equity in  $t - 1$  and market equity (from CRSP) for December of  $t - 1$  and June of  $t$ . The portfolios exclude securities CRSP does not classify as ordinary common equity. The breakpoints for year  $t$  use only securities that are on the NYSE in June of year  $t$ .

*Eugene F. Fama and Kenneth R. French 43*

*Figure 3*  
**Average Annualized Monthly Return versus Beta for Value Weight Portfolios Formed on B/M, 1963–2003**

market proxies, like the value-weight portfolio of U.S. stocks, that lead to rejections of the model in empirical tests. The contradictions of the CAPM observed when such proxies are used in tests of the model show up as bad estimates of expected returns in applications; for example, estimates of the cost of equity capital that are too low (relative to historical average returns) for small stocks and for stocks with high book-to-market equity ratios. In short, if a market proxy does not work in tests of the CAPM, it does not work in applications.

**Conclusions**

The version of the CAPM developed by Sharpe (1964) and Lintner (1965) has never been an empirical success. In the early empirical work, the Black (1972) version of the model, which can accommodate a flatter tradeoff of average return for market beta, has some success. But in the late 1970s, research begins to uncover variables like size, various price ratios and momentum that add to the explanation of average returns provided by beta. The problems are serious enough to invalidate most applications of the CAPM.

For example, finance textbooks often recommend using the Sharpe-Lintner CAPM risk-return relation to estimate the cost of equity capital. The prescription is to estimate a stock’s market beta and combine it with the risk-free interest rate and the average market risk premium to produce an estimate of the cost of equity. The typical market portfolio in these exercises includes just U.S. common stocks. But empirical work, old and new, tells us that the relation between beta and average return is flatter than predicted by the Sharpe-Lintner version of the CAPM. As a

44 *Journal of Economic Perspectives*

result, CAPM estimates of the cost of equity for high beta stocks are too high (relative to historical average returns) and estimates for low beta stocks are too low (Friend and Blume, 1970). Similarly, if the high average returns on value stocks (with high book-to-market ratios) imply high expected returns, CAPM cost of equity estimates for such stocks are too low.<sup>7</sup>

The CAPM is also often used to measure the performance of mutual funds and other managed portfolios. The approach, dating to Jensen (1968), is to estimate the CAPM time-series regression for a portfolio and use the intercept (Jensen's alpha) to measure abnormal performance. The problem is that, because of the empirical failings of the CAPM, even passively managed stock portfolios produce abnormal returns if their investment strategies involve tilts toward CAPM problems (Elton, Gruber, Das and Hlavka, 1993). For example, funds that concentrate on low beta stocks, small stocks or value stocks will tend to produce positive abnormal returns relative to the predictions of the Sharpe-Lintner CAPM, even when the fund managers have no special talent for picking winners.

The CAPM, like Markowitz's (1952, 1959) portfolio model on which it is built, is nevertheless a theoretical tour de force. We continue to teach the CAPM as an introduction to the fundamental concepts of portfolio theory and asset pricing, to be built on by more complicated models like Merton's (1973) ICAPM. But we also warn students that despite its seductive simplicity, the CAPM's empirical problems probably invalidate its use in applications.

■ *We gratefully acknowledge the comments of John Cochrane, George Constantinides, Richard Leftwich, Andrei Shleifer, René Stulz and Timothy Taylor.*

<sup>7</sup> The problems are compounded by the large standard errors of estimates of the market premium and of betas for individual stocks, which probably suffice to make CAPM estimates of the cost of equity rather meaningless, even if the CAPM holds (Fama and French, 1997; Pastor and Stambaugh, 1999). For example, using the U.S. Treasury bill rate as the risk-free interest rate and the CRSP value-weight portfolio of publicly traded U.S. common stocks, the average value of the equity premium  $R_{Mt} - R_{ft}$  for 1927–2003 is 8.3 percent per year, with a standard error of 2.4 percent. The two standard error range thus runs from 3.5 percent to 13.1 percent, which is sufficient to make most projects appear either profitable or unprofitable. This problem is, however, hardly special to the CAPM. For example, expected returns in all versions of Merton's (1973) ICAPM include a market beta and the expected market premium. Also, as noted earlier the expected values of the size and book-to-market premiums in the Fama-French three-factor model are also estimated with substantial error.

### Cost of Newly Issued Common Stock, or External Equity, $r_e$

The cost of new common equity,  $r_e$ , or external equity, is higher than the cost of equity raised internally by reinvesting earnings,  $r_s$ , because of flotation costs involved in issuing new common stock. What rate of return must be earned on funds raised by selling new stock to make issuing stock worthwhile? To put it another way, what is the cost of new common stock?

The answer for a constant growth stock is found by applying this formula:

$$r_e = \frac{D_1}{P_0(1 - F)} + g \quad | 10-9 |$$

In Equation 10-9,  $F$  is the percentage flotation cost incurred in selling the new stock, so  $P_0(1 - F)$  is the net price per share received by the company.

Assuming that Axis has a flotation cost of 10 percent, its cost of new outside equity is computed as follows:

$$\begin{aligned} r_e &= \frac{\$1.24}{\$23(1 - 0.10)} + 8.0\% \\ &= \frac{\$1.24}{\$20.70} + 8.0\% \\ &= 6.0\% + 8.0\% = 14.0\% \end{aligned}$$

Investors require a return of  $r_s = 13.4\%$  on the stock.<sup>16</sup> However, because of flotation costs the company must earn *more* than 13.4 percent on the net funds obtained by selling stock if investors are to receive a 13.4 percent return on the money they put up. Specifically, if the firm earns 14 percent on funds obtained by issuing new stock, then earnings per share will remain at the previously expected level, the firm's expected dividend can be maintained, and, as a result, the price per share will not decline. If the firm earns less than 14 percent, then earnings, dividends, and growth will fall below expectations, causing the stock price to decline. If the firm earns more than 14 percent, the stock price will rise.

As we noted earlier, most analysts use the CAPM to estimate the cost of equity. Suppose the CAPM cost of equity for Axis is 13.8 percent. How could the analyst incorporate flotation costs? In the example above, application of the DCF methodology gives a cost of equity of 13.4 percent if flotation costs are ignored and a cost of equity of 14.0 percent if flotation costs are included. Therefore, flotation costs add 0.6 percentage point to the cost of equity ( $14.0 - 13.4 = 0.6$ ). To incorporate flotation costs into the CAPM estimate, you would add the 0.6 percentage point to the 13.8 percent CAPM estimate, resulting in a 14.4 percent estimated cost of external equity. As an alternative, you could find the average of the CAPM, DCF, and bond-yield-plus-risk-premium costs of equity ignoring flotation costs, and then add to it the 0.6 percentage point due to flotation costs.

<sup>16</sup>If there were no flotation costs,  $r_s = \frac{\$1.24}{\$23} + 8.0\% = 13.4\%$ .

## Size as a Predictor of Equity Returns

The size effect is based on the empirical observation that companies of smaller size are associated with greater risk and, therefore, have greater cost of capital. The “size” of a company is one of the most important risk elements to consider when developing cost of equity capital estimates for use in valuing a business simply because size has been shown to be a *predictor* of equity returns. In other words, there is a significant (negative) relationship between size and historical equity returns – as size *decreases*, returns tend to *increase*, and vice versa.<sup>1</sup>

Traditionally, researchers have used market value of equity (market capitalization, or simply “market cap”) as a measure of size in conducting historical rate of return studies. However, as we discuss later in this chapter, market cap is not the only measure of size that can be used to predict return, nor is it necessarily the best measure of size to use.

Much of the research of the size effect relies on the data provided by the Center for Research in Security Prices (CRSP) databases at the University of Chicago. The CRSP database includes U.S. equity total returns (capital appreciation plus dividends) going back to 1926.

The CRSP databases enabled researchers to look at stocks with different characteristics and analyze how their returns differed. One of the first characteristics that researchers analyzed was large-market-capitalization (large-cap) companies versus small-market-capitalization (small-cap) companies.

For example, a 1981 study by Rolf Banz examined the returns of New York Stock Exchange (NYSE) small-cap companies compared to the returns of NYSE large-cap companies over the period 1926–1975.<sup>2</sup> What Banz found was that the returns of small-cap companies were *greater* than the returns for large-cap companies. Banz’s 1981 study is often cited as the first comprehensive study of the size effect.

### Possible Explanations for the Greater Returns of Smaller Companies

Some valuation analysts treat small firms as equivalent to scaled-down large firms. This is likely an erroneous assumption.

There are theoretical reasons for the greater returns of smaller companies (i.e., the “size effect”), which might include: (i) small stocks are less liquid (with higher associated

## Capital Budgeting and Risk

Long before the development of modern theories linking risk and expected return, smart financial managers adjusted for risk in capital budgeting. They realized intuitively that, other things being equal, risky projects are less desirable than safe ones. Therefore financial managers demanded a higher rate of return from risky projects, or they based their decisions on conservative estimates of the cash flows.

Various rules of thumb are often used to make these risk adjustments. For example, many companies estimate the rate of return required by investors in their securities and use the **company cost of capital** to discount the cash flows on all new projects. Since investors require a higher rate of return from a very risky company, such a firm will have a higher company cost of capital and will set a higher discount rate for its new investment opportunities. For example, in Table 8-1 we estimated that investors expected a rate of return of .163 or about 16.5 percent from Microsoft common stock. Therefore, according to the company cost of capital rule, Microsoft should have been using a 16.5 percent discount rate to compute project net present values.<sup>1</sup>

This is a step in the right direction. Even though we can't measure risk or the expected return on risky securities with absolute precision, it is still reasonable to assert that Microsoft faced more risk than the average firm and, therefore, should have demanded a higher rate of return from its capital investments.

But the company cost of capital rule can also get a firm into trouble if the new projects are more or less risky than its existing business. Each project should be evaluated at its *own* opportunity cost of capital. This is a clear implication of the value-additivity principle introduced in Chapter 7. For a firm composed of assets A and B, the firm value is

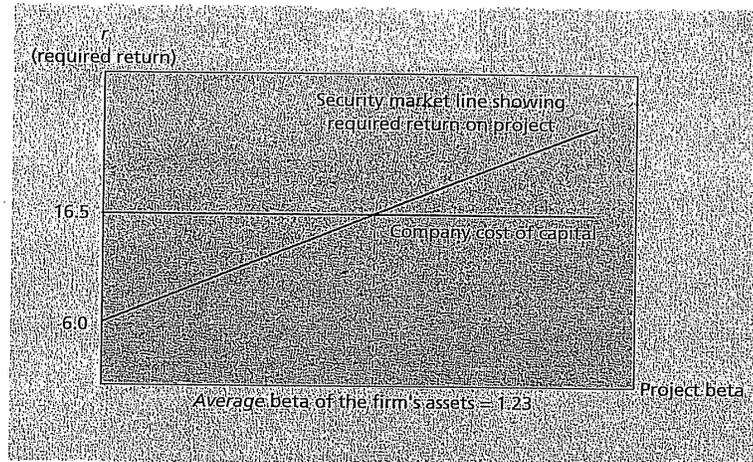

$$\text{Firm value} = \text{PV}(\text{AB}) = \text{PV}(\text{A}) + \text{PV}(\text{B}) = \text{sum of separate asset values}$$

Here PV(A) and PV(B) are valued just as if they were mini-firms in which stockholders could invest directly. Investors would value A by discounting its forecasted cash flows at a rate reflecting the risk of A. They would value B by discounting at a rate reflecting the risk of B. The two discount rates will, in general, be different.

<sup>1</sup>Microsoft did not use any significant amount of debt financing. Thus its cost of capital is the rate of return investors expect on its common stock. The complications caused by debt are discussed later in this chapter.

CHAPTER 9: Capital Budgeting and Risk

**Figure 9-1** A comparison between the company cost of capital rule and the required return under the capital asset pricing model. Microsoft's company cost of capital is about 16.5 percent. This is the correct discount rate only if the project beta is 1.23. In general, the correct discount rate increases as project beta increases. Microsoft should accept projects with rates of return above the security market line relating required return to beta.

If the firm considers investing in a third project C, it should also value C as if C were a mini-firm. That is, the firm should discount the cash flows of C at the expected rate of return that investors would demand to make a separate investment in C. *The true cost of capital depends on the use to which the capital is put.*

This means that Microsoft should accept any project that more than compensates for the *project's beta*. In other words, Microsoft should accept any project lying above the upward-sloping line that links expected return to risk in Figure 9-1. If the project has a high risk, Microsoft needs a higher prospective return than if the project has a low risk. Now contrast this with the company cost of capital rule, which is to accept any project *regardless of its risk* as long as it offers a higher return than the *company's* cost of capital. In terms of Figure 9-1, the rule tells Microsoft to accept any project above the horizontal cost-of-capital line, i.e., any project offering a return of more than 16.5 percent.

It is clearly silly to suggest that Microsoft should demand the same rate of return from a very safe project as from a very risky one. If Microsoft used the company cost of capital rule, it would reject many good low-risk projects and accept many poor high-risk projects. It is also silly to suggest that just because Duke Power has a low company cost of capital, it is justified in accepting projects that Microsoft would reject. If you followed such a rule to its seemingly logical conclusion, you would think it possible to enlarge the company's investment opportunities by investing a large sum in Treasury bills. That would make the common stock safe and create a low company cost of capital.<sup>2</sup>

The notion that each company has some individual discount rate or cost of capital is widespread, but far from universal. Many firms require different returns from different categories of investment. For example, discount rates might be set as follows:

<sup>2</sup>If the present value of an asset depended on the identity of the company that bought it, present values would not add up. Remember, a good project is a good project is a good project.

Category	Discount Rate
Speculative ventures	30%
New products	20%
Expansion of existing business	15% (company cost of capital)
Cost improvement, known technology	10%

The capital asset pricing model is widely used by large corporations to estimate the discount rate. It states

$$\text{Expected project return} = r = r_f + (\text{project beta})(r_m - r_f)$$

To calculate this, you have to figure out the project beta. Before thinking about the betas of individual projects, we will look at some problems you would encounter in using beta to estimate a company's cost of capital. It turns out that beta is difficult to measure accurately for an individual firm: Much greater accuracy can be achieved by looking at an average of similar companies. But then we have to define *similar*. Among other things, we will find that a firm's borrowing policy affects its stock beta. It would be misleading, e.g., to average the betas of Chrysler, which has been a heavy borrower, and General Motors, which has generally borrowed less.

The company cost of capital is the correct discount rate for projects that have the same risk as the company's existing business but *not* for those projects that are safer or riskier than the company's average. The problem is to judge the relative risks of the projects available to the firm. To handle that problem, we will need to dig a little deeper and look at what features make some investments riskier than others. After you know *why* AT&T stock has less market risk than, say, Ford Motor, you will be in a better position to judge the relative risks of capital investment opportunities.

There is still another complication: Project betas can shift over time. Some projects are safer in youth than in old age; others are riskier. In this case, what do we mean by *the* project beta? There may be a separate beta for each year of the project's life. To put it another way, can we jump from the capital asset pricing model, which looks out one period into the future, to the discounted-cash-flow formula that we developed in Chapters 2 and 6 for valuing long-lived assets? Most of the time it is safe to do so, but you should be able to recognize and deal with the exceptions.

We will use the capital asset pricing model, or CAPM, throughout this chapter. But don't infer that the CAPM is the last word on risk and return. The principles and procedures covered in this chapter work just as well with other models such as arbitrage pricing theory (APT). For example, we could have started with an APT estimate of the expected rate of return on Microsoft stock; the discussion of company and project costs of capital would have followed exactly.

## MEASURING BETAS

Suppose that you were considering an across-the-board expansion by your firm. Such an investment would have about the same degree of risk as the existing business. Therefore you should discount the projected flows at the company cost of capital. To estimate that, you could begin by estimating the beta of the company's stock.

An obvious way to measure the beta of the stock is to look at how its price has responded in the past to market movements. For example, in Figure 9-2a and b we have plotted monthly rates of return from AT&T and Hewlett-Packard against mar-

Thus we could view the project as offering an expected payoff of  $.5(1500) + .5(0) = 750$ , or \$750,000, at  $t = 1$  on a \$125,000 investment at  $t = 0$ . Of course, the certainty equivalent of the payoff is less than \$750,000, but the difference would have to be very large to justify rejecting the project. For example, if the certainty equivalent is half the forecasted cash flow and the risk-free rate is 7 percent, the project is worth \$225,500:

$$\begin{aligned} \text{NPV} &= C_0 + \frac{\text{CEQ}_1}{1 + r_f} \\ &= -125 + \frac{.5(750)}{1.07} = 225.5, \text{ or } \$225,500 \end{aligned}$$

This is not bad for a \$125,000 investment—and quite a change from the negative NPV that management got by discounting all future cash flows at 25 percent.

You sometimes hear people say that because distant cash flows are “riskier,” they should be discounted at a higher rate than earlier cash flows. That is quite wrong: Using the same risk-adjusted discount rate for each year’s cash flow implies a larger deduction for risk from the later cash flows. The reason is that the discount rate compensates for the risk borne *per period*. The more distant the cash flows, the greater the number of periods and the larger the *total* risk adjustment.

It makes sense to use a single risk-adjusted discount rate as long as the project has the same market risk at each point in its life. But look out for exceptions like the electric mop project, where market risk changes as time passes.

## 9-6 SUMMARY

In Chapter 8 we set out some basic principles for valuing risky assets. In this chapter we have shown you how to apply these principles to practical situations.

The problem is easiest when you believe that the project has the same market risk as the company’s existing assets. In this case, the required return equals the required return on a portfolio of the company’s securities. This is called the *company cost of capital*.

Capital asset pricing theory states that the required return on any asset depends on its risk. In this chapter we have defined risk as beta and used the capital asset pricing model to calculate expected returns.

The most common way to estimate the beta of a stock is to figure out how the stock price has responded to market changes in the past. Of course, this will give you only an estimate of the stock’s true beta. You may get a more reliable figure if you calculate an industry beta for a group of similar companies.

Suppose that you now have an estimate of the stock’s beta. Can you plug that into the capital asset pricing model to find the company’s cost of capital? No, the stock beta may reflect both business and financial risk. Whenever a company borrows money, it increases the beta (and the expected return) of its stock. Remember, the company cost of capital is the expected return on a portfolio of all the firm’s securities, not just the common stock. You can calculate it by estimating the expected return on each of the securities and then taking a weighted average of these separate returns. Or you can calculate the beta of the portfolio of securities and then plug this *asset beta* into the capital asset pricing model.

The company cost of capital is the correct discount rate for projects that have the same risk as the company's existing business. Many firms, however, use the company cost of capital to discount the forecasted cash flows on all new projects. This is a dangerous procedure. In principle, each project should be evaluated at its own opportunity cost of capital; the true cost of capital depends on the use to which the capital is put. If we wish to estimate the cost of capital for a particular project, it is *project risk* that counts. Of course the company cost of capital is fine as a discount rate for average-risk projects. It is also a useful starting point for estimating discount rates for safer or riskier projects.

We cannot give you a neat formula that will allow you to estimate project betas, but we can give you some clues. First, avoid adding fudge factors to discount rates to offset worries about bad project outcomes. Adjust cash-flow forecasts to give due weight to bad outcomes as well as good; *then* ask whether the chance of bad outcomes adds to the project's market risk. Second, you can often identify the characteristics of a high- or low-beta project even when the project beta cannot be calculated directly. For example, you can try to figure out how much the cash flows are affected by the overall performance of the economy: Cyclical investments are generally high-beta investments. You can also look at the project's operating leverage: Fixed production charges work like fixed debt charges; i.e., they increase beta.

