Re: Docket No. 20260020-EI
Petition for Determination of Need for Andytown-Oasis Transmission Lines Project in Broward and Miami-Dade Counties, by Florida Power & Light Company

Dear Mr. Teitzman:

Please find enclosed for filing in the above-referenced docket the Direct Testimony and Exhibits of David Cranston on behalf of Intervenor, Environmental Defense Fund, Inc. ("EDF"). This filing is being made via the Florida Public Service Commission's web-based electronic filing portal.

Please let me know if you should have questions regarding this submission.

Cordially yours,

Robert Scheffel Wright

BEFORE THE FLORIDA PUBLIC SERVICE COMMISSION

In re: Petition for Determination of Need For Andytown-Oasis Transmission Lines Project in Broward and Miami-Dade Counties, by Florida Power & Light Company	)))))	DOCKET NO. 20260020-EI FILED: MARCH 24, 2026

DIRECT TESTIMONY

OF DAVID CRANSTON

On Behalf of

Environmental Defense Fund, Inc.

IN RE: PETITION FOR DETERMINATION OF NEED FOR ANDYTOWN-OASIS TRANSMISSION LINES PROJECT IN BROWARD AND MIAMI-DADE COUNTIES, BY FLORIDA POWER & LIGHT COMPANY, DOCKET NO. 20260020-EI

DIRECT TESTIMONY OF DAVID CRANSTON

ON BEHALF OF ENVIRONMENTAL DEFENSE FUND, INC.

INTRODUCTION AND QUALIFICATIONS

Q. Please state your name and business address.

A. My name is David Cranston, and my business address is 136 4th Street N, Suite 317, St. Petersburg, Florida 33701.

Q. On whose behalf are you testifying in this proceeding?

A. I am testifying on behalf of the Environmental Defense Fund, Inc., commonly known as EDF, an international not for profit organization that advocates for pragmatic solutions to environmental issues in all sectors of the world economy, including energy and electricity, based on sound science, economics, law, and public policy.

Q. Please summarize your educational background and professional experience with respect to the issues in this transmission line need determination proceeding.

A. I earned a Bachelor of Arts degree in Political Science from the University of Connecticut in 2011 and a Master's degree in Public Affairs from the University of Texas at Austin's Lyndon B. Johnson School of Public Affairs in 2014. Since February 2024 I have served as the Florida Energy Policy Manager for EDF, where I engage on a broad range of topics pertaining to the energy and electric power sectors in Florida through research, data analysis, written reports, and stakeholder engagement forums. This includes my current participation in the stakeholder process hosted by the Florida Reliability Coordinating Council (FRCC) to update the regional transmission planning framework for Florida utilities in alignment with the Federal Energy Regulatory Commission's (FERC) Order No. 1920. Previously, I served as a Conservation Program Associate and then as a Business Process Specialist at Austin Energy, which is the municipal electric utility that serves the city of Austin, TX and surrounding areas. With more than 550,000 customers, Austin Energy is one of the largest

municipal utilities in the United States. My role was based in the Customer Renewable Solutions division where I helped develop and deliver programs for all customers who adopted distributed energy resources (DERs), and where I led an effort to update the utility's DER interconnection policies.

Q. Have you previously testified in proceedings before utility regulatory authorities? If so, please briefly describe your prior testimony and presentations before regulatory authorities.

A. No, I have not.

Q. Are you testifying as an expert in this proceeding? If so, please state the area or areas of your expertise relevant to your testimony.

A. Yes, I am testifying as an expert on appropriate principles and considerations to be followed by public utilities and public utility regulatory authorities in making planning and investment decisions for transmission and related utility power supply assets.

Q. Are you sponsoring any exhibits in this case?

A. Yes, I am sponsoring the following exhibits:

Exhibit DC-1	Résumé of David Cranston;
Exhibit DC-2	Assessment of Florida's Electric Transmission System Performance and Opportunities for Enhancement (2026);
Exhibit DC-3	FERC Order No. 1000;
Exhibit DC-4	FERC Order 1920;
Exhibit DC-5	FERC Orders 1920-A;
Exhibit DC-6	FERC Orders 1920-B;
Exhibit DC-7	EDF Comments to FRCC 1920 Tariff Language;
Exhibit DC-8	EDF Comments to FRCC Order 1920 Tariff Language;
Exhibit DC-9	EQ Research EDF Florida Fuel Cost Report;
Exhibit DC-10	Rao Konidena Testimony in Indiana Ameren CPCN Case;
Exhibit DC-11	The Untapped Grid (March 2026); and
Exhibit DC-12	Unlocking the Queue with GETs (Feb 2021).

PURPOSE AND SUMMARY OF TESTIMONY

Q. What is the purpose of your testimony?

A. As EDF's Florida Energy Policy Manager, I focus on research, analysis, and industry discussions on the latest developments in energy policy, technology, and markets in Florida and at the national level. This provides me with a broad foundation of knowledge on the current operation and performance of Florida's electric power sector, and with deep perspective on opportunities to improve the affordability, reliability, and security of Florida's power supply through responsible policy. My work spans Florida's energy resource mix, demand-side management solutions, and power grid modernization. With respect to grid modernization, I have adopted a special focus on power generation and transmission planning in the context of the regional transmission planning requirements of the FERC. As part of this subject matter focus, I managed a study of Florida's electric transmission system in partnership with an engineering team at the University of Florida (UF). I also co-authored the report on our findings.

In addition, since September 2025 I have been engaged on EDF's behalf as a stakeholder in the effort to incorporate the principles and

requirements of Order No. 1920 into the regional transmission planning process of Florida's electric utilities. As part of this process, I have collaborated with other expert stakeholders to discuss directly with utility transmission planners their proposed reforms to the existing regional planning process, and co-authored and submitted multiple rounds of comments on those proposals.

Consistent with my role with EDF, my testimony addresses what I believe are systemic defects in the planning processes that FPL claims support its Andytown-Oasis Transmission Lines Project (the "Andytown-Oasis Project" or the "Project"). My testimony includes extensive discussion of measures that FPL should have included in its planning processes to produce results that are better for its customers, better for Florida as a whole, and consistent with the requirements of federal regulations.

Finally, my testimony describes EDF's organizational mission – accelerating a clean and economically sustainable energy transition – and EDF's Florida membership.

Q. Please summarize your opinions regarding FPL's proposed Andytown-Oasis Transmission Lines Project.

A. FPL conducts transmission planning in conjunction with FRCC. Both FPL's and the FRCC's planning activities fail to provide transmission planning and investment decisions that serve the public interest. Accordingly, I recommend that the Florida Public Service Commission deny FPL's petition for the Project and direct FPL to consider the regional needs that were identified by the FRCC through the last regional Biennial Transmission Planning Process, and where those previous studies do not appropriately reflect regional needs, to conduct legitimate and robust regional transmission planning studies that are consistent with the requirements of the FERC's orders to determine which regional needs could be jointly served by a transmission solution. The Commission should also require that FPL evaluate alternative solutions to the identified needs, not merely changes to routing. These alternatives should include the potential role of Advanced Transmission Technologies (ATTs) and Grid Enhancing Technologies (GETs) including but not limited to Dynamic Line Rating, Advanced Power Flow Controllers, Reconductoring,

Topology Optimization, and Battery Energy Storage Systems, to cost-effectively meet the needs that the Andytown-Oasis Transmission Lines Project is designed to address, as well as potential future regional needs. The Commission should further require that FPL engage all stakeholders in a timely way in those planning studies, with stakeholders having full access to FPL's modeling in a reasonable time frame.

FLORIDA'S TRANSMISSION CHALLENGES

Q. As part of your work at EDF you undertook an evaluation of the Florida transmission system. Please describe that work.

A. EDF engaged an engineering team at the University of Florida to conduct a comprehensive study of Florida's transmission system . The study began in spring 2025 and was completed at the end of the year. It uses 2024 data on transmission assets and 2023 data on electricity usage. The transmission lines studied range from 69 kilovolts (kV) to 500 kV.

Florida's power grid is changing. Historically, its electricity supply has primarily came from coal plants. Over the last several

decades, natural gas has taken coal's place and now provides about three-quarters of the state's electricity. These thermal plants are typically hundreds or thousands of megawatts (MW) in size. Florida's energy resource mix is continuing to change as utility-scale solar facilities have started to receive much more investment relative to thermal plants. In their most recent Ten-Year Site Plans published in 2025, the state's three largest electric utilities (Florida Power & Light, Duke Energy Florida, and Tampa Electric Company) plan to build more than 23 GW of new solar facilities through 2034. This will create a significant shift in the energy resource mix, as solar energy is projected to rise from 7% to 28% while natural gas is projected to fall to 56% of the state's electricity generation. In addition, the solar facilities being built in Florida are smaller and more geographically dispersed than the state's thermal plants. The typical solar generation facility in Florida is just under 75 MW to qualify for exemption under the Power Plant Siting Act. More solar capacity is emerging in rural northern Florida, to complement expanding solar capacity in the central and southwest parts of the state, so in coming years we expect to see increased power

flows from rural areas to load centers, especially in summer peak hours.

Florida is also seeing new electricity demand. While population growth continues, increased loads from transportation electrification and large load customers such as artificial intelligence (AI) data centers are projected to drive demand higher. Electricity consumption in Florida increased by 8% from 2015-2024; it is projected to increase another 11% by 2034. On top of this, the resilience of Florida's grid to system shocks is under increasing pressure from extreme weather events, such as hurricanes.

This structural shift to a more dynamic generation mix and new load sources, plus the impact of increasingly extreme weather, adds to the operational challenges that Florida's utilities face in managing a reliable transmission system. As I will describe below, it creates or amplifies transmission reliability needs throughout the state, as well as opportunities for more economic operation of the power grid.

The UF team constructed a model of Florida's transmission system using publicly available data. The model includes all transmission lines that span two or more counties, including line type,

voltage level, and associated substations. The model also includes county-level load and generation information. The UF team then applied a production cost model with power flow component to analyze how much each line is utilized and the system-level production cost across a range of scenarios. These include the base case (i.e., without contingencies), loss of a transmission line, loss of one or more generation resources, loss of both generation and transmission resources, and the addition of a single new large load customer. The UF team tested these scenarios during average load conditions and during both summer and winter peak hours. In addition to testing these scenarios with current generation and transmission assets, the UF team also tested them under a "2035 outlook" after adding in all new generation and inter-county transmission assets that are projected to come online by 2035 per the latest Ten-Year Site Plans. The purpose of this analysis was to identify vulnerabilities, reliability needs, and operational bottlenecks across the system. To my knowledge, this is the first such statewide assessment of the Florida transmission system.

We identified a pattern of transmission reliability needs that appear from north to west central to south Florida. Reliability constraints are amplified in the 2035 outlook compared to today, with more transmission lines reaching full loading or exceeding 80% of their limit during the base case and during most contingency events. Lines in southwest and southeast Florida experience the highest share of reliability constraints (i.e., high or full line loading) relative to the number of connections that exist in these areas. With respect to economic constraints, we found that contingencies that occur in south Florida (such as transmission line and generator outages) tend to drive the largest increases in system-wide production cost.

The UF team also evaluated three different types of transmission solutions to quantify their effects on congestion, production cost, and overall system reliability. Specifically, they studied the impacts of building a new greenfield transmission line, expanding capacity on an existing transmission line, and applying Dynamic Line Rating to an existing transmission line. We found opportunities to attain significant production cost savings and net economic benefit to ratepayers through implementation of these

solutions, especially through new regional transmission projects and especially where south Florida transmission assets are involved.

FLORIDA'S FLAWED PLANNING PARADIGM

Q. Please summarize the regulatory framework applicable to transmission planning.

A. FERC has overall regulatory responsibility for regulation of the electric transmission system, including transmission planning, pursuant to the Federal Power Act. Through numerous orders, FERC requires that utilities participate in regional planning and has established principles and considerations applicable to utility transmission planning.

Q. What is your understanding of the function of FERC Order No. 1000 and Order No. 1920 and the obligations that utilities have under those Orders?

A. Those are FERC's regional planning orders and they require that utilities participate in regional planning. While FERC found in promulgating Order No. 1920, that the existing regional planning processes under Order No. 1000 were unjust and unreasonable, it

nevertheless found that the additional long term planning under Order No. 1920 established a just and reasonable replacement. So what this means for utilities like FPL is that they must engage in planning with their regional grid planner – in this case the Florida Reliability Coordinating Council, alongside the other Florida utilities – and look at the system needs state wide, and find solutions that address these system-wide needs. Under Order No. 1000 these processes can be limited to region-wide reliability violations. Under Order No. 1920, they must look at both reliability and economic system needs. And crucially under Order No. 1920, the forecast for the needs looks 20 years out into the future so that these decades long assets can be planned for what comes up at these later junctures.

Q. Please describe the historical framework of FPL's regional planning obligations under FERC Order 1000.

A. Issued in 2011, FERC Order No. 1000 was originally designed to encourage robust, cost-effective regional transmission planning. To spur competition and lower costs for ratepayers, the order eliminated the federal Right of First Refusal (ROFR) for regionally planned

projects. The goal was to open the door for independent transmission developers to compete to build the most efficient regional lines.

Q. Did FERC Order 1000 successfully produce robust regional transmission development in Florida?

A. No, it resulted in a widely recognized, unintended consequence known in the industry as the "local loophole." Because incumbent utilities lost their monopoly rights to build regional lines, they drastically shifted their capital investments toward local transmission projects. Local projects retained the Right of First Refusal (ROFR), allowed utilities to avoid competitive bidding, and historically faced far less regulatory scrutiny. Rather than holistic regional development, this loophole incentivized the kind of piecemeal, inefficient grid expansion we are seeing with FPL's localized proposals today.

Q. How has the Federal Energy Regulatory Commission addressed the failure of Order 1000 to produce efficient regional buildouts?

A. In May 2024, FERC issued Order No. 1920. Recognizing the systemic failure of the previous framework, FERC designed Order No. 1920 to

force transmission providers to take a broader, more forward-looking view of grid reliability and to explicitly rein in the industry's over-reliance on inefficient local projects.

Q. What specific mandates does FERC Order No. 1920 place on utilities and entities like the FRCC to correct these inefficiencies in their transmission planning activities?

A. Order 1920 contains three critical mandates designed to ensure that ratepayers are not funding sub-optimal, fragmented grid expansions. First, it requires transmission providers to develop comprehensive, 20-year regional planning scenarios that proactively account for long-term load growth and shifting generation resources, rather than reacting to short-term, localized bottlenecks. Second, it specifically requires transmission providers to evaluate whether local transmission projects can be "right-sized"—meaning expanded or modified in scale—to address broader regional needs. This ensures that a single, slightly larger line is built to solve regional constraints more cost-effectively than building multiple smaller, siloed local lines over time. Third, it explicitly mandates the evaluation of Advanced

Transmission Technologies ("ATTs"), sometimes called Grid-Enhancing Technologies ("GETs")—such as dynamic line ratings and advanced power flow controls. Planners must prove they have attempted to maximize the capacity of the existing grid using these advanced technologies before defaulting to expensive new conventional line construction.

Q. Has EDF attempted to participate in the FRCC processes? If so, why is EDF not satisfied with the FRCC processes?

A. Yes. EDF representatives have raised these issues to the FRCC, but thus far, they have not been incorporated into the FRCC's planning analyses. See, for example, my Exhibits DC-7 and DC-8, which are comments provided by EDF to the FRCC regarding tariff language in relation to Order No. 1920. EDF is not satisfied with the results of FRCC's processes for the several reasons discussed in my testimony.

Q. What are ATTs and GETs?

A. ATTs or GETs are hardware and software options that increase the capacity, efficiency, and/or reliability of the existing transmission grid. They are quick-deployment, cost-effective tools that maximize the capabilities of the infrastructure we already have, rather than strictly relying on building expensive new transmission lines. The four most commonly deployed GETs today are Dynamic Line Ratings (DLR), Advanced Power Flow Controllers, Advanced or “High Performance” Conductors (also called “reconductoring” when used to upgrade an existing transmission line), and Topology Optimization.

Q. How do these federal obligations relate to FPL’s current application before the Florida Public Service Commission?

A. FPL’s application exemplifies the exact "local loophole" behavior that FERC Order 1920 was designed to eliminate. By bringing forward a localized project without demonstrating a rigorous evaluation of right-sizing opportunities or ATTs. FPL is operating under an outdated planning paradigm. It is circumventing its obligation to participate in a modern, cost-effective regional planning process, ultimately passing the cost of that inefficiency onto Florida ratepayers.

Q. After reviewing FPL's petition and supporting materials, do you believe that FPL's planning process will result in solutions that deliver low-cost electrical energy that will assure the economic well-being of Florida residents and businesses?

A. No, I do not. In fact, it is structurally impossible for FPL to determine a low-cost solution—as affirmatively required by the Transmission Line Siting Act ("TLSA")—under its current planning paradigm. FPL has described a planning process that is explicitly limited to addressing localized reliability violations under standards published by the North American Electric Reliability Corporation ("NERC"). While meeting NERC reliability standards is a mandatory baseline, treating a minimum compliance standard as a comprehensive grid strategy ensures that systemic economic efficiencies are completely ignored.

Q. How does this narrow focus on NERC violations specifically manifest in the proposed Andytown-Oasis Project?

A. FPL's proposed Andytown-Oasis Project exemplifies a fundamentally flawed, siloed approach to transmission planning. By deliberately

limiting its scope to a single NERC violation and ignoring broader, well-documented system constraints, FPL has engineered a sub-optimized, piecemeal solution.

Q. In contrast to FPL's approach, what would a prudent utility planning process entail?

A. A prudent utility planning process would evaluate whether "right-sizing" this corridor could simultaneously resolve adjacent regional constraints. By looking at the overlapping needs of the broader system, a utility can capture critical economies of scale—building one high-capacity, highly efficient corridor instead of multiple fragmented ones. Instead, FPL's narrowly tailored design solves a single, localized issue while leaving obvious, overlapping system needs completely unaddressed.

Q. What are the long-term consequences for Florida ratepayers if the Commission approves this fragmented approach?

A. This artificially fragmented approach guarantees future grid congestion. Because FPL is deliberately leaving adjacent constraints

unresolved, it is virtually ensuring that its ratepayers will be forced to fund additional, redundant infrastructure in the coming years. Ratepayers will be forced to pay twice for what a properly right-sized project could have accomplished once.

Q. Are there system-wide needs that FPL did not consider?

A. Yes. The University of Florida study was completed on behalf of EDF and found that there were several areas where there were constraints that the development of transmission could help resolve.

These include constrained lines in south Florida. For example, that exceed 80% of their limit the Palm Beach to Miami-Dade line operates above 80% of its limit during summer and winter peak hours, and the Hendry to Palm Beach line operates at its full limit during average load and summer peak hours, a. In 2035 these two lines are projected to be constrained under all load conditions.

Q. Based on your review of FPL's historical and current transmission planning, do you have reason to believe that its planning process is

consistent with the long-term economic interests of Florida ratepayers?

A. No, I do not. FPL's transmission planning demonstrates a clear, recurring pattern of designing localized, fragmented projects that solve immediate objectives while deliberately ignoring broader, long-term statewide needs. This narrowly tailored approach consistently fails to capture critical economies of scale, ultimately forcing ratepayers to absorb the costs of an inefficient and sub-optimized grid.

Q. Can you provide a historical example of this flawed planning approach on the FPL system?

A. Yes. A prime example is the North Florida Resiliency Connection (NFRC), a transmission project FPL constructed to physically interconnect its legacy peninsular system with its newly acquired Gulf Power territory in the Panhandle. Despite the massive geographic and operational scale of integrating these two major electric systems, FPL chose to construct this critical interconnection as a relatively low-capacity 161 kV line.

Q. Why is constructing the NFRC at 161 kV indicative of planning that harms ratepayers?

A. From a long-term engineering and economic perspective, the NFRC was drastically underbuilt. Connecting two massive regional grids should have been an opportunity to construct a robust, high-voltage (e.g., 345 kV or 500 kV) corridor capable of moving vast amounts of low-cost generation across the state. However, under the Florida Transmission Line Siting Act, constructing a line at 230 kV or above generally triggers a mandatory, highly scrutinized Need Determination proceeding before this Commission. By artificially constraining the NFRC design to 161 kV, FPL kept the project just below the statutory threshold for regulatory review, thereby circumventing a rigorous public evaluation of cost-effective alternatives and long-term statewide benefits.

Q. What is the ultimate impact on Florida consumers when FPL underbuilds a line like the NFRC?

A. It locks ratepayers into a cycle of redundant spending. Because the 161 kV NFRC line was underbuilt relative to the true, long-term capacity

needs between the Panhandle and the Peninsula, the corridor will inevitably experience severe congestion as power demands grow and more generation is integrated. FPL will eventually have to build additional, parallel infrastructure to solve the capacity constraints that a single, "right-sized" high-voltage line would have solved from the beginning. Ratepayers pay the "piecemeal penalty" of funding multiple inefficient projects instead of one optimal project.

Q. How does FPL's installation of the NFRC project relate to the Andytown-Oasis Project currently before the Commission?

A. It establishes that FPL's localized planning methodology—designing projects in a vacuum to avoid broader regional solutions—is not an anomaly; it is a standard operating procedure. Just as FPL artificially constrained the NFRC to bypass rigorous alternatives assessment, it is now presenting the Andytown-Oasis Project as a narrow, localized fix while deliberately ignoring the broader system constraints identified in regional planning studies. In both cases, FPL's planning process prioritizes the utility's immediate corporate convenience over the

statutory mandate to deliver abundant, low-cost energy through the most cost-effective, right-sized infrastructure.

FPL'S FAILURE TO THOROUGHLY EVALUATE APPROPRIATE ALTERNATIVES

Q. Did FPL conduct a robust and thorough evaluation of alternatives to the proposed Andytown-Oasis Project?

A. No, it did not. In its application, FPL claims to have evaluated two alternatives to the proposed line: the Conservation-Oasis Project and the Andytown-Oasis Two Circuits Project. However, these are not fundamental engineering or economic alternatives. They are merely alternative *routes* and configurations for the exact same localized, traditional infrastructure project.

Q. Do you believe that these alternatives are adequate to determine whether the Project will result in low-cost electric energy to assure the economic well-being of the residents" of Florida?

A. I do not. FPL did not adequately consider alternative solutions, merely alternative routes.

Q. Why is the distinction between an "alternative route" and an "alternative solution" important in this proceeding?

A. Because evaluating different geographic routes for the same expensive infrastructure does not answer the fundamental economic question. The TLSA requires the Commission to consider the need for "abundant, low-cost electrical energy to assure the economic well-being of the residents of this state." To satisfy that standard, a utility cannot just compare two different paths for putting new steel in the ground. A prudent utility must evaluate entirely different *classes* of solutions to ensure ratepayer funds are being deployed as efficiently as possible. FPL completely failed to do this.

Q. What specific alternative solutions did FPL fail to evaluate in its application?

A. While FPL is quick to detail the catastrophic impacts it claims will occur if the line is not built, its alternatives assessment presents a false choice between building this exact line or doing nothing. There is zero rigorous, quantitative discussion of building a more expansive, right-sized regional project to capture economies of scale. Even more

egregiously, there is no evaluation of ATTs or GETs—such as dynamic line ratings or advanced power flow controls—as potential solutions to the NERC violations identified, either on their own or as part of a portfolio.

Q. Please explain how Dynamic Line Ratings (DLR) could potentially resolve localized capacity constraints.

A. Utilities historically use static or seasonal line ratings, which are based on highly conservative weather assumptions and leave significant excess, unused capacity on the transmission line during most hours of the year. However, Dynamic Line Ratings utilize non-contact sensors to monitor real-time weather conditions—such as wind speed, sunlight, and conductor temperature—to maximize available capacity. Because wind cools the conductor, real-time monitoring can safely increase the transmission capacity of an existing line by up to 44%. Deploying DLR sensors is incredibly cost-effective, estimated at roughly $22,727 per mile, compared to the millions of dollars per mile required for new transmission construction. This is consistent with the assessment of energy consultant Rao Konidena of Rakon Energy from

his testimony on behalf of EDF and the Citizens Utility Board in Ameren Transmission Company's 2024 Joint Petition for a Certificate of Public Convenience and Necessity (Exhibit DC-10.

Q. How do Advanced Power Flow Controllers and Topology Optimization address grid congestion?

A. Advanced Power Flow Controllers are hardware devices that change the reactance on a constrained transmission line, effectively "pushing" excess power away from the congested line and onto neighboring, unconstrained lines. Topology Optimization is a software-based solution—often described as the "Waze for the transmission grid"—that identifies real-time system reconfigurations, such as opening and closing circuit breakers, to route power around congested areas. Both technologies resolve localized bottlenecks by optimizing the flow of power across the broader network, often eliminating the need for localized infrastructure upgrades.

Q. How does reconductoring with Advanced Conductors compare to building a completely new transmission line?

A. Reconductoring with advanced conductors involves replacing traditional aluminum-core steel-reinforced (ACSR) wires on existing transmission towers with conductors that have a different structure and core. This process can increase the current-carrying capacity of an existing corridor by up to 250%. Because reconductoring utilizes existing towers and Right-of-Way, it avoids the massive costs of acquiring new land and erecting new steel, often allowing capacity to be doubled at half the price of building a new line.

Q. Why should a prudent utility evaluate ATTs before proposing a new capital-intensive transmission line like the Andytown-Oasis project?

A. There are three primary reasons: Cost, speed of deployment, and mitigation of land-use impacts. First, ATTs generally cost a fraction of what a new transmission line costs. Second, ATTs can accelerate the speed at which thermal constraints and reliability problems are resolved. For example, procuring large power transformers for new substations can take more than two years. In contrast, sensors for Dynamic Line Ratings can be installed rapidly without even requiring a transmission outage. Finally, ATTs do not require the acquisition of

new Right-of-Way (ROW) or land rights, which significantly minimizes environmental disruptions and landowner impacts.

Q. Why does FERC Order No. 1920 make FPL's failure to evaluate these technologies at the local level problematic?

A. FERC Order No. 1920 officially established that evaluating ATTs is no longer experimental or optional: It is a mandatory component of prudent, cost-effective transmission planning. While Order 1920 applies explicitly to regional planning, it sets a clear, undeniable industry standard: A modern utility simply cannot accurately assess the "need" for new infrastructure without first evaluating whether advanced technology can unlock capacity on existing rights-of-way.

Q. What is the regulatory consequence of FPL failing to evaluate GETs?

A. Under the Florida Transmission Line Siting Act (TLSA), FPL bears the absolute burden of proving that the Andytown-Oasis Project is needed to ensure system reliability and to deliver abundant, low-cost electrical energy to assure the economic well-being of the residents of the state, and by extension, of all Floridians. By completely failing to

evaluate whether rapid, low-cost GETs could resolve the identified constraints on existing rights-of-way, FPL has rendered its alternatives assessment fundamentally flawed and incomplete. Without this analysis, it is impossible for the Commission to conclude that FPL's proposed capital-intensive project is genuinely the "least-cost means" of satisfying the needs of Florida ratepayers.

EDF'S FLORIDA MEMBERSHIP AND ENERGY POLICY MISSION

Q. Please describe EDF's membership in the State of Florida.

A. EDF is a national non-profit environmental advocacy organization with a substantial and active membership base in Florida. As of March 23, 2026, EDF has approximately 17,000 members residing in the state who support our mission to protect human health and the environment.

Q. Of those Florida members, how many are customers of Florida Power & Light?

A. Based on a review of our membership data and utility service territories, EDF has approximately 8,900 members who are

residential or commercial retail ratepayers of FPL. These members have a direct, substantial financial interest in the outcome of this proceeding, as they will be required to fund the costs of the proposed Andytown-Oasis Transmission Lines Project through their utility bills.

Q. Please describe EDF's organizational mission and activities as they relate to energy policy.

A. EDF's organizational interest is deeply rooted in advancing a clean, affordable, and reliable energy transition. As stated explicitly in EDF's public foundational documents and Energy Transition platforms, "We're working with partners around the world, and across the public and private sectors, to use the power of markets and technology to drive down pollution quickly and affordably—and to shift the world to clean energy as fast as possible."

In furtherance of its policy goals and purposes, EDF routinely intervenes in administrative and regulatory dockets before key public utility and energy commissions, including FERC, as well as the state commissions of states including California, Colorado, Illinois,

Louisiana, Massachusetts, New Jersey, New York, North Carolina, Pennsylvania, and Texas. EDF's interventions focus on supporting comprehensive grid modernization, promoting robust grid planning for extreme weather resilience, and protecting ratepayers from the stranded asset costs associated with the expansion of unnecessary natural gas infrastructure.

Q. How does EDF's advocacy for a clean energy transition intersect with the economic and reliability issues under the Commission's jurisdiction?

A. EDF's advocacy directly ties the environmental goal of pollution reduction to the economic goal of affordable utility rates through the mechanism of grid modernization. When evaluating infrastructure, these goals are inseparable.

Q. Has EDF historically engaged in advocacy in Florida that connects energy development choices to ratepayer costs?

A. Yes, extensively. EDF's Florida advocacy specifically focuses on how energy development impacts ratepayer economics. For example, last year EDF commissioned an in-depth study analyzing the economic

impact of rising natural gas costs on Florida utility customers. That study concluded that continued reliance on gas generation in the state will result in a staggering $21 billion increase in costs for Florida ratepayers between 2025 and 2034. Protecting our members from these types of massive, avoidable economic burdens is a core function of our advocacy.

CONCLUSIONS AND RECOMMENDATIONS

Q. Please summarize the main conclusions and recommendations of your testimony.

A. The processes by which FPL came to propose the Andytown-Oasis Transmission Lines Project cannot legitimately be characterized as the natural result or by-product of effective regional transmission planning, nor does it demonstrate a rigorous evaluation of low-cost solutions to meet the articulated need. FPL's alternative consideration processes were localized consideration of routes, not meaningful transmission system alternatives.

FPL's failures to thoroughly consider all available transmission alternatives, including technologies as well as routes, will result in its

customers paying more than necessary for service, thereby frustrating the Transmission Line Siting Act's requirement that new transmission lines are to ensure the provision of abundant, low-cost electrical energy for the economic well-being of all Floridians.

Q. Does this conclude your direct testimony?

A. Yes.

PROFESSIONAL EXPERIENCE

Florida Energy Policy Manager (Feb 2024 - Present)
Environmental Defense Fund - Deerfield Beach, FL

- Research policies and trends that affect Florida's electric power sector
    - Review and analyze data in Florida Public Service Commission (PSC) filings, U.S. Energy Information Administration (EIA) publications, Florida Statutes, and other sources
    - Review industry reports and industry publications to stay abreast of energy policy, technology, and market developments within Florida and the U.S. at large
    - Select and collaborate with external consultants to perform Florida-focused studies
    - Track progress of energy-related bills during annual Legislative Session
    - Subject matter areas include: Energy resource mix, energy efficiency and demand-side management, electric transmission, power grid modernization, utility business models and regulatory frameworks, distributed energy resources, transportation electrification
- Identify and advance solutions that promote more affordable, reliable, clean, and secure energy
    - Develop reports and issue briefs on the benefits of diversifying Florida's energy portfolio, strengthening regional transmission planning, and harnessing residential and commercial energy efficiency potential
    - Participate in stakeholder engagement with energy policy decision makers, including in the FERC Order 1920 transmission planning reform process with Florida's electric utilities
- Educate and support policymakers in efforts to make Florida's energy system more resilient and affordable
    - Speak at industry conferences and seminars on energy policy matters
    - Communicate with state officials about energy sector developments and opportunities to improve energy security for Floridians
    - Engage local officials to assist their development, implementation, and messaging of energy-related policies and programs
    - Engage private sector stakeholders to understand and advise on their energy concerns
    - Collaborate with grassroots organizations to enhance their communications with local communities regarding energy policy impacts and opportunities
- Coordinate with other EDF teams - including Political Affairs, Legal & Regulatory, and Power Analytics - to share findings, develop new initiatives, and improve EDF research output

Business Process Specialist / DER Interconnection Specialist (Dec 2022 - Sep 2023)
Austin Energy - Austin, TX

- Developed process improvements for distributed energy resource (DER) interconnection, focused on solar and energy storage systems
    - Led updates to Austin Energy Interconnection Guide for distributed generation
    - Led updates to Austin Energy Design Criteria Manual with respect to DER installation
    - Led user acceptance testing for enhancements to DER permitting and inspection in City of Austin web portal
    - Developed and maintained process documentation for DER interconnection
- Managed DER inspection program to ensure safe, code-compliant interconnection to the grid
    - Maintained inspection request and scheduling web platform
    - Organized daily schedules and routes for inspectors, and coordinated scheduling changes
    - Ran regular meetings with inspectors and Customer Renewable Solutions Manager to discuss issues of code interpretation and enforcement
- Advised customers and electrical contractors on DER permitting, installation, incentive programs, inspections, and permission to operate
- Reviewed applications for proposed DER projects to ensure sufficiency of local grid infrastructure
- Administered Austin Energy solar incentive programs
    - Reviewed commercial incentive applications to ensure accuracy and completeness
    - Oversaw contractor compliance with incentive program requirements. Drafted and sent disciplinary letters to non-compliant contractors.

Conservation Program Associate (Dec 2020 - Dec 2022)
Austin Energy - Austin, TX

- Administered and supported development of Austin Energy solar incentive programs
    - Reviewed incentive applications to ensure accuracy and completeness of submitted materials
    - Oversaw contractor compliance with incentive program requirements
    - Notified contractors of non-compliance and discussed their improvement plans
- Oversaw and developed process improvements for DER interconnection, focused on solar and energy storage systems
    - Led updates to Austin Energy Interconnection Guide for distributed generation. Shepherded changes through multi-stakeholder approval process and finalized publication.
    - Managed development of interconnection process for utility-side solar (front of meter)

  - Developed requirements for City of Austin web portal enhancements for DER permitting and inspection

- Managed DER inspection program to ensure safe, code-compliant interconnection to the grid
  - Developed web platform with automated processes for requesting, scheduling, and disposition of inspections, and customized reporting capability.
- Advised customers and electrical contractors on DER permitting, installation, incentive programs, inspections, and permission to operate
- Reviewed applications for DER projects to ensure sufficiency of local grid infrastructure
- Developed process documentation

Senior Paralegal (Jul 2015 - Dec 2020)
Ogletree Deakins - Austin, TX

- Managed high volume of complex projects to secure immigration benefits, including U.S. work authorization and permanent residence, for clients
- Prepared filings for submission to multiple government agencies
  - Developed case presentation strategies to maximize chances of success
  - Drafted briefs/letters to articulate clients' eligibility for benefits
- Advised clients on immigration rules and processes, and managed their expectations
- Compiled data to facilitate case tracking and alert colleagues to government policy changes

Paralegal (Mar 2012 - Jul 2015)
Azarmehr Law Group - Austin, TX

- Managed complex projects to secure immigration benefits, including U.S. work authorization and permanent residence, for clients
- Prepared filings for submission to multiple government agencies
  - Drafted briefs/letters to articulate clients' eligibility for benefits
  - Researched immigration regulations and determined their impact on specific projects
- Advised clients on immigration rules and processes, and managed their expectations

Marketing & Supply Chain Intern (Jun 2013 - Aug 2013)
HelioVolt Corporation - Austin, TX

- Researched state, local, and utility-level energy and demand response policies to evaluate favorability toward solar and other renewable energy resources
- Compiled database of nationwide utility information on rate types, prices, and generation mix
- Analyzed trends in customer pricing schemes across utilities
- Presented conclusions to company officials to inform go-to-market strategy for solar modules

Legislative Intern (Oct 2011 - Mar 2012)
Texas Legislature - Austin, TX

- Managed constituent relations for a state senator's office
- Conducted casework, drafting correspondence and maintaining constituent database
- Liaised with state agencies and district-level officials

EDUCATION

Master of Public Affairs (2014)
University of Texas at Austin - Lyndon B. Johnson School of Public Affairs

- *Coursework*: Qualitative/quantitative research and analysis methods, leadership principles, public organization management, economics, public finance, energy policy
- Policy Research Project: "Innovation, Growth and Conflicting National Interests: Analyzing the Evolution of the Global Solar Industry"
    - Assessed electricity consumption patterns of residential solar PV adopters in Texas

Bachelor of Arts, Political Science (2011)
University of Connecticut

- Inducted to Phi Beta Kappa, Phi Kappa Phi

SKILLS & KNOWLEDGE

- Project management
- Process development and improvement
- Stakeholder coordination
- Process documentation

Assessment of Florida's Electric Transmission System Performance and Opportunities for Enhancement

Executive Summary

Florida's electric power system is undergoing rapid transformation as an accelerated shift toward solar generation, transportation electrification and other large loads, and population growth reshape power flows and increase electricity demand. Florida's transmission network must keep pace with these changes to deliver power reliably and efficiently. This first-of-its-kind study applies a statewide model that looks beyond utilities' territorial boundaries to assess the current and future state of Florida's transmission network. We gauge its performance on both reliability and economic metrics under normal and contingency scenarios. Our analysis reveals a set of regional transmission needs, including potential reliability violations, that could be addressed through the long-term planning process envisioned by Federal Energy Regulatory Commission (FERC) Order 1920. Our study takes the first step in that direction by evaluating solutions that could be deployed to improve transmission system reliability and cost-effectiveness, increase its resilience to unplanned outages, and produce more just and reasonable rates for consumers long-term.

To set up our framework we compile comprehensive data from the U.S. Energy Information Administration (EIA), Florida Public Service Commission (PSC), and infrastructure sources to model Florida's transmission topology and generation portfolio. We then apply a versatile economic dispatch model that reveals transmission constraints and evaluates transmission upgrade choices under multiple generation and load scenarios. While our modeling results indicate that Florida's transmission network is generally robust under normal conditions today, it also shows constraints in critical corridors that will expand in coming years, as well as elevated reliability risks during unplanned outages. It shows that transmission congestion is and will continue to be most prevalent in northern Florida, the western Peninsula, and south Florida. It highlights increased congestion and cost to serve during contingencies, especially those caused by extreme weather. It further highlights that south Florida is the biggest geographic driver of system operating cost and that its inclusion in regional transmission solutions can produce the largest reductions in cost of service.

With respect to solutions, we test the impact of new transmission and grid-enhancing technologies on system performance. We find that when utilized in a regional transmission project, these solutions can provide significant economic benefit to grid operators and ratepayers. Net benefits reach billions of dollars per project over the lifetime of the asset. These benefits do not include the potential avoided cost of contingencies that occur without these solutions in place.

Our analysis provides actionable insights for transmission providers, the Florida Reliability Coordinating Council (FRCC), and regulators to aid transmission planning and investment that lowers Floridians' cost of power while enhancing the reliability and resilience of the power grid against high-impact, increasingly high-risk disruptions.

1. Introduction

The transmission system is the backbone of the electric power grid. It delivers electricity from power plants to consumers over long distances at high voltages, while maintaining a reliable power supply. The importance of a robust transmission system has grown with the growth of population in new areas and with the rapid expansion of renewable energy resources, especially solar and wind generation facilities, that are typically built farther from load centers and that introduce variable power flows for the system. Florida is the nation's 2nd-largest electricity consumer[1], is seeing steady population growth, and is undergoing a rapid buildout of generating capacity to meet new load. Meanwhile, frequent extreme weather events (like hurricanes) regularly threaten grid infrastructure. The state's residents and businesses depend on a reliable, affordable supply of electricity to maintain their personal welfare and economic livelihoods.

To meet increased demand and threats, grid infrastructure including transmission requires an increasing level of investment in expansion, hardening, and new assets. These investments are expensive and ultimately paid for by customers on their electric bills. These factors make a comprehensive, statewide evaluation of Florida's transmission system critical to determine whether grid planners are building and utilizing this system in the most efficient, least-cost manner possible. By modeling how the system performs as one Florida-wide region and not just within each utility's service territory, our evaluation helps grid planners see this broader picture – by identifying constraints, quantifying risks, and testing solutions to determine whether there are more optimal ways to deliver reliable and affordable electric service.

This work is made more timely by recent federal policy.. FERC Order No. 1920[2] requires transmission providers to update their long-term regional transmission planning (LTRTP) process to ensure that it results in just and reasonable rates. In issuing the Order, FERC found evidence that existing regional transmission planning under Order No. 1000 does not deliver just and reasonable rates, in part because it has not produced regional projects that distribute benefits across a wider audience and that could deliver greater long-term cost savings to ratepayers than the status quo.

In Order No. 1920, FERC directs transmission providers to use a 20-year time horizon to assess transmission system needs, draw from seven "categories of factors" to identify those needs, and apply seven potential benefits of transmission to calculate the total benefits of a proposed transmission project. It also directs transmission providers to consider right-sizing and applying grid-enhancing technologies to existing transmission lines, as an alternative to building brand new transmission. These requirements are meant to ensure that beneficial transmission projects are not overlooked during system planning.

[2] *Building for the Future Through Electric Regional Transmission Planning & Cost Allocation*, Order No. 1920, 89 FR 49280 (June 11, 2024), 187 FERC ¶ 61,068.

In the spirit of this federal Order and Florida transmission providers' current efforts to comply, we incorporate various elements of Order No. 1920 into this analysis as explained below.

1.1. Florida's Electric Power System

Florida's electric power system is experiencing significant challenges as the state's population and electricity demand grow and as it undergoes substantial change in how power is generated. Electricity consumption in Florida increased by 8% from 2015-2024 and is projected to increase another 11% by 2034[3]. The state's largest utility, Florida Power & Light, forecasts industrial load growth of nearly 9% annually through 2034[4] due to increased interest from artificial intelligence (AI) datacenter developers. Electrification of the transportation sector is also contributing to new load, as Florida has the 2nd-most registered electric vehicles (EVs) in the United States[5].

Meanwhile, Florida's generation portfolio is shifting toward new energy sources. Over the last two decades, much coal-fired generation has been retired and replaced with natural gas-fired generation capacity[6] which today provides 73% of the state's electricity, while coal is down to 3%[7]. However, the dominant trend in new generation today is the rapid increase in utility-scale solar power, which highlights a shift from thermal to inverter-based generators taking place nationally. Florida installed over 3 gigawatts (GW) of utility-scale solar generating capacity in 2024 alone, the 2nd-most of any state[8], and maintained its position as the 3rd-ranked state for total solar installed[9]. Florida's largest utilities plan to build a lot more solar and develop a sizable portfolio of battery storage through 2034. This structural shift to a more dynamic generation mix and new load sources, plus increased pressure from extreme weather, creates new operational challenges for the transmission network that Florida's grid operators must prudently manage.

Florida is a compelling case study. It is not part of an independent system operator (ISO) or regional transmission organization (RTO) with a centralized market structure. Instead, utilities trade power directly between one another. Today it operates as a largely self-contained regional grid, as Florida's utilities have limited arrangements to transfer power to or from providers in other states – i.e., interregional transfer capability. (However, Florida could increase its imports and exports of power with other states.) Because of these characteristics, Florida's utilities balance supply and demand internally within their own service territories. In addition, Florida's grid historically was built to transmit thermal

generation near load centers, but the network now faces altered power flow patterns due to more widespread gas and (especially) solar generation[10]. Assessing network capability, potential upgrades and expanded connections, and adoption of new technologies that improve line performance will leave planners better prepared to meet this set of power system challenges.

1.2. Study Background

As referenced above, FERC Order No. 1920 presents a timely reason to study Florida's transmission system, more deeply than prior research. The Order highlights limitations in current transmission planning processes nationwide. Our intent is to determine whether Florida grid planners have opportunities to harness regional transmission solutions – beyond what is being deployed in the state today – to achieve a reliable grid at lower cost. While meeting reliability standards is a top priority for planners, keeping costs down is also a vital consideration. This is evident in the mission statement of the Florida Public Service Commission, which regulates electric utilities in the state: Its role is "to facilitate the efficient provision of safe and reliable utility services **at fair prices**" (emphasis added). As such, the Commission's goals include providing a regulatory process "that results in fair and reasonable rates"[11].

The duty of electric utilities to serve their customers at least cost is especially salient today, as the rising cost of electricity is now a leading concern for Americans. Florida is no exception. The state's average residential electric bill is up 20% since 2021, and it was a top-10 state for highest residential bills in 2024 (the most recent year of available data)[12]. New transmission projects can cost billions of dollars, so if analysis of system needs and proposed projects does not lead to selection of the best ones, it significantly raises the risk that customers will pay excessive costs. While Florida utilities will need to make new investments in transmission infrastructure to meet the challenges of growing demand and increased impacts of extreme weather described above, they must choose those investments cost-effectively to ensure that large upfront costs maximize long-term savings for ratepayers by providing access to lower-cost generation resources than within their own service territory – thereby making electricity more affordable in the long term.

Florida's utilities have focused on building local transmission projects to meet near-term power reliability needs. Local projects are specific to a single utility: Unlike regional transmission projects, they do not serve or deliver benefits to a wider group of customers across multiple utilities, and do not allow for increased transfer of low-cost electricity across utilities. No regional transmission projects have been built, or even identified for further review, over the past decade in the Florida region. At the same time, investment in

[10] "National Transmission Analysis Maps Next Chapter of US Grid Evolution," National Laboratory of the Rockies, October 3, 2024.
[11] "About the PSC: Mission Statement and Goals," Florida Public Service Commission.
[12] *Electric Sales, Revenue, and Average Price, Table 5.a: 2024 Average Monthly Bill – Residential*. U.S. Energy Information Administration, October 7, 2025.

transmission by Florida's three largest utilities (Florida Power & Light, Duke Energy Florida, and Tampa Electric) has risen from $500 million to $1.9 billion per year[13]. When more money is being spent on new and upgraded local transmission that serves a narrower set of needs, it is worth taking a closer look at Florida's transmission system at the *regional* level to see if there are regional solutions that can meet reliability needs more cost-effectively than a group of ad-hoc local projects.

To this end, Order No. 1920 formalizes a process to help transmission planners make these decisions in the most cost-effective manner. It has several elements that are not included in Florida's current Regional Transmission Planning Process (RTPP) and that lead to a more thorough evaluation of regional transmission opportunities. These include considering several long-term (20-year) scenarios and evaluating a set of specific cost savings and other benefits (e.g., production cost savings, reduced congestion due to transmission outages) for a proposed regional transmission facility. Under Florida's existing Order No. 1000 process, which determines whether there are any Cost Effective and Efficient **Regional** Transmission Solutions (CEERTS) available, planners only compare the cost of the proposed CEERTS project to the cost of the local project(s) it would displace. The CEERTS cost must be less than or equal to that of the displaced project(s)[14]. The evaluation does not consider any separate and additional cost savings and other benefits that might accrue to the CEERTS project. In this study, we take up elements of Order No. 1920 including certain transmission benefits to ensure a robust calculation of cost savings available from regional transmission projects.

Prior technical reports have focused on various aspects of Florida's grid[15]. Research has modeled the grid impact of high-penetration solar, assessed the potential for grid-enhancing technologies (GETs)[16] such as dynamic line rating, and evaluated strategies for grid resilience against hurricanes[17] (e.g., undergrounding transmission lines).

Prior studies on transmission planning, renewable energy resource integration, and grid resilience in other U.S. regions have examined regional systems under increasing solar and natural gas penetration, often within ISO/RTO market structures[18]. Methodological developments have also demonstrated the importance of optimizing generation and

transmission expansion planning to increase the capacity of renewable generation[19]. However, no prior work for Florida has combined detailed data such as generation locations, transmission line capacities, county-level load forecasts, and solar generation growth to simulate power flows, congestion, and the state-level effects of losing major transmission lines or generators. This absence of a comprehensive statewide assessment of Florida's transmission system robustness and performance is particularly important given Florida's system structure and rapid solar expansion. A framework that captures both the spatial distribution of generation and the topology and limits of the transmission network is needed to understand how Florida's grid will perform under future load growth, renewable resource deployment, and extreme events.

1.3. Preexisting Challenges and Our Contributions

Existing studies of Florida's transmission system are limited. They typically focus on individual utilities, regions, or components rather than the state as a whole. Prior work rarely evaluates multiple stress scenarios across the full system, and few analyses quantify the operational and economic impacts of potential solutions such as line expansion, dynamic line rating, or a new greenfield line. As a result, planners lack a comprehensive, data-driven foundation to identify vulnerabilities, assess resilience, and guide informed infrastructure investments that optimize at the system level.

To address these gaps, our study provides a statewide assessment of Florida's transmission system using county-level data and analysis, evaluates resilience under multiple contingencies, and tests practical solutions. The main contributions are summarized as follows:

1. Formalize the first county-level model of Florida's transmission system by integrating diverse datasets.

2. Conduct a resilience analysis under multiple contingency scenarios to identify vulnerabilities, reliability needs, and operational bottlenecks.

3. Evaluate transmission solutions and quantify their effects on congestion, production cost, and overall system reliability.

4. Provide actionable insights for grid planners and policymakers, highlighting critical corridors, vulnerable regions, and strategies to improve the resilience and efficiency of Florida's transmission network.

The remainder of this report is organized as follows: Section 2 describes the data sources and the construction of Florida's transmission, energy generation, and consumption datasets. Section 3 presents the modeling framework and scenario design. Section 4

[19] Alanazi et al., "Co-Optimization Generation and Transmission Planning for Maximizing Large-Scale Solar PV Integration," *International Journal of Electrical Power & Energy Systems* 118 (2020): 105723.

reports the results of all scenarios modeled for both the current and future transmission system, including contingencies and a menu of infrastructure solutions. Section 5 points to future analysis that would expand upon our models and contribute meaningful new insight. Finally, Section 6 concludes with a recap of key findings.

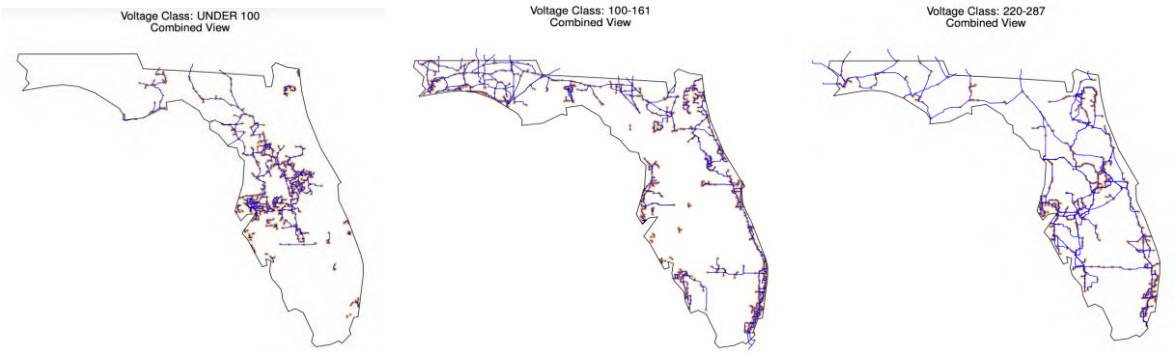
2. Data

We collect diverse and high-quality datasets from multiple reliable sources to build a realistic, fully integrated model of Florida's electric power system. This is the foundation for our subsequent modeling and analysis.

2.1. Transmission Network

Transmission line data is sourced from Homeland Infrastructure Foundation-Level Data (HIFLD)[20]. It provides detailed attributes on the U.S. bulk power transmission system including line type, voltage level, associated substations, operating status, and geographic shape. The dataset contains 96,620 lines in total, with 3,438 lines that connect to at least one substation within Florida. The oldest line was sourced in January 1996 and the newest line was sourced in September 2024.

We use this data to map Florida's transmission lines in Figure 1. The spatial distribution of voltage levels is revealing: Lines below 100 kV are concentrated in central and north-central Florida; 100-161 kV lines are mostly located in the Panhandle and along both coasts; 220-287 kV lines form a dense network linking major population centers such as Jacksonville, Orlando, Tampa, and Fort Lauderdale; and the few 500 kV lines run primarily along the eastern corridor of the state.



[20] "Electric Power Transmission Lines," Homeland Infrastructure Foundation-Level Data. U.S. Department of Homeland Security, 2025.

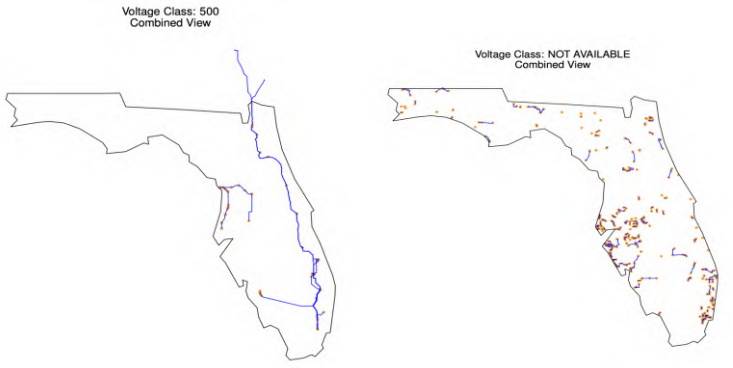


Fig. 1. Florida transmission lines and electrical substations by voltage level. Blue lines connect to at least one substation in Florida. Yellow dots are electrical substations.

This layered transmission system combines local delivery needs with statewide and interstate bulk power transfer capability. Specifically, lower-voltage networks are built up around population centers while long-distance, higher-voltage paths provide north-south and east-west connection.

2.2. Generators

Generator data is for 2023, which was the latest year available when our research began. Natural gas has become the dominant source of electricity in Florida, with capacity growing from 28 GW to nearly 36 GW from 2017 to 2023[21]. However, solar capacity had the biggest jump during this period, growing from roughly 0.5 GW to more than 7.8 GW. Alongside this solar growth, Florida's utilities have started to incorporate grid-scale battery storage, reaching about 560 MW by 2023. Figure 2 shows these capacity shifts.

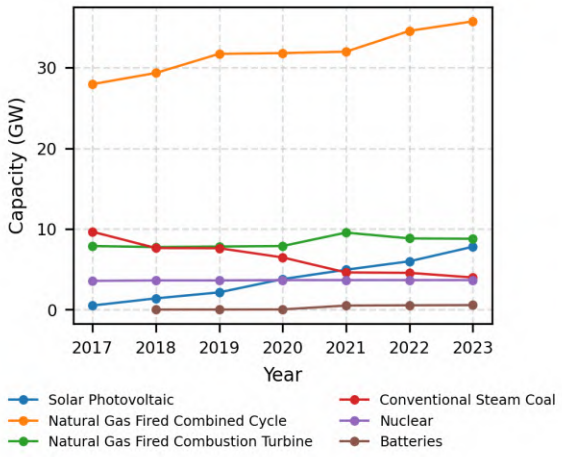

Fig. 2. Florida's Generator Capacity Trends (2017-2023)

[21] *Form EIA-860: Annual Electric Generator Report*. U.S. Energy Information Administration (data for 2023).

While gas and solar have grown, older fossil fuel resources have shut down. Conventional coal capacity dropped by more than half during this period, falling from 9.6 GW to roughly 4 GW. Petroleum-fired capacity decreased sharply from 5 GW to 1.6 GW. Meanwhile nuclear power capacity, which comes from two facilities on Florida's east coast, has remained steady at 3.6 GW.

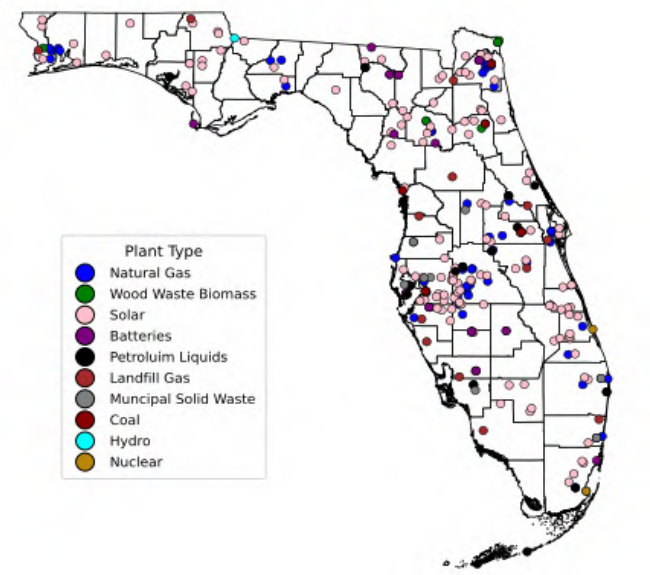

Fig. 3. Spatial distribution of Florida's existing power plants by type.

In addition to mapping Florida's transmission network, it is also important to consider the spatial distribution of the state's power plants, as illustrated in Figure 3. Most of Florida's power plants are concentrated in the central and eastern parts of the state. A large cluster is located around the Orlando-Tampa corridor, which hosts both natural gas units and other plant types. The east coast similarly hosts such clusters especially (moving north to south) in Brevard, Indian River, St. Lucie, and Palm Beach counties. In contrast, North Florida has fewer plants overall with smaller clusters near Pensacola and in Tallahassee and Jacksonville. Many rural counties have very few or no large generating plants.

However, this dynamic will shift as Florida's largest utilities plan to build more generation (primarily solar) in rural northern Florida. This shift is already emerging. In 2017 only a few counties including DeSoto, Manatee, and Charlotte (in west central and southwest Florida) had solar farms. As utilities invested more in solar energy, solar facilities expanded quickly across central and east central Florida in counties including Polk, Osceola, Brevard, and St. Lucie. By 2023, solar farms were widespread across the state with strong growth in northwestern counties and other rural areas. In coming years we expect to see increased power flows from these rural areas to load centers, especially during summer peak hours. A question for this analysis is whether Florida's transmission system is set up to accommodate this change. As the maps in Figure 4 show, while most of northern Florida

has energy consumption levels that are similar to their generation, they have less transmission resources than more heavily populated regions of the Peninsula.

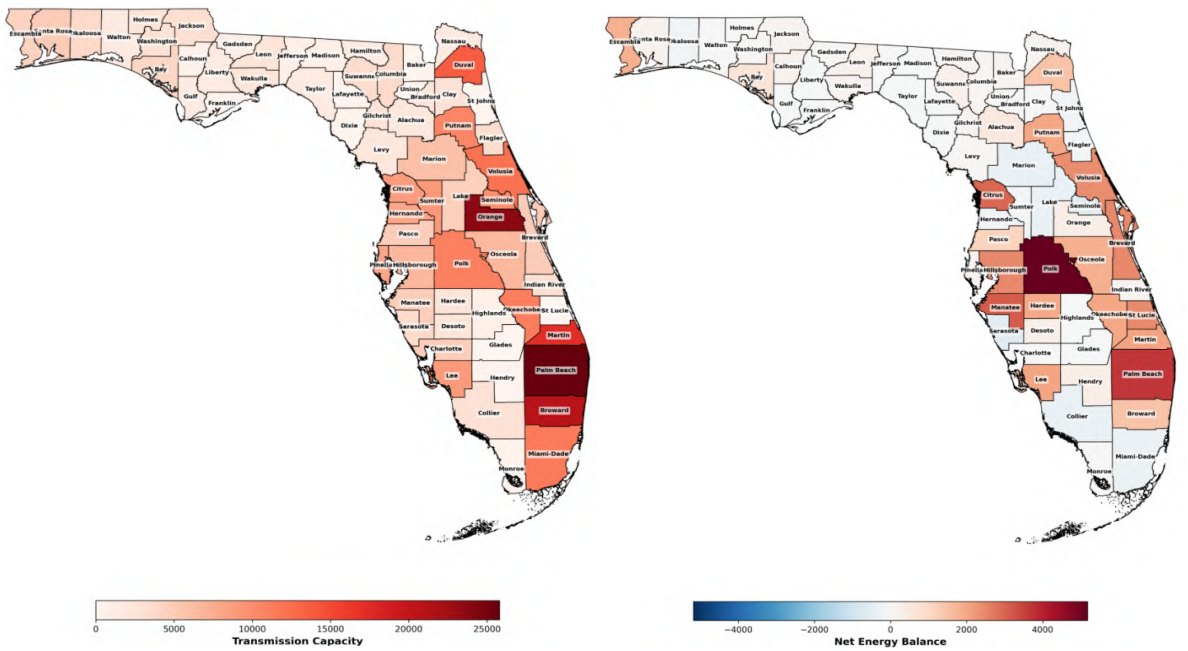

Fig. 4. Left: Transmission capacity available in each Florida county, showing lower levels of transmission in northern Florida and the Panhandle as opposed to the Peninsula. Right: Net balance of generation and consumption in each Florida county. Those in darker red generate more energy than they consume, whereas those in lighter color are close to even.

This transformation of the generation portfolio along with Florida's increasing demand for power calls for assessing statewide transmission system adequacy and cost-effectiveness.

2.3. Electricity Consumption

Florida consumes the 2nd-most electricity in the country. Its load has grown steadily due to population increase, economic development, and more recently transportation electrification. Statewide demand data from the U.S. Grid Monitor show a clear upward trend in annual electricity use over the past 10 years, with noticeably increased demand during summer peaks, whereas winter peaks remain mild[22]. On the county level, the highest consumption consistently occurs in south Florida, particularly in Miami-Dade, Broward, and Palm Beach counties followed by other densely populated areas including Hillsborough, Orange, and Duval counties[23]. Those counties also show high year-to-year increases. In contrast, many rural northern and inland counties maintain much lower demand levels as illustrated in Figure 5.

[22] "Hourly Balancing Authority Demand: U.S. Grid Monitor," U.S. Energy Information Administration.
[23] "Energy Consumption and Expenditure," National Renewable Energy Laboratory, 2023.

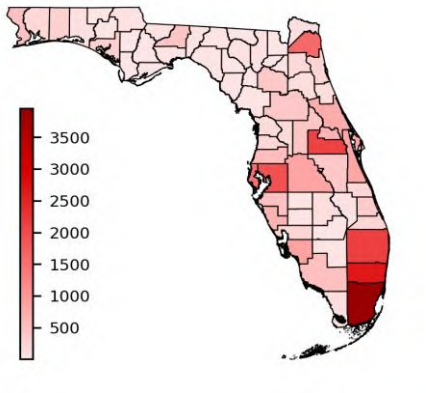

Fig. 5. 2023 average electricity load (MW) by county.

2.4. Other Data

In addition to the above data used to establish the electric power system model for Florida, this study incorporates two other data sources to support a resilience assessment and future-proof analysis.

First, Florida's exposure to extreme weather events is characterized using the National Risk Index (NRI) published by the U.S. Federal Emergency Management Agency (FEMA)[24]. As a coastal state frequently affected by hurricanes, Florida faces recurring stress on its transmission infrastructure. The NRI Risk Score is based on social vulnerability, community resilience, and expected annual loss, which captures the frequency and magnitude of socioeconomic impacts of hurricane events. Scores are highest where impacts will be most severe.

Second, given the accelerating adoption of electric vehicles in Florida, EV charging station location and load data is included[25] to examine potential future operational impacts and siting considerations. We calculate the historical EV load growth rate and apply it to each county. We use this rate to project EV charging load by 2035, which is incorporated into our future scenarios.

3. Methodology

After constructing the layout of Florida's transmission system from the collected datasets, we develop a production cost modeling framework based on economic dispatch. It is also a power flow model, as it incorporates flow capacity constraints that allow us to calculate the actual power flows under a given scenario. Using this baseline model, we design eight scenarios (including the Base Case) to evaluate transmission constraints, quantify

[24] "National Risk Index: Data Resources," Federal Emergency Management Agency, 2025.
[25] "Electric Vehicle Charging Station Locations," U.S. Department of Energy, Alternative Fuels Data Center, 2025.

operational vulnerabilities, and test the reliability and economic performance of the current and future system under a range of plausible contingencies.

3.1. Production Cost Modeling

Production cost modeling is widely used in transmission system planning and operational assessment to evaluate the cost-effective dispatch of generation resources while meeting system demand under transmission constraints[26]. Not only does it allow grid planners to meet reliability needs, but it also allows them to identify more economically efficient (lower-cost) means of serving customers. Other U.S. regions use production cost modeling in their regional transmission planning and Florida utilities use it in their local transmission planning. **However, Florida utilities and the Florida Reliability Coordinating Council (FRCC, which oversees the statewide power system) *do not* use production cost modeling to conduct regional transmission planning**. Because Florida's planners do not optimize transmission system cost at the statewide level, our study seeks to fill this gap.

By simulating the hourly operation of all of Florida's generators, transmission lines, and county-level load, this framework reveals economic dispatch patterns, identifies transmission bottlenecks, and quantifies congestion levels and reliability risks for transmission lines. Our production cost model is formulated as follows:

$$min \quad \sum_{g \in G} C_g p_g, \tag{1}$$

$$\text{s.t.} \quad \sum_{g \in G} p_g = \sum_{b \in B} D_b, \tag{2}$$

$$P_g^{\min} \leq p_g \leq P_g^{\max}, \forall g \in G, \tag{3}$$

$$\left| \sum_{b \in B} \delta_{b,l} \left(\sum_{g \in G(b)} p_g - D_b \right) \right| \leq F_l, \forall l \in L. \tag{4}$$

Here the decision variable is the generation dispatch p_g for generator g. Model parameters include the marginal generation cost C_g for generator g, generation limits $P_g^{\min}$ and $P_g^{\max}$, county-level electricity demand D_b, line shift factor $\delta_{b,\ell}$, and transmission line capacity $F_\ell^{\max}$. The objective (1) is to minimize total system production cost, while the constraints (2)-(4) enforce generation-consumption balance, unit operating limits, and line flow limits, respectively.

[26] *2024 Summer Loads and Resources Assessment*. California Independent System Operator, May 8, 2024; *Regional Transmission Expansion Planning: Meeting the Grid's Future Needs*, PJM Interconnection, 2024.