There is one more fence to jump. Most projects produce cash flows for several years. Firms generally use the same risk-adjusted rate  $r$  to discount each of these cash flows. When they do this, they are implicitly assuming that cumulative risk increases at a constant rate as you look further into the future. That assumption is usually reasonable. It is precisely true when the project's future beta will be constant, i.e., when risk *per period* is constant.

But exceptions sometimes prove the rule. Be on the alert for projects where risk clearly does *not* increase steadily. In these cases, you should break the project into segments within which the same discount rate can be reasonably used. Or you should use the certainty-equivalent version of the DCF model, which allows separate risk adjustments to each period's cash flow.

#### APPENDIX: USING THE CAPITAL ASSET PRICING MODEL TO CALCULATE CERTAINTY EQUIVALENTS

When calculating present value, you can take account of risk in either of two ways. You can discount the expected cash flow  $C_1$  by the risk-adjusted discount rate  $r$ :

$$PV = \frac{C_1}{1 + r}$$

Alternatively, you can discount the certainty-equivalent cash flow  $CEQ_1$  by the risk-free rate of interest  $r_f$ :

$$PV = \frac{CEQ_1}{1 + r_f}$$

In this appendix we show how you can derive  $CEQ_1$  from the capital asset pricing model.

We know from our present value formula that  $1 + r$  equals the expected dollar payoff on the asset divided by its present value:

Chapter 16 The Cost of Capital 623

traded, then we cannot calculate the firm's beta. For the privately owned firm, we might use the so-called "pure play" CAPM technique. This involves finding a firm in the same line of business that does have public equity, estimating its beta, and then using this beta as a proxy for that of the small business in question.

To illustrate the pure play approach, again consider BTG. The firm is not publicly traded, so we cannot estimate its beta. However, data are available on more established firms, such as Genentech and Genetic Industries, so we could use their betas as representative of the biological and genetic engineering industry. Of course, these firms' betas would have to be subjectively modified to reflect their larger sizes and more established positions, as well as to take account of the differences in the nature of their products and their capital structures as compared to those of BTG. Still, as long as there are public companies in similar lines of business available for comparison, the estimates of their betas can be used to help estimate the cost of capital of a firm whose equity is not publicly traded. Note that a "liquidity premium" as discussed in Chapter 3 would also have to be added to reflect the illiquidity of the small, nonpublic firm's stock.

### Flotation Costs for Small Issues

When external equity capital is raised, flotation costs increase the cost of equity capital beyond what it would be for internal funds. These external flotation costs are especially significant for smaller firms, and they can substantially affect capital budgeting decisions involving external equity funds. To illustrate this point, consider a firm that is expected to pay constant dividends forever, and hence whose growth rate is zero. In this case, if  $F$  is the percentage flotation cost, then the cost of equity capital is  $k_e = D_1 / (P_0(1 - F))$ . The higher the flotation cost, the higher the cost of external equity.

How big is  $F$ ? According to the latest Securities and Exchange Commission data, the average flotation cost of large common stock offerings (more than \$50 million) is only about 4 percent. For a firm that is expected to provide a 15 percent dividend yield (that is,  $D_1/P_0 = 15\%$ ), the cost of equity is  $15\% / (1 - 0.04)$ , or 15.6 percent. However, the

SEC's data on small stock offerings (less than \$1 million) show that flotation costs for such issues average about 21 percent. Thus, the cost of equity capital in the preceding example would be  $15\% / (1 - 0.21)$ , or about 19 percent. When we compare this to the 15.6 percent for large offerings, it is clear that a small firm would have to earn considerably more on the same project than a large firm. Small firms are therefore at a substantial disadvantage because of the effects of flotation costs.

### The Small-Firm Effect

A number of researchers have observed that portfolios of small-firm stocks have earned consistently higher average returns than those of large-firm stocks; this is called the "small-firm effect." On the surface, it would seem to be advantageous to the small firm to provide average returns in the stock market that are higher than those of large firms. In reality, it is bad news for the small firm; what the small-firm effect means is that the capital market demands higher returns on stocks of small firms than on otherwise similar stocks of large firms. Therefore, the cost of equity capital is higher for small firms. This compounds the high flotation cost problem noted above.

It may be argued that stocks of small firms are riskier than those of large ones and that this accounts for the differences in returns. It is true that academic research usually finds that betas are higher on average for small firms than for large ones. However, the larger returns for small firms remain larger even after adjusting for the effects of their higher risks as reflected in their beta coefficients.

The small-firm effect is an anomaly in the sense that it is not consistent with the CAPM theory. Still, higher returns reflect a higher cost of capital, so we must conclude that smaller firms do have higher capital costs than otherwise similar larger firms. The manager of a small firm should take this factor into account when estimating his or her firm's cost of equity capital. In general, the cost of equity capital appears to be about four percentage points higher for small firms (those with market values of less than \$20 million) than for large, New York Stock Exchange firms with similar risk characteristics.

Press Release

**Despite Successfully Navigating Effects of Pandemic, Gas Utility Customer Satisfaction Remains Lukewarm , J.D. Power Finds**

Increasing Communications Key to Boosting Overall Satisfaction

**TROY, Mich.: 30 Nov. 2022** — With the price of natural gas increasing in the past year and utilities shifting away from billing forgiveness, price satisfaction is the lowest it has been in since 2016, according to the J.D. Power 2022 Gas Utility Residential Customer Satisfaction Study,<sup>SM</sup> released today. Specifically, price satisfaction is 677, down from a pre-pandemic level of 688 in 2019.

"In an effort to counteract the satisfaction with natural gas price increase, gas utility providers can elevate satisfaction through effective customer communications," said **Mark Spalinger, director of utilities intelligence at J.D. Power**. "Utility companies that communicate pricing programs, ways to save and usage awareness tend to have higher satisfaction. Effective communication is only part of the equation. Along with increasing prices, we also see an increase in customers contacting their utility and the majority are using digital channels which are highly satisfying. Continuing to enhance and optimize the website and mobile app experience will help boost overall satisfaction."

**Study Rankings**

- East Large Segment: **PSE&G**
- East Midsize Segment: **Elizabethtown Gas** (for an eighth consecutive year)
- Midwest Large Segment: **DTE Energy** (for a third consecutive year)
- Midwest Midsize Segment: **Atmos Energy**

## J.D. POWER

Listening to the Voice of the Customer is the first step in targeting performance improvement initiatives that can increase overall customer satisfaction.

## GAS UTILITY BUSINESS CUSTOMER SATISFACTION STUDY

As the demands of business utility customers continue to evolve, it is imperative that utility companies stay up to date regarding their customers' needs and expectations. Utilities that understand their customers' attitudes, behaviors, and preferences are better able to target performance improvement initiatives that can increase overall customer satisfaction.

### The Solution

The *J.D. Power Gas Utility Business Customer Satisfaction Study<sup>SM</sup>* measures business utility customers' satisfaction with gas utility companies across four U.S. geographic regions: East, Midwest, South, and West. The study, which provides the gas industry with insights into the evolving needs and demands of business customers, includes four objectives:

- Capturing a nationwide footprint of gas utility performance by including as many utilities as possible
- Analyzing the relative performance of major gas utility companies throughout the United States in terms of how well they satisfy their business customers
- Confirming the drivers of overall satisfaction among business customers
- Providing actionable information to utilities by developing insights regarding the needs of business customers

### How It Works

#### Sampling

To be included in the study, utilities must first meet the minimum market share criteria of having more than 25,000 business customers. Utilities meeting that criterion are given a sample size quota to fulfill surveying requirements, after which an online survey is deployed in two waves of fielding. For the study, more than 9,000 online interviews with gas utility business customers are conducted. Respondents are weighted to reflect the experiences of more than 4 million business customers served by 60 gas utilities profiled in the study.

## J.D. POWER

Based on data obtained from the survey, an index is created that quantifies the impact that the factors and the attributes within them have on customer satisfaction.

## Leveraging J.D. Power Data to Better Understand Competitive Position

### Satisfaction Drivers

The Gas Utility Business Customer Satisfaction Index segments the customer experience into six factors:

- Safety and Reliability
- Customer Service
- Billing and Payment
- Price
- Corporate Citizenship
- Communications

### Oversampling

J.D. Power offers a proprietary oversample opportunity allowing utilities that are not currently profiled in the syndicated study to obtain competitive data sets in order to benchmark their performance against peer utilities that are profiled in the study. This opportunity is also available for profiled utilities that want to dive deeper into a specific topic covered in the study. The same questionnaire used for the syndicated study is used for the proprietary oversample study.

### Industry Best Practices

Key Performance Indicators (KPIs)—or best practices—and diagnostics provide in-depth analyses of customer needs and preferences at each service “moment of truth” by identifying the top service practices. This information has proven invaluable in helping companies prioritize strategies that target the areas most important to customers.

KPIs are individual diagnostic items that have the most significant relationship with a customer’s overall experience with their gas utility. The KPI break point is the specific point at which satisfaction significantly improves, indicating a best practice.

## J.D. POWER

KPIs and diagnostics have proven invaluable in helping companies prioritize strategies that target the areas most important to customers.

### Subscription Details

The *Gas Utility Business Customer Satisfaction Study* provides access to the insights and tools needed to gain a comprehensive, in-depth understanding of how your utility is performing and to identify key areas needing improvement.

Biannual deliverables:

- Access to a **competitive data** set allowing you to see how your utility stacks up against your peers, the industry, and the highest performers across six factors and 36 attributes at both the national and regional levels
- **Study Questionnaire**
- **Results Webcast**

Final Deliverables (in addition to above):

- An **on-site executive presentation** with management insights, which includes customized strategic recommendations, study results, ongoing best practices, and analyses of high-performing gas utilities
- **Calculator**: A tool for identifying improvement opportunities by executing what-if scenarios in order to model changes to a given attribute or set of attributes.
- **Executive Briefing**
- **Study Methodology**

All deliverables will be available on the J.D. Power PowerSource portal, our online communications tool and download site. The PowerSource portal provides the following features:

- **Active portal**: Data elements in the portal include all study data and such items as key charts and tables that highlight KPIs and rankings
- **Performance analysis**: Allows users to easily view key metrics against multiple points of reference, providing more control when performing root-cause analyses and benchmarking
- **Verbatim comments**: Full search functionality allows rapid access to verbatims of interest

GAS UTILITY BUSINESS CUSTOMER SATISFACTION STUDY

**J.D. POWER**

**ABOUT J.D. POWER**

J.D. Power is a global leader in consumer insights, advisory services and data and analytics. A pioneer in the use of big data, artificial intelligence (AI) and algorithmic modeling capabilities to understand consumer behavior, J.D. Power has been delivering incisive industry intelligence on customer interactions with brands and products for more than 50 years. The world's leading businesses across major industries rely on J.D. Power to guide their customer-facing strategies.

J.D. Power is headquartered in Troy, Mich., and has offices in North America, Europe and Asia Pacific.

**OUR EXPERIENCE**

J.D. Power has been capturing and analyzing the Voice of the Customer for 50 years. Through our proprietary index model, the many drivers of the customer experience are identified, accurately measured, and linked to business results. Based on our findings, we provide clients with insights that can lead to an improvement in their financial performance.

Utilities that subscribe to the study will be better able to understand their competitive position at a detailed level, allowing them to pinpoint critical areas for improvement and make prudent investments in the service attributes that matter most to customers.

For more information about J.D. Power products and services, please contact your J.D. Power account manager.

DOCKET NO. 20230023-GU  
FILED 2/3/2023  
DOCUMENT NO. 00867-2023  
FPSC - COMMISSION CLERK

February 3, 2023

The Honorable Andrew Giles Fay  
Chairman  
Florida Public Service Commission  
2540 Shumard Oak Boulevard  
Tallahassee, FL 32399-0850

**Re: Peoples Gas System, Inc. - Test Year Notification  
Pursuant to Rule 25-7.140, Florida Administrative Code**

Dear Chairman Fay,

Peoples Gas System, Inc. (“Peoples” or the “company”) proudly continues to support the growth and economic vitality of Florida by providing safe, reliable, and clean natural gas to Floridians while evolving with changing energy markets and maintaining exceptional customer service. However, strong customer demand, the impacts of inflation, and higher costs of capital have significantly impacted the company’s operations.

After careful consideration, Peoples has concluded that it is necessary to seek rate relief. This letter is notice to the Florida Public Service Commission (“Commission”) that Peoples intends to petition for a general base rate increase on April 4, 2023, for new rates effective January 2024, and that the company proposes to use projected calendar year 2024 as the test period in that proceeding.

About Peoples

Peoples is expanding its system as Florida grows. The company was formed in 1895 and is the largest natural gas local distribution company in Florida. Through its 14 service areas, the company safely and reliably serves approximately 470,000 residential, commercial, industrial, and electric power generation customers in 39 of Florida’s 67 counties, including five major metropolitan areas. Peoples is a subsidiary of Emera Incorporated (“Emera”), a geographically diverse energy and services company headquartered in Halifax, Nova Scotia, Canada. Emera also owns our affiliate, Tampa Electric Company (“Tampa Electric”).

Florida’s Remarkable Growth

Florida’s growth has been remarkable, especially over the past few years. The state’s abundant natural resources, favorable tax system, balanced approach to regulation, and other thoughtful policy choices have helped make Florida one of the fastest-growing states in America. Florida is a national leader in new business formation and net population in-migration. While other states

The Honorable Andrew Giles Fay  
Page 2 of 10  
February 3, 2023

have experienced population declines, Florida's population is expected to be 22.6 million people in 2024, up 1 million since January 1, 2021.

Florida's population growth means: more new home construction; more hotels, hospital, stores, and restaurants; new and expanded roads and other construction; and more gas-fired electricity generation. As Florida grows, Peoples must: invest in new mains, laterals, service lines, and meters; hire team members to operate and maintain a growing system; and spend money building, upgrading, and moving the company's gas distribution infrastructure to accommodate construction. Peoples believes these activities are necessary to serve customer demand and support Florida's competitiveness.

Here are some measures of Peoples' system expansion:

From January 1, 2021, to December 31, 2022, Peoples added approximately 40,000 (10 percent) and approximately 1,500 (four percent) new residential and commercial customers, respectively. The company expects to add almost 28,000 new residential and approximately 1,200 new commercial customers from January 2023 to December 2024.

From January 2021 to December 2022, the company added approximately 1,200 miles of main and services and anticipates adding approximately 1,000 miles from January 2023 to December 2024. Residential sales for 2024, measured in therms, are expected to be up 12 percent over 2021 actuals.

The investments required to support this remarkable expansion contribute to the company's need for rate relief as do the demands of changing energy markets.

#### Changing Energy Markets

Peoples is a *local* gas distribution company, but its operations are influenced by weather, political activity, and economic factors around the world - all of which are beyond the company's control. Although natural gas prices recently have been more volatile, the abundant supply of domestic natural gas has reduced the cost of natural gas well below levels a decade ago and made the United States a major exporter of natural gas. Customer demand for natural gas is high in Florida because it is affordable, reliable, and safe, and while some states have attempted to restrict the use of natural gas, policymakers in Florida have wisely preserved natural gas as a choice for consumers. Natural gas has also replaced coal as the primary fuel for generating electricity in the state.

Gas customers in all classes are demanding faster and more reliable service, more information, and the ability to communicate with Peoples using multiple communication platforms. They also want alternative ways to receive natural gas such as liquefied natural gas ("LNG") and compressed natural gas ("CNG"), and innovative, Florida-sourced, carbon-friendly renewable energy solutions like renewable natural gas ("RNG").

Peoples has been an industry leader and has embraced these changes by: focusing on safety and outstanding customer service; supporting the growth and economic vitality of Florida; serving the natural gas needs of electric generators; advancing the growth of RNG, LNG, and CNG; and

The Honorable Andrew Giles Fay  
Page 3 of 10  
February 3, 2023

striving to keep its customer rates fair, just, reasonable, and competitive relative to other energy options.

#### Commitment to Safety and Customer Service

The safety of Peoples' team members, contractors, customers, and the public is paramount. The company's commitment to exceptional customer service runs a close second. Peoples is proud of its record in both areas.

On the safety side, the company's Occupational Safety and Health Administration (OSHA) injury rate for team members and contractors is an industry low. Peoples was awarded the Industry Leader Accident Prevention Award from the American Gas Association for a DART (days away, restricted, or transferred) incidence rate below the industry average in 2022. Peoples also received Gold Shovel Standard Certification for its use of underground damage prevention best practices and has required the same of its strategic partners. The company continues to have excellent Pipeline and Hazardous Materials Safety Administration ("PHMSA") compliance results.

Peoples has a record of outstanding customer service:

In 2022, the company ranked highest in the *south* midsize segment of the J.D. Power Gas Utility Residential Customer Satisfaction study for the 10th year in a row, and highest in the south segment of the Gas Utility Business Customer Satisfaction study for the fourth year in a row and sixth time since 2016.

Peoples has led the *nation* in the J.D. Power residential study in eight of the past ten years and ranked highest in the nation in the business study the past three years.

Peoples was named the Most Trusted Utility in the nation for the eighth time in the 2022 Cogent Syndicated Utility Trusted Brand & Customer Engagement: Residential study by Escalent.

Escalent also named Peoples a Trusted Business Partner (two consecutive years, one of the easiest utilities in the nation with which to conduct business, an Environmental Champion (eighth consecutive year), and a Customer Champion (ninth consecutive year).

#### Commitment to Sustainability and the Environment

Customer interest in sustainable and renewable energy continues to grow and has expanded beyond solar. To support Florida's clean energy future, Peoples is pursuing, and its rate case filing will include, three innovative RNG projects that will deliver sustainable, carbon-neutral, pipeline-quality gas made in Florida to customers in Florida. Projects like these reflect partnerships with farmers, counties, municipalities, and others to drive economic development, reduce methane emissions, and deliver Florida-sourced natural gas to customers.

For eleven years, the company has systematically replaced legacy pipe with new pipe through its Cast Iron Bare Steel/Problematic Plastic Pipe program ("CIBS/PPP"). This program has reduced gas leaks, lowered carbon emissions, and enhanced the efficiency of the company's distribution

The Honorable Andrew Giles Fay  
Page 4 of 10  
February 3, 2023

system. The company also continues to support customers who seek CNG and LNG - oil and diesel alternatives – as part of their energy solutions.

#### Peoples Supports the Communities it Serves

Peoples has a strong track record of helping its customers through challenges caused by public health issues, volatile economic conditions, and severe weather. During the COVID-19 pandemic, Peoples and its team members supported customers and offered payment assistance to over 6,000 residential and commercial customers. These support activities included: (1) extensive outreach efforts; (2) implementation of modified payment arrangement guidelines to provide greater flexibility to customers; (3) revised service disconnection/reconnection guidelines; and (4) personal call follow-ups with customers who had not reconnected service after three days to offer creative options for assistance.

Because most of its natural gas infrastructure is underground and less susceptible to wind damage, Peoples' natural gas service provides significant energy resiliency benefits to Florida during severe weather. During Hurricane Ian, only about 800 of the company's customers experienced service disruptions, even though some of the company's territories were in the hardest hit areas. Backup generation fueled by natural gas allows hospitals, nursing homes, residential communities, and other essential services to continue operations during and after major storms.