To apply this model, we obtain generation limits from EIA data[27]. Because detailed data on marginal generation cost and transmission line parameters are not readily available, we estimate marginal generation costs using generator technology type[28], heat rate, fuel price[29], and typical variable operating and maintenance costs[30]. We approximate transmission line capacity and line susceptance based on voltage level, line type, line length, and standard material characteristics[31].

3.2. Scenario Development

We evaluate current and expected future performance of Florida's transmission system under normal operating conditions, as well as its resilience and costs under realistic stress factors and its response to potential infrastructure additions. We develop and analyze scenarios for different outages of transmission and generation, addition of large loads, and deployment of new transmission solutions. To analyze the current state, all scenarios are developed on a county-level transmission representation of Florida using 2023 data.

To analyze the future state, we incorporate all new generation and transmission assets that Florida utilities planned to build as of their Ten-Year Site Plans (TYSPs) published in 2025, which extend through 2034. These were the latest TYSPs when our research began. All such assets are assumed to be online by the end of 2034, allowing for a forward-looking analysis of Florida's transmission system in 2035. Planned assets with specific locations are assigned directly to their designated county-level nodes. Where site information is unknown, capacity of the planned asset is distributed uniformly across those counties in that utility's footprint that have existing generation. This ensures that future capacity is anchored to probable transmission access points, providing a realistic 2035 baseline to identify inter-county flow constraints.

3.2.1. Transmission Topology

While Florida's transmission system is operated by individual utilities, aggregation at the utility level is too coarse to reveal meaningful transmission constraints. Conversely, modeling the system at the substation level requires highly granular data that are difficult to obtain. Therefore, we adopt a county-as-node approach: We represent each of Florida's 67 counties as an aggregated bus, retain inter-county transmission lines, and aggregate all loads within each county. Intra-county lines are excluded from the model because internal connections within a node do not affect power flow calculations between distinct county nodes. This modeling scale offers a tractable yet sufficiently informative framework to

identify transmission constraints and support actionable guidance for grid planners and system operators.

3.2.2. Base Scenarios

The Base Case scenario represents the operation of Florida's transmission system under normal operating conditions across three representative snapshots of load level: Average Load (AVG), Winter Peak (WIN), and Summer Peak (SUM).

Average load is calculated by taking each county's total electricity demand for 2023 and averaging it over all hours of the year. These values were updated for the 2035 analysis based on load projections. To model Winter and Summer Peaks, we scale this average load using a "peak factor": This is the ratio of the highest historical peak load to the average load observed over the last decade. As shown in Table 1, we derive these factors for each utility region in Florida using EIA Grid Monitor data[32] and apply each resulting factor to all counties within that utility's territory. To ensure accuracy, we exclude anomalous data points and instead use the highest reliable factor from the remaining years. For the 2035 analysis, we applied the same peak factor to the average load projection to derive the expected Winter and Summer Peaks. The results of modeling these scenarios provide the baseline against which to compare changes in congestion levels and production costs as contingencies and transmission solutions are applied in other scenarios.

Table 1. Highest winter and summer factors by utility, 2015-2024

Utility	***Summer Factor***	***Winter Factor***
FMPP	150.41	43
FPC	2.16	1.99
FPL	1.74	4.39
GVL	8.57	1.86
HST	4.55	1.65
JEA	1.88	2.04
NSB	2.04	5.72
SEC	6378.44	3869.6
TAL	1.95	1.93
TEC	1.85	1.72
Region (FLA)	**1.81**	**1.62**

Notes: For FMPP and SEC, the outliers are excluded and the next highest reliable historical factors are used in simulation. FMPP = Florida Municipal Power Pool, which includes the Florida Municipal Power Agency, Lakeland Electric, and Orlando Utilities Commission. FPC = Duke Energy Florida. FPL = Florida Power & Light.

[32] "Hourly Balancing Authority Demand: U.S. Grid Monitor," U.S. Energy Information Administration.

GVL = Gainesville Regional Utilities. HST = City of Homestead. JEA = Jacksonville Electric Authority. NSB = City of New Smyrna Beach. SEC = Seminole Electric Cooperative. TAL = City of Tallahassee. TEC = Tampa Electric.

We make two assumptions to improve the robustness of the analysis. First, we exclude battery storage from generation during Average Load because, in general, storage does not contribute to net generation. However, during peak periods we treat batteries as demand response resources capable of peak shaving. Because batteries are considered free generation resources, they are utilized whenever they are available to a load. We then report the percentage of total generation contributed by batteries. Second, we derate solar generation to 10% of installed capacity during Winter Peak to reflect low solar output during dawn and dusk hours when winter peaks typically occur. These same assumptions apply to all other scenarios.

Another important note is that we model the Base Case scenario using only the physical limits (aka, thermal limits) of the transmission lines. This is the maximum power flow that a line can handle without risking damage or destruction. We do not incorporate the *contingency limits* of transmission lines, where lines are run at a lower power flow than their physical limit to account for possible contingencies (e.g., an outage of an adjacent line) that would automatically push more power flow on to the line in question. In practice, grid operators use contingency limits; however, we do not have data on the contingency limits used by Florida utilities. Because our model uses a higher power flow limit than used in practice, **our estimates of the Florida transmission system's baseline congestion and cost are conservative**. Florida's grid will have heavier utilization of lines, increased risk of reliability violations, and higher cost of service (due to limits on cost-efficient dispatch of generation resources due to congestion) than is documented in this study.

3.2.3. Contingency Scenarios

To evaluate the resilience of Florida's transmission system to unplanned outages, we assess seven contingency scenarios, most of which remove one or more elements (N-1 or N-k) from the system:

- **Line Loss (LL)**: Simulates the outage of a single transmission line. Highlights additional congestion and production costs due to the outage, and shows which line losses create the highest system impact.

- **Load Spike (LS)**: Represents the entry of a customer with higher-than-normal load. Models a 100-MW increase in a county's demand to reveal the marginal cost of supplying these loads. Recognizes the rapid growth of large loads, such as hyperscale datacenters that support artificial intelligence (AI), across the United States and these customers' interest in Florida. Addresses two questions: Is Florida's grid prepared to handle large loads, and what is the incremental cost to serve them?

- **Biggest Generator Loss (BG)**: Simulates the outage of the largest power generation facility in a county. Provides insight into the adequacy of neighboring systems and inter-county dependency. Counties that do not have generation facilities are excluded from this analysis.

- **All Generator Loss (AG)**: Simulates the outage of all generation facilities in a county. Similarly provides insight into the adequacy of neighboring systems and inter-county dependency, based on a larger local outage event. Counties that do not have generation are excluded from this analysis as well.

- **County Disaster (CD)**: Combines the loss of all generation, load, and transmission within a county to assess how a complete local outage affects regional power flows.

- **Risk Score (RS)**: Models an extreme weather event that has a wider geographic impact. Incorporates the impact of hurricanes based on FEMA's National Risk Index[33]. Counties with the highest risk scores are assumed to suffer losses of power generation and transmission simultaneously. We evaluate two distinct Risk Score scenarios: One in which the highest-risk counties lose all their generation while load and transmission remain available; and one in which these counties lose all generation, load, and transmission.

Overall, we model 36 distinct instances of base and contingency scenarios. Each produces distinct outcomes with respect to system congestion and cost.

3.2.4. Planning Scenarios

In addition to identifying the constraints on Florida's transmission system under normal and contingency conditions, this study analyzes several solutions that could reduce system congestion and cost of service. We develop three planning scenarios that apply different transmission solutions, each of which has varying costs to deploy. Each is commonly utilized today and all are considered within Order 1920:

- **Dynamic Line Rating (DLR)**: Simulates the installation of DLR devices, which adjust the line's power-carrying capacity in real time in response to ambient conditions, on select inter-county lines to assess how it enhances operational flexibility. We assume that DLR provides a standard 15% increase in line capacity.

- **Line Expansion (LE)**: Models a 300-MW capacity increase along existing high-voltage transmission corridors, evaluating the effect on congestion and production cost. It is technology-agnostic as to how the 300-MW increase is achieved.

- **New Connection (NC)**: Models the construction of a new (i.e., greenfield) 230 kV transmission line with 600-MW power flow limit, to connect two counties that

[33] "National Risk Index: Data Resources," Federal Emergency Management Agency, 2025.

currently lack a direct link. Enables an assessment of how improved connectivity impacts system performance.

We also evaluate transmission switching as a solution to manage congestion. In this scenario, the grid operator selectively turns off (i.e., switches off) one or more lines to re-route power flow. However, this strategy is better suited for real-time grid operations than the static snapshot analysis used in typical transmission planning studies. Because the benefits of transmission switching were not quantifiable within our modeling framework, it was excluded from the final planning scenarios discussed herein.

3.3 Incorporation of Benefits

In evaluating the impact of the above scenarios on transmission system performance, we consider the benefits (or avoided costs) that can be realized by implementing one or more of the solutions we test. For the future-focused planning scenarios, we calculate the net benefits (in dollars) that accrue to the most promising applications of these solutions (the "top candidates").

Order No. 1920 requires transmission providers to consider seven benefits, at minimum, in their evaluation and selection of proposed regional transmission facilities[34]. These benefits are:

1) Avoided or deferred reliability transmission facilities and aging transmission infrastructure replacement
2) Reduced loss of load probability *or* reduced planning reserve margin
3) Production cost savings
4) Reduced transmission energy losses
5) Reduced congestion due to transmission outages
6) Mitigation of extreme weather events and unexpected system conditions
7) Capacity cost benefits from reduced peak energy losses

To align more closely with the long-term planning framework captured in the Order, we incorporate five of these seven benefits (specifically, Benefits 2-6) into our comprehensive analysis of grid stress and mitigation opportunities:

- The capacity stress-tests under Winter and Summer Peak conditions, as well as the Load Spike scenario, consider reduced loss of load probability by demonstrating how enhanced transmission connectivity can improve system adequacy in serving load. It also shows how enhanced connectivity can offset need for new generation resources to serve load, thereby reducing local planning reserve margins.

- We quantify production cost savings by comparing the dispatch costs of the Base Case scenarios against those in the planning scenarios. Wherever a solution results

[34] Order No. 1920 at P 720.

in a lower system cost than the Base Case, that equals savings to ratepayers. In addition, when system cost increases in a contingency scenario, that is an opportunity for a solution to avoid some or all of that added cost.

- The infrastructure upgrades modeled in the Line Expansion and New Connection scenarios address reduced transmission energy losses by creating more efficient power flow paths.

- We explicitly evaluate the ability of transmission projects to reduce congestion due to transmission outages by assessing how the tested solutions relieve bottlenecks that are identified in contingency scenarios.

- The Risk Score and County Disaster scenarios simulate the impact of hurricanes and larger-scale asset failures, allowing us to estimate the increased production costs during extreme events and sustained outages that could be reduced or avoided by implementing certain transmission solutions.

In our calculation of the net benefits of transmission solutions to the future system, we did not include avoided costs that would arise during contingencies. Our analysis of Benefit 2 did not incorporate a Value of Lost Load (VOLL), which is used in other U.S. regions to better capture the economic value to customers of maintaining access to electricity. We also did not consider Benefits 1 and 7 from Order 1920, due to the greater difficulty of modeling them in this particular analysis. Future work can explore the extent to which avoided costs should be included, integrate an appropriate VOLL into the reduced loss of load probability benefit, and attempt to quantify Benefits 1 and 7.

4. Results

In this section, we present our findings on Florida's current and future transmission system performance under the scenarios above. Our analysis reveals clear reliability needs that grid planners should seek to address. Operating constraints arise under both base and contingency scenarios, allowing us to pinpoint the lines and regions most at risk of causing reliability violations. We then apply the set of transmission solutions described above to reveal regional projects than can mitigate congestion and reduce system production cost.

We handle data processing and scenario generation in Python 3.13.2. We perform production cost modeling and scenario evaluation in Julia 1.11.6, using the UnitCommitment.jl package[35] for power system modeling and Gurobi 12.0.3 library to solve optimization programs. All model runs are performed on a computer powered by an Apple M1 Pro with 10-core CPU and 16GB of RAM.

[35] Xavier et al., "UnitCommitment.jl: A Julia/JuMP Optimization Package for Security-Constrained Unit Commitment (Version 0.4)," 2024.

Each scenario focuses on two metrics referenced above:

- **System-wide transmission line utilization**: Measures the level of congestion on individual lines and the transmission system as a whole. It is the percentage of a line's power flow limit that is used in a given scenario. A line with 0% utilization has no load, whereas a line with 100% or greater utilization is fully or over-loaded, which represents a reliability violation. This metric demonstrates the level of congestion across Florida's transmission network under each scenario, so we can see how congestion changes under contingencies and solutions. Because we have utilization data for all county pairings, we can also focus on single or regional locations of high congestion. This highlights both inefficiency and reliability concerns: Lines that are at or approaching full load stress the thermal limit, causing the line to degrade at a faster rate[36].

- **System-wide production cost**: This is the hourly cost, represented as a dollar value, to serve load over the transmission system using the most economic system-wide dispatch of generation. This metric identifies the economic costs of each contingency as compared to the Base Case, even if the contingency does not cause a reliability violation. Likewise, it identifies the economic benefits available from applied solutions that allow operators to use transmission resources – as opposed to generation only – to serve load at lower cost than the Base Case.

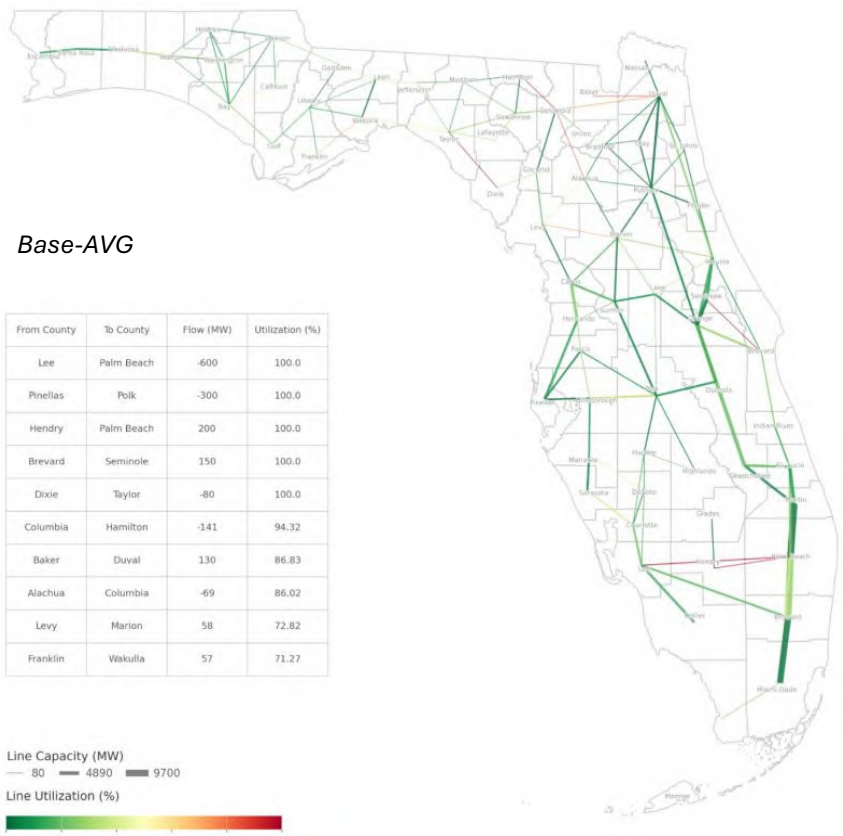
These metrics highlight the factors of congestion (and associated reliability risk) and cost that are each critical to transmission planning, taking a Florida system-wide view that is not part of any formal planning process today.

4.1. Current State: Base Case Assessment

Base Case results for the current transmission system in Average Load, Summer Peak, and Winter Peak conditions are visualized in Figure 6, which shows congestion levels across the system. Green lines indicate lightly loaded transmission paths, whereas red lines denote heavily congested ones.

[36] "IEEE Guide for Determining the Effects of High-Temperature Operation on Conductors, Connectors, and Accessories," in *IEEE Std 1283-2013 (Revision of IEEE Std 1283-2004)*, pp.1-47, October 2013, doi: 10.1109/IEEESTD.2013.6616559.

Base-AVG



From County	To County	Flow (MW)	Utilization (%)
Lee	Palm Beach	-600	100.0
Pinellas	Polk	-300	100.0
Hendry	Palm Beach	200	100.0

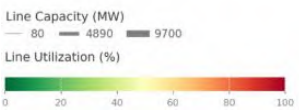
Franklin	Gulf	-129	80.51



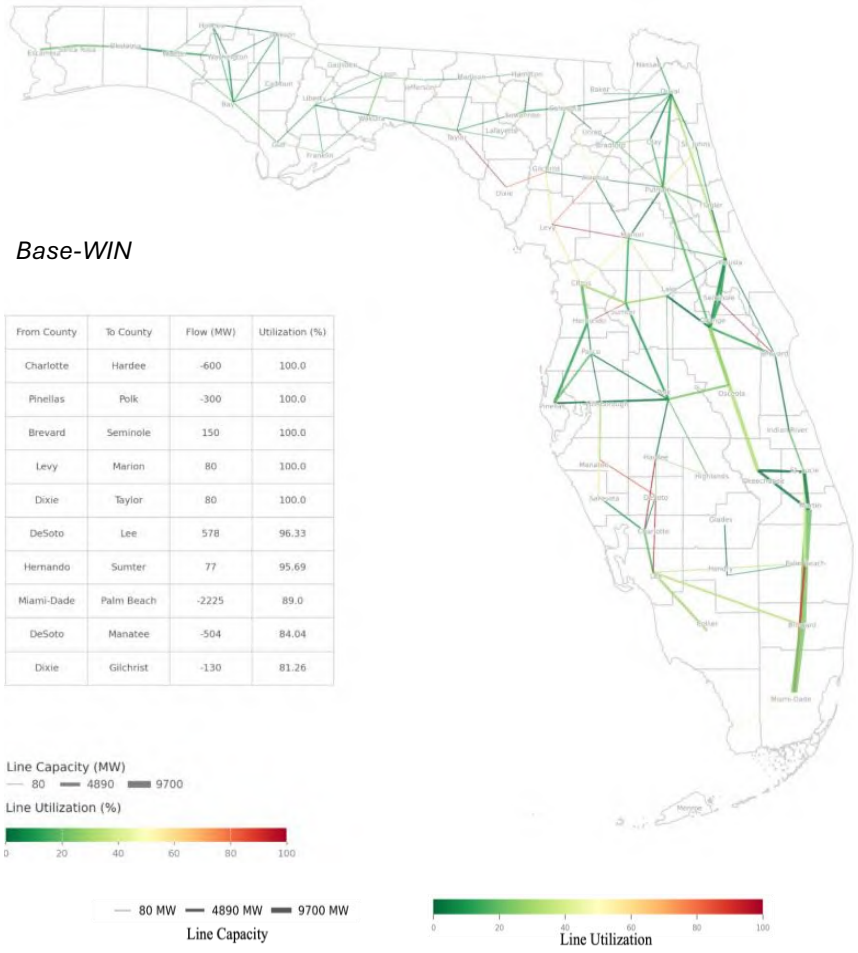


Fig. 6. Three snapshots of the Base scenario. Each colored line represents the aggregate connection of existing transmission lines between a pair of counties. The thickness of the line represents the total transmission capacity while the color of the line represents its congestion level. Each table shows the most congested county pairings under that load pattern, where a negative Flow number represents net power flow from the "To County" to the "From County". Base-AVG has a system-wide average line utilization of 23.4% and total hourly production cost of $1,032,780.69. Base-SUM has an average line utilization of 26.6% and total production cost of $4,014,889.56. Base-WIN has an average line utilization of 23.1% and total production cost of $2,881,448.77. In Base-SUM and Base-WIN, battery storage comprises 0.93% and 1.11% of the energy resource mix respectively.

While Florida's transmission system has significant headroom on a statewide basis today, with average utilization remaining below 30% even under Summer Peak, certain areas within the system see high levels of congestion that pose high reliability risks as lines are pushed to their limits. The spatial distribution of congestion shifts significantly across load patterns, and it appears in diverse locations within a single load pattern.

In the Base-AVG case, the most prominent bottlenecks occur along interfaces in south(Lee-Palm Beach, Hendry-Palm Beach), west central (Pinellas-Polk), east central (Brevard-Seminole), and north Florida (Dixie-Taylor), each operating at or above 100% of their limit. In the Base-SUM case, congestion spreads: While the Pinellas-Polk, Hendry-

Palm Beach, and Brevard-Seminole corridors continue to be fully loaded, more reliability violations appear in southeast (Miami-Dade–Palm Beach), southwest (DeSoto-Lee, Charlotte-Hardee), and north-central Florida (Levy-Marion) as well as the eastern Panhandle (Franklin-Wakulla). These changes indicate that while the current system has low loading in aggregate, narrower transmission constraints emerge especially under higher seasonal stress, reflecting Florida's uneven load distribution and the importance of regional transfer capability.

4.2. Current State: Contingency Analysis

Next, we test the resilience of today's transmission system to the contingencies described in Section 3.2.3 and examine deviations from the Base Case. The results in Table 2 reveal distinct patterns across contingency types. These patterns show that the contingency locations that drive the highest system congestion shift substantially across scenarios and load levels. Likewise, the locations that experience the highest congestion exhibit a geographically dispersed pattern, where different contingencies stress different parts of the network. While a core group of congestion hotspots from the Base Case continue to appear, the number of reliability violations and heavily stressed lines grows under contingency scenarios.

In contrast, the production cost results show a more consistent pattern. Contingencies that result in the largest cost increase overwhelmingly point toward south Florida as the source of instability – particularly St. Lucie, Palm Beach, Broward, and Miami-Dade County. These counties repeatedly drive the highest cost impacts, especially under Summer Peak. This suggests that the economic consequences of contingencies are disproportionately driven by the south Florida region, where limited import flexibility and high demand amplify marginal costs.

The largest impacts in each scenario are reported below. Additional results are reported in Appendices A and B. All system production costs are hourly.

Line Loss

The location of the line outage that causes the highest system-wide congestion shifts from west central Florida (Hillsborough-Pinellas) in LL-AVG, to the eastern Panhandle (Wakulla-Franklin) in LL-SUM, to north Florida (Wakulla-Taylor) in LL-WIN. **The largest spike in congestion occurs during Average Load**, with the outage of a 230 kV Hillsborough-Pinellas line causing a 3.8% increase in line utilization from the Base Case (proportionally, 15.8% higher than the Base Case value). This outage also drives the highest share of lines (8.6%) across the system that exceed 80% utilization, which is another metric we use to evaluate system stress. Lines that exceed the 80% threshold are approaching their thermal operating limit, so planners should consider ways to alleviate congestion on these lines to avoid reliability violations.

During Summer Peak, we see significant economic consequences of congestion appear after a critical line loss. Additional system cost is more than $928,000 (23.1% above the Base Case) due to an outage of the 500 kV Palm Beach-St. Lucie line, which serves the heavily populated southern Atlantic coast. There is a much smaller increase during Winter Peak and no change during Average Load regardless of which line is removed. The latter result owes to sufficient system headroom under Average Load that allows for solving the constraint without changing cost – whether the solution is an alternate transmission path for affected power flow, or dispatch of a similar-cost generator to serve load.

Load Spike

This scenario is of interest given the United States' interest in building AI capabilities and the associated surge in requests for interconnection from new datacenter load. Today's datacenters have significantly higher demand than those of the past, due to the increased complexity of computing tasks. Florida's two largest utilities have proposed new tariffs for large load customers in the past year (Florida Power & Light's was approved in its latest rate case)[37]. If a datacenter or other large industrial load sets up in Florida, it is useful for grid operators to know whether and where capacity exists to serve that load (and where major upgrades are needed), so the state can enjoy the economic benefit of new business while minimizing impact to its energy infrastructure and minimizing costs to ratepayers.

We use 100 MW as a proxy for large load. However, we recognize that some datacenter loads now exceed 1 GW, so future work should examine the impact of larger loads on the system. We determine which new large load sites (by county) would most disrupt grid performance. The location changes by load condition and whether we prioritize congestion or cost. The largest congestion impact is during Average Load, where adding 100 MW of load in Santa Rosa County in the western Panhandle drives a 1.6% increase in line utilization (6.8% above the Base Case). Meanwhile, during Winter Peak the system sees the highest share of lines (9.4%) exceeding 80% utilization, after adding 100 MW of load in north Florida's Lafayette County.

The largest increase in production cost occurs during Summer Peak when we put 100 MW of load in either Miami-Dade or Monroe County (in south Florida). This inflates system cost by $100,000 (+2.5%). This again demonstrates the influence that south Florida has on the economics of the state's grid operations, where significant change to its topology has wide-reaching effect. We note that during Average Load, the change in production cost is nearly uniform: The cost increases by $5,600 (+0.5%) when placing a new 100 MW load in all but two counties. This uniformity and fractional increase are likely due to the system headroom available during normal hours that limits the impact of such change.

[37] Joint Motion for Approval of Settlement Agreement by Florida Power & Light Company, et al. Florida Public Service Commission Docket No. 2025-0011, August 20, 2025; *Petition for Limited Proceeding to Approve Large Load Tariff by Duke Energy Florida, LLC*. Florida Public Service Commission Docket No. 2025-0113, September 5, 2025.

Biggest Generator Loss

Here the contingency involves a generation as opposed to a transmission asset. The largest impact occurs during Winter Peak when the largest generator in north Florida's Leon County goes offline: Congestion rises by 1.6% (6.9% above Base Case). This outage also results in the highest share of lines (8.6%) exceeding 80% utilization. During Average Load and Summer Peak, the largest impacts come from generator outages in Gadsden County (eastern Panhandle) and Pinellas County (west central Florida) respectively.

Disruptions in south Florida create the greatest economic stress for the system. The largest cost increase comes from the loss of Miami-Dade County's largest generator during Summer Peak, with an added expense of $860,000 (+21.4%). That same generator causes the most expensive loss during Winter Peak, while the loss of St. Lucie County's largest generator is the costliest during Average Load. In addition to Florida's southeastern counties being its largest population and load center, its two nuclear power facilities are in St. Lucie and Miami-Dade County. As these are two of Florida's largest power sources that operate around the clock, it is reasonable that an outage of either one would produce major cost consequences for the grid.

All Generator Loss

We broaden the extent of the outage to account for an extreme event that takes *all* power generation facilities in a county offline. We assess whether and how much this changes the results from the previous scenario. With respect to system congestion, the results are more varied geographically and larger in magnitude. The largest impact arises from north Florida during Average Load, where a loss of all generation in Suwannee County causes a 3.3% rise in system-wide line utilization (14.1% above Base Case). During Winter Peak, a loss of Escambia County's generation in the western Panhandle has the highest congestion impact, while during Summer Peak the biggest pain point shifts to south Florida with the loss of all generation in Broward County, the 2nd-most populous in the state. We see the highest share of lines (9.4%) exceeding 80% utilization in this instance.

South Florida remains the source of greatest system cost impacts, with larger cost increases compared to the loss of a single generator. The biggest jump occurs when Palm Beach County loses its generation during Summer Peak: This drives nearly $4 million in added cost, nearly double the Base Case. Palm Beach is home to the West County combined cycle facility, Florida's largest power plant by capacity. During Average Load, the largest increase occurs when St. Lucie County's generation (led by the St. Lucie nuclear plant) goes offline while during Winter Peak, losing Miami-Dade County's generation (led by the Turkey Point nuclear plant) drives the largest increase. This highlights south Florida as not just the highest load area but a critical source of generation.

County Disaster

We further expand the scope of the extreme event considered in the All Generator Loss scenario, removing all load and transmission resources in the county as well. This simulates a total localized disruption to the system where no power flows out of or into the county. Again, the sources of greatest reliability stress are geographically diverse whereas the sources of greatest economic stress are concentrated in south Florida. While there is less load to serve in this scenario, the loss of generation and transmission assets outweighs it and results in negative system impacts across the board.

The largest impact on system congestion occurs during Winter Peak where a total system outage in east central Florida's Orange County, home to Orlando, increase system-wide line utilization by 3.8% (16.5% above Base Case). A total outage in south Florida's Martin County drives the highest increase under Average Load, while during Summer Peak a loss of Taylor County's system in north Florida's Big Bend region has the greatest impact – and results in the largest share of lines (9%) above 80% utilization.

With regard to system cost, the largest increase results from total system loss in Palm Beach County during Summer Peak, driving an additional $4.7 million in cost (nearly 2.2 times the Base cost). An outage in this county is also the costliest during Winter Peak, while during Average Load an outage in St. Lucie County is most expensive to the system.

Table 2. Largest increase in system constraints by contingency

Scenario	***Largest Increase in Line Utilization***	***Largest Increase in Production Cost***
LL-AVG	Hillsborough – Pinellas (230 kV)	*Unchanged*
LL-SUM	Wakulla – Franklin (69 kV)	Palm Beach – St. Lucie (500 kV)
LL-WIN	Wakulla – Taylor (230 kV)	Pinellas – Polk (115 kV)
LS-AVG	Santa Rosa	Tied: 65 counties
LS-SUM	Lafayette	Tied: Miami-Dade, Monroe
LS-WIN	Lafayette	Jefferson

BG-SUM	Pinellas	Miami-Dade
BG-WIN	Leon	Miami-Dade
AG-AVG	Suwannee	St. Lucie
AG-SUM	Broward	Palm Beach
AG-WIN	Escambia	Miami-Dade
CD-AVG	Martin	St. Lucie
CD-SUM	Taylor	Palm Beach
CD-WIN	Orange	Palm Beach

Risk Score

While the County Disaster scenario characterizes the impact of an extreme local event that disrupts power system resources, it does not characterize the extreme weather events that are common in Florida. Hurricanes have regional impacts that span multiple counties and leave differing levels of damage in different places. To move closer toward capturing these circumstances, we develop a set of multi-county scenarios that incorporate county-level risk scores from FEMA's National Risk Index. The risk score is on a scale from 0 to 100, expressing the least to most risk to 18 different natural hazards.

We consider the 12 counties in Florida with the highest scores (all above 98) and divide them into three tiers. Tier 1 includes the counties with the four highest scores, Tier 2 has the four middle scores, and Tier 3 has the four lowest scores. In descending order of risk scores, the 12 counties are:

- Tier 1: Miami-Dade, Broward, Palm Beach, Hillsborough
- Tier 2: Lee, Brevard, Pinellas, Pasco
- Tier 3: Collier, Orange, Manatee, Sarasota

Three of the Tier 1 counties are in southeast Florida, five counties are in west central Florida, two counties are in southwest Florida, and two are in east central Florida.

The Risk Score analysis covers two distinct scenarios: One where the above counties have a simultaneous loss of generation (Scenario A), and one where they have simultaneous loss of generation, load, and transmission (Scenario B). Like the All Generator Loss vs. County Disaster scenarios, the distinction between Risk Score Scenarios A and B is a partial loss vs. total loss of power system assets.

We model each scenario at three different outage levels (Levels 1-3) as outlined in Table 3:

Table 3. Description of Risk Score Scenarios

Scenario	***Outage Type***	***Tier 1 Outage Level***	***Tier 2 Outage Level***	***Tier 3 Outage Level***
1A	Generation	40%	0%	0%
2A	Generation	70%	40%	0%
3A	Generation	100%	70%	40%
1B	Generation + Transmission	40%	0%	0%
2B	Generation + Transmission	70%	40%	0%
3B	Generation + Transmission	100%	70%	40%

These scenarios are meant to represent extreme weather events of varying severity, with Scenario 1A/1B being a less intense storm that only damages the most at-risk counties to a

limited extent, and Scenario 3A/3B being the most intense storm that damages all the high-risk counties to an extent that differs by their risk score.

The results of the Risk Score scenarios are summarized below, with full results reported in Appendix B.

For outages that only include power generation, system congestion during Average Load increases from an additional 0.2% in Scenario 1A to an additional 7.3% in Scenario 3A. Winter Peak it is more modest, increasing from an additional 2.9% to 3.6% between these scenarios. During Summer Peak the impact is most pronounced in Scenario 1A, where line utilization rises by 3.6%, with a smaller increase in higher-outage scenarios.

As generation losses increase over a larger geographic area, production costs rise across all load conditions. During Average Load the system cost increases go from $55,000 to $1.3 million from Scenario 1A to 3A (from 5.4% above the Base Case to more than doubling). During Winter Peak the cost increase jumps from $1.1 million to more than $13.3 million between the lowest- and highest-outage scenarios (from 37.8% above the Base Case to a more than fivefold increase). Outages during Summer Peak bring about the largest system cost increase of any scenario and load case, rising from an additional $3.7 million to $17.1 million between Scenarios 1A and 3A (from 93.9% above the Base Case to a more than fivefold increase).

When we remove load and transmission in addition to generation, the outcome changes considerably. Congestion levels either fall or increase similarly, while system costs either fall or see much smaller increases, compared to scenarios where only generation is lost. This is due to reduced load in this second set of scenarios – most of Florida's large population centers (e.g., Miami, Tampa, Orlando) are removed, so even though less generation is available it is offset by the drop in demand.

During Average Load, system congestion falls by 0.9% in Scenario 1B but rises by 2.5% in Scenario 2B as more generation goes offline. In comparison, Winter Peak congestion rises by 2% and then 4%, and Summer Peak congestion rises 1.5% and then 3.8%. System cost decreases during Average Load across all three outage levels, while Winter Peak and Summer Peak costs increase modestly at the lowest and highest outage levels. However, peak-hour production costs *decrease* at the middle outage level.

We recognize there are various ways to analyze extreme weather impacts on the power system. Our method benefits from a simple design that incorporates a regional scope and geographically varied risk of damage from extreme weather, focused on locations that are vulnerable to greatest losses. It is meant as a starting point to expand the discussion about the vulnerability of Florida's grid to natural hazards and options to improve grid resilience in these conditions, including the use of transmission solutions. As highlighted in Order No. 1920, regional transmission solutions may reduce system congestion and production costs that result from outages induced by extreme weather, accruing a tangible system

benefit. We encourage additional effort to calculate the potential value of this benefit by assessing the system costs of extreme weather contingencies.

Future work could build on this analysis by incorporating more tiers that subject more (or all) Florida counties to losses, rather than treat the remaining counties as unaffected. It could choose or develop a different dataset to identify relative risk of natural hazards across the state. For example, it could: Use a unit other than counties; calculate risk based on how often a location has been affected by stronger hurricanes (e.g., Category 4 and 5); or use a different historical lookback to calculate risk. It could make different assumptions about which system assets are lost depending on the severity of conditions.

Insights

Our evaluation finds a clear set of reliability transmission needs that can be addressed, at least partly, by regional transmission solutions. We find that congestion hotspots appear in a north-to-south corridor along the Peninsula. Congestion in these areas is higher during peak hours, and the hotspots expand during outage situations. During normal operations (the Base Case), 18 county-to-county interfaces experience line loading of more than 80% under at least one load condition. North central Florida has the most with six interfaces. North, west central, and southwest Florida each have four such interfaces, while southeast Florida has three.

Under contingencies, each of these regions sees additional interfaces become stressed, especially in west central and north central Florida. The eastern Panhandle also sees an uptick in congestion during contingencies, which may owe to less power system capacity being available in this region to manage topology changes. Broadly, the locations of greatest congestion suggest a constrained path that extends from Florida's northern Peninsula to its heavily populated southern tip, by way of the state's west coast (including the populous Tampa Bay area and fast-growing southwest counties). **Every scenario results in a reliability violation on at least interface** that reaches 100% loading. Appendix E provides a full accounting.

Tables 4-6 provide breakdowns of congestion results:

- Table 4 reports where heavily congested interfaces (i.e., at or above 80% utilization) are located by geographic region and load case. Florida is split into 10 regions for this purpose. Because different regions have different numbers of interfaces, Table 4 also provides the total instances of congestion in each region as a percentage of all possible outcomes where congestion could occur. Each interface has 36 total outcomes across all scenarios. This provides two ways to look at which regions are experiencing the most congestion.
- Table 5 provides a key that explains the color scheme that Table 4 uses.
- Table 6 shows which interfaces experience heavy congestion (more than 80% loading) the most often.

Table 4. Number of Congested Interfaces by Geographic Region and Load Case

Region	***Number of instances***				
	Average Load	Summer Peak	Winter Peak	**TOTAL**	Total as % of Possible Instances
Southeast	22	31	17	70	21.6
Southwest	22	41	29	92	25.6
West Central	24	50	46	120	13.9

22	Hendry-Palm Beach	Southwest, Southeast
21	Miami-Dade–Palm Beach	Southeast
20	Hardee-Highlands	West Central

The *source* of congestion varies across the state, depending on the type of contingency and the load case in which it arises. As for where congestion appears, it is not necessarily most severe at the source. It can arise far from the source and is not concentrated in a single region.

Meanwhile, contingencies that occur in south Florida consistently have the greatest impact on system cost. Of the 14 scenarios listed in Table 2 in which system production cost increases, south Florida contingencies produce the largest increase in 11 of them. As the state's primary load center and significant source of power generation, economic vulnerability is concentrated in south Florida and becomes most pronounced when the system is heavily loaded.

Extreme weather produces the most significant impact on system performance among the scenarios tested, though the volume of impact depends on the type of losses incurred. Where high-risk areas lose their generation but their load remains available for service, there are opportunities for transmission solutions to reduce the cost of service while minimizing outages in these communities. Whether the solution is new or enhanced transmission in optimal locations, growth of distributed energy resources in high-risk communities, or another alternative, it is a critical area of study to safeguard Florida's grid – and the residents it serves – from natural disasters that are all too familiar.

4.3. Current State: Solution Analysis

We look next to solutions that can reduce the system stress identified above and blunt the impact of contingencies that occur. We test three different transmission solutions and evaluate their effect on system reliability and economic performance, through the line utilization and production cost metrics used in the contingency analysis.

With respect to reducing congestion, the most beneficial transmission investments vary in their location by solution type and load case, as shown in Table 7. However, a more consistent geographic pattern emerges when seeking the largest economic benefit: These transmission solutions tend to involve south Florida as well as the Tampa Bay area (west central Florida). Of the eight instances that produce a distinct top candidate for reduced production cost, five include south Florida and the other three include the Tampa Bay area.

Line Expansion

We add 300 MW of capacity to an existing transmission corridor. Transmission line upgrades have lower project costs than comparable new-build transmission lines because the developer does not need to acquire a new right-of-way. We do not define an exact method to achieve this capacity increase, though we assume the most likely method is to construct a new parallel line in the existing corridor. Capacity may also be increased by reconductoring with high-performance conductors that increase thermal limits, or through voltage uprating (i.e., putting in a higher-voltage line) where existing structures and

clearances permit. Both options can save additional project cost by allowing developers to use existing tower infrastructure. Regardless of method, line expansion can provide a significantly cheaper alternative.

The most impactful line expansion for reducing Florida's system congestion, relative to the Base Case, is to upgrade the 138 kV Hendry-Palm Beach line. This is among the most frequently congested lines across the base and contingency scenarios. Expanding this line yields a 5.6% reduction in line utilization (23.9% below the Base Case) during Average Load. Each of the two 115 kV Pinellas-Polk lines are the best candidate during Summer Peak, while an expansion of the 115 kV Brevard-Seminole line is best during Winter Peak (and results in the lowest share of lines exceeding 80% utilization).

Summer Peak sees the largest potential reduction in system cost, when the 500 kV Miami-Dade–Palm Beach line is expanded. This lowers system cost by $500,000 per hour, or 12.5% below the Base Case cost. During Average Load the Hendry-Palm Beach line is the only one where an expansion lowers the system cost, which indicates that the system has enough headroom during normal hours such that adding 300 MW of power transfer does not alter system operation. For Winter Peak an expansion of the two Pinellas-Polk lines achieves the lowest-cost outcome.

Dynamic Line Rating

DLR devices are installed on transmission lines to take readings of local ambient conditions (e.g., temperature, wind, line sag) that affect power-carrying capacity and adjust the line's capacity in real time. Though DLR typically does not offer as large a capacity increase as reconductoring, voltage uprates, or building a new line, it can be an attractive option where the demand increase or need for congestion alleviation is smaller. As opposed to traditional static line ratings, which tend to be conservative and limit power flow, DLR gets more capacity out of affected lines as ambient conditions change. This allows greater power transfer (generally, 10-30% more) on existing corridors at lower investment cost than other transmission expansion projects. For our model, we assume a 15% increase in capacity due to DLR, because Florida is warmer and less windy than average.

The results of our DLR analysis are similar to the Line Expansion scenario. Applying DLR to the Hendry-Palm Beach line provides the greatest congestion relief, reducing line utilization during Average Load by 5.4% system-wide (proportionally, 23.1% below Base Case). During Summer and Winter Peak the lowest congestion comes from adding DLR to the 230 kV DeSoto-Lee line, which also leads to the lowest share of lines that exceed 80% utilization.

The largest impact on system cost occurs during Summer Peak when we apply DLR to the Hendry-Palm Beach line. This drops the production cost by $573,000 (-14.3%). This same line produces the lowest system cost during Average Load, but is the only line where DLR

makes a difference for this load case. Adding DLR to the two Pinellas-Polk lines produce the lowest cost during Winter Peak.

New Connection

Building a new greenfield transmission line can be the most attractive solution when the need for power transfer or the benefit to ratepayers is large enough. New connections are typically the most expensive option because none of the required elements exist yet. Developers must acquire and prepare new right-of-way, construct new towers (and possibly new substations), and string the lines. But greenfield transmission also offers the most freedom to pursue grid reliability and economic performance goals: It is not yet limited by existing space, infrastructure, or capacity constraints that appear in other solutions. For our model, we assume a new 230 kV line with 600 MW of power flow. 230 kV represents a typical long-distance line within Florida today. Our analysis offers evidence that new corridors can provide worthwhile congestion and cost reduction benefits for Florida's grid today and in the future.

Consistent with the other solutions, we see the largest decrease in system congestion during Average Load, with a new corridor between Alachua and Manatee County. This drives down line utilization by 7.8% (proportionally, 33.3% below Base Case). During Summer Peak, a new corridor from Calhoun to Highlands County is most impactful, while a new corridor from Jefferson to Okeechobee County is best during Winter Peak.

The impact on system cost is again more pronounced during peak hours. The largest cost decrease occurs during Summer Peak, where a new line from Bay to Miami-Dade County sees a reduction of $567,000 per hour (14.1% below Base Case). For Winter Peak, the lowest cost is a new line from Escambia to Pinellas County. The cost decrease during Average Load is much smaller, such that 127 different lines could achieve this same cost reduction. As with enlarging capacity on an existing corridor, building a new one appears to have limited economic value during Average Load in today's system. That assessment changes when examining the system in 2035, as we will see later.

This transmission solution exhibits the most potential grid improvements across the state. New inter-county connections can enhance power system flexibility in both rural and urban areas depending on system conditions. It is noticeable that top candidates are long-distance lines, especially Bay to Miami-Dade and Escambia to Pinellas, that connect regions of Florida that are far apart. It suggests new transmission paths can yield economic gains beyond the south Florida bottlenecks by enabling long-range power transfers, and points to the greater reliability and economic gains available when more regional transmission options exist to deliver power farther away.

Table 7. Best solutions by scenario and performance metric

Scenario	*Largest Decrease in Line Utilization*	*Largest Decrease in Production Cost*
LE-AVG	Hendry-Palm Beach (138 kV)	Hendry-Palm Beach (138 kV)
LE-SUM	Pinellas-Polk (115 kV)	Miami-Dade–Palm Beach (500 kV)
LE-WIN	Brevard-Seminole (115 kV)	Pinellas-Polk (115 kV)
DLR-AVG	Hendry-Palm Beach (138 kV)	Hendry-Palm Beach (138 kV)
DLR-SUM	DeSoto-Lee (230 kV)	Miami-Dade–Palm Beach (500 kV)
DLR-WIN	DeSoto-Lee (230 kV)	Pinellas-Polk (115 kV)
NC-AVG	Alachua-Manatee	Tied: 127 lines
NC-SUM	Calhoun-Highlands	Bay–Miami-Dade
NC-WIN	Jefferson-Okeechobee	Escambia-Pinellas

Insights

Our analysis shows that these transmission solutions can deliver significant reliability benefits to Florida's grid, especially during normal conditions. We see large reductions in system congestion under Average Load for each scenario, which suggests that these solutions can help grid operators to alleviate at least some of the reliability constraints we see today. These solutions can also deliver significant economic benefit to today's grid during Summer Peak hours, when system resources are most strained. It is also clear that regional, and not just local, transmission projects can help. Some of the top candidate solutions listed in Table 7 are for lines that cover two or more transmission providers.

The results of our solution analysis are not meant to be prescriptive. We recognize that transmission planning is a complex process and that new investments are based on a variety of factors, not all of which we consider. Rather, our intent is to provide a general indicator of what beneficial transmission investment *could* look like in Florida. The optimal outcome depends on the expected needs and system conditions that planners consider most critical to address. Future work could also apply each transmission solution to each contingency scenario to see how much cost it *avoids* in each contingency.

In a recurring theme from the contingency analysis, the most meaningful cost reductions tend to emerge when solutions strengthen south Florida's import capability, especially during Summer Peak. Another takeaway is that adding long-distance regional transmission links can introduce new efficiencies to the Florida power system and deliver lower-cost power to customers. Though new transmission investments typically incur major upfront cost, a careful evaluation of anticipated project benefits – including the benefits listed in Order No. 1920 for evaluating proposed long-term regional transmission projects – can facilitate selection of projects that generate long-term cost savings for Floridians, while developing a more robust definition of what "least-cost" electric service entails.

4.4 2035 Outlook: Base Case Assessment

Next, we look to the future and examine what Florida's electric power system will look like in 2035. Optimal planning requires forecasting how the system will evolve in the years ahead, based on factors that can be identified today, so that projects chosen in the near-term lead to development of grid infrastructure that meets long-term needs. This avoids situations where grid operators must react to new constraints only when they materialize.

As discussed earlier, Florida is undergoing significant shifts in generation and load that are likely to continue, if not amplify. While it relies on natural gas-fired power plants today, utility-scale solar has become the primary form of generation being built. Florida's three largest electric utilities (Florida Power & Light, Duke Energy Florida, and Tampa Electric), which together serve three-quarters of the state's load, have turned to utility-scale solar facilities for most of their planned investment in new generation. In their latest Ten-Year Site Plans (TYSPs), these three utilities collectively plan to build 23.2 GW of new solar capacity by the end of 2034 – more than 2.3 times the amount they had online at the end of 2024. They also plan more than 9 GW of new grid-scale battery storage over this period, primarily to pair with solar facilities; this is about 18 times the amount they had installed at the end of 2024[38]. Based on the TYSPs, it is projected that the share of Florida's electricity that comes from natural gas will fall to 56% by 2034 while the share generated by solar will rise to 28% (from 7% today)[39].

Along with the shift in the state's generation portfolio comes a shift in how its generation resources are distributed geographically. At present electric utilities rely mainly on large thermal power plants (led by gas-fired combined cycle facilities) that are hundreds or thousands of MW each, and which run continuously. In contrast, utility-scale solar facilities tend to be just under 75 MW, a result of Florida's Power Plant Siting Act that streamlines the approval process for facilities below that threshold[40]. This shifting resource portfolio means that Florida is moving from a grid where fewer, larger generators run around the clock to one where a higher volume of smaller, more dispersed units run intermittently, and where grid operators dispatch battery storage assets to help fill the gap.

Florida's future grid will have considerably more locations where energy is injected and will have more generation sourced from rural areas. In just the first three years of the latest TYSPs, rural northern counties will see more than 1.2 GW of solar installed at 17 facilities, while the interior counties of Florida's Peninsula – more lightly populated than its coastal counties – will see more than 1 GW of new solar across 13 sites. Meanwhile, St. Lucie

[38] *Ten Year Power Plant Site Plan, 2025-2034*, Florida Power & Light, April 2025; *Duke Energy Florida, LLC Ten-Year Site Plan, 2025-2034*, April 2025; *Tampa Electric Company Ten-Year Site Plan for Electrical Generating Facilities and Associated Transmission Lines, January 2025 to December 2034*, April 2025.
[39] *State of Florida Supplement to the 2025 Regional Load & Resource Plan*, p. 78. Florida Reliability Coordinating Council, June 2025.
[40] Florida Statutes 403.503(14).

County will add another 447 MW of solar across 6 sites, the 2nd-most of any county; this will expand power flow along the state's southeast coast[41].

Florida's load is also changing. Electricity demand is projected to keep rising as the state's population continues to grow: 6.6% growth at Summer Peak and 14.4% growth at Winter Peak by 2034-35[42]. While most residential buildings already run on electricity, transportation electrification is a fast-growing new source of load as more residents opt to drive electric vehicles. Not only passenger vehicles but also medium- and heavy-duty vehicles are electrifying, as evidenced by school districts and transit authorities around the state that chose to purchase electric buses in recent years. These loads may disrupt electricity usage patterns given their large power draw, varied locations, and time of charging. In addition, large loads – like the hyperscale datacenters discussed earlier – play a rapidly increasing role nationwide as developers look to construct these energy-intensive facilities anywhere the conditions are acceptable. Florida is receiving increased interest from datacenter developers and is striving to push its economy up the world rankings with a more business-friendly climate. It could soon be home to new large loads that alter the power flow landscape.

Lastly, Florida will continue to experience a steady drumbeat of extreme weather events that are becoming even more intense. To that end, transmission planning and investments add value when they reduce grid vulnerability during these events and mitigate congestion and costs during storm-induced outages.

We model Florida's grid in 2035 under the assumption that all new assets listed in the latest TYSPs will come online as planned. For the planned new power generation and battery storage facilities that do not yet have selected sites (including ~22 GW of generation and ~8 GW of storage)[43], we evenly distribute the capacity of each facility across the counties that already have generation in the associated utility's service territory. We also incorporate the load projections in the TYSPs. This provides the most informed picture available on the future state of the grid. The congestion results for the Base Case scenario across each load condition are shown in Figure 7.

Lake	Marion	-240	100.0
Gadsden	Leon	230	100.0

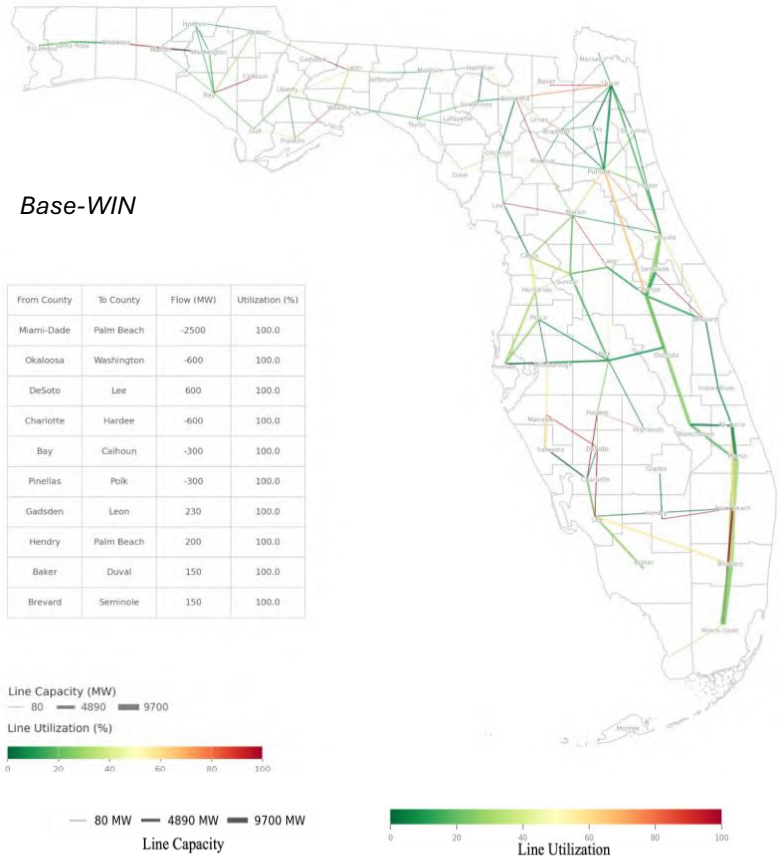

Fig. 7. Three snapshots of the Base scenario in 2035. Base-AVG has a system-wide average line utilization of 29.8% and total hourly production cost of $757,842.33. Base-SUM has an average line utilization of 41.8% and hourly production cost of $6,086,765.36. Base-WIN has an average line utilization of 32% and hourly production cost of $4,672,093.94. In Base-SUM and Base-WIN, battery storage comprises 9.58% and 17.3% of the energy resource mix respectively, an increase that owes to the massive buildout of battery storage facilities under latest TYSPs.

In the 2035 outlook, we see significant increases in congestion across all load conditions. This includes a 15.2% jump during Summer Peak and an 8.9% jump during Winter Peak. The number of lines that exceed 80% or reach 100% utilization also increases significantly. During Average Load, the number of inter-county pairings at or above 100% and between 80-100% of their limit each increases from four to seven, compared to the current state. During Winter Peak, six pairings reach or exceed 100% and 10 pairings operate between 80-100% of their limit, compared to three and eight today. The increase is most pronounced during Summer Peak, where 10 pairings reach or exceed 100% and 16 pairings operate between 80-100% of their limit, up from six and four today. Thus Florida's grid in 2035 will see more reliability violations and more spots where reliability is threatened, compared to today.

We see in Figure 7 how the spatial distribution of congestion expands as we move from today to 2035, with red and orange segments appearing in new places. In the Average Load case, we see the Pinellas-Polk, Hendry-Palm Beach, and Dixie-Taylor interfaces remain

among the most congested while new bottlenecks appear on geographically diverse segments including DeSoto-Lee, Columbia-Duval, Bay-Calhoun, and Gadsden-Leon. In Summer Peak the trend is amplified: The Miami-Dade–Palm Beach, Hendry-Palm Beach, Pinellas-Polk, DeSoto-Lee, Levy-Marion, and Franklin-Wakulla interfaces remain at their limits while the Lake-Marion, Columbia-Hamilton, and Taylor-Wakulla segments become stretched to their limits. These new hotspots cover southwest, west central, north central, and north Florida along with the eastern and western Panhandle. This demonstrates the increased strain that Florida's grid faces in accommodating the topology changes to come and suggests that there is increased value in regional transmission solutions to meet more dispersed long-term needs.

One noteworthy change in the Base Case is that under Average Load in 2035, the system-wide production cost *decreases* by 26.6%. We suggest that because utility-scale solar operates at lower cost than other generation resources on Florida's grid, the addition of significantly more of this resource by 2035 pulls down the average system cost. This does not hold true for peak hours, where system cost rises by 52% during Summer Peak (when the system is most constrained despite the availability of solar resources) and by 62% during Winter Peak (when solar has minimum availability). As we will see later, there are still major opportunities to reduce long-term cost of service through thoughtfully selected transmission investments.

4.5 2035 Outlook: Contingency Analysis

As with the current-state analysis, we assess the resilience of Florida's transmission system in 2035 under the same contingencies. We find significant growth in system reliability needs compared to today. More constraints arise across contingency scenarios, as more reliability violations occur and additional lines experience heavy loading at over 80% of their operating limit.

Congestion increases in all scenarios. Compared to today, during Average Load in 2035 the system experiences higher increases in congestion relative to the Base Case during the Line Loss and Biggest Generator Loss scenarios, along with half the natural disaster Risk Score scenarios. As shown in Table 8, the contingencies that most stress the system occur in myriad locations across northern and central Florida depending on contingency type and load condition.

The 2035 outlook continues to show that contingencies involving south Florida drive the greatest increase in system production cost. St. Lucie, Palm Beach, Miami-Dade, and Monroe counties all feature among the highest-impact results. Compared to today, the magnitude of cost increases relative to the Base Case tends to be higher for Average Load and Winter Peak but more muted for Summer Peak.

The largest impacts in each scenario are reported below. Additional results are reported in Appendices F and G.

Line Loss

The line outage of most consequence for reliability occurs in north Florida's Big Bend region, where loss of the 69 kV line from Dixie to Taylor County during Average Load causes a 5.7% increase in system congestion (proportionally, 19.1% above the Base Case). During Summer and Winter Peak, the highest-impact line outages happen in north central Florida (Sumter-Citrus) and north and northeast Florida (Duval-Columbia) respectively.

The monetary cost of a line outage is much larger compared to today. Whereas today there is no change in production cost for this contingency under Average Load, in 2035 there is. Across all load cases, the costliest outcome is a loss of the 500 kV Palm Beach-St. Lucie line during Summer Peak, which adds more than $1.5 million in cost (+25.7%). This same line is also the most consequential during Winter Peak.

Load Spike

Whereas in the current-state analysis, we see that adding a 100-MW load in the western Panhandle most impacts system congestion during Average Load, in 2035 it is a new 100-MW load in west central Florida. Placing this large load in Pasco County increases system-wide line utilization by 1.3%. During Summer and Winter Peak the highest impact comes from new load in the eastern Panhandle: Leon County in the summer and Jefferson County during winter, which produces the highest share of lines above 80% utilization.

While a new 100-MW load in Alachua County (north central Florida) drives the largest increase in production cost under Average Load, the largest absolute increase in cost would result during Summer and Winter Peak hours by adding this large load in Miami-Dade or Monroe County (south Florida). This adds $100,000 to system cost (+1.6% from baseline for summer and +2.1% for winter).

These are small impacts compared to other contingencies. It suggests Florida's grid is well prepared for the addition of a large load. However, it provides no guarantee that the grid is similarly prepared for multiple large loads in one region or for loads larger than 100 MW.

Biggest Generator Loss

The power plant outages that most impact reliability occur in the northern part of the state. The largest increase results from an outage of Madison County's (north Florida) largest generator during Average Load, which drives a 1.9% increase in system-wide line utilization (proportionally, 6.4% above Base Case). During Summer and Winter Peak, the highest-impact outages come from Duval County (northeast Florida) and Alachua County (north central Florida) respectively.

The greatest increases in production cost are once again due to disruptions in south Florida, specifically the same two power generation facilities as today. The largest single increase across load cases occurs when the Turkey Point nuclear facility in Miami-Dade

County goes offline during Summer or Winter Peak, which adds about $860,000 to system cost during both scenarios (14.1% above Base Case for summer and +18.4% for winter). During Average Load, an outage of the St. Lucie nuclear plant causes the largest system cost increase.

All Generator Loss

Expanding the scope of the generation outage to all power plants within a county, the largest driver of system congestion across all load cases is the loss of Alachua County's generation (north central Florida) during Winter Peak, which triggers a 3.8% increase in system-wide line utilization (11.9% above the Base Case). During Average Load the most impactful outage is in Manatee County (west central Florida), which leads to the highest share of lines operating above 80% of their limit. During Summer Peak the outage occurs in Gadsden County (eastern Panhandle).

During Summer Peak, we see the largest increase in system cost due to a total outage of Palm Beach County's generation – same as today. In 2035 this drives up system cost by nearly $4.3 million (+70.6%). During Average Load and Winter Peak, total generation loss in Miami-Dade County prompts the largest increase in cost. South Florida remains the source of greatest economic stress in this scenario.

County Disaster

When we expand the outage to include all generation and transmission in a county, events in east central Florida increase system congestion the most in two of the three load cases. The largest single increase is a total outage of the power system in Orange County during Winter Peak, which causes system-wide line utilization to go up 6.7% (proportionally, 20.9% above Base Case). During Average Load, an outage in neighboring Osceola County produces the largest increase. During Summer Peak an outage in Bay County (western Panhandle) puts the most additional stress on the system.

The most expensive county outage across all load cases is in Palm Beach County during Winter Peak, which increases system cost by more than $4.5 million (nearly double the Base Case). This outage remains the most expensive during Summer Peak, while a total system outage in St. Lucie County adds the most to system cost during Average Load. This maintains the pattern identified throughout this analysis where outages that occur in south Florida produce the largest economic penalty, as the Florida grid struggles to redistribute resources and serve demand cost-effectively in these situations.

Table 8. Largest increase in system constraints by contingency (2035)

Scenario	***Largest Increase in Line Utilization***	***Largest Increase in Production Cost***
LL-AVG	Dixie – Taylor (69 kV)	Duval – Columbia (230 kV)
LL-SUM	Sumter – Citrus (500 kV)	Palm Beach – St. Lucie (500 kV)

LL-WIN	Duval – Columbia (230 kV)	Palm Beach – St. Lucie (500 kV)
LS-AVG	Pasco	Alachua
LS-SUM	Leon	Tied: Miami-Dade, Monroe
LS-WIN	Jefferson	Tied: Miami-Dade, Monroe
BG-AVG	Madison	St. Lucie
BG-SUM	Duval	Miami-Dade
BG-WIN	Alachua	Miami-Dade
AG-AVG	Manatee	Miami-Dade
AG-SUM	Gadsden	Palm Beach
AG-WIN	Alachua	Miami-Dade
CD-AVG	Osceola	St. Lucie
CD-SUM	Bay	Palm Beach
CD-WIN	Orange	Palm Beach

Risk Score

Where generation is lost but transmission remains available in the 12 affected counties, it places greater strain on reliability during Average Load in 2035 than today, with larger increases in system congestion. It is the same for Winter Peak hours, but the opposite for Summer Peak hours where the impact is less in 2035. Average Load sees higher increases in congestion in 2035 when both generation and transmission are lost during an extreme weather event, but for peak hours the impact is lessened compared to today.

When only generation is lost, the economic impact of this extreme weather event increases for Average Load in 2035 compared to today. Whereas the trend for peak hours is mixed, with the system cost increase generally being lower than today. When both generation and transmission are lost, the cost decreases are higher and cost increases are lower in 2035 than today. In this latter set of scenarios, the loss of load across the 12 counties continues to drive costs *down*, even more so than today.

The results of the Risk Score scenarios are summarized below. Full results are reported in Appendix G.

For generation-only outages, system congestion during Average Load increases from an additional 2.2% in Scenario 1A to an additional 9% in Scenario 3A. Peak hours are more modest. During Winter Peak congestion increases an additional 4% in both lowest- and highest-outage scenarios, and during Summer Peak it falls from a 1.4% to a 1% increase between them.

As generation losses increase, the added production cost rises from $95,000 to more than $4.2 million per hour during Average Load (between Scenario 1A and 3A (i.e., from +12.6% to more than 6.5 times the Base Case). During Winter Peak the cost increase rises from

$3.2 million to $17.2 million between these scenarios (+69.5% to more than 4.5 times the Base Case). During Summer Peak the system cost increase goes from $4.2 million to $19.3 million between the lowest- and highest-outage scenarios (from +69.2% to more than four times the Base Case). The latter is the largest cumulative cost increase in any scenario.

After removing load and transmission along with generation, we see mixed results for congestion impacts and falling system costs. During Average Load, system congestion rises from +1% to +2.7% as the outage spreads. Winter Peak congestion rises from +1% to +1.5%, while Summer Peak congestion falls by 0.1% during the lowest-outage scenario but rises by +1.9% as the outage spreads.

System cost decreases during Average Load at the lowest outage level, but rises 4.6% under the highest outage. During Summer Peak the cost decreases at all outage levels, but falls the most in the middle scenario, while during Winter Peak the cost increases by 0.2% at the lowest outage level but decreases as the outage spreads.

Insights

Florida's transmission system reliability needs grow in 2035, expanding by geography and with more lines becoming constrained and operating at their limits under the scenarios studied. In the Base Case alone, 26 county-to-county interfaces experience line loading of more than 80% under at least one load condition (up from 18 today).As will be discussed in the next section, these reliability needs can be addressed by regional transmission solutions as opposed to strictly local projects. **Every scenario results in a reliability violation on at least four interfaces** due to full loading. More information is available in Appendix G.

We find a growing in 2035 of congestion occurring along a north-to-south pathway spanning the length of the Peninsula through its western half. Compared to the current-day outlook, in 2035 north central and north Florida and even the eastern Panhandle become key chokepoints. Once again, there is more congestion in these areas during peak hours. Out of all scenarios, inter-county pairings exceed 80% of their power flow limit the most times in north Florida, west central Florida, and north central Florida in that order. During Average Load and Summer Peak, north Florida pairings experience the most instances of loading, while during Winter Peak it is west central Florida that sees the heaviest congestion.

Tables 9-10 provide breakdowns of congestion results:

- Table 9 reports the locations of interfaces that are at or above 80% utilization, by geographic region and load case, as well as the percentage of outcomes where this heavy congestion occurs in each region. Refer to Table 5 for the color key.
- Table 10 shows which interfaces experience loading in excess of 80% the most often.

Table 9. Number of Congested Interfaces by Geographic Region and Load Case (2035)

Region	**Number of instances**				
	Average Load	Summer Peak	Winter Peak	**TOTAL**	Total as % of Possible Instances
Southeast	35	32	30	97	29.9
Southwest	34	38	37	109	30.3
West Central	34	59	53	146	16.9
Treasure Coast	7	5	4	16	5.6
East Central	24	43	31	98	13.0
Northeast	36	40	21	97	12.8
North Central	29	62	40	131	13.5
North	66	108	35	209	21.5

Panhandle - East	24	51	23	98	16.0
Panhandle - West	15	30	24	69	7.7

Table 10. Most Congested Interfaces, by Number of Instances at 80% or Above (2035)

Number of Instances	***Interface (County-to-County)***	***Region***
36	DeSoto-Lee	West Central, Southwest
	Alachua-Columbia	North Central, North
35	Baker-Duval	North, Northeast
	Bay-Calhoun	Panhandle – West
33	Hendry-Palm Beach	Southeast, Southwest
	Pinellas-Polk	West Central
	Gadsden-Leon	Panhandle – East
30	Franklin-Wakulla	Panhandle East
	Miami-Dade–Palm Beach	Southeast

These findings reflect the critical position that north central Florida hold within the state, as the gateway between the Panhandle and the Peninsula and where power flow begins to move south toward major demand centers. With more generation (especially solar) slated to come online in northern Florida by 2035, these regions will be called on to move more power, which will put more strain on existing transmission resources. Meanwhile, in west central Florida new generation is growing fast, in part because the state's 3rd-largest utility has a small service territory located entirely within it. High load and geographic constraints around Tampa Bay also contribute to congestion. We also note that while a 500-kV backbone runs the length of Florida's east coast, there is no continuous transmission line of similar capacity to serve demand along Florida's west coast, although population in that corridor has grown substantially in recent years.