#### Other Factors

Meeting the strong demand for natural gas, navigating changing markets, and increasing customer expectations has been challenging. Like other businesses, Peoples has experienced higher than expected inflation, labor market challenges, supply chain disruptions, and higher interest costs. Although the company has worked diligently to moderate them, the combined impact of growth and these factors is challenging the company's ability to continue to (1) safely and effectively operate and maintain its growing systems under current rates while (2) earning a fair rate of return on its investments. Consequently, Peoples finds itself with a need to petition for a general base rate increase as the term of its 2020 Agreement draws to a close.

#### Peoples' Last Rate Case

The company's last general rate case was filed on June 8, 2020, in Docket No. 20200051-GU, and yielded the Stipulation and Settlement Agreement approved by the Commission in Order No. PSC-2020-0485-FOF-GU, issued December 10, 2020, in Docket Nos. 20200051-GU, 20200166-GU, and 20200178-GU ("2020 Agreement"). This agreement authorized the company to implement new base rates and charges and established a return on equity ("ROE") midpoint of 9.90 percent with a range of 8.90 percent to 11.00 percent effective January 1, 2021. The base revenue increase of \$58 million included \$23.6 million of revenue requirements transferred from the CIBS/PPP Rider. The 2020 Agreement authorized Peoples to amortize \$34 million of depreciation reserve surplus as a credit to depreciation expense from 2020 through 2023.

The Honorable Andrew Giles Fay  
Page 5 of 10  
February 3, 2023

### Test Year Request

Peoples intends to seek general rate relief pursuant to the provisions of Section 366.06(3), Florida Statutes, as soon as the new rate schedules, the petition relating thereto, and the minimum filing requirements can be completed and filed. The company plans to file on April 4, 2023 and proposes to use a projected test year ending December 31, 2024, with a historic base year ending December 31, 2022. Given the expected impacts of future customer demand, inflation, and changes in the capital markets, the company's proposed 2024 test year will reasonably reflect the economic and operating conditions expected during the first 12 months that the company's proposed new rates will be in effect and will be more representative than a historic test year.

Peoples is finalizing its 2024 test year revenue requirement calculations but anticipates requesting a net incremental base rate revenue increase of approximately \$125 million to \$135 million, which excludes about \$12 million of revenue requirements transferred from the CIBS/PPP Rider. The company will not request interim rates or that its petition for rate relief be processed using the proposed agency action process authorized in Section 366.06(4), Florida Statutes.

### Major Factors Necessitating a General Base Rate Increase

The major factors driving the need for a rate case include strong customer and rate base growth, plus associated increases in depreciation expenses, property taxes and operations and maintenance ("O&M") expenses to operate the company's system safely and reliably that are outpacing the company's revenue growth. As a result of these factors, which are largely driven by external forces, and to fulfill its obligation to serve, the company expects to earn below the bottom of its approved ROE range in 2023 and earn approximately two percent ROE in 2024 without rate relief.

#### 1. Rate Base Growth

Peoples is committed to keeping up with Florida's remarkable growth. However, Peoples invests capital to meet growth and to: (1) improve the reliability, resiliency, and efficiency of its operations; (2) sustain (maintain) its system; and (3) replace legacy pipe. In total, Peoples expects the need to invest over a billion dollars in its system from January 1, 2022, to December 31, 2024. Due to this significant investment, approximately \$90 million of the company's revenue requirement increase from the 2020 Settlement is attributable to rate base growth. About half of this amount is return on rate base and the other half is increased depreciation expense and higher property tax expense associated with higher plant balances.

##### A. Customer Growth and Environmentally Friendly Projects

As previously noted, Peoples is investing heavily in new gas mains, laterals, and meters to serve thousands of new residential and commercial customers across the state. The company is also investing in environmentally friendly projects to meet specific customer needs and support changing energy markets. Three RNG projects will bring sustainable, made-in-Florida, pipeline-quality RNG to customers in Florida. A planned pipeline expansion will enhance Florida's market presence in the LNG market and support marine transportation, which is an important part of Florida's economy. The Big Bend-FGT lateral project supports

The Honorable Andrew Giles Fay  
Page 6 of 10  
February 3, 2023

Tampa Electric's transition to efficient natural gas generation at Big Bend Station. These projects are supported by revenue from customer-specific contracts, but nevertheless contribute to the company's overall rate base growth. The company expects to invest approximately \$600 million to support customer growth and environmental sustainability from January 1, 2022 to December 31, 2024, of which \$150 to 160 million is attributable to major, customer specific projects.

#### B. Reliability, Resiliency, and Efficiency

Peoples has made significant plant investments to maintain and improve the reliability, resiliency, and efficiency of its systems. This category includes many projects that enhance the safety and reliability of the natural gas supply to customers by maintaining adequate pressure or flow and ensuring availability of primary and secondary supply feeds, mandatory relocation activities and infrastructure in the company's 14 service areas. It also includes major projects approved in the 2020 Agreement in Jacksonville, Panama City, and Southwest Florida that provided resiliency and the capacity to serve the growing communities across the state. Since then, other major projects include the Dade City Connector, the Work and Asset Management System, and improvements to its Tampa distribution system. The company expects to invest approximately \$405 million to enhance reliability, resiliency, and efficiency from January 1, 2022 to December 31, 2024.

#### C. Legacy Pipe Replacement

The company's CIBS/PPP program continues to provide important safety, reliability and environmental benefits to Peoples, its customers, and the State of Florida. Although the related costs are recovered via a rider, the capital being invested in this valuable program contributes to the company's rate base growth. The company expects to invest approximately \$80 million to replace legacy pipe from January 1, 2022 to December 31, 2024.

### 2. Depreciation Expense

The company's rate base growth has been accompanied by a commensurate increase in depreciation expense, which is projected to increase from about \$55 million in 2021 to a projected \$90 million in 2024. Of this \$35 million increase, about 25 percent is attributable to the proposed new depreciation rates associated with the depreciation study filed with the Commission on December 28, 2022.

### 3. Pipeline Safety and Compliance with Changing Federal Requirements

The costs of safely operating the company's growing system and changing federal safety and security requirements continue to increase and will be reflected in the rate base and O&M expense levels in the test year:

The protection of the company's underground pipeline system is critical to safe operations. Peoples has invested in the people, technology, and process to improve the prevention of excavation damages caused by others. However, as Peoples' system grows, so too does the need

The Honorable Andrew Giles Fay  
Page 7 of 10  
February 3, 2023

to spend resources on safely locating and repairing underground facilities. The number of trips to identify underground facilities to accommodate construction in Florida and other reasons (“locates”) has grown from about 415,000 in 2015 to 630,000 in 2022 and is forecasted to continue to increase into 2024. Despite effort to increase public and construction industry awareness, Peoples experiences almost 2,000 damages by third parties annually which equates to approximately 5 damaged facilities a day.

Peoples has invested in technology to advance safety management including the enhancement of the Supervisory Control and Data Acquisition (SCADA) System, which monitors and manages the flow of gas, the implementation of a GPS and barcoding system to geographically pinpoint underground facilities within inches. Additionally, Peoples has deployed three vehicles outfitted with MobileGuard units that offer more efficient state-of-the-art leak detection.

The pace of new national PHMSA safety regulations has accelerated, so Peoples has adapted to comply with the PIPES 2020 Act and the first set of new regulations to enhance safety, which involves installation of Rupture Mitigation Valves. Peoples will be required to comply with future federal requirements such as new rules adopted pursuant to the Leonel Rondon Act, new greenhouse gas measurement and reduction mandates, the Mega Rule Rin 2 & 3, the proposed Standards update, and other requirements established during the PHMSA reauthorization in 2024.

The company prioritizes the protection of its assets from physical and cybersecurity attacks using a holistic approach to mitigate both risks. Peoples’ physical and cybersecurity activities are subject to regulation by the United States Department of Homeland Security and the United States Transportation Security Administration, both of which continue to impose more rigorous and costly cybersecurity requirements. The company is facing additional pressure to secure its physical assets. Consequently, the company, and its shared service provider (Tampa Electric), continue to invest in technology, controls, and processes to meet the evolving regulatory landscape, and to protect the company’s system.

#### 4. Inflation

The effects of inflation have been felt by our customers and Peoples has not been immune. Annual inflation was less than two percent when the company filed its last rate case but increased to about five and eight percent in 2021 and 2022, respectively. The company is hopeful that the pace of inflation will moderate somewhat in 2023 and 2024; however, the higher costs the company paid in 2021 and 2022, and is expecting to pay in 2023, are now reflected in the cost of labor and capital additions. The company does not expect the prices it pays for goods and services in 2023 and 2024 to revert to 2020 levels. The company has been able to effectively manage its overall O&M expense levels and the company’s 2022 O&M expense levels were more than 10 percent below the Commission’s benchmark. Nevertheless, the increasing costs of labor, contractors, materials, insurance, and healthcare benefits continue to put significant upward pressure on the company’s costs of doing business.

The Honorable Andrew Giles Fay  
Page 8 of 10  
February 3, 2023

## 5. Cost of Capital

In response to the economic distress caused by the COVID-19 pandemic, the Federal Reserve quickly and aggressively decreased its interest rates, but now is raising them to combat inflation. These changes have impacted capital markets, long- and short-term borrowing costs, and the cost of common equity. Further interest rate increases by the Federal Reserve are expected. Increases to the company's cost of capital are expected to account for approximately \$35 million of the company's projected 2024 test year revenue requirement increase.

An appropriate ROE is essential for a regulated utility to attract the capital necessary to make long-term investments, maintain and improve the company's quality of service, and lower costs for customers over time. Peoples will request that the Commission approve an authorized ROE of 11.0 percent, with a range of plus or minus 100 basis points, reflecting the significant market increase in the cost of capital.

Peoples has operated as a division of Tampa Electric Company since 1997, but on January 1, 2023, its assets were transferred to a separate corporation called Peoples Gas System, Inc., which is a subsidiary of TECO Gas Operations, Inc., which is a subsidiary of TECO Energy, Inc. Peoples' capital structure currently includes long-term and short-term debt allocations from Tampa Electric Company; however, during 2023, Peoples anticipates establishing an independent credit rating and raising capital through its own long-term debt issuances and short-term debt facility. Consequently, Peoples' cost of debt in the 2024 test year will reflect the impact of market rates commensurate with Peoples' independent credit rating.

### Actions and Measures to Avoid Requesting a Rate Increase

The growth Peoples has experienced not only impacts its capital spending but also requires more resources for customer service, operations, maintenance, compliance, and other activities. Peoples has worked diligently to avoid seeking a base rate increase and continues to pursue efficiencies to help it meet its customers' strong demand for natural gas service in the communities it serves. The following are some of the actions taken by Peoples:

1. Since 2021, Peoples has been operating under the "rate freeze" and "stay out" provisions of the 2020 Agreement and has successfully managed its growth and earnings to operate within the range of returns allowed in the agreement. However, the company expects to earn an ROE of less than eight percent in 2023, which is well below the bottom of its approved ROE Range.
2. Peoples has pursued cost savings, cost avoidance, efficiencies, and better performance throughout its operations by reorganizing and redeploying resources to deliberately seek and implement process improvements. The company's deliberate approach has yielded improvements in damage prevention and other safety metrics, talent acquisition, customer experience, and project management. The company's commitment to formal process improvement continues to provide cost avoidance and efficiency while meeting the needs of Peoples' growing system.
3. The company has invested in critical technology to manage its operations to provide efficiencies and opportunities to expand on those efficiencies. In its 2020 rate case, Peoples

The Honorable Andrew Giles Fay  
Page 9 of 10  
February 3, 2023

explained its plans to implement a Work and Asset Management system (“WAM”) to manage more efficiently the many operational, engineering, and construction activities involved in serving customers. WAM will be operational in 2023 and will begin to help moderate expense increases, improve operating efficiencies, and enhance customer service by automating functions that were previously performed manually. Peoples has also invested in improved call center technology, including an enhanced Interactive Voice Response (IVR) System, to provide further improvements to meeting customer service levels through the company’s call center. The pipeline safety improvements described above will help reduce carbon emissions and improve the efficiency of the company’s distribution system.

4. The 2020 Agreement contained a provision allowing Peoples to record depreciation expense credits totaling \$34 million during its term to keep rates stable and improve the ability to earn within its range of returns allowed in the Agreement. Peoples used \$14 million of these depreciation credits in 2022 and will use the remainder in 2023 consistent with the letter and spirit of the 2020 Agreement. Despite the company’s careful use of depreciation credits, Peoples expects to earn below the bottom of its authorized ROE range in 2023, the last year of the term of the 2020 Agreement.

5. Although it is not a base rate item, the price of the gas commodity is an important part of customer bills. Peoples has limited the impact of gas price volatility to customers by prudently managing the Purchased Gas Adjustment (PGA), which passes through the costs associated with the interstate capacity and commodity of natural gas. The company foresees that gas commodity prices will continue to stabilize which should help moderate customer bill increases in 2024.

#### Conclusion

Peoples is focused on safety, providing cleaner and greener energy for the communities it serves, and is proud of its best-in-class customer service. Safe and reliable natural gas service is a popular choice for residential customers, as well as essential to the growth and economic success of Florida’s many small, medium, large commercial and industrial businesses. The company is working diligently to sustainably grow with the state, meet demand for natural gas and superior customer service, and deliver high-quality natural gas distribution service at fair, just, and reasonable rates. The general base rate relief to be addressed in the company’s upcoming petition will be critically important to enable Peoples to maintain its financial integrity and support the growth of Florida while continuing to provide safe, reliable, responsible, and efficient service and to meet customer expectations.

### Industry Report Card:

## Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts

### Industry Credit Outlook

Creditworthiness has been somewhat mixed for the global utility universe since the beginning of 2008. The U.S., Canadian, and Latin American sectors continue to enjoy a period of relative ratings stability, while the credit environment for the European, Australian, and New Zealand utilities remains negative. The flurry of downgrades in the latter sectors can be traced predominately to accelerating merger and acquisition (M&A) activity. Additionally, increased pressures from national regulators and governments, coupled with sizeable construction programs, have weighed upon certain European utilities, while adverse weather conditions continue to negatively affect both Australian and New Zealand utilities.

Contributing to ratings stability for the U.S., Canadian, and Latin American sectors has been the focus on more conservative and lower-risk regulated operations, solid liquidity positions, steady capital market access, healthy cash flows, improving financial profiles overall, and rate orders from regulators that have generally supported utilities' creditworthiness. Nonetheless, the increasingly familiar challenges of escalating capital expenditures, declining generating reserve margins, aging infrastructure, environmental mandates, ongoing M&A activity, mounting requests for rate hikes, rising expenses, and volatile fuel prices will continue to dominate the credit picture for the foreseeable future.

Although these challenges and uncertainties may pressure financial performance, for the most part Standard & Poor's Ratings Services believes that the credit trend for these three sectors is likely to remain relatively steady. Yet in Europe, debt-financed acquisitions, weakening financial conditions, the need for substantial investment in generation, transmission and distribution and in midstream and upstream gas, and regulatory pressures will continue to threaten ratings. And, in the absence of normal rainfall, together with continuing M&A activity, the outlook for the Australian and New Zealand sectors will remain negative.

While some European utilities, especially hydroelectric and nuclear generators, will likely benefit from rising power prices and growth from renewable energy prospects, ratings are likely to remain under pressure due to M&A transactions and increasingly unsupportive regulation in Spain, Italy, and Germany. The Canadian utility sector continued its trend of stable credit quality, reflecting a focus on the expansion of lower-risk regulated core assets, modest M&A activity, and the absence of any indication of further material market restructuring in any of the provinces. The Australian utility sector remains under pressure due to increased M&A activity and ongoing drought, any worsening of which could restrict power station outputs causing high spot prices. However, ongoing sound liquidity and refinancing practices may temper these adverse conditions. In Latin America, utilities continue to benefit from economic growth, but are faced with relatively high capital outlays.

A very important dynamic for shaping the overall financial condition of the industry will be the quality of regulation. Future rate-setting actions in all sectors will weigh heavily on credit quality. In the U.S., recent rate

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

rulings have been supportive of new investment in power plant construction and of commodity pass-through via adjustment mechanisms. Still, regulators will likely be reluctant to authorize material rate increases. Substantial capital outlays, including environmental-related expenditures, high fuel and material costs, pension obligations, and health care expenses further exacerbate these pressures. In Europe, heightened regulatory pressures are stemming both from national regulators and the EU Commission. Adverse regulatory developments in Spain and Italy have recently dampened domestic utilities' earnings, while the regulatory environment in Germany has deteriorated markedly in recent months.

In the U.S. and Latin America, financial performance has been steady to moderately improving due to supportive rate actions, including the ability of most companies to pass on to customers higher fuel prices, deleveraging, and effective cost containment. However, this general improvement is likely to slow due to high energy costs and problems that could arise with fuel availability, the continuation of debt-financed acquisitions, and accelerating capital outlays. The global credit squeeze has had minimal effect on the credit quality of rated Australian and New Zealand utilities. Continued sound liquidity and refinancing practices of the Australian and New Zealand sectors will help to insulate these utilities, with fallout largely limited to some contraction of debt maturity profiles rather than in strained access to credit. In general, responsive and timely rate adjustments by regulators and credit-supportive actions by management will be necessary to prevent a decline in global bondholder protection.

## United States

Rating activity for the U.S. investor-owned electric utility sector continued to moderate during the first half of 2008. Since the year began, Standard & Poor's downgraded nine holding companies and operating subsidiaries (four of which related to a single entity, Consolidated Edison Inc., and three to PNM Resources Inc., whose ratings were lowered twice during the second quarter) , and upgraded six (three of which were related to Sierra Pacific Resources).

The negative credit momentum experienced was attributable to predominately weakening financial conditions. In the case of PNM Resources, a trading misstep and operational challenges led to its downgrade to 'BB-' from 'BB+'. Consolidated Edison's (A-/Stable/A-2) lower ratings can be traced to insufficient rate relief and prospects for declining measures of bondholder protection. The positive credit actions were the result of reduced exposure to riskier unregulated activities, generally supportive rate decisions, deleveraging, and increasing free cash flow. The upgrades on Sierra Pacific Resources and its operating subsidiaries Nevada Power and Sierra Pacific Power reflect the company's substantial progress to secure additional generating resources and reduce short positions, adequately hedge market exposures, reduce debt leverage, and constructively manage regulatory risk by working with the Public Utilities Commission of Nevada and the legislature to support timely cost recovery.

A notable development affecting certain companies has been the fallout from failed auctions for auction rate securities: long-term debt securities whose interest rates are reset via an auction process every seven, 28 or 35 days. The failures were the result primarily of investor concern with the financial health of bond insurers. However, non-punitive indentures and strong liquidity positions enabled utilities to deal with failed auctions in a credit-neutral manner. Yet the penalty rate for failed auctions has varied significantly. Some companies experienced considerably higher interest rates while others experienced moderate increases in interest costs. Numerous companies have refinanced or remarketed these securities and implemented different maturities to avoid the need to conduct auctions, or are in the process of pursuing other alternatives.

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

Credit quality in the U.S. regulated electric utility industry continues a long shift to greater stability as companies have shed noncore operations and strengthened their balance sheets. Yet significant longer-term challenges to utilities' financial health remain and are intensifying. These challenges will be prolonged, and will include:

- Heavy construction programs to address demand growth, declining capacity margins, and aging infrastructure;
- Regulatory responsiveness to mounting requests for rate increases;
- Rising operations and maintenance expenses, as well as escalating construction and raw material costs;
- Volatile fuel costs, especially natural gas;
- Environmental compliance, including renewable portfolio standards mandates, and uncertainty over the rules that will address carbon emissions; and
- Financing flexibility and access to capital markets.

To sustain their current credit quality in the face of these long-lived challenges, utilities need to have established -- and be able to maintain -- a firm credit foundation. This will require a strong and effective working relationship among management, regulators, and increasingly legislators and governors, in the planning and execution of strategies. A comprehensive vetting and understanding of the risks associated with the regulatory mechanisms under which the utility will recover its investment, which could include a cash return during construction and timely recognition of volatile costs, will be paramount in preserving creditworthiness.

Recent rate orders have been relatively supportive of companies' credit quality. However, prospectively, regulators will be addressing large base-rate relief requests related to new generating capacity additions to meet incremental load and to replace aging infrastructure, environmental modifications on coal plants, and transmission and distribution improvements. Current cash recovery and/or return by means of construction work in progress support what would otherwise be a significant cash flow drain, and reduce a utility's need to issue debt during construction. Moreover, allowing rate recovery of projected costs with subsequent periodic updates for actual results reduces lag in cost recovery.

A favorable development for credit quality is that many regulatory rulings related to the construction of new base load follow comprehensive settlement negotiations among utilities, commission staff, consumer advocates, and other major intervenors. Such an approach limits the possibility of any subsequent review of utilities' expenditure decisions. Also supportive has been the adoption in a growing number of states of environmental-tracking mechanisms and other riders that allow companies to reflect in rates capital costs associated with environmental compliance equipment, without having to file a formal rate case. Finally, the greater the percentage of a utility's rates that are recovered through fixed charges, rather than volume-based charges, the greater the support for credit quality.

The environmental consequences of management decisions have assumed a very prominent role politically. The U.S. Senate has begun the process to advance a bill restricting greenhouse gas emissions and new administration in Washington will likely pass some form of legislation in the next few years, which will almost certainly have far-reaching implications for capital and operating expenses and for resource planning by utilities. Ultimately, companies' ability to fully recover environmentally mandated costs in authorized rates and consumers' willingness to pay them will determine the electric utility industry's future credit strength.

One very significant consequence of the increased focus on environmental concerns is reconsideration of new nuclear power capacity. At both the federal level -- through passage of the Energy Policy Act of 2005 -- and the state

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

level -- through supportive cost recovery legislation -- public officials are displaying a level of support for the construction of new nuclear facilities not witnessed in decades. SCANA Corp. is the first investor-owned utility to actually file for a certificate of need, and once approved, will request recovery of financing costs during the construction period. Georgia Power Co. also plans to build two new units at an existing site and has filed with the Georgia Public Services Commission for recovery of pre-construction costs. Georgia does not have explicit legislation that provides for a cost recovery framework but rather relies on the approval by the Commission of the company's integrated resource plan. In addition, Georgia currently does not provide for recovery of financing costs on a current basis.

## Europe

The general adverse trend continues for major European utilities, with three negative rating actions on the 20 largest utilities since the beginning of the year and no positive rating actions. Moreover, three utilities have negative outlooks while another three are on CreditWatch with negative implications, reflecting the risk of a potential imminent downgrade. In comparison, we only have two companies with either positive outlooks or positive CreditWatch implications.

M&A activity has continued to be a key rating factor: It was the main reason for all three negative CreditWatch placements. It has, however, taken various forms: Some rating actions, such as those on Italian utility Enel SpA and on Spanish utility Endesa S.A. earlier this year, are linked to mega-transactions concluded in 2007. The planned merger between French utilities Gaz de France S.A. (GDF) and Suez S.A., as a result of which both groups are on CreditWatch, also belongs to this mega-transaction category.

As the current environment is less conducive to such large transactions, European utilities are now pursuing more limited and targeted acquisitions. These can nevertheless prove credit-dilutive and lead to lower ratings. Recent CreditWatch placements illustrate some of the areas which major European utilities are especially targeting at the moment, such as renewables or emerging markets with strong growth potential: British utility Scottish and Southern Energy PLC (SSE) was placed on CreditWatch with negative implications in January 2008 following its acquisition of renewables company Airtricity Europe, while Finnish incumbent Fortum Oyj was placed on CreditWatch with negative implications in March 2008 following the announcement of its acquisition of Russian generator TGC-10. A number of major utilities, such as French incumbent Electricite de France S.A. (EDF) and major German utilities E.ON AG and RWE AG, is also seeking to participate in the budding nuclear revival in the U.K. and in Eastern Europe. Such interest has not so far resulted in any rating action. It could, however, especially if such interest entails debt-funded bids for nuclear operator British Energy, which is considered to have the best sites for new nuclear build in the U.K.

The substantial investment programs announced by most European utilities, even though mostly organic and hence less risky than external growth, have nevertheless also started to take their toll on ratings. This reflects that such investment programs are large scale and will thus significantly weigh on financial profiles. The scale of investment programs was the key factor in the recent downgrades of Italian utility Edison SpA, Spanish utility Gas Natural SDG, S.A., and major German utility RWE. In the case of RWE, higher investment program's impact on financial measures was compounded by a more shareholder-friendly financial policy. In general, however, shareholder pressure is not a significant rating factor at present among EU utilities.

While not yet a negative rating factor per se, regulatory pressure both from national authorities and from the EU is

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

on the rise. The situation varies considerably, however, from one country to another. German utilities are particularly vulnerable, as demonstrated by the significant concessions E.ON, and to a lesser extent RWE, have offered to persuade the EU Commission to close pending antitrust cases against the group.

Nevertheless, major European utilities, especially generators, continue to benefit from a favorable outlook for power prices, which are continuing to rise in most markets. This is driven to a large extent by higher carbon dioxide (CO<sub>2</sub>) and commodity prices, and hence does not automatically translate into higher margins for all players: While such a context is very beneficial for hydro and nuclear generators in liberalized markets, it is less so for carbon-intensive generators which are affected by the reduction of free CO<sub>2</sub> allowances in phase II of the Emissions Trading Scheme and the resulting increase in the price of CO<sub>2</sub> allowances. At RWE, which has the largest CO<sub>2</sub> allowance deficit of all European utilities, the cost of buying allowances has thus risen to €307 million in the first quarter of 2008 from €26 million in the same period of 2007.

Enel and Iberdrola S.A. were both downgraded to 'A-' from 'A' following their acquisition sprees in 2007. Iberdrola benefits, however, from a stable outlook as it has already completed a large share of its planned disposals with the partial IPO earlier this year of its renewables arm, which generated a cash inflow of €4.5 billion. Conversely, the negative outlook on Enel's rating indicates that, notwithstanding the announced €11.8 billion disposal of Enel and Endesa assets to E.ON, further significant divestments are necessary to shore up its financial profile and 'A-' rating.

Renewable energy is a key area of growth for European utilities, reflecting the carrot of generally supportive regulatory frameworks on the one hand and the stick of requirements to source power from renewables sources and the reduction of free CO<sub>2</sub> allowances on the other. Acquisitions in this field tend to be very credit dilutive given their high price in particular in relation to earnings and cash flow generated, but also given the capital expenditures required to increase capacity: SSE acquired Airtricity in February 2008 for an enterprise value of €1.455 billion. As most of Airtricity's wind turbines are at the pipeline stage, its earnings contribution is minimal, while it is expected to account for the bulk of SSE's £2.5 billion capital expenditure in renewables by 2013. Nevertheless, renewables are proving to be a source of financial flexibility for early movers, as demonstrated by Iberdrola's successful IPO of a minority stake in its renewable subsidiary; Portuguese incumbent, EDP - Energias de Portugal, S.A., and Enel are thinking of doing the same.

M&A is likely to continue to heavily influence ratings in coming months. This reflects the substantial financial firepower of some groups, in particular RWE, whose financial profile is currently robust after the sale of its water operations; GDF-Suez whose merger will be an all-share transaction; and E.ON, even though the rest of its massive €63 billion investment program should be essentially focused on organic growth (following the purchase of assets from Enel and Endesa). EDF has also stated its interest in the U.K. and Spain, but its €33 billion investment program between 2008 and 2011 leaves limited financial flexibility for significant debt-funded acquisition at the current rating level.

Other players still face strategic issues, such as RWE which needs to reduce the carbon intensity of its generation and plans to expand further outside Germany. Likewise, British utility Centrica needs to reduce its exposure to wholesale gas prices. In addition a large number of power utilities, including EDF, RWE, Edison, and EnBW Energie Baden-Wuerttemberg AG, is seeking to expand in gas in order to secure supplies at a time of growing recourse to gas-fired power generation and to be able offer competitive dual fuel offerings to their retail client base. Furthermore, utilities that have only recently started to expand in renewables, such as RWE or GDF-Suez, may consider acquisitions to speed up their growth in this area.

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

Last, some markets, such as Spain, the Netherlands, and Italy, and possibly the U.K., continue to offer some consolidation opportunities.

The sizable investment programs announced by most major EU European utilities are triggered by:

- The declining reserve margin in most countries, which in turn reflects growing demand and the aging of generation fleets;
- Substantial investment in regulated distribution and transmission activities; and
- Investment in midstream and even upstream gas to secure gas supplies and participate in the electricity and gas convergence.

On top of the execution risks such large investment programs entail and their toll on credit measures, this new investment cycle is inherently more risky than previous ones because of the volatility of power prices in liberalized markets and of input prices. The uncertainty on long-term climate change policies adds a further layer of unpredictability as to the respective competitiveness of various forms of power generation. Moreover, the costs of power plant construction keep increasing as a result of higher commodity prices and strong demand. This has already led to the cancellation of a number of planned power plants.

Increased regulatory pressures are stemming both from national regulators and the EU Commission. Adverse regulatory developments in Spain and Italy have dampened domestic utilities' earnings in the first quarter, while the regulatory environment in Germany has deteriorated markedly in recent months.

The Spanish government announced a new regulation (Royal Decree 11/2007) based on the same principles as the measure introduced on Feb. 24, 2006 (Royal Decree 3/2006), which obliges the incumbent generators to deduct from generation revenues the cost of the CO2 emission rights allocated for free. These deductions will directly impact these companies' earnings. With these measures the government is seeking to reduce the tariff deficit in the electricity system. In the absence of implementation rules, the companies have estimated the deduction in generation revenues in their first-quarter results. The hit to earnings represented €106 million for Endesa (out of EBITDA of €1.63 billion) and €84 million for Iberdrola (out of EBITDA of €1.79 billion). The impact depends on the market price of CO2 rights and weather conditions, as these influence the generation mix in Spain and hence CO2 emissions. This explains why the reduction in the first quarter of 2008 was large compared with the first quarter of 2007. In Italy, the regulator has not yet taken action over the reimbursement of CO2 costs for CIP6 contracts, which hit Edison's earnings in the period. The group expects, however, that these costs will eventually be recovered, hence its guidance of 2008 earnings in line with those of 2007.

In Germany, the regulatory environment has deteriorated in 2008, with further tariff cuts for transmission and distribution networks, and the §29GWB amendment to the market abuse law passed at the end of 2007. This amendment targets utilities with dominant market positions. Utilities are considered dominant under the law when their prices exceed those of competitors by 10%, or if they inadequately reflect costs. In addition, the substantial concessions that E.ON has offered to the EU to close antitrust cases--disposal of its power transmission grid and of about 20% of its generation capacity--have increased pressures on the other major German utilities. To close a similar case, RWE has now offered to dispose of its gas transmission grid.

The EU is pursuing its two-pronged approach of seeking to liberalize the sector overall and launching cases against individual companies. The EU Commission is thus continuing to push for ownership unbundling of transmission networks, on which discussions are ongoing. With respect to cases against companies, the EU Commission has

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

recently launched an in-depth antitrust inquiry on GDF over alleged gas supply restrictions. This inquiry comes on top of the one launched in July 2007 against GDF and E.ON for alleged market sharing in gas

## Australia And New Zealand

The Australian utilities sector faces increased M&A activity, adverse climate conditions, and new regulations. Since the end of 2007, creditworthiness in the Australian sector has been subject to negative pressure due to the conclusion of a number of M&A transactions, resulting in an extraordinarily high 20 rating actions. The completion of the break-up of Alinta Ltd. (formerly rated 'BBB') resulted in nine rating actions. In contrast, credit quality of utilities in New Zealand has been relatively stable, with only two outlook changes: Transpower Ltd's (AA-/Stable/--) outlook was revised to stable from negative following reduced earnings risk as regulatory risks abate, and Watercare Ltd.'s (A/Negative/A-1) outlook was revised to negative from stable due to uncertainty in the company's ability to pass through capital expenditures to its end users.

Over the next 12 months we expect M&A activity to be the key determinant of credit quality. Major prospective transactions include the sale by New Zealand's Vector Ltd (BBB+/Stable/--) of its Wellington networks business to Hong Kong's CKI Group and the planned privatization by Australia's largest state, New South Wales, of its state-owned electricity assets. Of particular note was the vertically integrated utility Origin Energy Ltd's (Origin; BBB+/Stable/A-2) significant upgrade of its coal seam gas reserves that in the company's view represent an increase in value sufficient to warrant rejection of U.K.-based BG Energy Holdings Ltd's (BG; A/Watch Neg/A-1) takeover offer. The challenge for Origin will be to monetize the increased reserves to justify rejection of BG's offer.

Also weighing on the sector in both countries are ongoing adverse climate conditions. In the absence of normal winter and spring rainfall in Australia that will relieve generation constraints, there could be a return to the high wholesale prices of 12 months ago, resulting in the consequent erosion of retail margins and a cash-flow squeeze. In New Zealand, hydrological conditions are the worst since 1992, resulting in abnormally very high spot prices in this hydro dominated market. Nevertheless, we expect minimal impact on financial profiles in fiscal 2008 due to active management by the rated integrated generator-retailers. The nature of the "run of the river" market means conditions can turn around quickly and poor hydrology would need to persist for quite some months before cash flows are sufficiently adversely impacted to affect ratings.

Overlaying the sector's creditworthiness in both countries is the prospective introduction of carbon emission trading schemes. The Australian federal government has committed to decrease greenhouse gas emissions by 60% of 2000 levels by 2050. Both Australia and New Zealand plan to introduce their respective programs in 2010, but they currently lack detail, and the prospective impact on the energy sectors in both countries remains uncertain. Nevertheless, New Zealand retailers are likely to increase retail prices over the next 18 months in order to preserve profit margins in advance of inclusion of the energy sector in the country's carbon trading.

The global credit squeeze has had minimal effect on the credit quality of rated Australian and New Zealand utilities. Continued sound liquidity and refinancing practices of the sector will largely insulate the sector, with fallout largely limited to some contraction of debt maturity profiles rather than in limiting access to credit.

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

## Canada

The Canadian utility sector's credit quality remains stable, reflecting a focus on the expansion of lower-risk, regulated core assets. Nothing on the horizon suggests further material electricity market restructuring in any province. The sector remains solidly investment grade, with all issuer ratings falling within the 'A' and 'BBB' categories.

The pipeline sector continues to work on capacity expansion to accommodate oil sands growth. Enbridge Inc. remains very active, with a number of projects in Canada and the U.S. TransCanada PipeLines Ltd. (TCPL) also recently announced that it will begin construction of the Keystone pipeline in the second quarter. The pipeline has targeted completion in late 2009, and will convert part of its gas mainline into an oil sands pipeline. TCPL also has announced a proposal to build Keystone XL, a pipeline that would directly link the oil sands with refineries on the Gulf Coast. The company is seeking shipper commitments. If the project proceeds, construction would likely not begin until 2010.

On the M&A front, TCPL recently purchased for US\$2.8 billion the Ravenswood Generating Station in New York City, following last year's acquisition of U.S.-based ANR Pipeline Co. TCPL has some existing familiarity with the New York electricity market through its ownership of hydroelectric generation assets in New York State. The company recently completed an equity issue to partially finance this purchase.

Electricity supply adequacy is being addressed across Canada, with major refurbishment of nuclear units in New Brunswick and Ontario and greenfield development across the country. Several gas-fired projects are underway in Ontario and Alberta, with more to come. Construction of the 450 MW Keephills supercritical coal-fired unit also in Alberta is progressing, with unit commissioning expected by first quarter 2011. Hydro-Quebec, Manitoba Hydro-Electric Board, and British Columbia Hydro & Power Authority, all government-owned monopolies, are engaged in the approval and construction of several major hydroelectric developments. Construction of small hydroelectric developments and wind farms, supported by long-term contracts with government-owned utilities, is gaining momentum across most regions. Planning and approvals for intra- and inter-provincial transmission system expansion have begun.

Sectorwide, liquidity remains adequate and contributes to the predominantly intermediate financial risk profiles of investment-grade Canadian utilities. There has been active bond issuance by participants in the second quarter. Several utilities have also increased their credit lines in preparation for upcoming capital spending programs.

## Latin America

Latin American electric utilities continue to enjoy a benign rating environment despite the adverse global credit markets since the second half of 2007. Most of these companies enjoy adequate financial performance, which is supported by good cash flow generation fueled by solid demand for power deriving from economic growth, which partly reflects the positive environment for commodities in general.

The sector's big challenge has been to attract new investments to meet growing demand and offset the decreasing trend in capacity reserves in the last three to four years. In Chile, one of the most attractive markets in the region, potential new investments in power generation were delayed due to major uncertainties posed by increasing shortages of natural gas imported from Argentina since early 2004. However, the new legal framework defined in

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

May 2005 mitigated those uncertainties and triggered several new power generation projects that are projected to start operations from 2009 onwards. In the meantime, lower capacity reserves, combined with poor hydrology, have resulted in a very tight supply demand balance in the largest electric system during 2008, which significantly increased the risk of outages or potential rationing. However, the companies remain in relatively good shape, which is reflected in the mostly stable outlooks for rated Chilean electric utilities.

The most important issues for the Brazilian electric sector during 2008 and 2009 will be power supply and costs, capacity expansions, acquisitions, and the completion of the second tariff revision for distribution companies under the current regulatory framework. Overall, we expect the good performance of the Brazilian economy to allow electric utilities to continue improving cash flow generation and debt service coverage ratios while maintaining good liquidity and financial flexibility, which could potentially result in positive rating actions.

Argentine electric utilities show an improved financial performance mainly due to certain tariff and price increases in 2007 although they remain at low levels on a global basis. The higher tariffs for distribution companies resulted in soaring capital expenditures, which should allow those companies to maintain their relatively good service quality and financial indicators. In addition, a new legal framework for new power generation capacity has triggered new projects that are targeting large power users at significantly higher prices than current spot prices in the wholesale electricity market, which concentrates a great portion of domestic demand. However, the weak ratings (generally in the 'B' category) in the sector continue to reflect high political and regulatory risk.

Overall, we expect Latin American electric utilities to continue performing well during the second half of 2008. They should enjoy good cash flow generation, though in certain cases they will be pressured by relatively high capital expenditures, and to continue accessing new financing mainly in the local capital markets and in the local or international bank market, but at a higher cost than during the last three years. However, we will continue to closely monitor the financial flexibility of those companies in a weaker financial condition, with a too aggressive capital expenditure plan or that face a high level of bond maturities in the coming months.