Moving south, although southwest and southeast Florida have fewer overall instances of county pairings exceeding 80% of their limit , there are fewer counties in these regions and Table 10 shows that these areas have significantly higher *percentages* of highly constrained pairings than the rest – both around 30% of all possible outcomes. Thus in

south Florida, a higher share of transmission connections become heavily loaded across all scenarios despite a lower volume of connections.

While south Florida will see a higher share of congestion, contingencies that occur in this region continue to have the most influence on Florida's power system production cost. Of the 15 instances listed in Table 8, contingencies in this region drive the largest cost increase in 13 of them. Even with the coming buildout of lower-cost utility-scale solar in areas to the north, south Florida's position as the largest load center and home to several of the state's largest generators means that one adverse event there can have a significant adverse impact on ratepayers.

Despite Summer Peak remaining the most congested load condition in 2035, it is during Winter Peak that contingencies tend to have the greatest impact on system cost. This may owe to the anticipated change in Florida's generation mix. The grid is projected to receive a significantly higher share of generation from utility-scale solar during normal hours, but during Winter Peak hours solar has limited generation capability, for which we accounted by de-rating solar facilities to 10% of their nameplate capacity. As such, contingencies during these hours could further limit access to this lower-cost resource and force operators to call on more expensive generation options.

Lastly, in 2035 extreme weather continues to have the most significant impact on system performance when generation outages occur but transmission remains available. As seen above, the system cost can spike to extremes when catastrophic events produce a widespread generation outage. The Order No. 1920 directive to consider as a benefit of proposed regional transmission projects the degree to which they increase grid resilience to extreme weather events, and reduce the cost of managing outages, is salient in Florida.

4.6 2035 Outlook: Solution Analysis

For the 2035 outlook, we expand our solution analysis to include the top *three* candidates for both system congestion and cost reduction in each scenario. After identifying the candidates, we take the analysis one step farther and calculate the net benefit (in $) of each candidate, so that policymakers have a sense of the economic benefit that ratepayers would receive from the implementation of a particular solution.

As shown in Table 5, the top candidates for reducing system-wide congestion are all over the map depending on the solution type and load condition. But south Florida remains a consistent presence in the top solutions for reducing system cost, as the top economic solutions in eight of the nine instances studied include south Florida counties.

Line Expansion

Under Average Load (LE-AVG), the top two candidates for a 300-MW capacity addition are the two Madison-Jefferson lines, which each drive a 0.7% reduction in system-wide line

utilization. The third candidate is the Jackson-Washington line which brings about roughly the same reduction. The delta is slightly larger in peak hours: During Summer Peak (LE-SUM), expanding the Seminole-Brevard line makes the largest difference, driving a 1.8% decrease in line utilization and resulting in the lowest share of lines exceeding 80% utilization. Each of the two Pinellas-Polk lines provide about the same reduction. For Winter Peak (LE-WIN) the two Pinellas-Polk lines are the best candidate, reducing system utilization by 2%, while the Levy-Marion line is 3rd-best with a reduction of 0.7%.

As in the current state, when focusing on system cost reduction an expansion of the Palm Beach-Hendry line again provides the best result for Average Load. This drives down cost by $16,500 (2.2% below Base Case). The 2nd- and 3rd-best candidates are the Baker-Duval and Alachua-Columbia lines, which respectively reduce system cost by $16,200 (-2.1%) and $13,500 (-1.8%). For both Summer and Winter Peak an expansion of the Palm Beach-Miami-Dade line produces the top economic performance: In summer hours it reduces system cost by nearly $540,000 (-8.9%) and in winter hours by over $542,000 (-11.6%). Tied for the 2nd-best candidates across peak hours are the two Pinellas-Polk lines. During Summer Peak, expanding either one would produce more than $197,000 (-3.2%) in system cost savings, while during Winter Peak they would lower cost by more than $74,000 (-1.6%). It is worth noting that all the lines that would produce the most cost savings in the LE scenario are also the most heavily loaded during the Base Case scenario. Adding new capacity to these corridors provides significant economic benefit as well.

We next calculate the economic benefit from expanding the top-candidate lines. First, we estimate the cost of each project using line length (in miles) as the variable. For Line Expansion we use a cost factor of $2.5 million per mile. This is adapted from Florida Power & Light's most recent cross-county transmission project, the Sweatt-Whidden line, that required approval under Florida's Transmission Line Siting Act. The Sweatt-Whidden project converted 59 miles of an existing 69-kV line to 230 kV, constructed ~20 miles of new 230 kV line, and rebuilt or converted four substations. The project's total length of 79 miles and estimated cost of $213.5 million equates to ~$2.7 million per mile[44]. We adjust this value to $2.5 million per mile in our calculation because only ~75% of the Sweatt-Whidden project used an existing right-of-way, as opposed to 100% in the LE scenario. We leave room for other factors (e.g., construction of new towers, variable materials and administrative costs) that could increase project cost in the LE scenario compared to the Sweatt-Whidden project. We believe our cost factor to be conservative (i.e., the cost may well be lower in practice).

Second, we calculate the total economic benefit of the line expansion. We take the hourly cost difference compared to the Base Case and multiply it by 8,760 hours to determine the annual cost savings. We then multiply by 20 years to account for the length of time over

[44] *Petition for Determination of Need for Sweatt-Whidden 230 kV Transmission Line in Okeechobee, DeSoto, Highlands, and Glades Counties, by Florida Power & Light Company*. Florida Public Service Commission Docket No. 2022-0045, April 1, 2022.

which the benefit will be accrued. This is likely conservative as well: Transmission assets are typically in service for much longer than 20 years, and other planning regions use longer time horizons (up to 40 years) to calculate the total benefits of regional transmission projects. Here we use 20 years to align with the 20-year planning horizon of Order No. 1920.

Lastly, we subtract the project cost from the total benefit to determine the net economic benefit of the project. This represents savings to ratepayers over the 20-year time horizon. Note that we only make this calculation for the top solutions under Average Load. Because Summer Peak and Winter Peak only comprise a fraction of hours in a year, the process of calculating the benefit under these load conditions is more difficult and likely more subjective.

Applying these calculations to the top Average Load performers in the LE scenario, we find that adding 300 MW to the Palm Beach-Hendry line would produce more than $2.85 billion in net benefit over 20 years. The Baker-Duval line would produce $2.82 billion in net benefit over that timeframe, while the Alachua-Columbia line would produce over $2.34 billion in benefit. We do not include results for the top candidates that reduce congestion in the LE scenario: Because expanding these lines does not change the system cost from Base Case, they will not produce economic benefit.

Dynamic Line Rating

Applying DLR to existing lines tends to produce smaller reductions in system-wide utilization and system cost than a line expansion, which aligns with the lesser scale of the change being made. For Average Load (DLR-AVG), the Jackson-Washington line produces the best system congestion reduction from DLR – a drop of 0.6%. Tied for 2nd with a 0.4% decrease are the Pinellas-Hillsborough and Hillsborough-Pinellas lines, showing the opportunity for DLR to reduce line loading by targeting the Tampa Bay load center. These three solutions lead to the lowest share of lines that exceed 80% utilization. During peak hours, the Levy-Marion line has the best impact on congestion. At Summer Peak it reduces system line utilization by 0.7%, and at Winter Peak by 0.2%, when DLR is applied to it. During DLR-SUM the 2nd-best solution is the Palm Beach-Miami-Dade line, which reduces utilization by ~0.7%, and the 3rd-best solution is the Marion-Lake line with a 0.4% reduction. During DLR-WIN the two Pinellas-Polk lines come in 2nd and 3rd for impact, each reducing system-wide utilization by 0.2%.

Under Average Load, adopting DLR along the Duval-Columbia line produces the lowest system cost with a reduction of $5,600 (0.7% below Base Case). This is the only instance in which the solution for lowest system cost comes from outside south Florida. The 2nd- and 3rd-best economic solutions for Average Load are the Alachua-Columbia and Palm Beach-Hendry lines, which reduce system cost by $4,400 (-0.6%) and $2,200 (-0.3%) respectively. During both Summer and Winter Peak, applying DLR to the Palm Beach-Miami-Dade line results in the least cost, with an $892,000 drop in summer (-14.7%) and a $1.3 million drop

(-28.5%) in winter. At Summer Peak the 2nd- and 3rd-best solutions are the DeSoto-Lee and Levy-Marion lines, which cut the system cost by $38,000 (-0.6%) and $28,000 (-0.5%). At Winter Peak, the DeSoto-Lee line is again the 2nd-best option for DLR, reducing production cost by $57,000 (-1.2%). The Seminole-Brevard line is 3rd-best with a reduction of over $13,000 (-0.3%).

We follow the same process to calculate the net benefit of DLR solutions as for Line Expansion, except the cost factor changes. Adding DLR devices to a line is much cheaper than adding a new line or new towers, much less acquiring new right-of-way. We use a cost factor of $50,000 per mile in this scenario[45]. Looking specifically at Average Load cases, we calculate a net benefit of $984.7 million over 20 years from applying DLR to the top economic solution (Duval-Columbia). The Alachua-Columbia and Palm Beach-Hendry lines see net benefits of $784 million and $384.7 million over that timeframe. Once again, we do not include calculations for the top congestion-reducing solutions because they do not change the system cost.

Because heavy congestion is concentrated along certain transmission corridors rather than being widespread across the state, and because near-term demand is not predicted to spike by abnormal amounts in any area, Florida's transmission planners may find DLR and other grid-enhancing technologies to be an attractive option to increase system efficiency and reduce cost to serve. DLR has a lower upfront cost than other transmission investments, which is likely to interest utilities caught between the need to upgrade grid infrastructure and the obligation to limit impacts on ratepayers. Despite their smaller individual impacts on capacity, there is a clear opportunity for significant efficiency and economic gain by applying DLR to select corridors.

New Connection

We find that the largest potential benefits come from the construction of new transmission corridors, despite their high upfront cost. This solution presents the opportunity to reap the most impact on power system performance from individual projects. Though they require coordination between multiple transmission providers, the collaborative forum created by the Florida Reliability Coordinating Council offers a head start to plan these investments smoothly and effectively.

With respect to impacts on system-wide line utilization, the results are promising. During Average Load (NC-AVG), a new corridor between Dixie and Duval County across the northern Peninsula creates the biggest drop in utilization of 3% (proportionally, 10.1% below Base Case). The 2nd-best solution, a line from Duval to Hendry County, also provides a roughly 3% congestion decrease. A shorter line from Hendry to Highlands County in the state's lower middle would drive a 2.9% drop in system congestion. During Summer Peak (NC-SUM) we see the largest potential decreases in system-wide utilization, and we see

[45] *Dynamic Line Rating*. U.S. Department of Energy, June 2019.

two of the most ambitious projects that would run from the Panhandle to south Florida. Those are lines from Gadsden to Miami-Dade County, which would lower system utilization by 6.8% (proportionally, 16.3% below Base Case) and a line from farther west in Bay County to Miami-Dade, which would lower utilization by 6.2% (-14.8% proportional to Base Case). The model also poses a shorter-distance alternative: A new line from Lake to Wakulla County that would also reduce utilization by 6.2%. During Winter Peak (NC-WIN) we see several more long-distance projects. The top new line from Escambia to Pinellas County (connecting the Pensacola area to Tampa Bay) would reduce system congestion by 1.3%, while lines from DeSoto County to Gulf and Jackson County respectively would reduce congestion by 1.2% each.

With respect to impact on system production cost, the results are also promising – though the top projects are ambitious in scope. All the top solutions include Miami-Dade County as an endpoint, with the other endpoint located in the Panhandle or North Florida. Here the model highlights the importance of increasing power flow between north and south Florida as a pathway to improve system efficiency. During Average Load, the most impactful solution is Calhoun to Miami-Dade, which nets a $31,800 reduction in system cost (4.2% below Base Case). In 2nd is Jackson to Miami-Dade followed by Washington to Miami-Dade; these two new lines would each capture about $31,500 in cost savings (-4.2%). During Summer Peak, we see the potential gains increase. A new line from Baker to Miami-Dade is the most impactful, achieving over $625,000 in cost savings (-10.3%) with a 1.8% decrease. A new line from Bay to Miami-Dade brings the 2nd-lowest system cost with a $594,000 drop (-9.8%), while the new Jackson to Miami-Dade line is 3rd with an associated decrease of $590,000 (-9.7%). During Winter Peak, similar corridors produce the largest reductions in system cost relative to the Base Case. Same as Average Load, the top solution is Calhoun to Miami-Dade which achieves a $595,000 reduction in system cost (-12.7%), while the 2nd- and 3rd-choice new lines are Jackson to Miami-Dade and Bay to Miami-Dade which lower system cost by $590,000 and $587,000 respectively (-12.6%).

The New Connection scenario presents the highest costs for individual projects, but it also offers the largest net benefits of all solutions studied. We calculate net benefit in the same manner as previously described, but with a different cost factor. We use a cost factor of $4 million per mile to determine the cost of greenfield transmission projects. This is based on the most recent new-build long-distance transmission project in Florida, which is Florida Power & Light's North Florida Resiliency Connection (NFRC). This 176-mile line connects FPL's non-contiguous service territories in the western Panhandle and Peninsula at 161 kV. Its estimated cost, reported as a cumulative present value revenue requirement, was $722 million[46]. This equates to ~$4.1 million per mile. We adjust that slightly, recognizing that project developers may be able to utilize existing rights-of-way for segments of these new-build projects.

[46] *Petition by Florida Power & Light Company for Base Rate Increase and Rate Unification, Direct Testimony of Dr. Steven R. Sim*. Florida Public Service Commission Docket No. 2021-0015, March 12, 2021.

The top solutions under Average Load realize large net benefits in almost every instance. As the most cost-effective, the Calhoun to Miami-Dade line captures $3.83 billion in net benefit, followed by the Jackson to Miami Dade line ($3.7 billion) and Washington to Miami-Dade ($3.66 billion). Even among the top solutions for congestion reduction under Average Load, the 2nd- and 3rd-choice lines are still cost-effective: The Duval to Hendry line nets $556 million in benefit, and the Hendry-Highlands line nets $912.2 million. The latter shows that a shorter new-build (though still longer-distance than recent transmission projects in Florida) can drive considerable cost savings for ratepayers even if utilities choose not to build a more ambitious project.

Table 11. Best solutions by scenario and performance metric

Scenario	***Largest Increase in Line Utilization***	***Largest Increase in Production Cost***
LE-AVG	Madison – Jefferson (115 kV)	Palm Beach – Hendry (138 kV)
LE-SUM	Sumter – Citrus (500 kV)	Palm Beach – Miami-Dade (500 kV)
LE-WIN	Seminole - Brevard (115 kV)	Palm Beach – Miami-Dade (500 kV)
DLR-AVG	Jackson – Washington (115 kV)	Duval – Columbia (230 kV)
DLR-SUM	Levy – Marion (69 kV)	Palm Beach – Miami-Dade (500 kV)
DLR-WIN	Levy – Marion (69 kV)	Palm Beach – Miami-Dade (500 kV)
NC-AVG	Dixie – Duval	Calhoun – Miami-Dade
NC-SUM	Gadsden – Miami-Dade	Baker – Miami-Dade
NC-WIN	Escambia – Pinellas	Calhoun – Miami-Dade

Insights

The results show that even where Florida's transmission system does not violate reliability standards, there are still opportunities to build a system that can be operated at lower cost. Moreover, when applying the same infrastructure solutions today and in 2035, we find that the top projects can drive greater reductions in hourly system cost relative to the Base Case in 2035. By modifying their current approach to calculating the benefits of regional transmission projects and the time horizon over which those benefits are considered, planners can select infrastructure investments that deliver stronger regional linkages, more economic dispatch of power, and a new set of least-cost outcomes to ratepayers.

Planners may want to consider whether a portfolio of projects can, in combination, deliver the greatest net benefit as opposed to evaluating individual projects separately. The net benefits for each project above can be increased through a strategically distributed set of investments. Planners also have more solutions to consider than the ones we study here. Options like high-performance conductors, advanced power flow control, and expansion

of the interregional transmission network are discussed in the next section on Future Work. They could prove to be equally or more beneficial.

We emphasize that despite the upfront cost of these solutions, especially new greenfield lines, the long-term savings to operators and ratepayers can far outweigh the cost. Today grid operators optimize their own systems to ensure they can serve internal demand cost-effectively. However, they can unlock greater efficiency by aiming for state-wide optimization. Coordinated projects (involving two or more transmission providers) can deliver even more cost-effective operation, and cement Florida's leadership in providing affordable, resilient power to residents and businesses.

5. Future Work

While this analysis takes a wide view of Florida's transmission system performance in its current configuration and how it will change by 2035, planners can gain a more robust set of insights by evaluating several additional elements that help them meet the long-term regional transmission planning goals set in Order No. 1920:

Longer Time Horizon for Analysis

Order No. 1920 requires a 20-year planning horizon. While the 2035 outlook provides a medium-term picture of new challenges and geographic shifts in congestion and the future resource mix, studying a 20-year outlook will align the results with Order No. 1920 planning principles and better capture the arc of change in those factors (e.g., decarbonization, electrification, population growth, and the growth of new industries) that affect Florida's long-term grid needs. Using 2050 as the analysis year may be appropriate, when considering that Florida utilities' first Order No. 1920 planning cycle will not commence until at least 2027 and the cycle will take at least three years to complete. In addition, the three FERC-jurisdictional Florida utilities have net-zero generation goals of 2045 or 2050.

Study Additional Transmission Technologies

An emerging class of technologies presents less expensive alternatives for transmission providers to meet power demand more efficiently without building new greenfield lines or upsizing existing corridors. These are termed "alternative transmission technologies" (ATTs) in Order No. 1920, which requires providers to consider them as options to resolve long-term transmission needs.

ATTs include "grid-enhancing technologies" (GETs) that get more capacity out of the same lines with real-time optimization. GETs include dynamic line rating and transmission switching, which we address in this analysis. They also include **advanced power flow control** (APFC), which deploys substation-level devices to re-route power flow to less congested lines and better utilize existing assets. APFC should be included as a solution option in any subsequent analysis.

Likewise, advanced or **"high-performance" conductors** (HPCs) should be included as a solution option. HPCs use non-conventional design in their conductor cores that lets them carry more power than conventional conductors, without increasing the voltage. This means a less expensive reconductoring project with significant returns on power flow expansion capability. We did not consider the application of HPCs in this analysis, but they offer potentially greater capacity increase than is achieved in the Line Expansion scenario – at less cost.

Explore Interregional Transmission Opportunities

While Florida is primarily surrounded by water, it does share a long border with Georgia and Alabama to the north, whose common provider (Southern Company) belongs to the Southeastern Regional Transmission Planning (SERTP) region. The FRCC region shares a number of ties with Southern across this interface, with ~400 MW of firm import capability contracted today.

Though this analysis does not include Florida's interregional ties with SERTP, they are important to consider when determining how best to configure the state's transmission system to meet future demand at least cost to customers. Under Florida's current planning paradigm, utilities may not see a need to draw on interregional transfers to maintain system reliability. However, relying solely on in-state generation to balance the system may not be the least-cost or most efficient way to meet demand. It is an unknown that deserves further assessment.

Expand Analysis of Extreme System Conditions by Evaluating the Impact of Gas Supply Disruptions

Because Florida produces virtually no gas in-state, it must import all the gas burned in its power plants. It relies on three major pipelines – Florida Gas Transmission, Gulfstream, and Sabal Trail – for these imports. Florida Gas Transmission is the predominant supplier for most Florida gas power plants: 64 of the 70 utility-owned gas plants in the state[47]. A pipeline outage or limitation would leave Florida consumers at high risk of power outages, given the state's dependence on gas for electricity.

Dependence on an externally sourced fuel is a risk to Florida's generators. To date, there has been no significant disruption to the state's gas supply. However, history cannot be an excuse to forego assessment of future risk, particularly as other risks from cyber and physical attacks as well as natural disasters increase. Subsequent analysis should evaluate the impacts to Florida's transmission system if one or more of its gas supply pipelines (especially Florida Gas Transmission) experiences a major service disruption, which could force multiple gas-powered generators offline. Resilience should be tested to see if the existing system is prepared to handle such an outage or whether a new transmission project could maintain reliability in such scenario.

[47] *Form EIA-860: Annual Electric Generator Report*. U.S. Energy Information Administration, 2025.

6. Conclusion

This study provides the first comprehensive statewide assessment of Florida's electric transmission system under two timeframes: Today and in 2035. It integrates county-level power system data and detailed network modeling across normal operation and plausible contingency scenarios. We gauge its performance on both reliability and cost metrics under these conditions. Our analysis identifies that while the system is generally robust on a reliability basis, constraints emerge in certain regions and especially during peak hours. Key corridors are highly congested across the northern and western Peninsula as well as south Florida, with this trend growing in 2035. Meanwhile, south Florida's dependence on a limited high-voltage backbone serves as both a key pain point and economic opportunity. So too does the Panhandle's vulnerability due to sparse connectivity.

Our analysis of solution-driven scenarios demonstrates that expanding the capacity of existing corridors, applying DLR, and constructing new inter-county lines can significantly improve operational efficiency and system resilience. They can be particularly impactful in reducing cost to ratepayers, and most impactful where the solution serves south Florida.

These results are not meant to prescribe a specific course of action for Florida's transmission planners. They are meant to show planners the opportunity for transmission system optimization that can be revealed by taking a more integrated, holistic approach to analysis and planning than is currently enshrined in Florida's RTPP. We invite planners to consider how this analysis can help increase benefits to both reliability and ratepayers, as they prepare the grid for rapidly evolving challenges in coming years.

Summer peak	Broward	29.6	+3.0	+11.3
Winter peak	Escambia	26.2	+3.1	+13.4
Loss of most consequential county's generation + transmission				
Average load	Martin	27	+3.6	+15.4
Summer peak	Taylor	29.3	+2.7	+10.2
Winter peak	Orange	26.9	+3.8	+16.5
Natural Disaster: Tier 1, Generation loss only				
Average load	-	23.6	+0.2	+0.9

Summer peak	-	30.2	+3.6	+13.5
Winter peak	-	26	+2.9	+12.6
Natural Disaster: Tier 1-2, Generation loss only				
Average load	-	26.6	+3.2	+13.7
Summer peak	-	29.5	+2.9	+10.9
Winter peak	-	26.6	+3.5	+15.2
Natural Disaster: Tier 1-3, Generation loss only				
Average load	-	30.7	+7.3	+31.2
Summer peak	-	29.8	+3.2	+12.0
Winter peak	-	26.7	+3.6	+15.6
Natural Disaster: Tier 1, Generation + transmission loss				
Average load	-	22.5	-0.9	-3.8
Summer peak	-	28.1	+1.5	+5.6
Winter peak	-	25.1	+2.0	+8.7
Natural Disaster**: Tier 1-2, Generation + transmission loss				
Average load	-	25.9	+2.5	+10.7
Summer peak	-	30.4	+3.8	+14.3
Winter peak	-	27.1	+4.0	+17.3

**L2040 is a 230 kV line from Hillsborough to Pinellas County, L541 is a 69 kV line from Wakulla to Franklin County, and L1392 is a 230 kV line from Wakulla to Taylor County.*
***System-wide congestion is not calculable for Natural Disaster: Tiers 1-3, Generation + Transmission Loss. Because some counties lose their transmission entirely while their own generation cannot cover their load, there is no feasible dispatch solution in our model to satisfy every county's load. Hence no power flow is set under this situation, resulting in a system-wide "null" result.*

Table 13. Largest System Cost Changes by Contingency

Scenario	Highest Impact	System Cost ($/hour)	Absolute Change from Base	% Change from Base
Base Case				
Average load	-	1,032,780.69	-	-

Baker	Duval	111	73.81
Manatee	Sarasota	1431	59.63

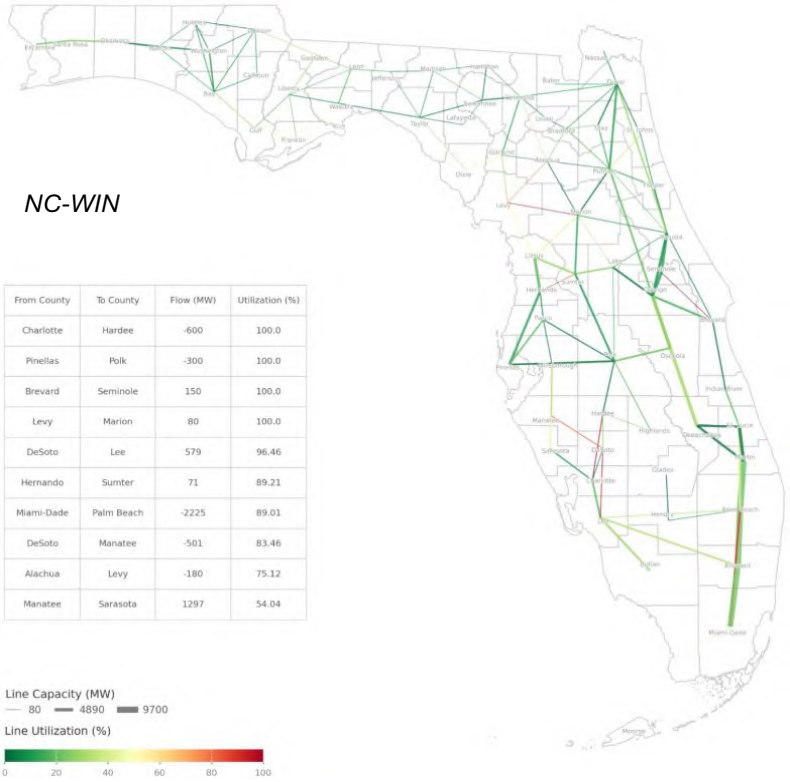

Fig. 21. Represents system congestion after constructing a new transmission corridor between two counties that are not currently connected, to achieve the greatest reduction in congestion in each load case. The new connection is a 230 kV line with 600 MW of capacity.

Appendix D: Solution Analysis Results – Current State

Table 14. Largest System Congestion Changes by Solution Type

Solution	Best Line	Line Utilization (%)	Absolute Change from Base	% Change from Base
Best new line				
Average load	Alachua-Manatee	15.6	-7.8	-33.3
Summer peak	Calhoun-Highlands	24.8	-1.8	-6.8
Winter peak	Jefferson-Okeechobee	21.5	-1.6	-6.9
Best line to upgrade*				
Average load	L8	17.8	-5.6	-23.9
Summer peak	L2106, L336	25.7	-0.9	-3.4
Winter peak	L2134	22.3	-0.8	-3.5
Best line for DLR*				
Average load	L8	18	-5.4	-23.1
Summer peak	L562	26.4	-0.2	-0.8
Winter peak	L562	22.9	-0.2	-0.9

**L8 is a 138 kV line from Palm Beach to Hendry County, L2106 and L336 are both 115 kV lines from Pinellas to Polk County, L2134 is a 115 kV line from Seminole to Brevard County, and L562 is a 230 kV line from DeSoto to Lee County.*

Table 15. Largest System Cost Changes by Solution Type

Solution	Best Line	System Cost ($/hour)	Absolute Change from Base	% Change from Base
Best new line				
Average load	Tied: 127 different lines	1,028,867.58	-3,913.11	-0.4
Summer peak	Bay-Miami-Dade	3,447,105.86	-567,783.70	-14.1
Winter peak	Escambia-Pinellas	2,859,121.04	-22,327.73	-0.8
Best line to upgrade				
Average load	L8	1,028,867.58	-3,913.11	-0.4
Summer peak	L2692*	3,513,908.09	-500,981.47	-12.5
Winter peak	L2106, L336	2,813,726.83	-67,721.94	-2.4

Best line for DLR				
Average load	L8	1,030,580.69	-2,200.00	-0.2
Summer peak	L2692	3,441,549.58	-573,339.98	-14.3
Winter peak	L2106, L336	2,870,727.49	-10,721.28	-0.4

**L2692 is a 500 kV line from Palm Beach to Miami-Dade County.*

Appendix E: High-Risk County Pairings – Current State

Table 16. Most Congested Lines, by County Pairing

Scenario	***Lines ≥ 100%***	***Lines at 80-99.9%***
Base Case: Average load	Hendry-Palm Beach	Brevard-Seminole
	Pinellas-Polk	Columbia-Hamilton
	Lee-Palm Beach	Alachua-Columbia
	Dixie-Taylor	Baker-Duval
Base Case: Summer peak	Hendry-Palm Beach	Miami-Dade–Palm Beach
	Pinellas-Polk	DeSoto-Manatee
	Brevard-Seminole	Charlotte-Hardee
	Franklin-Wakulla	Franklin-Gulf
	DeSoto-Lee	
	Levy-Marion	
Base Case: Winter peak	Levy-Marion	Miami-Dade–Palm Beach
	Pinellas-Polk	Dixie-Taylor
	Brevard-Seminole	DeSoto-Manatee
		Charlotte-Hardee
		DeSoto-Lee
		Hernando-Sumter
		Dixie-Gilchrist
		Alachua-Levy
Loss of most consequential line (L2040): Average load	Hendry-Palm Beach	Levy-Marion
	Lee-Palm Beach	Dixie-Taylor
	Pinellas-Polk	Baker-Duval
	Columbia-Hamilton	Columbia-Duval
	Brevard-Seminole	
	Franklin-Wakulla	
	Hardee-Highlands	
Loss of most consequential line (L541): Summer peak	Hendry-Palm Beach	Pinellas-Polk
	Brevard-Seminole	Franklin-Liberty
	Charlotte-Hardee	Gadsden-Leon
	DeSoto-Lee	
	Levy-Marion	
	Miami-Dade–Palm Beach	
Loss of most consequential line (L1392): Winter peak	Levy-Marion	Miami-Dade–Palm Beach
	Pinellas-Polk	Dixie-Taylor
	Brevard-Seminole	DeSoto-Manatee
		Charlotte-Hardee
		DeSoto-Lee
		Hernando-Sumter

		Alachua-Levy
		Jefferson-Taylor
Large load addition (Santa Rosa): Average load	Hendry-Palm Beach	Hardee-Highlands
	Lee-Palm Beach	Alachua-Columbia
	Brevard-Seminole	Baker-Duval
	Franklin-Wakulla	Okaloosa-Washington
Large load addition (Lafayette): Summer peak	Hendry-Palm Beach	Miami-Dade–Palm Beach
	Pinellas-Polk	DeSoto-Manatee
	Brevard-Seminole	Charlotte-Hardee
	Franklin-Wakulla	Franklin-Gulf
	DeSoto-Lee	Lafayette-Taylor
	Levy-Marion	
Large load addition (Lafayette): Winter peak	Levy-Marion	Miami-Dade–Palm Beach
	Pinellas-Polk	DeSoto-Manatee
	Dixie-Taylor	Charlotte-Hardee
	Brevard-Seminole	DeSoto-Lee
		Hernando-Sumter
		Dixie-Gilchrist
		Alachua-Levy
		Lafayette-Taylor
Loss of most consequential generator (Gadsden): Average load	Hendry-Palm Beach	Baker-Duval
	Brevard-Seminole	Lee-Palm Beach
	Franklin-Wakulla	Alachua-Columbia
	Hardee-Highlands	
Loss of most consequential generator (Pinellas): Summer peak	Hendry-Palm Beach	Miami-Dade–Palm Beach
	Pinellas-Polk	DeSoto-Lee
	Brevard-Seminole	Levy-Marion
	Charlotte-Hardee	Hardee-Highlands
	Franklin-Wakulla	
Loss of most consequential generator (Leon): Winter peak	Levy-Marion	Miami-Dade–Palm Beach
	Pinellas-Polk	DeSoto-Manatee
	Dixie-Taylor	Charlotte-Hardee
	Brevard-Seminole	DeSoto-Lee
		Hernando-Sumter
		Dixie-Gilchrist
		Alachua-Levy
Loss of most consequential county's generation (Suwannee): Average load	Hendry-Palm Beach	Levy-Marion
	Pinellas-Polk	Lee-Palm Beach
	Brevard-Seminole	Dixie-Taylor
	Franklin-Wakulla	Columbia-Hamilton
	Hardee-Highlands	Baker-Duval
	Hendry-Palm Beach	Miami-Dade–Palm Beach
	Brevard-Seminole	Pinellas-Polk