## Issuer Review

Table 1

Company/Corporate Credit Rating*/Comments	Country	Analyst
<b>U.S.</b>		
<b>American Electric Power Co. Inc.</b> ( BBB/Stable/A-2) AEP faces an almost constant cycle of regulatory proceedings in one or more of the 11 states in which it operates, as well as at the federal level. The mostly coal-burning company has spent a lot of money on environmental compliance and plans to spend more on new generation and transmission, a massive undertaking that heightens operating and regulatory risk and could possibly erode AEP's generation cost advantage. Longer-term challenges include, most prominently, the prospect of climate change legislation and its effect on AEP's existing resources and planning decisions, and the evolving state of the regulatory compact in Ohio. The company's response to the recently-passed legislation in Ohio will be an important harbinger of management's attitude toward risk throughout the organization and could affect the outlook on ratings.	U.S.	Todd Shipman
<b>Consolidated Edison Inc.</b> ( A-/Stable/A-2) Con Edison's credit quality will be impacted by the firm's financial policy in regards to debt leverage and cash flow realization, combined with cost recovery of capital expenditures. Future debt and equity issuances will be required to fund annual capital spending of about \$2.5 billion (2008 estimate), common dividends of more than \$500 million per year (\$350 million to \$400 million of dividends paid annually to Con Edison from Con Edison's Consolidated Edison Co. of New York Inc.), and debt maturities of \$809 million in 2008. Importantly, any deviation in expected cash flows, delays in reducing leverage, or difficulty recovering environmental and stranded costs in a timely manner may weaken the financial profile, heightening the potential for outlook revision to negative or a downgrade.	U.S.	John Kennedy

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

**Dominion Resources Inc.**( A-/Stable/A-2)

Fuel expenses, once not fully recoverable and a drag on credit metrics, are much less of an issue for the reconstituted Dominion. U.S. The company has sold most of its exploration and production assets and used sale proceeds in part to achieve financial measures that support credit quality. The lower exposure to unregulated activities, along with re-regulation in Virginia, have improved business risk. Aggressive capital plans will likely hold back any dramatic improvement in financial measures, dampening further ratings uplift, but steadier financial performance is expected to support credit quality.

Todd Shipman

**Duke Energy Corp.**( A-/Stable/--)

Duke's North Carolina operations continue to operate under the rate settlement reached in late 2007. As part of that settlement, U.S. the company agreed to capitalize environmental compliance costs in excess of what was captured in the Clean Smokestacks Act for recovery at a later date. The rate settlement in North Carolina should provide rate certainty over the next three years as the company pursues a large capital spending program to address load growth and environmental compliance that may include construction of new nuclear plants as well as a new coal- and gas-fired plant. Duke Energy estimates that it will need to add about 7,700MW of new generation over the next 10 years to satisfy demand. Duke Energy Ohio is preparing to file an Energy Security Plan as required by the passage of the recent SB 221 energy legislation. The plan is to take effect after the company's current rate stabilization period ends in 2008. While the Public Utility Commission of Ohio will be providing the necessary implementation details for the energy legislation, the legislation should address the uncertainty that has existed so far. Duke Energy Indiana is proceeding with plans to build a 630 MW integrated gasification combined cycle plant that is estimated to cost about \$2 billion. The consolidated financial profile remains strong with \$4 billion in funds from operations for the year ended March 31, 2008, leading to FFO interest coverage of 5.9x and FFO/total debt of 30%. Debt leverage remains modest at about 38%.

Dimitri Nikas

**Edison International**( BBB-/Stable/--)

Edison International produced sound consolidated credit metrics year to date due to good pricing and operational performance at its unregulated merchant operations owned by Edison Mission Energy and continued solid cash flows at Southern California Edison (SCE), which provides about 75% of operating cash flows. Consolidated FFO to debt and interest coverage were 19% and 2.9x respectively, as of March 31, 2008, with leverage in the range of 62%. SCE is in the midst of a large capital program that may nearly double its asset base by 2012. Its 2007 general rate case filing for 2009 through 2011 that requests a 6.2% increase in overall rates (or 16.2% increase in base rates) is scheduled for hearings at the end of May and a final decision is likely by year end 2008. Regulation continues to be supportive, although challenges exist in managing the capital program, flowing these costs through to customers (many of whom benefit from a rate freeze under legislation) and the potential for the reintroduction of direct access. We also expect that procurement obligations faced by the utilities could increase, with the California Dept. of Water Resources recent announcements that it would like to assign power contracts to the utilities in advance of their expiration.

Anne Selting

**Entergy Corp.**( BBB/Negative/--)

Despite some obstacles in the process, Entergy is moving along with the proposed spin-off of its merchant nuclear generation assets. The transaction is expected to be completed in a tax-free manner through the spin-off of the business to existing Entergy shareholders. The spin-off contemplates the leveraging up of the merchant business so that the entity will distribute about \$4 billion to Entergy, \$2.5 billion of which will be used for share repurchases and the balance of \$1.5 billion will be used for modest debt reduction at the holding company. As part of the spin-off, Entergy will form a services company that will be jointly owned with the spin-off entity, presenting some concern that Entergy may have some residual liability. Financial performance for the 12 months ending March 31, 2008 has weakened compared to year-end 2007, but still remains robust, as a result of higher

Dimitri Nikas

**Exelon Corp.**( BBB+/Stable/A-2)

Exelon's low-cost generation, which accounted for 85% of operating earnings in 2007, has benefited from high energy prices, but continues to face long-term exposure to market risk, material exposure to nuclear assets, and moderate counterparty credit exposure. We will monitor the developments of Pennsylvania's energy independence strategy to gauge potential influence of the regulatory environment on Exelon. Exelon generated meaningful discretionary free cash flow in 2007, most of which went for share buybacks. For first-quarter 2008, FFO Interest coverage ratio improved significantly to 5.3x, while FFO debt and leverage ratio improved marginally compared with last year. Liquidity, at over \$5.9 billion, is adequate.

Aneesh Prabhu

**FirstEnergy Corp.**( BBB/Negative/--)

The company's operating performance has been satisfactory, but lingering doubts in this area harm credit quality. Legislative and regulatory attention in Ohio on rates and the post-2008 market structure in Ohio harbor significant risk, but any resolution that pushes the transition out past this year could help resolve the negative outlook. Financial metrics and liquidity have improved as substantial debt was paid down in previous years, but share buybacks and capital spending have stalled the trend. A firm commitment to a market-based future for its generating assets in Ohio and Pennsylvania could dampen credit quality in the long-term.

Todd Shipman

**FPL Group Inc.**( A/Stable/--)

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

<p>FPL Group's ratings and stability rest on the strength of its utility operations at Florida Power &amp; Light (FP&amp;L). The integrated utility is a large contributor to the group's earnings and cash flow, and its robust business profile centers on a constructive regulatory environment and a very healthy service territory. Targeted growth in the unregulated wholesale energy business, a high-risk merchant energy portfolio, and an appetite for acquisitions will constrain credit quality. Financials provide thin support for the ratings, but have been improving. Florida regulators' decision last year to reject a proposed clean-coal plant has exacerbated FP&amp;L's dependence on natural gas to produce electricity.</p>	U.S.	Todd Shipman
<p><b>MidAmerican Energy Holdings Co.</b> (A-/Stable/--)                  MEHC's strong credit ratings reflects the explicit and implicit support afforded to it by its parent, Berkshire Hathaway Inc. (AAA/Stable/A-1+), which holds 88% of MEHC's common voting stock. Berkshire has provided MEHC a \$3.5 billion equity commitment agreement that expires in March 2011. Without Berkshire's support, MEHC's current aggressive financial profile, while showing some improvement, would support a rating that is in the low 'BBB' category. MEHC's FFO coverage of interest and debt stood at 2.9x and around 13%, respectively as of March 31, 2008. Consolidated MEHC debt to total capitalization is a weak 65%. Consolidated cash flows from operations are provided by MEHC's eight business platforms which consist of two investor owned utilities (PacifiCorp and MidAmerican Energy Co.) two FERC regulated interstate gas pipelines (Kern River Gas Transportation Co. and Northern Natural Gas), a UK electric distribution company (CE Electric UK), project financed power plant investments both in the U.S. and overseas (CalEnergy Domestic and CalEnergy Asia) and a predominately Midwest real estate brokerage company (Home Services). While the overall quality of cash flow is adequate for the rating, in 2008 PacifiCorp and MEC continue to invest heavily in infrastructure at the operating subsidiary level which will result in cash flows to pay parent debt being more concentrated on the other MEHC businesses.</p>	U.S.	Anne Selting
<p><b>Pacific Gas &amp; Electric Co.</b> (BBB+/Stable/A-2)                  PG&amp;E is expected to receive in the coming months a final decision from the California Public Utilities Commission in its cost of capital proceeding. The proposed decision would link the authorized return on equity (ROE, now at 11.35%) through 2010 to changes in a bond index, causing ROE to change if the index changes by more than 100 basis points. The utility continues to benefit from the average 4.5% rate increase approved in 2007 and in place through 2010. Storm costs and an extended nuclear refueling outage to replace Diablo Canyon #2's steam generator modestly eroded earnings in the second quarter, but cash flows remain strong. The company expects to spend \$3.6 billion in capital investment this year and during the first quarter spent \$853 million. Regulation continues to be supportive, although challenges exist in managing its capital program, flowing these costs through to customers (many of whom benefit from a rate freeze under legislation) and the potential for the reintroduction of direct access. Consolidated (including parent PG&amp;E Corp) FFO to debt and interest coverage were 28% and 3.6x, respectively, as of Mar. 31, 2008 with leverage at about 53%.</p>	U.S.	Anne Selting
<p><b>Progress Energy Inc.</b> (BBB+/Stable/A-2)                  Progress Energy has disposed of all of its non-regulated operations, a process that began in 2006, materially moderating business risk along the way. In addition, the company has reached a number of constructive regulatory outcomes in both the Carolinas and Florida, providing further support to credit quality. The financial profile remains aggressive and in light of the projected significant capital spending program over the next three years, will necessitate timely recovery of the investments in order to preserve the current ratings. For the year ended March 31, 2008 FFO/interest coverage of about 3.2x, while FFO to total debt was about 13.2% and debt leverage 57.7%.</p>	U.S.	Dimitri Nikas
<p><b>Public Service Enterprise Group Inc.</b> (BBB/Stable/A-2)                  Revenue enhancements from strong prices associated with the recent wholesale electricity auctions, the reliability pricing model results, and operational improvements resulted in FFO increasing to \$2.2 billion in 2007, up from about \$1.4 billion in 2006. Credit measures for the period ending March 2008 have improved, with adjusted FFO to interest coverage of over 4.8x, FFO to total debt of about 24% and debt leverage of just over 53%. Significant increase in capital spending to support the company's transmission growth and environmental commitments could slow the pace of improvement in credit metrics. As for regulation, PSE&amp;G has agreed not to implement either an electric or gas rate case until November 2009, exposing it to cost increases in the interim. The company's liquidity is adequate, with about \$2.5 billion available under credit lines.</p>	U.S.	Aneesh Prabhu
<p><b>Sempra Energy</b> (BBB+/Stable/A-2)                  The MOU signed by the company to acquire a 25% interest in the Sunstone pipeline project requires no immediate capital commitment as the proposed pipeline will not be in service until 2011. However, sector construction costs have increased considerably in recent years and unless curtailed, could influence the project and the amount of debt and equity Sempra would need to fund its portion of the project's costs. As such, Sempra's financing requirements for the project relative to its financial profile at this future point would need to be evaluated, considering the company's share repurchase plan will weaken credit metrics in the near term. The formation of RBS Sempra Commodities substantially improves Sempra's business risk, however this improvement is offset by Sempra's intention to complete a \$1.5 billion to \$2 billion leveraged share-repurchase program through 2009. Recent project completions include construction and performance testing of the Costa Azul terminal in Baja California, Mexico, as well as full service of the REX West pipeline in May 2008. On the regulated side, general rate case filings at both San Diego Gas &amp; Electric Co. and Southern California Gas Co. are the most significant near-term drivers of credit quality. Key cash flow metrics at Sempra Energy for the 12 months ended March 31, 2008 were maintained, with FFO to total debt and FFO to interest coverage of approximately 26% and 4.6x, respectively.</p>	U.S.	Bill Ferara

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

**Southern Co.** ( A/Stable/A-1)

Southern's credit profile continues to benefit from constructive regulatory frameworks for its operating companies, service territories with growing customer bases and attractive demographics, and strong operations. During 2007, Georgia Power settled its rate case achieving a moderately supportive outcome to raise base rates by \$100 million and recover \$222 million in environmental compliance costs annually for the next three years. Deferred fuel balances have declined by about \$150 million during the first quarter of 2008, and remain significant at about \$950 million, benefiting cash flow, and should decline further over the next few years, assuming no material fuel cost increases. Capital spending needs will be significant over the next three years and total about \$14.4 billion to address maintenance and growth prospects, as well as to meet increasingly stringent environmental compliance standards. Southern Company is also pursuing the construction of two new nuclear units and has entered into an engineering, procurement, and construction contract with Westinghouse. Subsidiary Georgia Power will be a 45.7% owner of the units. The company still needs approval from the Georgia Public Service Commission to proceed. The financial profile remains robust, benefiting from recent rate increases in Georgia and Alabama as well as recovery of deferred fuel costs. FFO/interest coverage for the 12 months ended March 31, 2008 was 4.4x, FFO to total debt was 19.2% and debt leverage remained stable at 56.9%.

U.S. Dimitri Nikas

**Canada**

**Brookfield Renewable Power Inc.** ( BBB/Stable/A-2)

The company reported first-quarter results were materially higher on a year-over-year basis. It experienced favorable hydrology; production was about 18% above long-term-averages. This, combined with higher power prices, led to a 29% increase in operating cash flows year-over-year.

Canada Kenton Freitag

**Canadian Utilities Ltd.** ( A/Stable/A-1)

First-quarter results increased by more than 10% on a year-over-year basis and were in line with our expectations. The company benefited from a growing rate base and higher gas use at its utilities division. The company's midstream segment also benefited from higher margins from its natural gas liquids extraction business.

Canada Kenton Freitag

**Enbridge Inc.** ( A-/Stable/--)

Earnings were up about 10% year-over-year and were consistent with our expectations. Aside from continued growth in earnings from its liquid pipelines, the company's gas distribution subsidiaries benefited from a colder-than-normal winter. The company continues to advance several projects, which will result in elevated project management risk during the next few years.

Canada Kenton Freitag

**Hydro One Inc.** ( A+/Stable/A-1)

Hydro One's first-quarter financial performance is consistent with our forecast of weaker-than-average cash flow credit metrics for the next few years. Capital expenditures are slightly higher than during the same period of 2007, in line with forecast. The company expects to invest about C\$1.4 billion of capital in its regulated rate base in 2008 (compared with C\$1.1 million in 2007).

Canada Nicole Martin

**Hydro-Québec** ( A+, A-1+)

First-quarter (ended March 31) results were in line with our expectations. Recent regulated rate increases and favorable hydrology and electricity prices have largely offset the impact on consolidated earnings of higher water royalties payable to Quebec. The company continues its capital expansion program, including a 1,250 MW interconnection with Ontario to be completed in 2010, and the Eastmain Rupert Diversion project near James Bay (expected in service from 2009-2012).

Canada Nicole Martin

**TransCanada PipeLines Ltd.** ( A-/Stable/--)

First-quarter earnings were up about 30% on a year-over-year basis and were consistent with our expectations. The company benefited from the full quarter addition of earnings from ANR Pipeline Co. (purchased in early 2007) and from improved generation and prices from its hydro assets in New York. The company continues to advance its Keystone Pipeline, which will serve the oilsands and expects construction to commence in the second quarter. The company recently announced its purchase of the Ravenswood Generating Station in New York State. The acquisition represents higher risk than TCPL's traditional regulated pipelines but does not materially affect the company's overall credit profile given the substantial equity issued to finance the acquisition.

Canada Kenton Freitag

**TransAlta Corp.** ( BBB/Stable/--)

We expect the US\$303 million sale of TransAlta's Mexican assets (303 MW) to close in second-quarter. Management plans to use most of the proceeds to buy back shares. The negative impact on balance-sheet strength should not move the rating given the company's near-term cash flow strength. At first quarter-end, TransAlta's liquidity resources to support operations (including trading activities) remained adequate.

Canada Nicole Martin

**Europe**

**E.ON AG** ( A/Stable/A-1)

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

E.ON has recently announced that it will buy assets in Spain, Italy, and France from Enel and Endesa for an enterprise value of €11.8 billion. This large acquisition, which is the group's second-largest purchase ever, is part of its massive €63 billion investment program between 2007 and 2010. As a result of these substantial investments and a shareholder friendly policy—with a €7 billion share buyback to be completed this year and a 22% increase in the dividend per share to be paid this year—E.ON's financial profile, which is currently solid, with FFO coverage of adjusted net of 32.7% in 2007, will sharply deteriorate from 2008. It is, however, expected to remain in line with the ratings. E.ON's offer to the EU to settle antitrust cases by divesting its power transmission grid and about 20% of its domestic generation capacity will weaken its position in Germany. The earnings contribution of the power transmission operation is, however, modest, while the group will remain the clear No. 2 in generation in its domestic market. Moreover, E.ON's intention is to exchange rather than sell these generation assets for assets outside Germany, which should enable it to strengthen its European coverage.

Germany  
 Hugues de la Presle

**EDP - Energias de Portugal, S.A. (A-/Negative/A-2)**

EDP reported a strong 14% growth in EBITDA in 2007 driven by strong growth in its Brazilian unit (35%) as well as in its currently relatively small wind business (46%). The group also benefited from robust 12% EBITDA growth in its large Iberian generation and supply operation. Thanks to a high volume of output sold forward, EDP's liberalized generation and supply operations were only moderately affected by the lower pool prices in Spain in 2007. The group has already contracted 58% of its 2008 output. Following the acquisition of U.S. wind power operator Horizon in 2007, EDP's financial profile is weak for the ratings with FFO to net debt of about 16% at year-end 2007. However, the group is in the process of partially listing its wind operation with a view to using the proceeds to fund this unit's substantial capital expenditures.

Portugal  
 Hugues de la Presle

**Electricité de France S.A. (AA-/Stable/A-1+)**

EDF posted a 6.1% increase in consolidated EBITDA in 2007, primarily driven by the 6.9% growth in EBITDA in its core French operations (66% of 2007 EBITDA), largely thanks to the savings derived from the Altitude cost-cutting program. These savings more than offset the negative impact of the lower availability of French nuclear plants. The group's main European subsidiaries made more subdued contributions, reflecting lower gas sales because of mild weather, regulatory pressures, and intense competition in the U.K. The group has announced very high capital expenditure of €35 billion between 2008 and 2010, which will significantly limit its free cash flow generation over that period. The group thus has limited flexibility at the current rating level for any large debt-funded acquisitions. As a result we are closely monitoring EDF's apparent interest for British Energy. We could take negative rating actions on EDF if it became clear that its credit measures could weaken significantly and lastingly as a result of a bid for British Energy.

France  
 Hugues de la Presle

**Endesa S.A. (A-/Negative/A-2)**

In March 2008, Endesa published the guidelines of its future business plan for the period 2008-2012, which include significant investments (€24.4 billion), particularly when taking into consideration the reduced size of the group once some of the European generation assets will have been sold to E.ON and renewable assets are transferred to a company controlled by Acciona. We estimate that investments under this plan are about €7 billion higher than under the previous one. They will moreover be only partly funded by asset sale proceeds given the payment of a special dividend of up to €4.5 billion. The company's board must still approve the business plan, and changes are possible. Although the company has not provided details on its future capital structure and credit metrics, we expect debt to increase in the coming years, mainly to finance Endesa's hefty investments and dividend payments. Cash flow protection metrics should nevertheless remain adequate for the ratings, with FFO to total debt exceeding 20%. Ultimately, future debt levels will depend on the evolution of operating cash flow and, even more so, on the business strategy and financial policy implemented by the shareholders. Going forward Endesa's rating will be based on its stand-alone creditworthiness, but we cannot look at the ratings in complete isolation from the credit quality of Endesa's controlling shareholders Enel SpA (A-/Negative/A-2) and Acciona, which acquired respectively 67% and 25% of Endesa in October 2007. These owners will steer Endesa's growth and investment strategy, and its financial and dividend policies.

Spain  
 Ana Nogales

**Enel SpA (A-/Negative/A-2)**

Following the acquisition of 67% in Endesa and close to 60% in Russian generator OGC5, Enel has become an international utility with substantial geographic and operational diversification. It enjoys leading positions in Italy and Spain and is vertically integrated in most of its key markets. Its capital structure, however, has weakened significantly. Reported gross debt at the end of 2007 was €60 billion and Enel's gearing (debt to equity plus debt) was 72%. Enel plans, however, to sell material assets (with a total enterprise value of about €18 billion) in the next couple of years. Most of the sales should be completed during 2008, in particular, that of Endesa and Enel assets to E.ON, which has been agreed at €11.8 billion. The other disposals are exposed to varying levels of execution risk. Given Enel's commitment to maintain an 'A' category rating, we expect that if market conditions or other issues result in lower proceeds, the group will take the necessary measures to offset the impact. To sustain the current ratings, we expect Enel to achieve credit metrics in line with the 'A-' rating by year-end 2009—namely, FFO to debt of about 18% and FFO interest coverage of about 4x. These metrics factor in the investment of €37 billion over the next five years, as announced by the company in February 2008.

Italy  
 Ana Nogales

**Iberdrola S.A. (A-/Stable/A-2)**

Following the acquisition of Scottish Power, Iberdrola has leading positions in Spain, the U.K., and Latin America. It is also seeking to finalize the €6.4 billion acquisition of U.S. utility Energy East Corp. (BBB+/Negative/A-2). Over the next three years, Iberdrola will undertake a large investment program of €24.2 billion, with renewables accounting for about half of organic

Spain  
 Ana Nogales

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

investments. Proceeds from the IPO of Iberdrola Renovables (€4.48 billion) will finance this growth and are key to maintaining credit metrics that are consistent with an 'A-' rating, namely gearing below 50%, FFO to debt of about 17%, and FFO interest coverage of about 4x. Furthermore we expect Iberdrola to fund 72% of its cash outflows for the 2008-2010 period with operating cash flows, asset disposals of more than €3 billion, and the IPO proceeds. First-quarter results were strong, thanks to the consolidation of Scottish Power and to the good performance of all operations. The group reported EBITDA of €1.8 billion, a 64% increase in relation to the first quarter of 2007, thanks to the €500 million contribution from Scottish Power, and to an increase of 18% in the EBITDA contribution of the remaining operations. Reported gross debt of €22 billion remains unchanged from Dec. 31, 2007.

**National Grid PLC**( A-/Stable/A-2)

National Grid's ratings continue to be driven by the group's consistent focus on regulated networks in the U.K. and U.S., with the proportion of regulated cash flows increasing again after the recently announced sale by U.S. subsidiary KeySpan of the Ravenswood merchant generator in New York for \$2.9 billion (£1.5 billion). The financial impact of the sale, which was required by the regulator, is already factored into the ratings. In January, National Grid announced a more aggressive dividend policy from 2007/2008 that will reduce projected FFO to adjusted debt to about 13%. While this remains commensurate with existing ratings, National Grid has reduced flexibility at this rating level. Management maintains its policy of maintaining 'A' category ratings for its operating subsidiaries in the U.K.

U.K. Mark  
Davidson

**RWE AG**( A/Stable/A-1)

RWE was recently downgraded to 'A' from 'A+' reflecting the expected weakening in its financial profile in coming years as a result of its large investment program. A key objective of RWE under its strategic plan is to increase leverage. The group aims to grow its debt factor (which corresponds under the group's definition to net debt adjusted for postretirement and asset retirement provisions to EBITDA) to between 2.8x and 3.4x by 2010, from 2.1x at the end of 2007. This increase in debt will stem from large capital expenditures of €33 billion between 2008 and 2012; some external growth; and higher shareholder returns, especially a €2.5 billion share buyback, which the group plans to complete this year. RWE's financial profile, which is currently robust, with FFO to adjusted net debt of 37% in 2007, is thus expected to weaken markedly. RWE's offer to the EU to close antitrust cases to sell its gas transmission grid in Germany should not significantly lower its share of regulated earnings, given this business's relatively limited contribution.

Germany Hugues de  
la Presle

**Suez S.A.**( A-/Watch Pos/A-2)

Under the revised terms announced for the merger between Suez and GDF, 21 GDF shares will be exchanged for 22 Suez shares, while 65% of the share capital of Suez's environment arm (21% of Suez's 2007 EBIT) will be spun off to Suez shareholders at the time of the merger, with the enlarged group retaining a 35% stake. With respect to the merger process, the recent filings of a negative opinion by GDF's European works and Central works councils are important steps forward. Their views are not binding, but French rules demand that these bodies, made up of union and workers representatives, give an opinion--be it positive or negative--before the tie-up can proceed. Suez's European and Central works councils have both already filed their views. The main remaining hurdle for the merger is the approval by both groups' shareholders. Both groups are also making progress on the disposals requested by the EU to approve the merger, especially the sale of Belgian gas incumbent Distrigaz and that of GDF's stake in the second-largest Belgian power generator SPE, for which it has now entered into final negotiations. To resolve the CreditWatch placement we will focus on the enlarged group's strategy and financial policy. So far management has announced a large €10 billion per annum capital expenditure program between 2008 and 2010, as well as a planned growth in dividends of 10% to 15% per year between the dividend paid in 2007 (by GDF: €1.1 per share) and the dividend to be paid in 2010, with potential further returns to shareholders, while seeking to maintain a "strong 'A'" rating.

France Hugues De  
La Presle

**Vattenfall AB**( A-/Stable/A-2)

Vattenfall reported stable earnings in 2007, despite a sharp drop in electricity spot prices compared with 2006, which was an exceptionally strong year. The negative impact of lower electricity prices was offset by the group's strategy of selling its output forward. In addition, the Nordic businesses reported an increase in hydro output and nuclear generation; the latter based on improved availability at the group's Swedish plants. The large German generation operations improved, mainly because of better availability of the coal-fired plants, but also because of hedging gains, which more than offset unplanned outages at two of the group's German nuclear units. Pressure on tariffs--particularly in Germany--resulted in deteriorating profitability within Vattenfall's network operations, whereas gross margins in electricity retail sales remain under pressure due to fierce competition in the group's main markets. We expect Vattenfall to continue its growth strategy, which may entail acquisitions. The group has the flexibility to fund such growth, with FFO interest coverage at 6.8x in 2007 (compared with 8.1x in 2006) and FFO to debt at 32% (from 37% in 2006).

Sweden Mark  
Schindele

**Veolia Environnement S.A.**( BBB+/Stable/A-2)

Veolia's operational performance continued to be solid in 2007, with 14% sales growth and a 9.8% advance in EBITDA. For 2008, the group is targeting at least 10% sales growth and a commensurate increase in EBITDA on the back of the maturing of contracts signed in recent years, the full impact of recently completed acquisitions, ongoing productivity improvements, and some strengthening in earnings in the transport business. The group's financial profile remains moderate, however, given the group's substantial investments, which totaled a hefty €6.1 billion in 2007. FFO coverage of adjusted net debt was about 19% in

France Hugues de  
la Presle

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

2007. In light of the group's substantial €15 billion-€20 billion investment program between 2007 and 2009, including €4 billion in capital expenditures on maintenance and organic growth in 2008, as well as possible further acquisitions and a high dividend payout, VE's financial profile is unlikely to improve in coming years, despite projected increases in earnings and cash flow.

**Australia/New Zealand**

**AGL Energy**( BBB/Negative/--)

AGL Energy's earnings outlook for the fiscal year ending June 30, 2008 remains on track, with the company forecasting EBITDA of A\$830-A\$875 million amid continued improvements in the company's cost-to-grow and cost-to-serve metrics. The rating remains on negative outlook following a weakening in AGL Energy's financial metrics, with the company working on an active program to reduce debt by A\$600-A\$700 million in order to return its funds from operations (FFO)-to-interest ratio to at least 5x. Debt will be reduced by a mix of using its underwritten dividend-reinvestment plan and disposal of non-core assets. As part of this process, AGL recently announced the sale of its Chilean GasValpro business for A\$90 million. Other non-core assets being considered include the divestment of its assets in Papua New Guinea. Any further deterioration in AGL's earnings outlook, or a delay in the credit metrics recovery over the medium term, will likely result in a rating downgrade of AGL Energy.

Australia  
Andrew Palmer

**Contact Energy Ltd.**( BBB/Stable/A-2)

Contact's earnings to date are in line with budget expectations. The December 2007 decommissioning of the 300 MW New Plymouth thermal power plant continues to be offset by synthetic arrangements to replicate the plants capacity and will ultimately be replaced with the planned 200 MW gas-fired Stratford peaking plant expected to be commissioned in 2010. Contact's upcoming extensive expenditure in future generation will further diversify the company's generation portfolio, while reducing its reliance on gas. Of the company's possible next five-year capital expenditure of NZ\$1.1 billion, 9% is earmarked for hydro generation, 31% for gas-fired generation, and 36% for geothermal generation. We expect Contact to manage its risk exposure commensurate with the current rating tolerance and time projects in order to preserve credit metrics close to current levels, with only minor weakening during times of peak expenditure.

New Zealand  
Tammy Garay

**Diversified Utility and Energy Trusts (DUET)**( BBB-/Stable/--)

DUET has announced a capital restructure in which its listed 'POWERS' notes will be refinanced with bank debt. The re-finance will improve the groups ability to manage its capital structure and importantly debt refinancing given current credit market conditions. Overall, DUET continues to perform to expectations, with solid earnings growth driven by its three major assets: United Energy, DBNGP, and Duquesne Light Holdings Inc. . DUET's earnings growth is contributing to stronger debt coverage than historically achieved; nevertheless, underlying asset quality remains a key focus, with four of its five assets currently on negative outlook.

Australia  
Andrew Wilkie

**Origin Energy Ltd.**( BBB+/Stable/A-2)

Origin has upgraded its 3P coal seam gas (CSG) reserves 121% to 10,122PJ. Recent market sales of CSG suggests the value of the reserves has increased substantially. Accordingly Origin has rejected a proposal from BG Energy Holdings Ltd (BG; A/WatchNeg/A-1) to acquire Origin despite a share price offer premium in excess of 40%. While an increase in CSG reserves of this magnitude potentially provides Origin with significant commercial opportunities the challenge for the company is to monetize the reserves to obtain indicated value. Origin has also given market guidance that reported profit for the June 2008 fiscal year will be up 15%.

Australia  
Richard Creed

**Latin America**

**AES Gener S.A.**( BBB-/Stable/--)

AES Gener has developed an aggressive expansion strategy through the construction of new thermal capacity for around 1,200MW and is analyzing other important power projects for around 1,300MW in Chile. The strategy is to take advantage of the positive environment deriving from the attractive regulatory framework for power generation after the passage of the Short Law II in 2005. The already announced projects would represent a high level of investments of around \$2.0 to 2.5 billion that are projected to be financed by a mix of equity and recourse and non recourse debt. To partly finance its capital contributions in those projects, AES Gener has and will raise long term debt and will raise capital for about \$300 million (AES Corp already announced that it will exercise its right to buy 80,11% of that amount). The BBB- rating reflects the assumption that total debt to EBITDA will be below 4x and FFO interest coverage and FFO to average total debt will remain above 3x and 20%, respectively.

Chile  
Sergio Fuentes

**Comision Federal De Electricidad (CFE)**( FC: BBB+/Stable/--; LC: A-/Stable/--)

The ratings on CFE and the United Mexican States (UMS) are linked reflecting CFE's importance to the UMS as its primary vertically integrated electric utility, which constitutes a strong economic incentive for the sovereign to support CFE during periods of financial distress. CFE enjoys a good liquidity and financial flexibility based on its fluid access to the financial markets and high cash position, that reached about \$4,8 billion compared with a \$1,5 billion short term debt as of March 31, 2008. We expect CFE to carry out capital expenditures for about \$5 billion in 2008, mainly concentrated in generation and distribution.

Mexico  
Fabiola Ortiz

**Companhia Energetica de Sao Paulo**( B/Positive/--)

*Industry Report Card: Utility Sectors In The Americas Remain Stable, While Challenges Beset European, Australian, And New Zealand Counterparts*

CESP continued improving its debt structure after a series of financial transactions that resulted in positive advances in the company's financial risk profile. CESP raised Br\$2 billion in the national and international capital markets in 2007 to refinance debt maturities and also reduced its total debt to Br\$ 6.3 billion as of March 2008 from Br\$ 6.7 billion as of December 2007, which resulted in a much more adequate debt profile. In addition, the company improved its cash flow protection measures: FFO to total debt and FFO to interest reached 11.5% and 2.3x, respectively in the twelve months ended in March 31, 2008 compared with 5.7% and 1.5x in the same period of the previous year.

Brazil  
Juliana Gallo

**Eletropaulo Metropolitana Eletricidade de Sao Paulo S.A.**( BB-/Stable/--)

We expect that even after the 8.43% tariff reduction in July 2007, Eletropaulo's cash flow generation was slightly affected and the company was able to reduce overall debt by Br\$500 million. We expect the company to continue working on its liability management to reduce costs and improve its debt amortization profile. FFO to total debt and FFO interest coverage reached 29.1% and 4.4x, respectively, in the 12 months ended March 31 2008, compared with 33% and 4x in the same period of 2007.

Brazil  
Marcelo Costa

**Interconexion Electrica S.A. E.S.P. (ISA)**( FC: BB+/Stable/--; LC: BBB-/Stable/--)

The ratings reflect the company's dominant position as a transmission grid operator in Colombia, its strategic importance to the country, efficient operations, and the government's ownership. For the last twelve months as of March 31 2008, the company presented an FFO interest coverage of 3.1x which was slightly above our expectations. We expect FFO interest coverage to maintain its historical levels of 2.5x to 3.0x

Colombia  
Monica Ponce

**Enerjis S.A.**( BBB/Stable/--)

Enerjis' credit quality mainly benefits from the good credit profile of its Chilean investments in power generation and distribution, and from its good financial risk profile, as evidenced by its adequate leverage (total debt to EBITDA below 3x), debt service coverage ratios, and very good liquidity and financial flexibility. We expect Enerjis to continue to benefit from the still favorable economic environment in Latin America during 2008, and FFO interest coverage and FFO to total debt to reach about 3.5x to 4.5x and 25% to 35%, respectively.

Chile  
Sergio Fuentes

\*Ratings are as of June 23, 2008. †Debt rating guaranteed by the Province of Quebec. FC--Foreign currency. LC--Local currency.

## Overview

- **Ratings Outlook:** Rating trends across regulated utilities remain mostly stable supported by stable regulatory oversight, slow but steady demand for utility services, and tempered by aggressive capital spending that will keep credit metrics from improving. Emerging new political trends in historically stable regions like Europe and the U.S. may have far-reaching effect on utilities over time, but S&P Global Ratings sees little immediate influence from those factors in 2017. Sovereign rating developments can influence utility ratings in some countries and we expect them to vary in different parts of the globe.
- **Forecasts:** Credit ratios are likely to be stable in 2017 with some slight downside risk as revenue growth will be modest in most regions in keeping with the slow demand growth in regions where the utility industries are mature. In contrast, growth can be higher in countries and regions where utility services have not fully penetrated the market offset by large investment needs. We expect margins across the industries globally to be flat to improving slightly as operating conditions and favorable fuel cost trends are maintained.
- **Assumptions:** Sales growth at most utilities is closely tied to the general economic outlook in its service territory, which can vary considerably from utility to utility. We project solid regulatory support for utility earnings and cash flow, with the occasional exception due to specific political or policy issues at the local level. Capital spending will continue to be elevated in most areas, with substantial infrastructure needs.
- **Risks:** Transformative risks abound in utility industries. Corporate transformations (M&A) are an ever-present risk to ratings. Electric generation transformation is ongoing as carbon concerns and other environmental considerations lead utilities to change the mix of fuel sources. Grid transformation is becoming more prominent as utilities react to technological advances and the need for greater attention to cyber security.
- **Industry Trends:** The utility industry in most regions is stable, consistent with our general ratings outlook and the nature of the essential products and services utilities sell. The unsettled state of the world economy, buffeted by political volatility and uncertain capital flows as international trade and tax reform emerge as urgent issues, could spill over into the utility space. However, the industry as a whole is well positioned to withstand mild shocks, and we see steady growth and stable credit quality overall.

**Ratings trends and outlook**

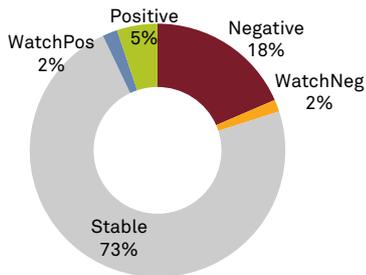

**Global Utilities**

**Chart 1 – Ratings distribution**

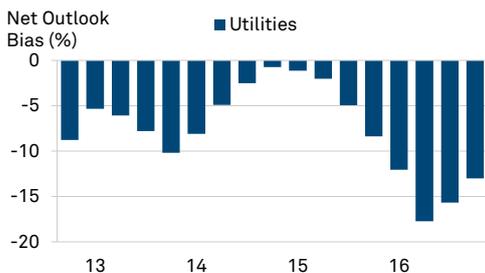

The industry remains largely investment-grade.

**Chart 3 – Ratings outlooks**

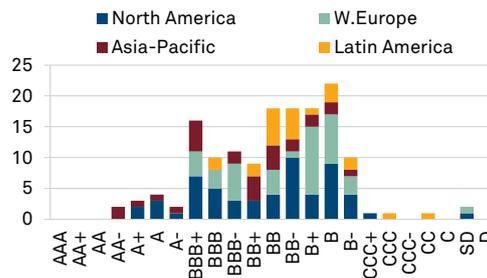

Mostly stable, but a little more tilt toward the negative than last year.

**Chart 5 – Ratings outlook net bias**

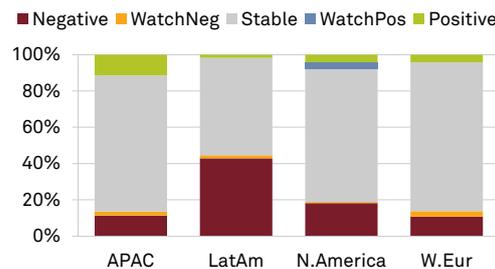

Source: S&P Global Ratings. Ratings data measured quarterly with last shown quarter ending December 31, 2016

**Chart 2 – Ratings distribution by region**

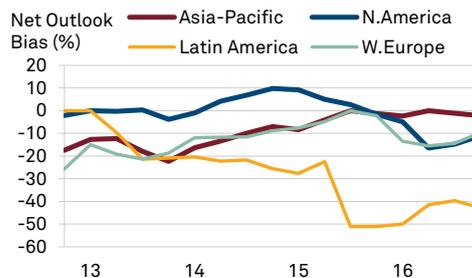

Ratings are distributed mostly the same, with a notable shift in EMEA toward the lower end of investment grade.