Loss of most consequential county's generation (Broward): Summer peak	Charlotte-Hardee	DeSoto-Manatee
	Franklin-Wakulla	Levy-Marion
	DeSoto-Lee	Palm Beach-St. Lucie
		Hardee-Highlands
		Broward-Lee
Loss of most consequential county's generation (Escambia): Winter peak	Okaloosa-Washington	Miami-Dade–Palm Beach
	Dixie-Taylor	Pinellas-Polk
	Brevard-Seminole	DeSoto-Manatee
		Charlotte-Hardee
		Franklin-Wakulla
		DeSoto-Lee
		Dixie-Gilchrist
Loss of most consequential county's gen + transmission (Martin): Average load	Hendry-Palm Beach	Hernando-Sumter
	Brevard-Seminole	Pinellas-Polk
	Franklin-Wakulla	Lee-Palm Beach
		Baker-Duval
Loss of most consequential county's gen + transmission (Taylor): Summer peak	Hendry-Palm Beach	Levy-Marion
	Pinellas-Polk	Columbia-Hamilton
	Brevard-Seminole	Charlotte-Hardee
	DeSoto-Lee	Franklin-Gulf
	Miami-Dade–Palm Beach	Franklin-Wakulla
	Jefferson-Leon	
Loss of most consequential county's gen + transmission (Orange): Winter peak	Levy-Marion	Miami-Dade–Palm Beach
	Franklin-Wakulla	DeSoto-Lee
	Brevard-Seminole	Pinellas-Polk
		Lee-Palm Beach
		Charlotte-Hardee

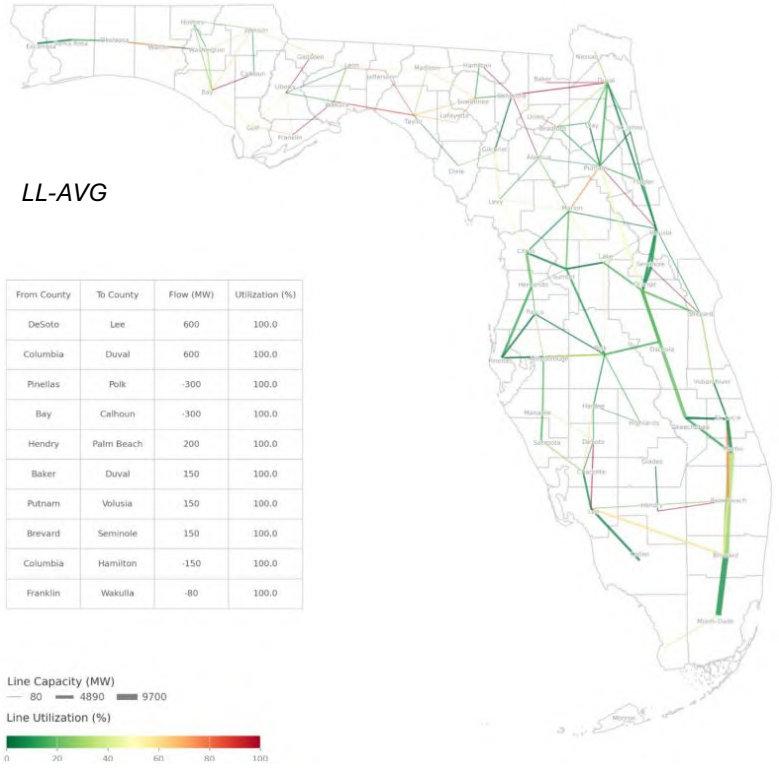
Appendix F: Contingency Analysis Maps – 2035 Outlook

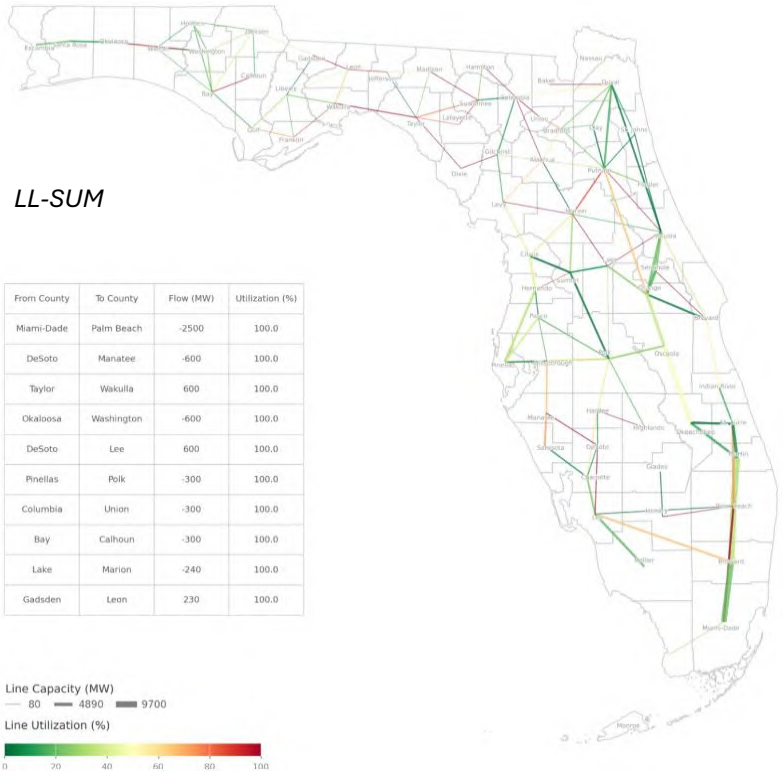
Congestion Map: Line Loss Scenario

LL-AVG



From County	To County	Flow (MW)	Utilization (%)
DeSoto	Lee	600	100.0
Columbia	Duval	600	100.0
Pinellas	Polk	-300	100.0
Bay	Calhoun	-300	100.0
Hendry	Palm Beach	200	100.0
Baker	Duval	150	100.0
Putnam	Volusia	150	100.0
Brevard	Seminole	150	100.0
Columbia	Hamilton	-150	100.0
Franklin	Wakulla	-80	100.0

LL-SUM



From County	To County	Flow (MW)	Utilization (%)
Miami-Dade	Palm Beach	-2500	100.0
DeSoto	Manatee	-600	100.0
Taylor	Wakulla	600	100.0
Okaloosa	Washington	-600	100.0
DeSoto	Lee	600	100.0
Pinellas	Polk	-300	100.0
Columbia	Union	-300	100.0
Bay	Calhoun	-300	100.0
Lake	Marion	-240	100.0
Gadsden	Leon	230	100.0

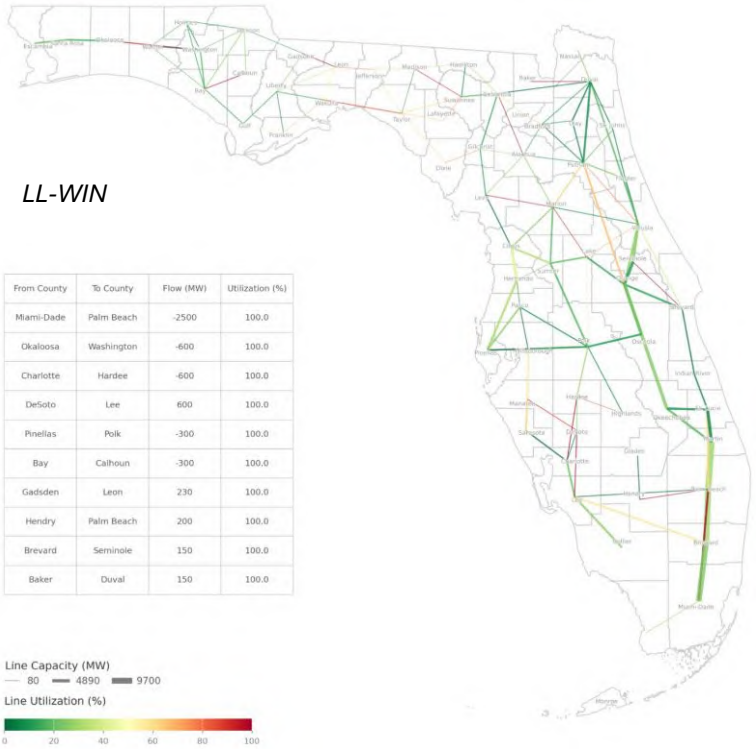


Fig. 22. Represents the transmission line outage that causes the largest increase in system congestion under each load case. These are Line 2404 (Dixie-Taylor), Line 1617 (Sumter-Citrus), and Line 2020 (Duval-Columbia) for LL-AVG, LL-SUM, and LL-WIN respectively.

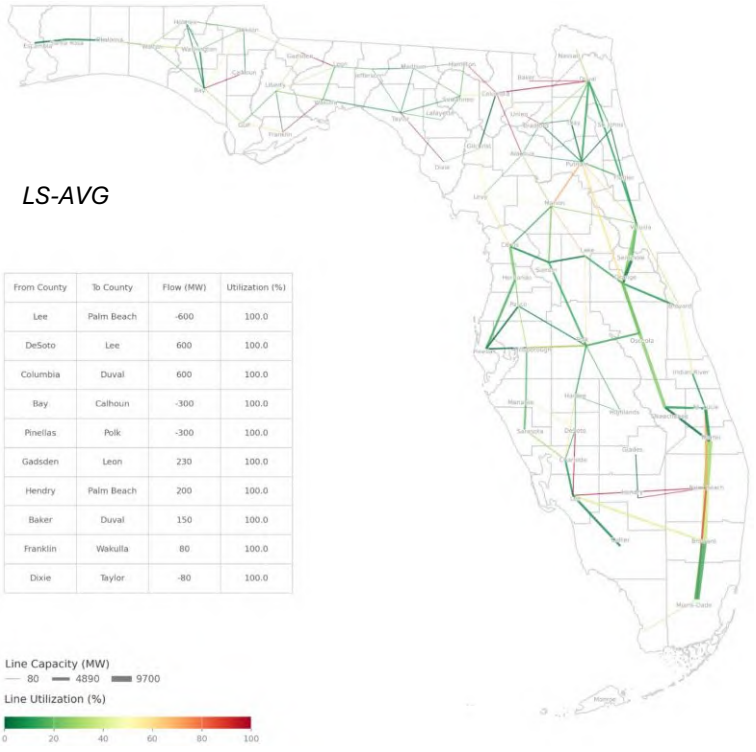
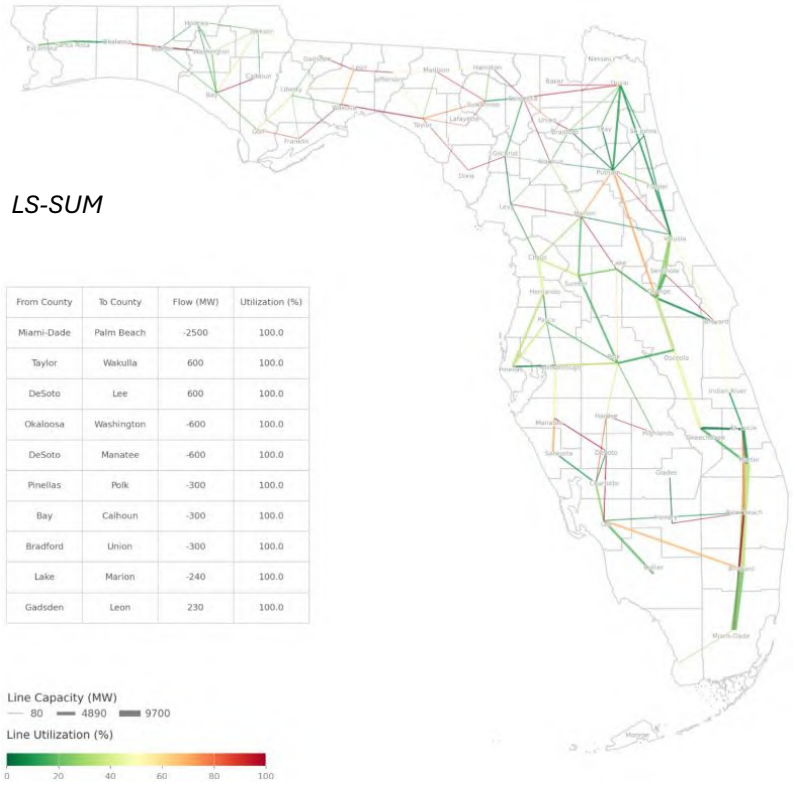
Congestion Map: Load Spike Scenario



LS-SUM

From County	To County	Flow (MW)	Utilization (%)
Miami-Dade	Palm Beach	-2500	100.0
Taylor	Wakulla	600	100.0
DeSoto	Lee	600	100.0
Okaloosa	Washington	-600	100.0
DeSoto	Manatee	-600	100.0
Pinellas	Polk	-300	100.0
Bay	Calhoun	-300	100.0
Bradford	Union	-300	100.0
Lake	Marion	-240	100.0
Gadsden	Leon	230	100.0



LS-WIN

From County	To County	Flow (MW)	Utilization (%)
Miami-Dade	Palm Beach	-2500	100.0
Okaloosa	Washington	-600	100.0
DeSoto	Lee	600	100.0
Charlotte	Hardee	-600	100.0
Bay	Calhoun	-300	100.0
Pinellas	Polk	-300	100.0
Gadsden	Leon	230	100.0
Hendry	Palm Beach	200	100.0
Baker	Duval	150	100.0
Brevard	Seminole	150	100.0

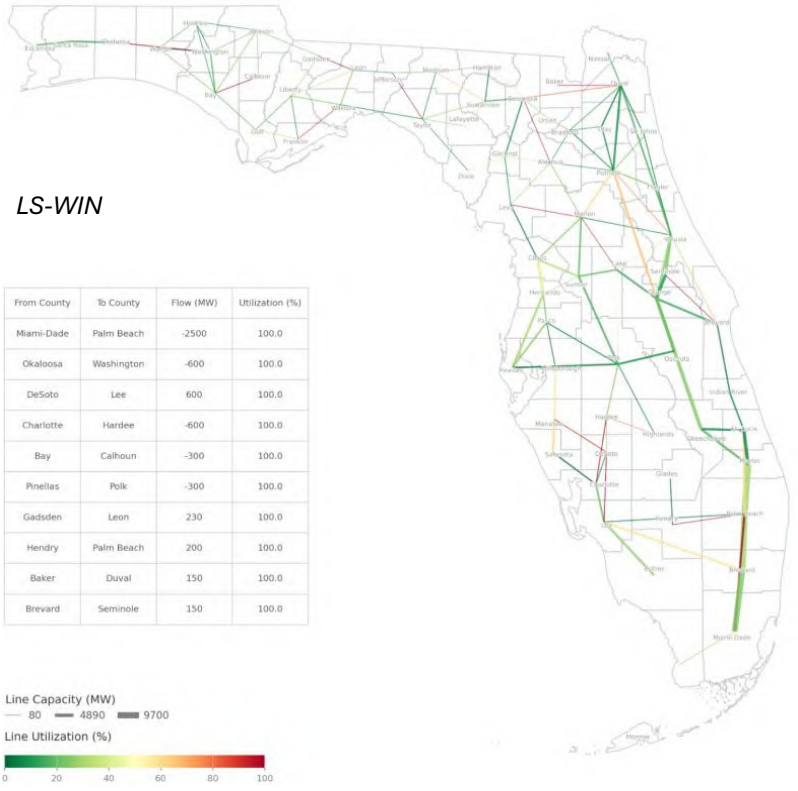


Fig. 23. Represents system congestion after adding a 100-MW load in the highest-impact county under each load case. These are Pasco County for LS-AVG, Leon County for LS-SUM, and Jefferson County for LS-WIN.

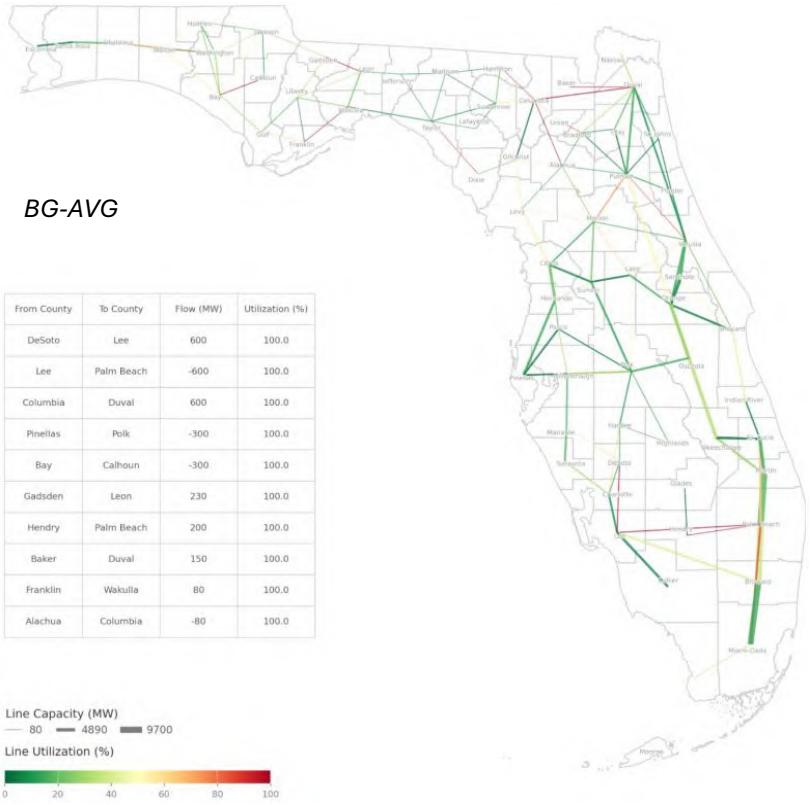
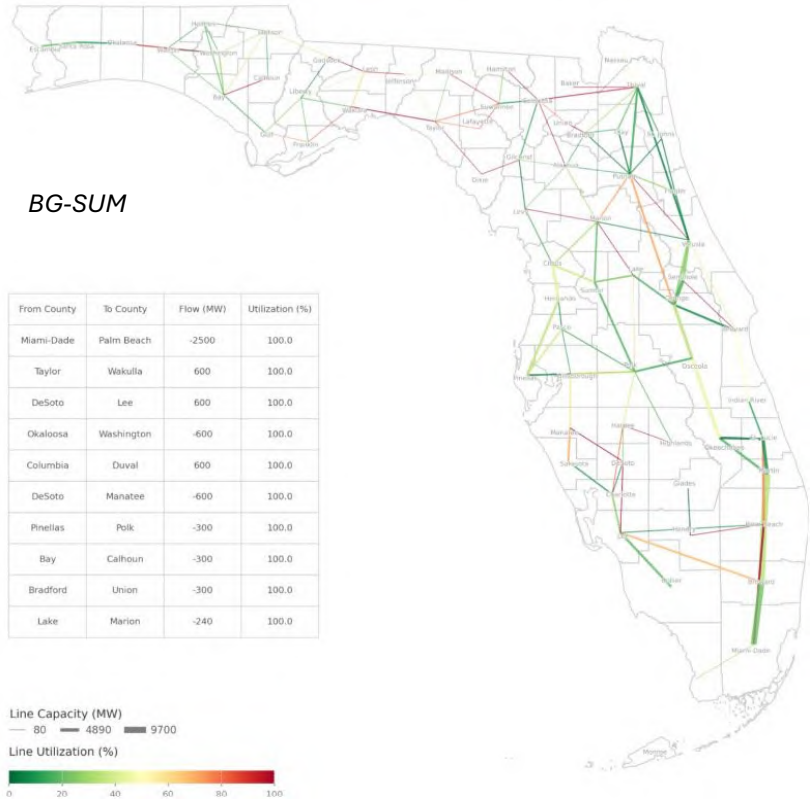
Congestion Map: Biggest Generator Loss Scenario

BG-AVG



From County	To County	Flow (MW)	Utilization (%)
DeSoto	Lee	600	100.0
Lee	Palm Beach	-600	100.0
Columbia	Duval	600	100.0
Pinellas	Polk	-300	100.0
Bay	Calhoun	-300	100.0
Gadsden	Leon	230	100.0
Hendry	Palm Beach	200	100.0
Baker	Duval	150	100.0
Franklin	Wakulla	80	100.0
Alachua	Columbia	-80	100.0

BG-SUM



From County	To County	Flow (MW)	Utilization (%)
Miami-Dade	Palm Beach	-2500	100.0
Taylor	Wakulla	600	100.0
DeSoto	Lee	600	100.0
Okaloosa	Washington	-600	100.0
Columbia	Duval	600	100.0
DeSoto	Manatee	-600	100.0
Pinellas	Polk	-300	100.0
Bay	Calhoun	-300	100.0
Bradford	Union	-300	100.0
Lake	Marion	-240	100.0

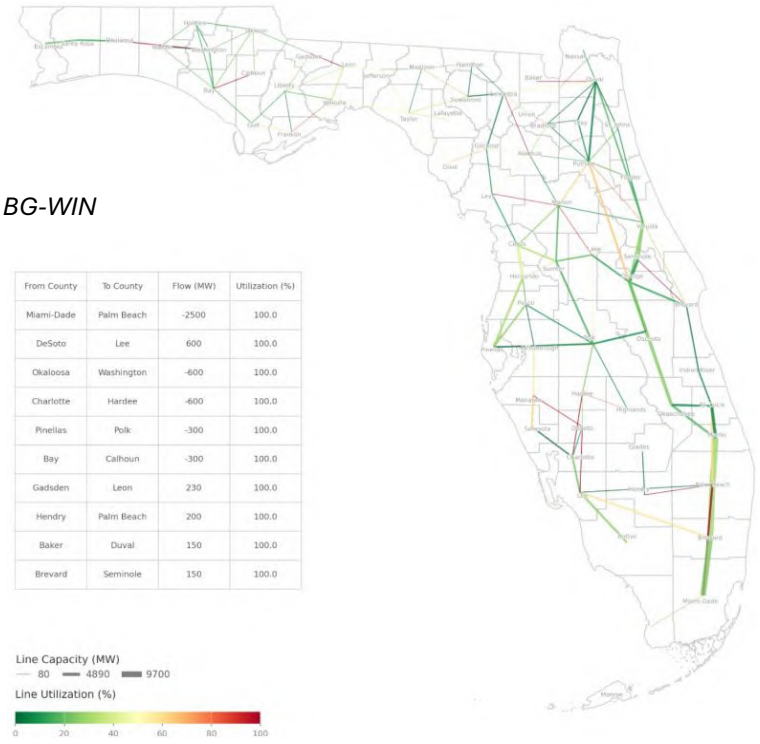


Fig. 24. Represents system congestion after the largest power generation facility goes offline in the highest-impact county under each load case. These are Madison, Duval, and Alachua counties for BG-AVG, BG-SUM, and BG-WIN respectively.

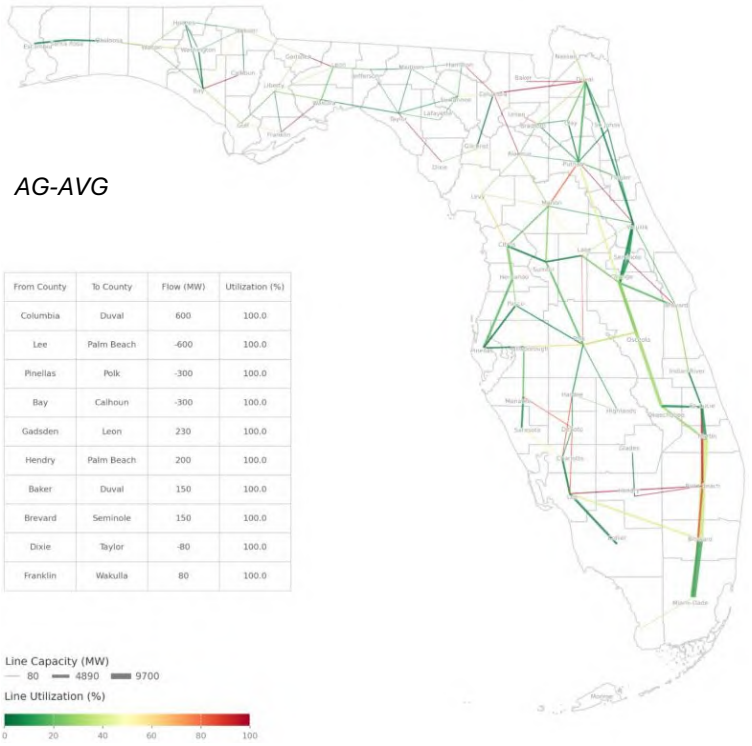
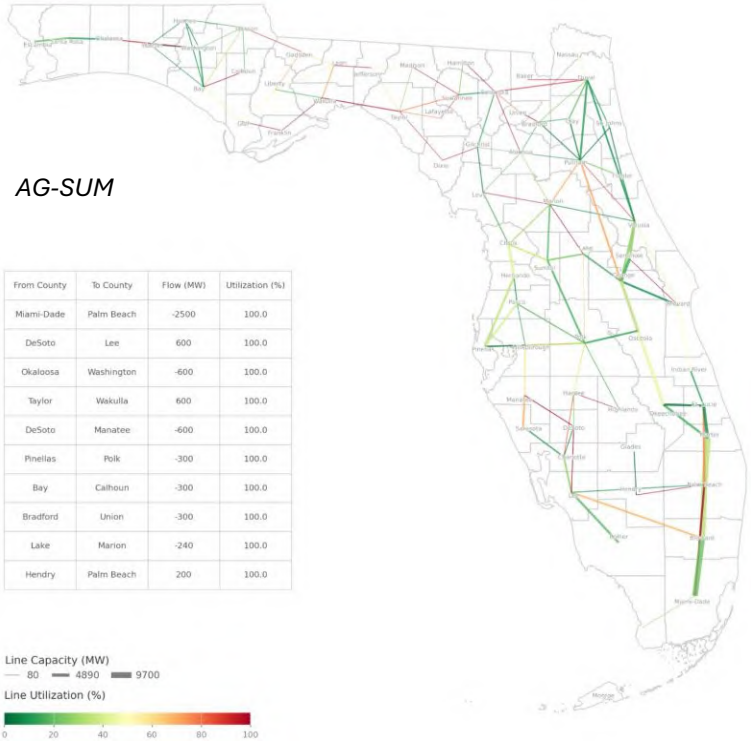
Congestion Map: All Generator Loss Scenario





AG-SUM

From County	To County	Flow (MW)	Utilization (%)
Miami-Dade	Palm Beach	-2500	100.0

Solution	Best Line	Line Utilization (%)	Absolute Change from Base	% Change from Base
Best new line				
Average load	Dixie-Duval	26.8	-3.0	-10.1
Summer peak	Gadsden–Miami-Dade	35	-6.8	-16.3
Winter peak	Escambia-Pinellas	30.7	-1.3	-4.1
Best line to upgrade*				
Average load	L213, L2402	29.1	-0.7	-2.3
Summer peak	L2134	40	-1.8	-4.3
Winter peak	L2106, L336	30	-2.0	-6.3
Best line for DLR*				
Average load	L829	29.2	-0.6	-2.0
Summer peak	L2306	41.1	-0.7	-1.7
Winter peak	L2306	31.8	-0.2	-0.6

**L213 and L2402 are both 115 kV lines from Madison to Jefferson County, L2134 is a 115 kV line from Seminole to Brevard County, L2106 and L336 are both 115 kV lines from Pinellas to Polk County, L829 is a 115 kV line from Jackson to Washington County, and L2306 is a 69 kV line from Levy to Marion County.*

Table 20. Largest System Cost Changes by Solution Type

Solution	Best Line	System Cost ($/hour)	Absolute Decrease from Base	% Decrease from Base
Best new line				
Average load	Calhoun-Miami-Dade	725,963.64	-31,878.69	-4.2
Summer peak	Baker-Miami-Dade	5,460,986.70	-625,778.66	-10.3
Winter peak	Calhoun-Miami-Dade	4,076,832.24	-595,261.70	-12.7
Best line to upgrade*				
Average load	L8	741,342.33	-16,500.00	-2.2
Summer peak	L2692	5,547,140.20	-539,625.16	-8.9
Winter peak	L2692	4,129,801.55	-542,292.39	-11.6
Best line for DLR*				

Average load	L2020	752,208.80	-5,633.53	-0.7
Summer peak	L2692	5,194,558.84	-892,206.52	-14.7
Winter peak	L2692	3,341,822.64	-1,330,271.30	-28.5

**L8 is a 138 kV line from Palm Beach to Hendry County, L2692 is a 500 kV line from Palm Beach to Miami-Dade County, and L2020 is a 230 kV line from Duval to Columbia County.*

Table 21. Net Benefits by Solution Type – Top 3 Economic Candidates per Solution

Solution*	Best Line	Project Cost**	Total Benefit (20 years)	Net Benefit (20 years)
Best new line	Calhoun-Miami-Dade	$1,748,480,000.00	$5,585,146,488.00	$3,836,666,488
	Jackson-Miami-Dade	$1,833,720,000.00	$5,530,941,360.00	$3,697,221,360
	Miami-Dade-Washington	$1,867,040,000.00	$5,528,581,416.00	$3,661,541,416
Best line to upgrade***	L8	$37,875,000.00	$2,890,800,000.00	$2,852,925,000
	L154	$23,225,000.00	$2,843,394,384.00	$2,820,169,384
	L2122	$23,425,000.00	$2,368,618,152.00	$2,345,193,152
Best line for DLR***	L2020	$2,281,500.00	$986,994,456.00	$984,712,956
	L2122	$468,500.00	$784,470,264.00	$784,001,764
	L8	$757,500.00	$385,440,000.00	$384,682,500

**Net benefits are calculated for Average Load case only.*
***Project Cost Factors: New line = $4 million/mile, upgrade = $2.5 million/mile, DLR = $50,000/mile*
****L154 is a 115 kV line from Baker to Duval County and L2122 is a 69 kV line from Alachua to Columbia County.*

Appendix J: High-Risk County Pairings – 2035 Outlook

Table 22. Most Congested Lines, by County Pairing

Scenario	***Lines ≥ 100%***	***Lines at 80-99.9%***
Base Case: Average load	Hendry-Palm Beach L2	Dixie-Taylor L139
	Pinellas-Polk L47	Columbia-Duval L124
	DeSoto-Lee L68	Alachua-Columbia L129
	Baker-Duval L20	Miami-Dade–Palm Beach
	Gadsden-Leon L44	Columbia-Hamilton L123

Appendix K: Breakdown of Florida's Regions

We assign Florida's counties into 10 different geographic regions. We then assign all of Florida's inter-county transmission lines to the corresponding region. Where the start and end county are in two different regions, the line is assigned to both regions. Transmission lines that connect to locations outside Florida are excluded.

This allows us to determine the number of reliability constraints that arise in each region, and identify which regions have the greatest transmission reliability needs. The regional breakdown is provided here:

Table 23. Florida's County-to-County Transmission Connections by Region

Region	*Counties*	*Source*	*Sink*
Southeast	Palm Beach, Broward, Miami-Dade, Monroe	Hendry	Palm Beach
		Broward	Miami-Dade
		Martin	Palm Beach
		Miami-Dade	Monroe

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 35

[Docket No. RM10-23-000; Order No. 1000]

Transmission Planning and Cost Allocation by Transmission Owning and Operating Public Utilities

(Issued July 21, 2011)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Final Rule

SUMMARY: The Federal Energy Regulatory Commission is amending the transmission planning and cost allocation requirements established in Order No. 890 to ensure that Commission-jurisdictional services are provided at just and reasonable rates and on a basis that is just and reasonable and not unduly discriminatory or preferential. With respect to transmission planning, this Final Rule: (1) requires that each public utility transmission provider participate in a regional transmission planning process that produces a regional transmission plan; (2) requires that each public utility transmission provider amend its OATT to describe procedures that provide for the consideration of transmission needs driven by public policy requirements in the local and regional transmission planning processes; (3) removes from Commission-approved tariffs and agreements a federal right of first refusal for certain new transmission facilities; and (4) improves coordination between neighboring transmission planning regions for new

interregional transmission facilities. Also, this Final Rule requires that each public utility transmission provider must participate in a regional transmission planning process that has: (1) a regional cost allocation method for the cost of new transmission facilities selected in a regional transmission plan for purposes of cost allocation; and (2) an interregional cost allocation method for the cost of certain new transmission facilities that are located in two or more neighboring transmission planning regions and are jointly evaluated by the regions in the interregional transmission coordination procedures required by this Final Rule. Each cost allocation method must satisfy six cost allocation principles.

Regulatory Text

Appendix A: Summary of Compliance Requirements
Appendix B: Abbreviated Names of Commenters
Appendix C: *Pro Forma* Open Access Transmission Tariff Attachment K

I. Introduction

1. In this Final Rule, the Commission acts under section 206 of the Federal Power Act (FPA) to adopt reforms to its electric transmission planning and cost allocation requirements for public utility transmission providers.[1] The reforms herein are intended to improve transmission planning processes and cost allocation mechanisms under the *pro forma* Open Access Transmission Tariff (OATT) to ensure that the rates, terms and conditions of service provided by public utility transmission providers are just and reasonable and not unduly discriminatory or preferential. This Final Rule builds on Order No. 890,[2] in which the Commission, among other things, reformed the *pro forma* OATT to require each public utility transmission provider to have a coordinated, open, and transparent regional transmission planning process. After careful review of the voluminous record in this proceeding, the Commission concludes that the additional reforms adopted herein are necessary at this time to ensure that rates for Commission-jurisdictional service are just and reasonable in light of changing conditions in the

[1] 16 U.S.C. 824e (2006).

[2] *Preventing Undue Discrimination and Preference in Transmission Service*, Order No. 890, 72 FR 12266 (Mar. 15, 2007), FERC Stats. & Regs. ¶ 31,241, *order on reh'g*, Order No. 890-A, 73 FR 2984 (Jan. 16, 2008), FERC Stats. & Regs. ¶ 31,261 (2007), *order on reh'g and clarification*, Order No. 890-B, 73 FR 39092 (July 8, 2008), 123 FERC ¶ 61,299 (2008), *order on reh'g*, Order No. 890-C, 74 FR 12540 (Mar. 25, 2009), 126 FERC ¶ 61,228 (2009), *order on clarification*, Order No. 890-D, 74 FR 61511 (Nov. 25, 2009), 129 FERC ¶ 61,126 (2009).

industry. In addition, the Commission believes that these reforms address opportunities for undue discrimination by public utility transmission providers.

2. The Commission acknowledges that significant work has been done in recent years to enhance regional transmission planning processes. The Commission appreciates the diversity of opinions expressed by commenters in response to the Notice of Proposed Rulemaking[3] as to whether, in light of the progress being made in many regions, further reforms to transmission planning processes and cost allocation mechanisms are necessary at this time. On balance, the Commission concludes that the reforms adopted herein are necessary for more efficient and cost-effective regional transmission planning. As discussed further below, the electric industry is currently facing the possibility of substantial investment in future transmission facilities to meet the challenge of maintaining reliable service at a reasonable cost. The Commission concludes that it is appropriate to act now to ensure that its transmission planning processes and cost allocation requirements are adequate to allow public utility transmission providers to address these challenges more efficiently and cost-effectively. In reaching this conclusion, the Commission has balanced competing interests of various segments of the industry and designed a package of reforms that, in our view, will support the

[3] *Transmission Planning and Cost Allocation by Transmission Owning and Operating Public Utilities*, Notice of Proposed Rulemaking, FERC Stats. & Regs. ¶ 32,660 (2010) (Proposed Rule).

development of those transmission facilities identified by each transmission planning region as necessary to satisfy reliability standards, reduce congestion, and allow for consideration of transmission needs driven by public policy requirements established by state or federal laws or regulations (Public Policy Requirements). By "state or federal laws or regulations," we mean enacted statutes (i.e., passed by the legislature and signed by the executive) and regulations promulgated by a relevant jurisdiction, whether within a state or at the federal level.

3. Through this Final Rule, we conclude that the existing requirements of Order No. 890 are inadequate. Public utility transmission providers are currently under no affirmative obligation to develop a regional transmission plan that reflects the evaluation of whether alternative regional solutions may be more efficient or cost-effective than solutions identified in local transmission planning processes. Similarly, there is no requirement that public utility transmission providers consider transmission needs at the local or regional level driven by Public Policy Requirements. Nonincumbent transmission developers seeking to invest in transmission can be discouraged from doing so as a result of federal rights of first refusal in tariffs and agreements subject to the Commission's jurisdiction. While neighboring transmission planning regions may coordinate evaluation of the reliability impacts of transmission within their respective regions, few procedures are in place for identifying and evaluating the benefits of alternative interregional transmission solutions. Finally, many cost allocation methods in

place within transmission planning regions fail to account for the beneficiaries of new transmission facilities, while cost allocation methods for potential interregional facilities are largely nonexistent.

4. We correct these deficiencies by enhancing the obligations placed on public utility transmission providers in several specific ways. While focused on discrete aspects of the transmission planning and cost allocation processes, the specific reforms adopted in this Final Rule are intended to achieve two primary objectives: (1) ensure that transmission planning processes at the regional level consider and evaluate, on a non-discriminatory basis, possible transmission alternatives and produce a transmission plan that can meet transmission needs more efficiently and cost-effectively; and (2) ensure that the costs of transmission solutions chosen to meet regional transmission needs are allocated fairly to those who receive benefits from them. In addition, this Final Rule addresses interregional coordination and cost allocation, to achieve the same objectives with respect to possible transmission solutions that may be located in a neighboring transmission planning region.

5. Certain requirements of this Final Rule distinguish between "a transmission facility in a regional transmission plan," and "a transmission facility selected in a regional transmission plan for purposes of cost allocation."[4] A "transmission facility selected in a

[4] *See infra* P 63.

regional transmission plan for purposes of cost allocation" is one that has been selected, pursuant to a Commission-approved regional transmission planning process, as a more efficient or cost-effective solution to regional transmission needs. As discussed in more detail below, this distinction is an essential component of this Final Rule.

6. Turning to the specific discrete reforms we adopt today, we first require public utility transmission providers to participate in a regional transmission planning process that evaluates transmission alternatives at the regional level that may resolve the transmission planning region's needs more efficiently and cost-effectively than alternatives identified by individual public utility transmission providers in their local transmission planning processes. This requirement builds on the transmission planning principles adopted by the Commission in Order No. 890, and the regional transmission planning processes developed in response to this Final Rule must satisfy those principles. These processes must result in the development of a regional transmission plan. As part of our reforms, we also require that the regional transmission planning process, as well as the underlying local transmission planning processes of public utility transmission providers, provide an opportunity to consider transmission needs driven by Public Policy Requirements. We conclude that requiring each local and regional transmission planning process to provide this opportunity is necessary to ensure that transmission planning processes identify and evaluate transmission needs driven by relevant Public Policy

Requirements, and support more efficient and cost-effective achievement of those requirements.

7. Second, we direct public utility transmission providers to remove from their OATTs or other Commission-jurisdictional tariffs and agreements any provisions that grant a federal right of first refusal to transmission facilities that are selected in a regional transmission plan for purposes of cost allocation.[5] We conclude that leaving federal rights of first refusal in place for these facilities would allow practices that have the potential to undermine the identification and evaluation of a more efficient or cost-effective solution to regional transmission needs, which in turn can result in rates for Commission-jurisdictional services that are unjust and unreasonable or otherwise result in undue discrimination by public utility transmission providers. To implement the elimination of such federal rights of first refusal, we adopt below a framework that requires, among other things, the development of qualification criteria and protocols for the submission and evaluation of transmission proposals. In addition, as described in section III.B.3, we also require each public utility transmission provider to amend its OATT to describe the circumstances and procedures under which public utility transmission providers in the regional transmission planning process will reevaluate the regional transmission plan to determine if delays in the development of a transmission

[5] *See infra* P 313.

facility selected in a regional transmission plan for purposes of cost allocation require evaluation of alternative solutions, including those the incumbent transmission provider proposes, to ensure the incumbent can meet its reliability needs or service obligations. This requirement, however, applies only to transmission facilities that are selected in a regional transmission plan for purposes of cost allocation and not, for example, to transmission facilities in local transmission plans that are merely "rolled up" and listed in a regional transmission plan without going through an analysis at the regional level, and therefore, not eligible for regional cost allocation.

8. Third, we require public utility transmission providers to improve coordination across regional transmission planning processes by developing and implementing, through their respective regional transmission planning process, procedures for joint evaluation and sharing of information regarding the respective transmission needs of transmission planning regions and potential solutions to those needs. These procedures must provide for the identification and joint evaluation by neighboring transmission planning regions of interregional transmission facilities to determine if there are more efficient or cost-effective interregional transmission solutions than regional solutions identified by the neighboring transmission planning regions. To facilitate the joint evaluation of interregional transmission facilities, we require the exchange of planning data and information between neighboring transmission planning regions at least annually.

9. Finally, we require public utility transmission providers to have in place a method, or set of methods, for allocating the costs of new transmission facilities selected in a regional transmission plan for purposes of cost allocation. We also require public utility transmission providers in each transmission planning region to have, together with the public utility transmission providers in a neighboring transmission planning region, a common method, or set of methods, for allocating the costs of a new interregional transmission facility that is jointly evaluated by the two or more transmission planning regions in their interregional transmission coordination procedures. Given the fact that a determination by the transmission planning process to select a transmission facility in a plan for purposes of cost allocation will necessarily include an evaluation of the benefits of that facility, we require that transmission planning and cost allocation processes be aligned. Further, all regional and interregional cost allocation methods must be consistent with regional and interregional cost allocation principles, respectively, adopted in this Final Rule. Nothing in this Final Rule requires either interconnectionwide planning or interconnectionwide cost allocation.

10. The cost allocation reforms adopted today, and the cost allocation principles that each proposed regional and interregional cost allocation method or methods must satisfy, seek to address the potential opportunity for free ridership inherent in transmission services, given the nature of power flows over an interconnected transmission system. In particular, the principles-based approach requires that all regional and interregional cost

allocation methods allocate costs for new transmission facilities in a manner that is at least roughly commensurate with the benefits received by those who will pay those costs. Costs may not be involuntarily allocated to entities that do not receive benefits. [6] In addition, the Commission finds that participant funding is permitted, but not as a regional or interregional cost allocation method.

11. As noted above, the various specific reforms adopted in this Final Rule are designed to work together to ensure an opportunity for more transmission projects to be considered in the transmission planning process on an equitable basis and increase the likelihood that those transmission facilities selected in a regional transmission plan for purposes of cost allocation are the more efficient or cost-effective solutions available. At its core, the set of reforms adopted in this Final Rule require the public utility transmission providers in a transmission planning region, in consultation with their stakeholders, to create a regional transmission plan. This plan will identify transmission facilities that more efficiently or cost-effectively meet the region's reliability, economic and Public Policy Requirements. To meet such requirements more efficiently and cost-effectively, the regional transmission plan must reflect a fair consideration of transmission facilities proposed by nonincumbents, as well as interregional transmission

[6] However, it is possible that the developer of a facility selected in the regional transmission plan for purposes of cost allocation might decline to pursue regional cost allocation and, instead rely on participant funding. *See infra* P 723-729.

facilities. The regional transmission plan must also include a clear cost allocation method or methods that identify beneficiaries for each of the transmission facilities selected in a regional transmission plan for purposes of cost allocation, in order to increase the likelihood that such transmission facilities will actually be constructed.

12. The transmission planning and cost allocation requirements in this Final Rule, like those of Order No. 890, are focused on the transmission planning *process*, and not on any substantive outcomes that may result from this process. Taken together, the requirements imposed in this Final Rule work together to remedy deficiencies in the existing requirements of Order No. 890 and enhance the ability of the transmission grid to support wholesale power markets. This, in turn, will fulfill our statutory obligation to ensure that Commission-jurisdictional services are provided at rates, terms, and conditions of service that are just and reasonable and not unduly discriminatory or preferential.

13. We acknowledge that public utility transmission providers in some transmission planning regions already may have in place transmission planning processes or cost allocation mechanisms that satisfy some or all of the requirements of this Final Rule. Our reforms are not intended to undermine progress being made in those regions, nor do we intend to undermine other planning activities that are being undertaken at the interconnection level. Rather, the Commission is acting here to identify a minimum set of requirements that must be met to ensure that all transmission planning processes and cost allocation mechanisms subject to its jurisdiction result in Commission-jurisdictional

services being provided at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential.

14. The Commission appreciates the significant work that will go into the preparation of compliance proposals in response to this Final Rule. To assist public utility transmission providers in their efforts to comply, the Commission directs its staff to hold informational conferences within 60 days of the effective date of this Final Rule to review and discuss the requirements imposed herein with interested parties. Moreover, as public utility transmission providers work with their stakeholders to prepare compliance proposals, the Commission encourages frequent dialogue with Commission staff to explore issues that are specific to each transmission planning region. The Commission will monitor progress being made.

A. Order Nos. 888 and 890

15. In Order No. 888,[7] issued in 1996, the Commission found that it was in the economic interest of transmission providers to deny transmission service or to offer transmission service to others on a basis that is inferior to that which they provide to

[7] *Promoting Wholesale Competition Through Open Access Non-Discriminatory Transmission Services by Public Utilities; Recovery of Stranded Costs by Public Utilities and Transmitting Utilities*, Order No. 888, 61 FR 21540 (May 10, 1996), FERC Stats. & Regs. ¶ 31,036 (1996), *order on reh'g*, Order No. 888-A, 62 FR 12274 (Mar. 14, 1997), FERC Stats. & Regs. ¶ 31,048, *order on reh'g*, Order No. 888-B, 81 FERC ¶ 61,248 (1997), *order on reh'g*, Order No. 888-C, 82 FERC ¶ 61,046 (1998), *aff'd in relevant part sub nom. Transmission Access Policy Study Group v. FERC*, 225 F.3d 667 (D.C. Cir. 2000), *aff'd sub nom. New York v. FERC*, 535 U.S. 1 (2002).

themselves.[8] Concluding that unduly discriminatory and anticompetitive practices existed in the electric industry and that, absent Commission action, such practices would increase as competitive pressures in the industry grew, the Commission in Order No. 888 and the accompanying *pro forma* OATT implemented open access to transmission facilities owned, operated, or controlled by a public utility.

16. As part of those reforms, Order No. 888 and the *pro forma* OATT set forth certain minimum requirements for transmission planning. For example, the *pro forma* OATT required a public utility transmission provider to account for the needs of its network customers in its transmission planning activities on the same basis as it provides for its own needs.[9] The *pro forma* OATT also required that new facilities be constructed to meet the transmission service requests of long-term firm point-to-point customers.[10] While Order No. 888-A went on to encourage utilities to engage in joint and regional transmission planning with other utilities and customers, it did not require those actions.[11]

17. In early 2007, the Commission issued Order No. 890 to remedy flaws in the *pro forma* OATT that the Commission identified based on the decade of experience since the issuance of Order No. 888. Among other things, the Commission found that *pro forma*

---

[8] Order No. 888, FERC Stats. & Regs. at 31,682.

[9] *See* Section 28.2 of the *pro forma* OATT.

[10] *See* Sections 13.5, 15.4, and 27 of the *pro forma* OATT.

[11] Order No. 888-A, FERC Stats. & Regs. at 30,311.

OATT obligations related to transmission planning were insufficient to eliminate opportunities for undue discrimination in the provision of transmission service. The Commission stated that particularly in an era of increasing transmission congestion and the need for significant new transmission investment, it could not rely on the self-interest of transmission providers to expand the grid in a not unduly discriminatory manner. Among other shortcomings in the *pro forma* OATT, the Commission pointed to the lack of clear criteria regarding the transmission provider's planning obligation; the absence of a requirement that the overall transmission planning process be open to customers, competitors, and state commissions; and the absence of a requirement that key assumptions and data underlying transmission plans be made available to customers.

18. In light of these findings, one of the primary goals of the reforms undertaken in Order No. 890 was to address the lack of specificity regarding how stakeholders should be treated in the transmission planning process. To remedy the potential for undue discrimination in transmission planning activities, the Commission required each public utility transmission provider to develop a transmission planning process that satisfies nine principles and to clearly describe that process in a new attachment to its OATT (Attachment K). The Order No. 890 transmission planning principles are: (1) coordination; (2) openness; (3) transparency; (4) information exchange; (5) comparability; (6) dispute resolution; (7) regional participation; (8) economic

planning studies; and (9) cost allocation for new projects.[12]

19. The transmission planning reforms adopted in Order No. 890 apply to all public utility transmission providers, including Commission-approved RTOs and ISOs. The Commission stated that it expected all non-public utility transmission providers to participate in the local transmission planning processes required by Order No. 890, and that reciprocity dictates that non-public utility transmission providers that take advantage of open access due to improved planning should be subject to the same requirements as public utility transmission providers.[13] The Commission stated that a coordinated, open, and transparent regional planning process cannot succeed unless all transmission owners participate. However, the Commission did not invoke its authority under FPA section 211A, which allows the Commission to require an unregulated transmitting utility (i.e., a non-public utility transmission provider) to provide transmission services on a comparable and not unduly discriminatory or preferential basis.[14] The Commission instead stated that if it found, on the appropriate record, that non-public utility

[12] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 418-601.

[13] *Id.* P 441.

[14] FPA section 211A(b) provides, in pertinent part, that "the Commission may, by rule or order, require an unregulated transmitting utility to provide transmission services – (1) at rates that are comparable to those that the unregulated transmitting utility charges itself; and (2) on terms and conditions (not relating to rates) that are comparable to those under which the unregulated transmitting utility provides transmission services to itself and that are not unduly discriminatory or preferential." 16 U.S.C. 824j.

transmission providers are not participating in the transmission planning processes required by Order No. 890, then the Commission may exercise its authority under FPA section 211A on a case-by-case basis.

20. On December 7, 2007, pursuant to Order No. 890, most public utility transmission providers and several non-public utility transmission providers submitted compliance filings that describe their proposed transmission planning processes.[15] The Commission addressed these filings in a series of orders that were issued throughout 2008. Generally, the Commission accepted the compliance filings to be effective on December 7, 2007, subject to further compliance filings as necessary for the proposed transmission planning processes to satisfy the nine Order No. 890 transmission planning principles. The Commission issued additional orders on Order No. 890 transmission planning compliance filings in the spring and summer of 2009.

21. As a result of these compliance filings, regional transmission organization (RTO) and independent system operators (ISO) have enhanced their regional transmission planning processes, making them more open, transparent, and inclusive. Regions of the country outside of RTO and ISO regions also have made significant strides with respect to transmission planning by working together to enhance existing, or create new, regional

[15] A small number of public utility transmission providers were granted extensions.

transmission planning processes.[16] These improvements to transmission planning processes have given stakeholders the ability to participate in the identification of regional transmission needs and corresponding solutions, thereby facilitating the development of more efficient and cost-effective transmission expansion plans. This Final Rule expands upon the reforms begun in Order No. 890 by addressing new concerns that have become apparent in the Commission's ongoing monitoring of these matters.

B. Technical Conferences and Notice of Request for Comments on Transmission Planning and Cost Allocation

22. In several of the above-noted orders issued in 2008 and early 2009 on filings submitted to comply with the Order No. 890 transmission planning requirements, the Commission stated that it would continue to monitor implementation of these transmission planning processes. The Commission also announced its intention to convene regional technical conferences in 2009.

23. Consistent with the Commission's announcement, Commission staff in September 2009 convened three regional technical conferences in Philadelphia, Atlanta, and

[16] The regional transmission planning processes that public utility transmission providers in regions outside of RTOs and ISOs have relied on to comply with certain requirements of Order No. 890 are the North Carolina Transmission Planning Collaborative, Southeast Inter-Regional Participation Process, SERC Reliability Corporation, ReliabilityFirst Corporation, Mid-Continent Area Power Pool, Florida Reliability Coordination Council, WestConnect, ColumbiaGrid, and Northern Tier Transmission Group.

Phoenix, respectively. The focus of the technical conferences was to: (1) determine the progress and benefits realized by each transmission provider's transmission planning process, obtain customer and other stakeholder input, and discuss any areas that may need improvement; (2) examine whether existing transmission planning processes adequately consider needs and solutions on a regional or interconnectionwide basis to ensure adequate and reliable supplies at just and reasonable rates; and (3) explore whether existing transmission planning processes are sufficient to meet emerging challenges to the transmission system, such as the development of interregional transmission facilities and the integration of large amounts of location-constrained generation. Issues discussed at the technical conferences included the effectiveness of the current transmission planning processes, the development of regional and interregional transmission plans, and the effectiveness of existing cost allocation methods used by transmission providers and alternatives to those methods.

24. Following these technical conferences, the Commission in October 2009 issued a Notice of Request for Comments.[17] The October 2009 Notice presented numerous questions with respect to enhancing regional transmission planning processes and allocating the cost of transmission. In response to the October 2009 Notice, the

[17] Federal Energy Regulatory Commission, Notice of Request for Comments, Transmission Planning Processes under Order No. 890; Docket No. AD09-8-000, October 8, 2009 (October 2009 Notice).

Commission received 107 initial comments and 45 reply comments.

C. Additional Developments Since Issuance of Order No. 890

25. Other developments with important implications for transmission planning have occurred amid the above-noted Order No. 890 compliance efforts on transmission planning and as the Commission gathered information through the technical conferences and the October 2009 Notice discussed above.

26. For example, in February 2009, Congress enacted the American Recovery and Reinvestment Act (ARRA), which provided $80 million for the U.S. Department of Energy (DOE), in coordination with the Commission, to support the development of interconnection-based transmission plans for the Eastern, Western, and Texas interconnections. In seeking applications for use of those funds, DOE described the initiative as intended to: improve coordination between electric industry participants and states on the regional, interregional, and interconnectionwide levels with regard to long-term electricity policy and planning; provide better quality information for industry planners and state and federal policymakers and regulators, including a portfolio of potential future supply scenarios and their corresponding transmission requirements; increase awareness of required long-term transmission investments under various scenarios, which may encourage parties to resolve cost allocation and siting issues; and facilitate and accelerate development of renewable energy or other low-carbon generation

resources.[18]

27. In December 2009, DOE announced award selections for much of this ARRA funding. In each interconnection, applicants awarded funds under what DOE defined as Topic A are responsible for conducting interconnection-level analysis and transmission planning. Applicants awarded funds under Topic B are to facilitate greater cooperation among states within each interconnection to guide the analyses and planning performed under Topic A.[19] Broad participation in sessions to date related to this initiative suggest that the availability of federal funds to pursue these goals has increased awareness of the potential for greater coordination among regions in transmission planning.

28. In describing the activities undertaken under this transmission analysis and planning initiative, DOE staff leading the project has explained that its activities are based on the premise that the electricity industry faces a major long-term challenge in ensuring an adequate, affordable and environmentally sensitive energy supply and that an open, transparent, inclusive, and collaborative process for transmission planning is essential to securing this energy supply.[20] To that end, DOE staff has stressed that all

---

[18] Department of Energy, *Recovery Act- Resource Assessment and Interconnection-Level Transmission Analysis and Planning Funding Opportunity Announcement*, at 5-6 (June 15, 2009).

[19] *Id.* at 4-8.

[20] Department of Energy, "*DOE Initiative Regarding Interconnection-Level Transmission Analysis and Planning;*" presented at the NGA Transmission Roundtable

(continued…)

stakeholders need to be involved in assessing options to meeting this future need and that ARRA funds are "seed money" to help establish capabilities to address transmission planning issues.[21] In DOE staff's view, the goal of this funding is to help planners develop a portfolio of long-term energy supply and demand for future needs and associated transmission requirements to assess the implications of these alternative future energy scenarios and identify facilities appropriate for consideration in the development of long-term infrastructure plans. Key deliverables of the DOE-funded planning activities are 10- and 20-year plans that analyze the transmission needs of each interconnection under a range of scenarios.

29. While the results of these planning efforts are not yet available, there is already a growing body of evidence that, in DOE's words, "[s]ignificant expansion of the transmission grid will be required under any future electric industry scenario."[22] In its most recent Long-Term Reliability Assessment, North American Electric Reliability Corporation (NERC) identifies 39,000 circuit-miles of projected high-voltage transmission over the next 10 years.[23] NERC estimates that roughly a third of these

[23] NERC 2010 Assessment at 22.

transmission facilities will be needed to integrate variable and renewable generation.[24] Much of this investment in renewable generation is being driven by renewable portfolio standards adopted by states. Some 28 states and the District of Columbia have now adopted renewable portfolio standard measures. In addition, there are 9 states with non-binding goals. The key difference is that the states with requirements usually have financial penalties for non-compliance, known as alternative compliance payments. States with non-binding goals usually have no financial penalty, although some have instituted financial incentives for meeting the goal (e.g., Virginia). These measures typically require that a certain percentage of energy sales (MWh) or installed capacity (MW) come from renewable energy resources, with the target level and qualifying resources varying among the renewable portfolio standard measures. Most of these portfolio standards are set to increase annually, further amplifying the potential need for transmission facilities.

II. The Need for Reform

A. Proposed Rule

30. In light of the changes occurring within the electric industry, and based on the Commission's experience in implementing Order No. 890 and comments submitted in response to the October 2009 Notice, the Commission issued the Proposed Rule on June

[24] *Id.* at 24.

17, 2010 identifying further reforms to the *pro forma* OATT in the areas of transmission planning and cost allocation. These reforms, discussed in detail below, were aimed at ensuring that the transmission planning and cost allocation requirements established in Order No. 890 continue to result in the provision of Commission-jurisdictional service at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential. The Commission received roughly 5,700 pages of initial and reply comments in response. Based on these comments, the Commission concludes that amendment of the transmission planning and cost allocation requirements established in Order No. 890 is necessary at this time to ensure that Commission-jurisdictional services are provided at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential.

31. The Commission noted in the Proposed Rule that transmission planning processes, particularly at the regional level, have seen substantial improvement through compliance with Order No. 890. However, the Commission explained that changes in the nation's electric power industry since issuance of Order No. 890 required the Commission to consider additional reforms to transmission planning and cost allocation to reflect these new circumstances. The Commission stated its intention was not to disrupt the progress being made with respect to transmission planning and investment in transmission infrastructure, but rather to address remaining deficiencies in transmission planning and cost allocation processes so that the transmission grid can better support wholesale power

markets and thereby ensure that Commission-jurisdictional services are provided at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential.

B. Comments

32. A number of commenters generally support the Commission's decision to initiate a rulemaking proceeding that proposes reforms to the transmission planning and cost allocation processes.[25] Several of these commenters state that inadequate transmission planning and cost allocation processes have impeded the development of transmission infrastructure.[26]

33. For example, Transmission Dependent Utility Systems state that they support the primary objective of the Proposed Rule to correct deficiencies in transmission planning and cost allocation processes so that the transmission grid can better support wholesale

[25] *E.g.*, 26 Public Interest Organizations; AEP; American Transmission; AWEA; Anbaric and PowerBridge; Atlantic Grid; Colorado Independent Energy Association; Conservation Law Foundation; Duke; East Texas Cooperatives; Energy Future Coalition; Exelon; Gaelectric; Green Energy Express and 21st Century; Iberdrola Renewables; Imperial Irrigation District; Integrys; ISO New England; ITC Companies; MidAmerican; Multiparty Commenters; National Audubon Society; National Grid; New York ISO; New York PSC; NextEra; Northwest & Intermountain Power Producers Coalition; Old Dominion Electric Cooperative; Pennsylvania PUC; Ignacio Perez-Arriaga; Senators Dorgan and Reid; SPP; Transmission Access Policy Study Group; Transmission Dependent Utility Systems; Western Grid Group; Wind Coalition; WIRES; and Wisconsin Electric.

[26] *E.g.*, AEP; AWEA; Exelon; Iberdrola Renewables; ITC Companies; MidAmerican; and NextEra.

markets and ensure that jurisdictional services are provided at rates, terms, and conditions that are just and reasonable and not unduly discriminatory or preferential. Exelon argues that the current system of disconnected priorities and mixed criteria is simply not working. Pennsylvania PUC encourages the Commission to eliminate the current uncertainty regarding planning and paying for future transmission expansion and upgrades.

34. MidAmerican adds that transmission has grown from an industry sector focused on rebuilds, reliability improvements on existing infrastructure, and construction of generation-dependent interconnection facilities, to one where new and upgraded transmission infrastructure is necessary to effectuate the expansion of regional power markets, promote a more reliable transmission system, accommodate increasing reliance on renewable generation sources, and address the uncertainty of the future role of existing conventional generation. AWEA contends that existing processes for planning and paying for transmission are not sufficient to meet the emerging challenges to the transmission system. AWEA argues that many cost allocation methodologies, as they are applied today, are flawed, which together with the fragmented and short-term transmission planning regimes prevalent today, have often stifled investment in, or otherwise led to the inefficient use and inadequate expansion of the nation's transmission network. Senators Dorgan and Reid state that better coordination of regional transmission planning and clarifying cost allocation are two important steps in

overcoming hurdles to developing the nation's vast renewable energy resources and providing clean energy jobs. National Grid contends that the creation of a robust transmission system is imperative to achieving important policy goals, environmental objectives, market efficiencies, and the integration of renewable and distributed resources into electric power markets.

35. NextEra agrees on reply that there is a need for generic reform at this time, stating that there is a sufficient basis for the Commission to proceed with a rulemaking proceeding and that there is ample evidence of the pressing need to enhance the transmission grid. NextEra states that the Proposed Rule demonstrates how and why existing transmission planning and cost allocation rules are inadequate.

36. A number of commenters provide specific examples of developments that further demonstrate the need for reform. Colorado Independent Energy Association states that, in WestConnect, regional transmission providers are not ignoring the problem of transmission constraints, but that development of transmission facilities is not being undertaken and, second, transmission facilities are not being properly sized. In its view, the problems can be traced to the absence of cost allocation methods or the lack of means for identifying the most needed projects and pursuing them to completion.

37. Iberdrola Renewables contends that the lack of transmission expansion in the MISO has led to significant congestion in areas with extensive operating wind generation. It states that the MISO has reported that wind curtailments primarily caused

by congestion averaged five percent for the first six months of 2010 compared with 2 percent on average in 2009. Exelon adds that the lack of coordination between the MISO and PJM transmission planning regions has resulted in a significant increase in the out-of-merit dispatch of generation on the Commonwealth Edison system to maintain NERC reliability requirements. Exelon states that these events have increased from 31 in 2006 to 280 in 2009, and they result in higher costs on the system and excessive wear and tear on equipment.

38. Brattle Group states that it has identified approximately 130 mostly conceptual and often overlapping planned transmission projects throughout the country with a total cost of over $180 billion.[27] It contends that a large portion of these projects will not be built due to overlaps and deficiencies in transmission planning and cost allocation processes. Brattle Group states that many of the benefits associated with economic and public policy projects are difficult to quantify and, without changes to transmission planning and cost allocation processes, many of these projects may fail to gain the needed support for approval, permitting, and cost recovery.

39. Other commenters question the need for Commission action at this time, urging the Commission to be more rigorous in its proposed findings and holdings and arguing

[27] Brattle Group, Attachment at 5.

that the Proposed Rule is not supported by substantial evidence.[28] Large Public Power Council disagrees with the Commission's assertions in the Proposed Rule that state that renewable portfolio standards have contributed to the need for new transmission. Large Public Power Council states that the Commission offers no factual evidence to support its assertions[29] and that the evidence available actually weighs against the Commission. Large Public Power Council states that renewable portfolio standards have not increased meaningfully since the Commission issued Order No. 890. Furthermore, Large Public Power Council cites a report produced by Edison Electric Institute that states that the members of Edison Electric Institute are making significant and growing investments in transmission infrastructure, including interstate projects and projects that will facilitate the integration of renewable resources. Moreover, Large Public Power Council contends

[28] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Salt River Project; Large Public Power Council (each commenter cites *National Fuel Gas Supply Corp. v. FERC*, 468 F.3d 831 (D.C. Cir. 2006) (*National Fuel*)); Large Public Power Council (citing *Associated Gas Distrib. v. FERC*, 824 F.2d 981 (D.C. Cir. 1985) (*Associated Gas Distributors*)); PSEG Companies; Salt River Project; and San Diego Gas & Electric.

[29] Citing Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 148-154 (Large Public Power Council cites to the following two assertions in the Proposed Rule: "further expansion of regional power markets has led to a growing need for new transmission facilities that cross several utility, RTO, ISO or other regions." (Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 150); and "…the increasing adoption of state resource policies, such as renewable portfolio standard measures, has contributed to rapid growth of location-constrained renewable energy resources that are frequently remote from load centers, as well as a growing need for new transmission facilities across several utility and/or RTO or ISO regions." (Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 151)).

that the Commission offers no evidence that the reforms of the type proposed are a necessary or satisfactory solution to the perceived problem.

40. Replying to commenters that stress the need for reform, discussed above, several commenters argue that none provides evidence supporting the need for a nationwide rule at this time.[30] Ad Hoc Coalition of Southeastern Utilities states that commenters such as Exelon and Multiparty Commenters provide only anecdotes supporting their contention that there is a need to reform transmission planning and cost allocation processes, and argues that these individual issues can be addressed on a case-specific basis rather than through generic rules. Joined by Southern Companies, Ad Hoc Coalition of Southeastern Utilities argues that factual allegations of transmission expansion deficiencies are not applicable to the Southeast, pointing to their robust transmission grid. They state that, to the extent these allegations raise issues for other regions, then they should be addressed within those regions and that these issues do not merit nationwide treatment.[31] Additionally, Ad Hoc Coalition of Southeastern Utilities asserts that existing planning processes under Order No. 890 have not been in place long enough to determine whether reforms are needed, and other commenters assert that existing planning processes are

[30] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Large Public Power Council; San Diego Gas & Electric; and Southern Companies.

[31] Ad Hoc Coalition of Southeastern Utilities, Large Public Power Council and Southern Companies cite to *Associated Gas Distributors*, 824 F.2d 981 at 1019.

working well.[32] PSEG Companies assert that the real issue is the siting process, which makes it difficult to actually build projects even if they are truly needed to maintain system reliability.