**Chart 4 – Ratings outlooks by region**

Very consistent, with slightly less negative bias in North America and EMEA, and more positive outlooks in EMEA and APAC

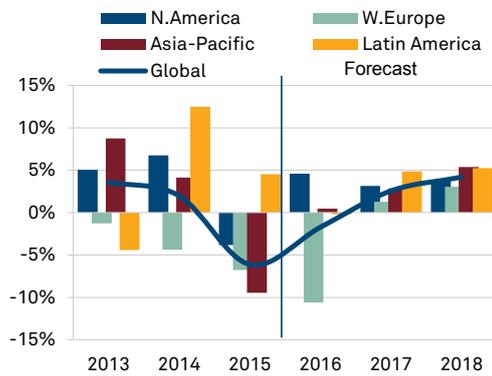

**Chart 6 – Ratings net outlook bias by region**

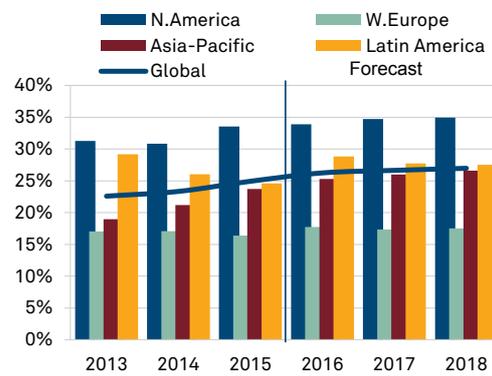

**Industry forecasts**

**Global Utilities**

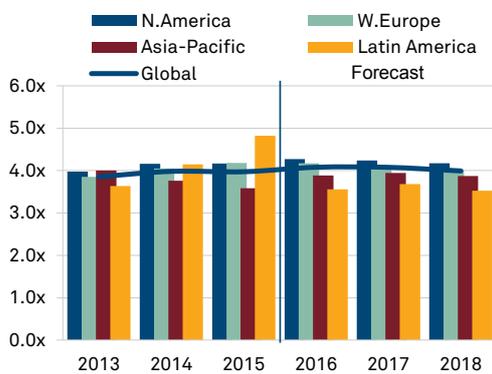

**Chart 7 – Revenue growth (local currency)**

**Chart 8 – EBITDA margin (adjusted)**

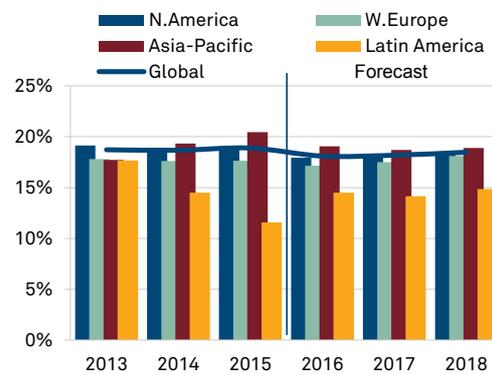

**Chart 9 – Debt / EBITDA (adjusted)**

Stable margins across all regions

**Chart 10 – FFO / Debt (adjusted)**

A little more stable than last year's projections

This has been remarkably stable globally, and we project a rebound in regions where there's been some deterioration.

Source: S&P Global Ratings. Revenue growth shows local currency growth weighted by prior-year common-currency revenue-share. All other figures are converted into U.S. Dollars using historic exchange rates. Forecasts are converted at the last financial year-end spot rate.

**Key assumptions**

**Global Utilities**

<b>1</b>	<p><b>Industry demand growth broadly linked to economic growth</b></p> <p>Historically, demand for electricity, natural gas, and other utility services has correlated broadly with overall economic growth. In regions where market penetration is low the growth can outpace the economy. In mature markets where appliance and industrial efficiency has advanced through the years, load growth has slackened and lagged the performance of the broader economy. In <b>Europe</b>, we expect most economies to have low but improving economic growth and inflation slightly increasing from commodity prices. Moderate inflation in the U.K. and the Eurozone support earnings growth for regulated utilities whose remuneration is linked to the consumer price index or retail prices index. This is particularly true for the U.K. utilities. In <b>North America's</b> economies, the ability of utilities to maintain a growth profile alongside the economy has faltered in what has been a long-term trend, and we assume low growth for most utilities. In <b>Canada</b> the downturn in energy prices has had a knock-on effect on load in combination with continued conservation initiatives. <b>Latin American</b> revenues will remain constrained by the overall sluggish economic activity, especially in Brazil, although a pick-up in commodity prices could help. We expect a mixed trend in <b>APAC</b>, with few Asian countries such as <b>India</b> and <b>Indonesia</b> likely to see revenue growth outpace economic growth due to increasing capacities to bridge power needs and government policies to move towards 100% electrification. In other parts of Asia-Pacific, we expect modest to sedate growth.</p>
<b>2</b>	<p><b>Regulation supports earnings and cash flow</b></p> <p>Regulatory behavior is notoriously difficult to predict, but the political and economic conditions in many regions have enabled utility regulators to sustain a long period of supportive cost recovery through rates and support for capital improvements to bolster service reliability and quality, which has translated into earnings and cash flow stability. In <b>APAC</b>, some markets are going through or experiencing some form of industry restructure, although the regulatory environment is largely stable and supportive. Abrupt changes, if any, driven by political or socioeconomic reasons are not anticipated in our base assumptions but also difficult to predict. Stability has held in <b>North America</b>, where commodity and financing costs have steadied the regulatory environments as rate increases have been mild. In <b>Europe</b>, recent regulatory reviews (France and Italy notably) have led to generally lower remuneration of the asset base, reflecting the overall lower cost of capital, but it was manageable and generally did not hamper the affected credit quality. We view regulatory frameworks in <b>Latin America's</b> main economies as relatively stable, with utilities being able to recover its costs while presenting adequate returns.</p>
<b>3</b>	<p><b>Capital spending elevated to meet infrastructure needs</b></p> <p>We assume that capital spending will remain a focus of most utility managements and strain credit metrics. It provides growth when sales are diminished by ongoing demanded efficiency from regulators and other trends, and it is welcomed by policymakers that appreciate the economic stimulus and the benefits of safer, more reliable service. The speed with which the regulatory process turns the new spending into higher rates to begin to pay for it is an important factor in our assumptions and the forecast. Any extended lag between spending and recovery can exacerbate the negative effect on credit metrics and therefore ratings. As for last year, the main drive for high investments will remain integration of new renewables capacity and decentralized generation / micro grids, which require new connections and significant network upgrades to manage a less predictable demand –supply curve. Some distribution networks are also responsible for smart meter deployment, which can represent a significant share of the capital investments. Investments in <b>Latin America</b> should remain focused on the expansion of networks and quality of services and there are important projects in transmission that are currently in progress. Increasing generation capacity to meet the growing needs of the population should continue to drive the construction of new power generation facilities. <b>Asian</b> markets should see elevated investments leading to some weakness in metrics until the new projects are commissioned, while the mature markets of Australia and New Zealand should see investments in line with past few years.</p>

## Key risks and opportunities

### Global Utilities

1

#### Corporate transformation

In order to respond to the sector challenges, we expect M&A activity to remain strong in 2017. On the one side, we see utilities spinning off some of their more mature networks given the attractive prices they can obtain, supported by the strong appetite of infrastructure funds eager to invest in defensive assets generating decent yields. In **Europe**, we see Italy, France, and the U.K. as recent examples, for which selling prices were well above the regulated asset base. The proceeds of such disposals would in turn be primarily used to remunerate shareholders and to finance the growing regulated network activities, where significant upgrades are needed and investments may be substantial. We also see execution of disposal programs for some integrated utilities as paramount for the maintenance of their credit quality this year. Targeted assets include the more volatile thermal and merchant generation assets, oil and gas upstream activities, and non-core, non-domestic assets. In **APAC**, offshore investments mainly by Chinese entities are likely to remain the theme although certain restrictions can see some softening of the trend. Japan, China, and some other Asian countries are seeing some industry reforms that can lead to tariff reforms or the dismantling of integrated entities, which could have a bearing on the credit quality over the next few years.

**North American** utilities have been focusing on cross-industry (gas utilities buying electric utilities) or cross-border (**Canadian** holding companies buying U.S. utilities) combinations and using historically low interest rates and strong stock prices and plentiful leverage to justify paying large multiples. Cost of capital has been rising but is still well below historical averages, so 2017 could bring more transactions before higher interest rates start to dissuade purchasers. Transactions outside the utility space, which are typically more credit-negative because of added risk, have been less prevalent but could accelerate if growth on the utility side slows. In **Latin America**, we view Brazil to remain attractive to investors despite the still weak economic activity, as some integrated entities resort to asset sales aiming to reduce leverage and improve liquidity, amid tight credit markets. Participants from Europe and the region were active in 2016, but expect the activity to slow down as rated participants integrate recent acquisitions in 2017.

In order to meet increasingly tough efficiency targets set by regulators and to face IT challenges associated with smart technologies and the integration of renewables in the network management, we see sector consolidation as a key theme for 2017 in certain areas. This could vary across markets driven by local policies. In **Italy** for example, we see the sector consolidation as a key theme given the high number of small-scale municipal networks. A similar trend is emerging in **Canada** in the province of Ontario with the merger of several municipal distribution companies. We also see investments in quasi-regulated/midstream assets as being a hot topic for the regulated utilities sector, as some of them try to search for new growth drivers outside of their core markets. These include notably investments in optic fiber, long-term contracted pipelines, liquefied natural gas (LNG) assets and storage businesses.

In such an environment, we will focus on effective execution of disposal programs, appetite for growth and change in financial policies towards potential high leverage--especially in a context of low interest rate environment.

2

---

### Generation transformation

As in previous years, and notably following the COP 21 in late 2015 and the following adherence to the Paris Agreement at the national level during the course of 2016, the more stringent environmental targets globally will continue to reshape the generation mix towards an accelerated penetration of renewable energies, notably solar and wind. In some regions, we also see growth in gas assets (both gas-fired power plants and LNG facilities) as driving new infrastructure developments to distribute power in the respective areas. In **Canada** the Alberta government has mandated the complete replacement of coal generation with gas assets and renewables by 2030. We believe significant push for renewable power will increase share of renewables in the energy-mix for countries like **India**. However, coal is likely to remain the mainstay in the fuel-mix and power generation there and in **Indonesia** due to significant capacity additions.

The significant amount of new projects will require new connections and new transmission lines, which we believe will be a key driver for the asset base and revenue growth for the sector. This is notably because new connections may be complex and expensive (notably for offshore wind) and because the location of new generation sites may be quite remote from the end-users given potential land constraints as well as geographic or weather characteristics. Beyond the political push, we believe the development of renewable energies is also driven by significant progress in technologies and cost. Wind and solar have indeed seen their cost reducing significantly in recent years (by about 60% for solar between 2009 and 2016, according to the **International Renewable Energy Agency** (IRENA) and efficiencies have increased (as measured through load factors and wind turbine capacity notably). These significant manufacturing and technology progress make their value proposition economically more acceptable and therefore more financeable. Some studies show that technology parity versus efficient thermal assets can be reached between 2020 and 2025, while recent auctions (notably in **Latin America**) reflected the more competitive nature of renewable projects.

Similar themes are seen to varying degree in the **Asian** markets given the big gap between demand and supply. While a number of Asian countries, such as India, China, Thailand, and Australia are increasingly looking at renewable projects, coal and gas are likely to remain the mainstay for most Asian countries. Associated with growing renewables is the need for investment to manage intermittency which can lead to a different approach to grid management and cost recovery. We believe this is an evolving space. Potential easing of environmental regulation in the U.S. may allow East Asia-based electric and gas utility companies to further stabilize fuel costs due to improved U.S. shale gas supplies.

---

3

---

### **Grid Transformation**

The inherent intermittency of the generation profile for renewable assets requires in many cases a significant upgrade of the networks to manage such complex and somewhat less predictable power inflow. We also believe that the growth of renewable energies goes together with the development of so-called micro grids, which aim at increasing consumption of locally produced energy. With increasing decentralized production and self-consumption, systems need to forecast and manage a much more dense and complex network, which requires significant big data management and sophisticated forecasting tools, which we believe represent significant IT investments.

This goes alongside with a push for the penetration of smart meters, to better measure and control the network. The digitalization of the network represents in our view a significant opportunity for network operators to optimize their cost structure (given the more centralized control of the network, avoiding physical intervention). Where the network operators are also in charge of the roll-out of such smart meters, we believe it will also boost the regulated asset base and allowed revenues.

Yet both the need for optimized balancing of the flows and digitalization of the networks require evolving roles and responsibilities of the network operators, and a potential change in their remuneration scheme in the near future. In this context, we believe not all players are well prepared for such transition and we may see increasing differentiation in operating performance (and ultimately cash flows) between network operators. We further believe that while increasing responsibilities may push for higher allowed revenues, we see a potential risk that such additional remuneration may not fully compensate for the additional costs and risks associated with these new responsibilities. This is notably because of the lack of track record when transitioning to these uncharted territories driven by new technologies. What's more, in an increasingly digitalized environment, we see cyber security as an increasing threat to the sector. Beyond the obvious risk of blackout associated to cyber piracy, we see data security (given the big data management model associated to the generally large customer base) as another major threat. This ultimately may result in reputation risk for the networks; and unforeseen financial consequences.

---

## **Industry developments**

### **Corporate strategy and diversification**

With some notable exceptions, utilities are experiencing a secular slowdown in growth prospects. This is especially true in regions and countries where the provision of electricity and natural gas and water is well-established and has broadly penetrated the relevant market. The causes are many and center mainly around significant past investments based on economic growth rates (and power and gas consumption) that did not materialize, slowing population growth, and increasing efficiency in end-use products that use natural gas and power. A furnace that is twice as efficient as the one it replaces may encourage the customer to stay a little warmer by raising the thermostat, but it's still not going to make up for the fact that it uses half as much fuel as its predecessor. Industrial usage offers the same story.

Another factor that is intruding on the ability of utilities to grow, prevalent mostly in electric markets, is the popularity of customers providing their own commodity and depriving the utility of the margins for that service and cutting down topline growth. In electricity it's called self-generation or distributed generation. Solar panels on individual customer roofs is the most recent and dramatic manifestation of this phenomenon, but it's been a long-standing trend for large commercial and industrial customers going back decades with "cogeneration" plants and outright leaving the grid (often called "behind-the-fence" projects) as industrial firms looked for ways to lower costs.

Firms facing low growth potential may find it more difficult to attract equity investors, and the natural impulse of any corporation and its managers to desire to grow to satisfy stockholders adds to the imperative to look for alternatives to their core utilities to invest in. This activity often goes in cycles,

seemingly as constant as the ocean tide, ebbing and flowing as utility managers hear the irresistible siren call of growth and greater profits— most of the time away from regulated activities. With that kind of growth comes risk, of course, and thus pressure on ratings.

Many **APAC** utilities still have traditional investment and integrated operations. Australia could see more asset privatization and potentially some consolidation. Market reforms in China and Japan are likely to occur over the next few years which may take few years to reflect in how the industry shapes up. Companies' ability to adapt to such reforms and maintain their balance sheet profile will be key to their credit quality. In **Latin America**, corporate groups still have opportunities to grow by expanding their coverage and improving basic service, and acquisition opportunities remain, particularly in Brazil. The energy reform in Mexico will also offer opportunities to build new generation capacity (mainly gas) and to provide services to the national utility to improve the country's transmission and distribution infrastructure.

We think we may be on the cusp of another cycle in some areas. In **North America**, utilities have been practicing a "back-to-basics" approach for many years in the wake of a difficult period of diversification efforts that accompanied deregulation of first natural gas and then electricity. While corporate strategic moves for the past decade or so have been mainly inside the industry (utilities combining with other utilities) to assist growth, the attractiveness of that strategy could wane if interest rates and other costs begin to rise and harm M&A economics. In **Europe**, international expansion (notably in Latin America) is privileged to build a new growth story. Also on the radar are midstream assets (pipelines, storage, and regasification plants, for example), which utilities see as having business similarities.

#### **Alternative financing, private equity, and infrastructure funds**

Corporate transformation (see Key Risks and Opportunities) and the diversification discussion immediately above suggest that M&A transactions and other corporate-level reformations will continue to be a feature of utility credit quality considerations in 2017. Corporate finance techniques outside of the usual debt/equity playbook have risen in popularity, especially as transactions have become more expensive and more creative avenues are needed to make the numbers work. Increased regulatory costs of being a public company has also contributed in the past to some utilities, especially small ones, "going private" to escape the cost and other burdens of full securities regulation. Institutional investors' appetite for secured, above-average-yield assets remains significant for utilities, and as mentioned above prices paid for such assets often come with significant premiums over the regulated asset base.

**APAC** utilities are likely to see dominant group and government ownership, particularly in Asia. Private equity firms have not been very active in the utilities space and we see limited prospects due to significant presence of industry super funds, dominant corporate groups and national wealth funds. Strong growth and investment in renewables could attract private equity, but interest seems to be low. We expect infrastructure funds to remain a dominant force in the market as also sovereign wealth funds (such as from Singapore, UAE) and private investors like SoftBank of Japan providing sufficient financial flexibility to fund large projects. Asset pooling to diversify risks across countries/sites and resources like hydro /wind/ solar is also expected to gain momentum.

In **Europe**, such pricing environment has recently led some utilities to sell their lower-growth networks, and we see the trend continuing in 2017. Proceeds first aim at offering the excess returns to shareholders and then to partly fund the capital expenditures on the higher-growth part of the network. In the transactions we have seen so far, little, if any, has been allocated to debt reduction. Funding in **Latin America** should continue to be dominated by bank and capital markets financing. However, some alternative financing structures are emerging in selected markets like Mexico, where entities similar to U.S. master limited partnerships have been recently launched in the infrastructure space.

Hybrid securities, whether in the form of preferred stock or some sort of subordinated debt with interest deferral permitted, are commonly used in M&A deals (as in last year's acquisition of TECO Energy by Emera Inc.), as well as other types of hybrids such as mandatory convertible debt that provides for equity support a few years after the merger.

Less associated with M&A is the use of unconventional corporate structures, which are invariably undertaken for tax reasons to reduce the issuer's cost of capital. While it's challenging to generalize about the myriad structures that exist, the details of which are limited only by the imaginations of tax attorneys and investment bankers, they do exhibit common attributes that can affect credit quality. In **Europe**, the sophistication of corporate structures is also significant in order to maximize the debt and benefit from a still low interest rate environment. We notably see more transactions that favor a tranche of subordinated debt with a holding company level, above the regulatory perimeter and sometimes with some ring-fencing structures. To understand the robustness of such structures, we generally take in consideration not only the documentation and financial structure, but also the legal and regulatory frameworks in which the utility operates.

In **North America** we see master limited partnerships and "yieldcos" as archetypes of this kind of entity. As tax-driven vehicles, they are frequently pass-through entities (so the tax man can get his share somewhere), so the ability of these issuers to retain earnings and build equity to provide creditors with a cushion is limited. The tax advantages mostly benefit shareholders, though some crumbs do accrue to creditors. Because their allure for equity investors is mostly in a steady but growing dividend, the structures often compel issuers to emphasize growth through acquisitions that carry extra risk. Consequently, we believe non-standard corporate structures connote lesser credit quality, although we always evaluate each entity on its merits and do not let the structure govern our opinion. Their use may change over time if tax reform takes hold, as is possible in the **U.S.**, but history tells us they will never disappear.

### **Operating efficiency through digitalization and cost control**

Although utilities are sometimes viewed as staid, bureaucratic organizations in a mature industry that contains no technological challenges, indifferent to all the changes occurring around them, the reality is quite different. Putting aside the advanced techniques and tools needed to operate, maintain, and monitor pipelines and power plants (the "pigs" that travel through a pipeline are high-tech marvels, not to mention nuclear plants and continent-wide electric grids), utilities spend considerable time and effort to leverage digital technology and the latest cost-control tools to push efficiency measures throughout their systems. If indeed utilities begin to experience greater cost pressures outside their control—capital costs, commodity costs, etc.—the need to implement more stringent cost-cutting efforts will become acute to improve operating efficiency and avoid putting undue pressure on the regulatory environment to sustain ratings performance. The digitalization of the network includes the significant deployment of sensors and remotely-controlled substations across the network. The technology allows for more centralized problem diagnostics and maintenance – limiting the physical presence needed to resolve network issues. Further, we have seen drones widely used for active network surveillance and access to difficult areas. Digitalization of the networks improves problem prevention, shortens response time, and reduces or optimizes utilization of human capital.

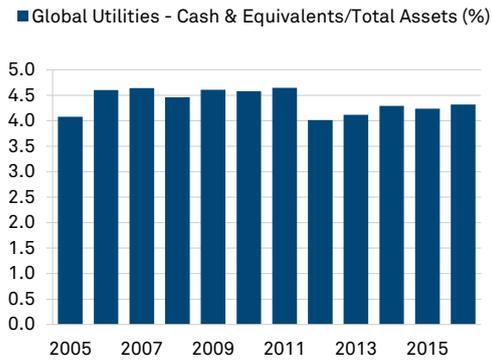

In the **Asia-Pacific** market, remote control apps, smart metering, consolidation of control room functions, and integrated outsourcing of operations and maintenance are avenues that will continue to lower the cost profile of utilities. With cost efficiency at the forefront of regulatory decisions, we expect increasing shift to incentive-based regulation. This could lead to optimal reliability and availability standards that could optimize investment in the networks. Cost profile of most Asian utilities remains relatively high and we don't expect an immediate change in the composition of their cost base. This is partly a reflection of their scale and integrated operations, high investment phase, and socio economic obligation under government ownership,

★ Supplementary Report in this week's issue. For Timeliness, 3-5 year Target Price Range, or Estimated Earnings 12 months to 6-30-23, the row indicates a change since the preceding week. When a diamond ◆ (indicating a new figure) appears alongside the latest quarterly earnings results, the rank change probably was primarily caused by the earnings report. In other cases, the change is due to the dynamics of the ranking system and could simply be the result of the improvement or weakening of other stocks.

Volume LXXVIII, Number 21, Issue 8. The Value Line Investment Survey (ISSN 0042-2401) is published weekly by Value Line Publishing LLC, 551 Fifth Avenue New York, NY 10176 and is accorded expeditious treatment prescribed for newspapers. Subscription rate for one year in the United States and US possessions is \$598. Foreign rates upon request. Periodical Postage Paid at New York, NY and additional mailing offices.

The contents are protected by copyright 2022. Factual material is not guaranteed, but is obtained from sources believed to be reliable. Rights of reproduction and distribution are reserved to the publisher VALUE LINE PUBLISHING LLC.

**The Value Line INFORMATION YOU SHOULD KNOW — Wealth Newsletter** - No matter where you are in life, you can successfully plan and save for the retirement you want. We can help. Each month, you will learn the answers you need to know to basic planning questions.

**Special Situations** - *The Value Line Special Situations Service* is designed for those seeking investment ideas in the small-cap arena that span the range from aggressive to income oriented.

**Select** - Once a month, subscribers receive a detailed report by *Value Line* senior analysts, recommending one stock that has the best upside and risk/reward ratio.

**Value Line Select: Dividend Income & Growth** - A monthly, in-depth report recommending one dividend-paying stock, providing extensive information about the company's finances, prospects, and projected earnings. One alternative selection is also evaluated.

**Value Line Select: ETFs** - Once a month, subscribers receive a thorough report by Value Line senior analysts, recommending one ETF that is expected to outperform the broader market.

**Fund Advisor Plus** - An essential, one-of-a-kind investment guide that recommends a model portfolio of mutual funds based on risk tolerance and time horizon. The service also includes data and analysis on 20,000 mutual funds.

**Options Survey** - Interactive daily analysis and rankings of more than 200,000 Stock and Stock Index Options—now with Bid and Ask Prices and Evaluations.

**The Value Line Climate Change Investing Service** – Subscribers receive an insightful monthly report by *Value Line* analysts that is designed for the climate-conscious, profit-oriented investor. It also includes a managed portfolio of twenty stocks that stand to benefit from business opportunities related to Climate Change.

**The Value Line Mergers & Acquisitions Service** - This service is designed for investors who are interested in mergers & acquisitions. The objective of the publication is to identify companies (one per month) that offer characteristics that would interest larger corporations or private equity firms.

\*Based on the Timeliness™ ranks of the stocks in the industry

**Noteworthy Rank Changes**

Listed below are some of the stocks whose Timeliness ranks have changed this week. We include mostly rank changes caused by fundamentals such as new earnings reports. Even when a significant change in earnings momentum has been forecast, the stock's rank will not be affected until the actual results, confirming that forecast, are reported. In most cases, we omit stocks that have been bumped up or down in rank by the dynamism of the ranking system.

**STOCKS MOVING UP IN TIMELINESS RANK**

Stock Name	Old Rank	New Rank	Reason for Change	Earnings Est. 12 months to 6-30-23
Amkor Technology	2	1	Dynamism of the ranking system.	
BioMarin Pharmac.	2	1	Dynamism of the ranking system.	
Enerpac Tool Group	2	1	Higher than expected earnings. Nov. quarter 29¢ vs. year ago 16¢. Our estimate was 20¢.	Under Review
EnPro Industries	2	1	Dynamism of the ranking system.	
Graham Hldgs.	2	1	Dynamism of the ranking system.	

**STOCKS MOVING DOWN IN TIMELINESS RANK**

Stock Name	Old Rank	New Rank	Reason for Change	Earnings Est. 12 months to 6-30-23
Expedia Group	1	2	Dynamism of the ranking system.	
Floor & Decor Hldgs.	1	2	Dynamism of the ranking system.	
Lam Research	1	2	Dynamism of the ranking system.	
Qualcomm Inc.	1	2	Dynamism of the ranking system.	
VeriSign Inc.	1	2	Dynamism of the ranking system.	
Worthington Inds.	3	4	Lower than expected earnings. Nov. quarter 44¢ vs. year ago \$2.15. Our estimate was \$1.00.	Under Review

EULAV also manages investment companies and other accounts that use the rankings and recommendations in this publication as part of their investment strategies. These accounts, as well as the officers, directors, employees of VLI, may dispose of a security notwithstanding the fact that The Value Line Investment Survey (the "Survey") ranks the issuer favorably; conversely, such accounts or persons may purchase or hold a security that is poorly ranked by the Survey. Some of the investment companies managed by EULAV only hold securities with a specified minimum Timeliness Rank by the Survey and dispose of those positions when the Timeliness Rank declines or is suspended. Subscribers to the Survey and its related publications as well as some institutional customers of VLI will have access to all updated Ranks in the Survey by 8:00 AM each Monday. At the same time, portfolio managers for EULAV will receive reports providing Timeliness Ranking information. EULAV's portfolio managers also may have access to publicly available information that may ultimately result in or influence a change in rankings or recommendations, such as earnings releases, changes in market value or disclosure of corporate transactions. The investment companies or accounts may trade upon such information prior to a change in ranking. While the rankings in the Survey are intended to be predictive of future relative performance of an issuer's securities, the Survey is not intended to constitute a recommendation of any specific security. Any investment decision with respect to any issuer covered by the Survey should be made as part of a diversified portfolio of equity securities and in light of an investor's particular investment objectives and circumstances. ★ Supplementary Report in this week's issue.  
▲ Arrow indicates the direction of a change. When it appears with the Latest Dividend, the arrow signals that a change in the regular payment rate has occurred in the latest quarter.  
For Timeliness, 3-5 year Target Price Range, or Estimated Earnings 12 months to 6-30-23, the number indicates a change since the preceding week. When a diamond ◆ (indicating a new figure) appears alongside the latest quarterly earnings results, the rank change probably was primarily caused by the earnings report. In other cases, the change is due to the dynamics of the ranking system and could simply be the result of the improvement or weakening of other stocks.

Volume LXXVIII, Number 20, Issue 7. The Value Line Investment Survey (ISSN 0042-2401) is published weekly by Value Line Publishing LLC, 551 Fifth Avenue New York, NY 10176 and is accorded expeditious treatment prescribed for newspapers. Subscription rate for one year in the United States and US possessions is \$598. Foreign rates upon request. Periodical Postage Paid at New York, NY and additional mailing offices.

**The Value Line INFORMATION YOU SHOULD KNOW — Wealth Newsletter** - No matter where you are in life, you can successfully plan and save for the retirement you want. We can help. Each month, you will learn the answers you need to know to basic planning questions.

**Special Situations** - *The Value Line Special Situations Service* is designed for those seeking investment ideas in the small-cap arena that span the range from aggressive to income oriented.

**Select** - Once a month, subscribers receive a detailed report by *Value Line* senior analysts, recommending one stock that has the best upside and risk/reward ratio.

**Value Line Select: Dividend Income & Growth** - A monthly, in-depth report recommending one dividend-paying stock, providing extensive information about the company's finances, prospects, and projected earnings. One alternative selection is also evaluated.

**Value Line Select: ETFs** - Once a month, subscribers receive a thorough report by Value Line senior analysts, recommending one ETF that is expected to outperform the broader market.

**Fund Advisor Plus** - An essential, one-of-a-kind investment guide that recommends a model portfolio of mutual funds based on risk tolerance and time horizon. The service also includes data and analysis on 20,000 mutual funds.

**Options Survey** - Interactive daily analysis and rankings of more than 200,000 Stock and Stock Index Options—now with Bid and Ask Prices and Evaluations.

**The Value Line Climate Change Investing Service** – Subscribers receive an insightful monthly report by *Value Line* analysts that is designed for the climate-conscious, profit-oriented investor. It also includes a managed portfolio of twenty stocks that stand to benefit from business opportunities related to Climate Change.

**The Value Line Mergers & Acquisitions Service** - This service is designed for investors who are interested in mergers & acquisitions. The objective of the publication is to identify companies (one per month) that offer characteristics that would interest larger corporations or private equity firms.

\*Based on the Timeliness™ ranks of the stocks in the industry

**Noteworthy Rank Changes**

Listed below are some of the stocks whose Timeliness ranks have changed this week. We include mostly rank changes caused by fundamentals such as new earnings reports. Even when a significant change in earnings momentum has been forecast, the stock's rank will not be affected until the actual results, confirming that forecast, are reported. In most cases, we omit stocks that have been bumped up or down in rank by the dynamism of the ranking system.

**STOCKS MOVING UP IN TIMELINESS RANK**

Stock Name	Old Rank	New Rank	Reason for Change	Earnings Est. 12 months to 6-30-23
Black Stone Minerals	2	1	Dynamism of the ranking system.	
Crestwood Equity Part.	2	1	Dynamism of the ranking system.	
Ethan Allen Interiors	2	1	Dynamism of the ranking system.	
Hostess Brands	2	1	Dynamism of the ranking system.	
Imperial Oil Ltd.	2	1	Dynamism of the ranking system.	
Lamb Weston Hdgs.	2	1	Dynamism of the ranking system.	
Photonics Inc.	2	1	Dynamism of the ranking system.	(A)
SFL Corp. Ltd	2	1	Dynamism of the ranking system.	
Washington Federal	2	1	Dynamism of the ranking system.	

**STOCKS MOVING DOWN IN TIMELINESS RANK**

Stock Name	Old Rank	New Rank	Reason for Change	Earnings Est. 12 months to 6-30-23
AES Corp.	1	2	Dynamism of the ranking system.	
Aon plc	1	2	Dynamism of the ranking system.	
CSW Industrials	1	2	Dynamism of the ranking system.	
Cloudflare, Inc.	1	2	Dynamism of the ranking system.	
Devon Energy	1	2	Dynamism of the ranking system.	
Dollar Tree, Inc.	1	2	Dynamism of the ranking system.	
Hubbell Inc.	1	2	Dynamism of the ranking system.	(A)
Peloton Interactive	1	2	Dynamism of the ranking system.	
Wolfspeed, Inc.	1	2	Dynamism of the ranking system.	(A)

Officers, directors, or employees of Value Line, Inc. and its affiliates and subsidiaries ("VLI"), and EULAV Asset Management ("EULAV"), may hold stocks that are reviewed or recommended in this publication. EULAV also manages investment companies and other accounts that use the rankings and recommendations in this publication as part of their investment strategies. These accounts, as well as the officers, directors, employees of VLI, may dispose of a security notwithstanding the fact that The Value Line Investment Survey (the "Survey") ranks the issuer favorably; conversely, such accounts or persons may purchase or hold a security that is poorly ranked by the Survey. Some of the investment companies managed by EULAV only hold securities with a specified minimum Timeliness Rank by the Survey and dispose of those positions when the Timeliness Rank declines or is suspended. Subscribers to the Survey and its related publications as well as some institutional customers of VLI will have access to all updated Ranks in the Survey by 8:00 AM each Monday. At the same time, portfolio managers for EULAV will receive reports providing Timeliness Ranking information. EULAV's portfolio managers also may have access to publicly available information that may ultimately result in or influence a change in rankings or recommendations, such as earnings releases, changes in market value or disclosure of corporate transactions. The investment companies or accounts may trade upon such information prior to a change in ranking. While the rankings in the Survey are intended to be predictive of future relative performance of an issuer's securities, the Survey is not intended to constitute a recommendation of any specific security. Any investment decision with respect to any issuer covered by the Survey should be made as part of a diversified portfolio of equity securities and in light of an investor's particular investment objectives and circumstances. ★ ★ Supplementary Report in this week's issue. For Timeliness, 3-5 year Target Price Range, or Estimated Earnings 12 months to 6-30-23, the row indicates a change since the preceding week. When a diamond ◆ (indicating a new figure) appears alongside the latest quarterly earnings results, the rank change probably was primarily caused by the earnings report. In other cases, the change is due to the dynamics of the ranking system and could simply be the result of the improvement or weakening of other stocks.

Volume LXXVIII, Number 19, Issue 6. The Value Line Investment Survey (ISSN 0042-2401) is published weekly by Value Line Publishing LLC, 551 Fifth Avenue New York, NY 10176 and is accorded expeditious treatment prescribed for newspapers. Subscription rate for one year in the United States and US possessions is \$598. Foreign rates upon request. Periodical Postage Paid at New York, NY and additional mailing offices.

\*Based on the Timeliness™ ranks of the stocks in the industry

**Noteworthy Rank Changes**

Listed below are some of the stocks whose Timeliness ranks have changed this week. We include mostly rank changes caused by fundamentals such as new earnings reports. Even when a significant change in earnings momentum has been forecast, the stock's rank will not be affected until the actual results, confirming that forecast, are reported. In most cases, we omit stocks that have been bumped up or down in rank by the dynamism of the ranking system.

**STOCKS MOVING UP IN TIMELINESS RANK**

Stock Name	Old Rank	New Rank	Reason for Change	Earnings Est. 12 months to 6-30-23
Analog Devices	2	1	Dynamism of the ranking system.	
Casey's Gen'l Stores	2	1	Dynamism of the ranking system.	
Dollar General	2	1	Dynamism of the ranking system.	
Science Applications	3	2	Earnings turnaround, as forecast. Oct. period \$1.90 vs. year ago \$1.85. Our estimate was \$1.90.	\$7.47
US Foods Hldg.	2	1	Dynamism of the ranking system.	

**STOCKS MOVING DOWN IN TIMELINESS RANK**

Stock Name	Old Rank	New Rank	Reason for Change	Earnings Est. 12 months to 6-30-23
Carvana Co.	1	-	Rank removed - see report.	
Cracker Barrel	3	4	Surprise factor, decreasing profit growth. Oct. period 99¢ vs. year ago \$1.52. Our estimate was \$1.20.	Under Review
Equitable Holdings	1	2	Dynamism of the ranking system.	
Lindsay Corp.	1	2	Dynamism of the ranking system.	
Mettler-Toledo Int'l	1	2	Dynamism of the ranking system.

Officers, directors, or employees of Value Line, Inc. and its affiliates and subsidiaries ("VLI"), and EULAV Asset Management ("EULAV"), may hold stocks that are reviewed or recommended in this publication. EULAV also manages investment companies and other accounts that use the rankings and recommendations in this publication as part of their investment strategies. These accounts, as well as the officers, directors, employees of VLI, may dispose of a security notwithstanding the fact that The Value Line Investment Survey (the "Survey") ranks the issuer favorably; conversely, such accounts or persons may purchase or hold a security that is poorly ranked by the Survey. Some of the investment companies managed by EULAV only hold securities with a specified minimum Timeliness Rank by the Survey and dispose of those positions when the Timeliness Rank declines or is suspended. Subscribers to the Survey and its related publications as well as some institutional customers of VLI will have access to all updated Ranks in the Survey by 8:00 AM each Monday. At the same time, portfolio managers for EULAV will receive reports providing Timeliness Ranking information. EULAV's portfolio managers also may have access to publicly available information that may ultimately result in or influence a change in rankings or recommendations, such as earnings releases, changes in market value or disclosure of corporate transactions. The investment companies or accounts may trade upon such information prior to a change in ranking. While the rankings in the Survey are intended to be predictive of future relative performance of an issuer's securities, the Survey is not intended to constitute a recommendation of any specific security. Any investment decision with respect to any issuer covered by the Survey should be made as part of a diversified portfolio of equity securities and in light of an investor's particular investment objectives and circumstances. ★ Supplementary Report in this week's issue. For Timeliness, 3-5 year Target Price Range, or Estimated Earnings 12 months to 6-30-23, the rank change probably was primarily caused by the results, the rank change probably was primarily caused by the earnings report. In other cases, the change is due to the dynamics of the ranking system and could simply be the result of the improvement or weakening of other stocks.

▲ Arrow indicates the direction of a change. When it appears with the Latest Dividend, the arrow signals that a change in the regular payment rate has occurred in the latest quarter.

◆ When a diamond appears alongside the latest quarterly earnings since the preceding week. When a diamond (indicating a new figure) appears alongside the latest quarterly earnings

Volume LXXVIII, Number 18, Issue 5. The Value Line Investment Survey (ISSN 0042-2401) is published weekly by Value Line Publishing LLC, 551 Fifth Avenue New York, NY 10176 and is accorded expeditious treatment prescribed for newspapers. Subscription rate for one year in the United States and US possessions is \$598. Foreign rates upon request. Periodical Postage Paid at New York, NY and additional mailing offices.