41. Indianapolis Power & Light states that the Commission has not undertaken any type of analysis to find out what needs to be built, where it needs to be built, and who needs to build it. Indianapolis Power & Light asserts that the Commission has not looked closely at the different regions of the country to determine which areas could benefit from the new proposed reforms. Indianapolis Power & Light states that the Commission has not sufficiently demonstrated a need for this rulemaking and should consider whether its broad-based application is necessary in the first place. San Diego Gas & Electric recommends that the Commission not issue a Final Rule at this time, arguing that doing so based on the current proposals would disrupt and delay the build-out of the transmission grid and cause transmission providers to redirect resources away from that primary objective to the inevitable legal and compliance challenges to this Final Rule.

C. Commission Determination

42. The Commission concludes that it is appropriate to act at this time to adopt the package of reforms contained in this Final Rule. Our review of the record, as well as the

[32] *E.g.*, PSEG Companies and Salt River Project.

recent studies discussed above, indicates that the transmission planning and cost allocation requirements established in Order No. 890 provide an inadequate foundation for public utility transmission providers to address the challenges they are currently facing or will face in the near future. Although focused on discrete aspects of transmission planning and cost allocation processes, the reforms adopted in this Final Rule are designed to work together to ensure an opportunity for more transmission projects to be considered in the transmission planning process on an equitable basis and increase the likelihood that transmission facilities in the transmission plan will move forward to construction. The Commission's actions today therefore will enhance the ability of the transmission grid to support wholesale power markets and, in turn, ensure that Commission-jurisdictional transmission services are provided at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential.

43. The Commission acknowledges that transmission planning processes have seen substantial improvements, particularly at the regional level, in the relatively short time since the issuance of Order No. 890. Moreover, as some commenters note, transmission planning processes in many regions continue to evolve as public utility transmission providers and stakeholders explore new ways of addressing mutual needs. However, the Commission is concerned that the existing requirements of Order No. 890 regarding transmission planning and cost allocation are insufficient to ensure that this evolution will occur in a manner that ensures that the rates, terms and conditions of service by public

utility transmission providers are just and reasonable and not unduly discriminatory. As a number of commenters contend, inadequate transmission planning and cost allocation requirements may be impeding the development of beneficial transmission lines or resulting in inefficient and overlapping transmission development due to a lack of coordination, all of which contributes to unnecessary congestion and difficulties in obtaining more efficient or cost-effective transmission service.

44. The increase in transmission investment in recent years, as noted in the report produced by Edison Electric Institute and cited by Large Public Power Council,[33] does not mitigate our need to act at this time. To the contrary, as discussed below, the recent increase in transmission investment supports issuance of this Final Rule to ensure that the Commission's transmission planning and cost allocation requirements are adequate to support more efficient and cost-effective investment decisions moving forward. In its report, Edison Electric Institute states that its members have steadily increased investment in transmission over the period from 2001 to 2009, resulting in approximately $55.3 billion in new transmission facilities.[34] NERC confirms the recent increase in

[33] Large Public Power Council (citing *Edison Electric Institute report, available at* http://www.eei.org/ourissues/ElectricityTransmission/Documents/Trans_Project_lowres.pdf).

[34] Edison Electric Institute at v.

investment in its 2010 Long-Term Reliability Assessment.[35] This trend appears to be only the beginning of a longer-term period of investment in new transmission facilities. In another report commissioned by Edison Electric Institute, Brattle Group suggests that approximately $298 billion of new transmission facilities will be required over the period from 2010 to 2030.[36] NERC's analysis of the past 15 years of transmission development confirms the significant increase in future transmission investment, showing that additional transmission planned for construction during the next five years nearly triples the average miles that have historically been constructed.[37]

45. The need for additional transmission facilities is being driven, in large part, by changes in the generation mix. As NERC notes in its 2009 Assessment, existing and potential environmental regulation and state renewable portfolio standards are driving significant changes in the mix of generation resources, resulting in early retirements of coal-fired generation, an increasing reliance on natural gas, and large-scale integration of

[35] NERC 2010 Assessment at 25; *see also* Brattle Group, Attachment at 4 (noting rapid increase in transmission development, from $2 billion annually in the 1990s to $8 billion annual in 2008 and 2009).

[36] Transforming America's Power Industry at 37, http://www.eei.org/ourissues/finance/Documents/Transforming_Americas_Power_Industry.pdf.

[37] NERC 2010 Long-Term Reliability Assessment at 25.

renewable generation.[38] NERC has identified approximately 131,000 megawatts of new generation planned for construction over the next ten years, with the largest fuel-type growth in gas-fired and wind generation resources.[39] These shifts in the generation fleet increase the need for new transmission. Additionally, the existing transmission system was not built to accommodate this shifting generation fleet. Of the total miles of bulk power transmission under construction, planned, and in a conceptual stage, NERC estimates that 50 percent will be needed strictly for reliability and an additional 27 percent will be needed to integrate variable and renewable generation across North America.[40]

46. Rather than demonstrating a lack of need for action, as claimed by some commenters, the recent increases in constructed and planned transmission facilities supports issuance of this Final Rule at this time to ensure that the Commission's transmission planning and cost allocation requirements are adequate to support more efficient and cost-effective investment decisions. The increased focus on investment in new transmission projects makes it even more critical to implement these reforms to ensure that the more efficient or cost-effective projects come to fruition. The record in

[38] NERC 2009 Long-Term Reliability Assessment at 8; *see also supra* P 29 (summarizing current state renewable portfolio standards).

[39] NERC 2010 Long-Term Reliability Assessment at 12.

[40] *Id.* at 24.

this proceeding and the reports cited above confirm that additional, and potentially significant, investment in new transmission facilities will be required in the future to meet reliability needs and integrate new sources of generation. It is therefore critical that the Commission act now to address deficiencies to ensure that more efficient or cost-effective investments are made as the industry addresses its challenges.

47. As explained below, each of the individual reforms adopted by the Commission is intended to address specific deficiencies in the Commission's existing transmission planning and cost allocation requirements. Through this package of reforms, the Commission seeks to ensure that each public utility transmission provider will work within its transmission planning region to create a regional transmission plan that identifies transmission facilities needed to meet reliability, economic and Public Policy Requirements, including fair consideration of lines proposed by nonincumbents, with cost allocation mechanisms in place to facilitate lines moving from planning to development. Although focused on particular aspects of the Commission's transmission planning and cost allocation requirements, these reforms are integrally related and should be understood as a package that is designed to reform processes and procedures that, if left in place, could result in Commission-jurisdictional services being provided at rates that are unjust and unreasonable and unduly discriminatory or preferential.

48. A number of commenters maintain that the Commission in the Proposed Rule failed to provide adequate evidence to support a finding under section 206 of the FPA

that the reforms adopted in this Final Rule are necessary to ensure that Commission-jurisdictional services are provided at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential. Section 313(b) of the FPA makes Commission findings of fact conclusive if they are supported by substantial evidence.[41] When applied in a rulemaking context, "the substantial evidence test is identical to the familiar arbitrary and capricious standard."[42] The Commission thus must show that a "reasonable mind might accept" that the evidentiary record here is "adequate to support a conclusion,"[43] in this case that this Final Rule is needed "to correct deficiencies in transmission planning and cost allocation processes," as described.[44] In the legal authority sections throughout this Final Rule, the Commission discusses how the cases cited by commenters demonstrate that the Commission has met its burden.

49. Commenters that maintain that the Commission's proposal is not supported by substantial evidence demand that the Commission identify evidence that is far in excess of what a reasonable person would require. We thus disagree with such comments, including Indianapolis Power & Light's, that it is necessary for the Commission to

[41] 16 U.S.C. 825l(b).

[43] *Dickenson v. Zurko*, 527 U.S. 150, 155 (1999).

[44] Proposed Rule, FERC Stats & Regs. ¶ 32,660 at P 1.

determine what needs to be built, where it needs to be built, and who needs to build it. That is not, and is not required to be, the intent of this rulemaking. This rulemaking reforms processes and is not intended to address such questions. No commenter has contested the need for additional transmission facilities, and numerous examples have been provided here of transmission planning and cost allocation impediments to the development of such facilities. Our intent here is to continue to ensure that public utility transmission providers use just and reasonable transmission planning processes and procedures, as required by Order Nos. 888 and 890, to provide for the needs of their transmission customers. Such planning may require public utility transmission providers—in consultation with stakeholders—to determine what needs to be built, where it needs to be built, and who needs to build it, but the Commission is not making such determinations here.

50. We also reject the characterization of factual examples presented to demonstrate the need for reform as anecdotal evidence. A wide range of concerns have been raised by commenters, and the Commission need not, and should not, wait for systemic problems to undermine transmission planning before it acts. The Commission must act promptly to establish the rules and processes necessary to allow public utility transmission providers to ensure planning of and investment in the right transmission facilities as the industry moves forward to address the many challenges it faces. Transmission planning is a complex process that requires consideration of a broad range of factors and an assessment

of their significance over a period that can extend from present out to 20, 30 years or more in the future. In addition, the development of transmission facilities can involve long lead times and complex problems related to design, siting, permitting, and financing. Given the need to deal with these matters over a long time horizon, it is appropriate and prudent that we act at this time rather than allowing the types of problems described above to continue or to increase. In light of these conditions and as explained below, we find that it is reasonable to take generic action through this rulemaking proceeding.

51. A brief consideration of the two cases that commenters rely on to argue that the Commission has not satisfied the substantial evidence standard helps to demonstrate that the standard has been fully met. In *National Fuel*, the court found that the Commission had not met the substantial evidence standard when it sought to extend its standards of conduct that regulate natural gas pipelines' interactions with their marketing affiliates to their interactions with their non-marketing affiliates. The court noted that it had upheld the standards of conduct as applied to pipelines and their marketing affiliates because the Commission had shown both a theoretical threat that pipelines could grant undue preferences to their marketing affiliates and evidence that such abuse had occurred.[45] In finding that the Commission had not met the substantial evidence standard when seeking to extend the standards of conduct, the court noted that the Commission had not cited a

[45] *National Fuel*, 468 F.3d 831 at 839.

single example of abuse by non-marketing affiliates. It concluded that the Commission relied either on examples of abuse or comments from the rulemaking that simply reiterated a theoretical potential for abuse.[46] The court remanded the matter and noted that if the Commission chose to proceed it could even rely solely on a theoretical threat if it could show how the threat justified the costs that the rules would create.[47]

52. Our action in this Final Rule is entirely consistent with the standards that the court set forth in *National Fuel*. We conclude that the narrow focus of current planning requirements and shortcomings of current cost allocation practices create an environment that fails to promote the more efficient and cost-effective development of new transmission facilities, and that addressing these issues is necessary to ensure just and reasonable rates. In other words, the problem that the Commission seeks to resolve represents a "theoretical threat," in the words of the *National Fuel* decision, the features of which are discussed throughout the body of this Final Rule in the context of each of the reforms adopted here. This threat is significant enough to justify the requirement imposed by this Final Rule. It is not one that can be addressed adequately or efficiently through the adjudication of individual complaints. The problems that we seek to resolve here stem from the absence of planning processes that take a sufficiently broad view of

[46] *Id.* at 841.

[47] *Id.* at 844.

both the tasks involved and the means of addressing them. Individual adjudications by their nature focus on discrete questions of a specific case. Rules setting forth general principles are necessary to ensure that adequate planning processes are in place.

53. Stated in another way, in the terminology of *National Fuel*, the remedy we adopt is justified sufficiently by the "theoretical threat" identified herein, even without "record evidence of abuse." The actual experiences of problems cited in the record herein provide additional support for our action, but are not necessary to justify the remedy.

54. *Associated Gas Distributors* likewise is distinguishable from this proceeding. In that case, the court reviewed the Commission's rationale in Order No. 436 for industry-wide contract demand adjustment conditions, which permitted pipeline customers to reduce their contract demand by up to 100 percent over a period of five years.[48] The court held that the Commission failed to develop an adequate rationale for authorizing what it characterized as the "drastic action" of 100 percent contract demand reduction, and that the reasons the Commission provided "seem[ed] peripheral to the problem the Commission set out to solve."[49] The court also found that one of the Commission's arguments while "highly relevant" to contract demand reduction, failed to support the

[48] *Associated Gas Distributors*, 824 F.2d 981 at 1013.

[49] *Id.* at 1018-19.

broad remedy the Commission adopted.[50] The court explained that it was unclear why an industry-wide solution was necessary to solve a problem that the Commission suggested applied only "to a limited portion of the industry." [51]

55. We find that the facts and findings of *Associated Gas Distributors* are in no way comparable to the matters involved in this Final Rule. We disagree with commenters that characterize our reasoning as inadequate or peripheral to the problems that the Commission has identified in this proceeding. To the contrary, the reforms adopted herein are necessary to address those problems and are supported by the reasons set forth in this Final Rule. As discussed herein, the Commission finds that the narrow focus of current planning requirements and shortcomings of current cost allocation practices create an environment that fails to promote the more efficient and cost-effective development of new transmission facilities. There is a close relationship between those problems and the Commission's actions here to identify a minimum set of requirements that must be met to ensure that transmission planning processes and cost allocation methods subject to its jurisdiction result in Commission-jurisdictional services being provided at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential.

---

[50] *Id.* at 1019.

[51] *Id.* at 1018-19.

56. We also disagree with commenters that argue that the reforms adopted in this Final Rule will have an impact on industry that is comparable to the impact at issue in *Associated Gas Distributors*. The impact in that case involved the potential losses a gas pipeline could face from 100 percent contract demand reduction by a customer over a period of five years. Such reduction represents the complete elimination of expected revenues from gas sales under a contract. By contrast, compliance with this Final Rule will involve the adoption and implementation of additional processes and procedures. Many public utility transmission providers that are subject to this Final Rule already engage in processes and procedures of this type.

57. We acknowledge that some public utility transmission providers may need to do more than others to achieve compliance with the requirements of this Final Rule. Such differences, however, do not mean that the problems identified herein are "limited to a portion of the industry," in the terms used in *Associated Gas Distributors*. Indeed, acting on a generic basis is necessary for the Commission to identify and implement a minimum set of requirements for transmission planning processes and cost allocation methods, as discussed above.

58. We also disagree with commenters who assert that the Commission is relying on unsubstantiated allegations of discriminatory conduct or that the current Order No. 890 processes have not been in place long enough to justify the reforms proposed herein. The

courts have made clear that the Commission need not make specific factual findings of discrimination to promulgate a generic rule to ensure just and reasonable rates or eliminate undue discrimination.[52] In *Associated Gas Distributors*, the court explained that the promulgation of generic rate criteria involves the determination of policy goals and the selection of the means to achieve them and that courts do not insist on empirical data for every proposition upon which the selection depends: "[a]gencies do not need to conduct experiments in order to rely on the prediction that an unsupported stone will fall."[53] As discussed in this Final Rule, the Commission has received many comments arguing that commenters have experienced unjust and unreasonable, or unduly discriminatory or preferential practices in the transmission planning aspects of the transmission service provided by public utility transmission providers and that the lack of guidance from the Commission has delayed, as well as hindered, transmission projects. We have an obligation under section 206 to remedy these unjust and unreasonable, or unduly discriminatory or preferential rates, terms, and conditions and practices affecting rates.

59. It is thus clear to us that, notwithstanding the Commission's efforts in Order No. 890, deficiencies in the requirements of the existing *pro forma* OATT must be remedied

[52] *TAPS v. FERC*, 225 F.3d 667 at 688; *National Fuel*, 468 F.3d 831.

[53] 824 F.2d 981 at 1008.

to support the more efficient and cost-effective development of transmission facilities used to provide Commission-jurisdictional services. Moreover, action is needed to address the opportunities to engage in undue discrimination by public utility transmission providers. Our actions in this Final Rule are necessary to produce rates, terms and conditions that are just and reasonable. We therefore exercise our broad remedial authority[54] today to ensure that rates are not unjust and unreasonable and to limit the remaining opportunities for undue discrimination.

60. We also disagree with the commenters that claim that any concerns with current transmission planning and cost allocation processes are better dealt with on a case-specific basis rather than through a generic rule. While the concerns discussed above that are driving the need for these reforms may not affect each region of the country equally, we remain concerned that the existing transmission planning and cost allocation requirements of Order No. 890 are inadequate to ensure the development of more efficient and cost-effective transmission. It is well established that the choice between rulemaking and case-by-case adjudication "lies primarily in the informed discretion of the administrative agency."[55] It is within our discretion to conclude that a generic

[54] *Niagara Mohawk Power Corp. v. FPC*, 379 F.2d 153, 159 (D.C. Cir. 1967).

[55] *SEC v. Chenery Corp*., 332 U.S. 194, 203 (1947). *See also Alaska Power & Telephone Co.*, 98 FERC ¶ 61,092, at 61,277 (2002); *Trailblazer Pipeline Co.*,

(continued…)

rulemaking, not case-by-case adjudications, is the most efficient approach to take to resolve the industry wide problems facing us.

61. Nevertheless, the Commission recognizes that each transmission planning region has unique characteristics and, therefore, this Final Rule accords transmission planning regions significant flexibility to tailor regional transmission planning and cost allocation processes to accommodate these regional differences. The Commission recognizes that many transmission planning regions have or are in the process of taking steps to address some of the concerns described in this Final Rule. We encourage those regions to use the objectives and principles discussed in this Final Rule to guide continued development and compel them to abide by the requirements of this Final Rule.

62. The Commission recognizes the scope of these requirements, and to that end the Commission will continue to make its staff available to assist industry regarding compliance matters, as it did after Order No. 890. As stated above, as public utility transmission providers work with their stakeholders to prepare compliance proposals, the Commission encourages frequent dialogue with Commission staff to explore issues that are specific to each transmission planning region. The Commission will monitor progress being made.

---

79 FERC ¶ 61,274, at 62,183 (1997).

D. Use of Terms

63. Before turning to the requirements of this Final Rule, the Commission defines several of the key terms used herein. For purposes of this Final Rule, there is a distinction between a transmission facility in a regional transmission plan and a transmission facility selected in a regional transmission plan for purposes of cost allocation. Transmission facilities selected in a regional transmission plan for purposes of cost allocation are transmission facilities that have been selected pursuant to a transmission planning region's Commission-approved regional transmission planning process for inclusion in a regional transmission plan for purposes of cost allocation because they are more efficient or cost-effective solutions to regional transmission needs. Those may include both regional transmission facilities, which are located solely within a single transmission planning region and are determined to be a more efficient or cost-effective solution to a regional transmission need, and interregional transmission facilities, which are located within two or more neighboring transmission planning regions and are determined by each of those regions to be a more efficient or cost effective solution to a regional transmission need. Such transmission facilities often will not comprise all of the transmission facilities in the regional transmission plan; rather, such transmission facilities may be a subset of the transmission facilities in the regional transmission plan. For example, such transmission facilities do not include a transmission facility in the regional transmission plan but that has not been selected in the

manner described above, such as a local transmission facility or a merchant transmission facility. A local transmission facility is a transmission facility located solely within a public utility transmission provider's retail distribution service territory or footprint that is not selected in the regional transmission plan for purposes of cost allocation.

64. In distinguishing between transmission facilities selected in a regional transmission plan for purposes of cost allocation and other transmission facilities that also may be in the regional transmission plan, we seek to recognize that different regions of the country may have different practices with regard to populating their regional transmission plans. In some regions, transmission facilities not selected for purposes of regional or interregional of cost allocation nonetheless may be in a regional transmission plan for informational purposes, and the presence of such transmission projects in the regional transmission plan does not necessarily indicate an evaluation of whether such transmission facilities are more efficient or cost-effective solutions to a regional transmission need, as is the case for transmission facilities selected in a regional transmission plan for purposes of cost allocation. By focusing in parts of this Final Rule on transmission facilities selected in a regional transmission plan for purposes of cost allocation, we do not intend to disturb regional practices with regard to other transmission facilities that also may be in the regional transmission plan.

65. We also clarify that the requirements of this Final Rule are intended to apply to new transmission facilities, which are those transmission facilities that are subject to

evaluation, or reevaluation as the case may be, within a public utility transmission provider's local or regional transmission planning process after the effective date of the public utility transmission provider's filing adopting the relevant requirements of this Final Rule. The requirements of this Final Rule will apply to the evaluation or reevaluation of any transmission facility that occurs after the effective date of the public utility transmission provider's filing adopting the transmission planning and cost allocation reforms of the *pro forma* OATT required by this Final Rule. We appreciate that transmission facilities often are subject to continuing evaluation as development schedules and transmission needs change, and that the issuance of this Final Rule is likely to fall in the middle of ongoing planning cycles. Each region is to determine at what point a previously approved project is no longer subject to reevaluation and, as a result, whether it is subject to the requirements of this Final Rule.[56] Our intent here is that this Final Rule not delay current studies being undertaken pursuant to existing regional transmission planning processes or impede progress on implementing existing transmission plans. We direct public utility transmission providers to explain in their compliance filings how they will determine which facilities evaluated in their local and regional planning processes will be subject to the requirements of this Final Rule.

66. Finally, nothing in this Final Rule should be read as the Commission granting

[56] We note that existing planning processes already include specific points at which a project will no longer be subject to reevaluation.

approval to build a "transmission facility in a regional transmission plan" or a "transmission facility selected in a regional transmission plan for purposes of cost allocation." For purposes of this Final Rule, the designation of a transmission project as a "transmission facility in a regional transmission plan" or a "transmission facility selected in a regional transmission plan for purposes of cost allocation" only establishes how the developer may allocate the costs of the facility in Commission-approved rates if such facility is built. Nothing in this Final Rule requires that a facility in a regional transmission plan or selected in a regional transmission plan for purposes of cost allocation be built, nor does it give any entity permission to build a facility. Also, nothing in this Final Rule relieves any developer from having to obtain all approvals required to build such facility.

III. Proposed Reforms: Transmission Planning

67. This section of the Final Rule has three parts: (A) participation in the regional transmission planning process; (B) nonincumbent transmission developers; and (C) interregional transmission coordination.

A. Regional Transmission Planning Process

68. This part of the Final Rule adopts several reforms to improve regional transmission planning. First, building on the reforms that the Commission adopted in Order No. 890, this Final Rule requires each public utility transmission provider to participate in a regional transmission planning process that produces a regional

transmission plan and complies with existing Order No. 890 transmission planning principles. Second, this Final Rule adopts reforms under which transmission needs driven by Public Policy Requirements are considered in local and regional transmission planning processes. By "local" transmission planning process, we mean the transmission planning process that a public utility transmission provider performs for its individual retail distribution service territory or footprint pursuant to the requirements of Order No. 890. These reforms work together to ensure that public utility transmission providers in every transmission planning region, in consultation with stakeholders, evaluate proposed alternative solutions at the regional level that may resolve the region's needs more efficiently or cost-effectively than solutions identified in the local transmission plans of individual public utility transmission providers. [57] This, in turn, will provide assurance that rates for transmission services on these systems will reflect more efficient or cost-effective solutions for the region. Each of these reforms is discussed more fully below.

69. Part A of section III has four subsections: (1) need for reform concerning regional transmission planning; (2) legal authority for transmission planning reforms;[58]

[57] As in Order No. 890, the transmission planning requirements adopted here do not address or dictate which transmission facilities should be either in the regional transmission plan or actually constructed. *See* Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 438. We leave such decisions in the first instance to the judgment of public utility transmission providers, in consultation with stakeholders participating in the regional transmission planning process.

[58] Because the legal authority concerns raised by commenters with regard to our

(continued…)

(3) regional transmission plan and Order No. 890 transmission planning principles; and

(4) consideration of transmission needs driven by Public Policy Requirements.

1. Need for Reform Concerning Regional Transmission Planning

a. Commission Proposal

70. In the Proposed Rule, the Commission explained that, since the issuance of Order No. 890, it has become apparent to the Commission that Order No. 890's regional participation transmission planning principle may not be sufficient, in and of itself, to ensure an open, transparent, inclusive, and comprehensive regional transmission planning process. The Commission explained that, to meet that principle, each public utility transmission provider is currently required to coordinate with interconnected systems to: (1) share system plans to ensure that the plans are simultaneously feasible and otherwise use consistent assumptions and data; and (2) identify system enhancements that could relieve congestion or integrate new resources.[59] The Commission thus did not require development of a transmission plan by each transmission planning region. Moreover, the Commission did not require regional transmission planning activities to comply with the transmission planning principles established in Order No. 890.[60] As such, the

---

regional transmission planning reforms and our interregional transmission coordination reforms are so closely related, we address these concerns together.

[59] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 45 (citing Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 523).

[60] *See Entergy Services, Inc.*, 124 FERC ¶ 61,268, at P 104 (2008).

Commission proposed to require each public utility transmission provider to participate in a regional transmission planning process that satisfies the existing Order No. 890 transmission planning principles[61] and that produces a regional transmission plan.

71. The Commission also explained that, while it intended Order No. 890's economic planning studies transmission planning principle to be sufficiently broad to identify solutions that could relieve transmission congestion or integrate new resources and loads, including transmission facilities to integrate new resources and loads on an aggregated or regional basis,[62] it recognized that its statements with respect to the Order No. 890 economic planning studies transmission planning principle may have contributed to confusion as to whether Public Policy Requirements may be considered in the

[61] These transmission planning principles are: (1) coordination; (2) openness; (3) transparency; (4) information exchange; (5) comparability; (6) dispute resolution; and (7) economic planning.

[62] Order No. 890's economic planning studies transmission planning principle requires that stakeholders be given the right to request a defined number of high priority studies annually through the transmission planning process, which are intended to identify solutions that could relieve transmission congestion or integrate new resources and loads, including facilities to integrate new resources or loads on an aggregated or regional basis. *See* Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 547-48.

transmission planning process.[63] The Proposed Rule stated that, when conducting transmission planning to serve native load customers, a prudent public utility transmission provider will not only plan to maintain reliability and consider whether transmission facilities or other investments can reduce the overall costs of serving native load, but also consider how to enable compliance with relevant Public Policy Requirements. The Proposed Rule further stated that, to avoid acting in an unduly discriminatory manner, a public utility transmission provider must consider these same needs on behalf of all of its customers. The Commission also noted that providing for incorporation of Public Policy Requirements in transmission planning processes, where applicable, could facilitate cost-effective achievement of those requirements.[64] The Commission therefore proposed to require each public utility transmission provider to amend its OATT so that its local and regional transmission planning processes explicitly provide for consideration of Public Policy Requirements.

b. Comments

72. A number of commenters support the Commission's preliminary determination in the Proposed Rule that there is a need to enhance the regional transmission planning

[63] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 55-57 & n.76.

[64] *Id.* P 63.

process.[65] In supporting the proposal to implement new regional transmission planning requirements, Pennsylvania PUC argues that the current regional transmission planning process does not lend itself to the sort of open and transparent processes that allow state commissions to fully contribute to the regional transmission planning arena. Iberdrola Renewables states that the proposed reforms would advance the sound development of substantial new renewable energy resources, which it argues is critical to the nation's energy security, economic well-being, and the environment. AWEA states that existing transmission planning processes are too parochial in design and practice, and it suggests that the proposed transmission planning reforms will remedy these deficiencies.

73. However, other commenters argue that there is no need for reform of regional transmission planning requirements, at least on a nationwide basis.[66] Ad Hoc Coalition of Southeastern Utilities and Southern Companies argue that any problems that may exist regarding regional transmission planning are local in nature and the Commission should not undertake comprehensive, generic reform. They argue that the regional transmission planning concerns expressed in the Proposed Rule are not present in the Southeast.

---

[65] *E.g.*, 26 Public Interest Organizations; AWEA; Atlantic Grid; Clean Line; East Texas Cooperatives; Energy Future Coalition Group; Gaelectric; Iberdrola Renewables; Massachusetts Departments; NextEra; Pennsylvania PUC; Western Grid Group; and Wind Coalition.

[66] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Avista and Puget Sound; Bonneville Power; ColumbiaGrid; Indianapolis Power & Light; Southern Companies; and WestConnect.

ColumbiaGrid, Bonneville Power, Avista, and Puget Sound argue that regional transmission planning in the Northwest is robust. WestConnect makes a similar point regarding its collaborative planning process. Avista and Puget Sound state that the proposed reforms could threaten the continued viability of ColumbiaGrid's successful collaborative approach to planning because of concerns that some ColumbiaGrid members may not participate in that process if the Proposed Rule's reforms are adopted.

74. Others argue that the Commission should allow existing regional transmission planning processes to mature before taking action.[67] Sacramento Municipal Utility District contends that comprehensive transmission planning currently exists, planning studies are being performed, results are being evaluated, and interested stakeholders are actively engaged and, consequently, the Commission need not and should not take further action. Modesto Irrigation District states that existing regional and interconnectionwide transmission planning processes in the West provide an effective and comprehensive way to determine transmission needs and the transmission projects that efficiently address those needs in a manner that is consistent with the bottom up, stakeholder-driven

[67] *E.g.*, California Transmission Planning Group; Sacramento Municipal Utility District; and WestConnect.

transmission planning processes found in Order No. 890.[68] In reply, California Transmission Planning Group states that it agrees with commenters in the Western Interconnection that existing regional and interconnectionwide processes should continue to mature. It argues that comments expressing frustration with its planning process are indicative of the need to provide such processes time to mature, noting that its work has matured rapidly in the year since it was formed. Coalition for Fair Transmission Policy states that transmission investment has accelerated in recent years and, as a result, current transmission planning processes are working.

75. Others argue that the Proposed Rule would lead to undesirable outcomes. California Transmission Planning Group argues that the Proposed Rule would require it to transform itself from a regional coordinator of transmission studies and planning into a quasi-adjudicatory arbiter of the relative economic merits of specific transmission projects or alternatives and a gatekeeper to cost recovery and ratemaking mechanisms. California Transmission Planning Group also notes the legal constraints on many of its public agency members from assuming certain planning-related responsibilities.

[68] In describing these comments, we use the terms "interconnectionwide" and "regional" even though many commenters in the western United States used the term "regional" for interconnectionwide and "subregional" for regional. However, we will continue to use the terms "interconnectionwide" and "regional" in this Final Rule to make these comments clearer to readers outside of the West.

NorthWestern Corporation (Montana) does not believe the proposed approach is workable in the unorganized market areas in the West because the transmission provider, not the regional planning entity, has the obligation to the Commission through its tariff.

76. North Carolina Agencies argue that transmission planning must be initiated at the local and regional levels subject to state-level authority and based on the needs of customers who bear the burdens and benefits of the decisions resulting from the planning process. North Carolina Agencies also state that transmission developers who offer transmission projects as an alternative to locally planned solutions must be required to participate in and have their proposals considered as part of the relevant state planning process. Imperial Irrigation District points to potential confusion in the West, and states that it believes that the creation of a new regional transmission planning authority would impede, not hasten, transmission development.

77. However, Multiparty Commenters urge the Commission not to be swayed by arguments that reform of the transmission planning and cost allocation processes are not necessary simply because there has been an increase in transmission investment in the last few years**,** asserting that more investment does not mean that there is enough transmission being built to satisfy future needs, such as the interconnection of renewable resources. NextEra disagrees with commenters asserting that revising transmission planning procedures would disrupt existing processes under Order No. 890, arguing that those processes should be improved if there is a need to do so, as it would be wasteful to

withhold needed reforms to observe how current processes would evolve. Powerex states that, although progress has been made in transmission planning processes since Order No. 890 was issued, more reforms are needed to ensure transparency and a level playing field for all stakeholders. National Grid agrees that the Commission should not wait to exercise its authority to require improvements to transmission planning processes. 26 Public Interest Organizations argue that Southern Companies' claims that the transmission planning deficiencies identified in the Proposed Rule do not pertain to them and that implementation of the Proposed Rule would harm existing processes are unsupported by the facts and may reflect the inability of planning authorities to recognize the limits of their own procedures.

c. Commission Determination

78. We conclude that it is necessary to act under section 206 of the FPA to adopt the regional transmission planning reforms of this Final Rule, as discussed more fully below, to ensure just and reasonable rates and to prevent undue discrimination by public utility transmission providers. Our review of the record, including the comments submitted by numerous entities representing a variety of diverse viewpoints, makes clear to us that reform is necessary at this time. Specifically, we conclude that the existing requirements of Order No. 890 are inadequate to ensure that public utility transmission providers in each transmission planning region, in consultation with stakeholders, identify and evaluate transmission alternatives at the regional level that may resolve the region's

needs more efficiently or cost-effectively than solutions identified in the local transmission plans of individual public utility transmission providers. Moreover, the existing requirements of Order No. 890 do not necessarily result in the development of a regional transmission plan that reflects the identification by the transmission planning region of the set of transmission facilities that are more efficient or cost-effective solutions for the transmission planning region.

79. As the Commission explained in the Proposed Rule, when an individual public utility transmission provider engages in local transmission planning, it considers and evaluates transmission facilities and non-transmission alternatives that are proposed and then develops a local transmission plan that identifies what transmission facilities are needed to meet the needs of its native load (if any), transmission customers, and other stakeholders.[69] Through this process, the public utility transmission provider evaluates the various alternatives available to determine a set of solutions that meet the system's needs more efficiently or cost-effectively than other proposed solutions. At the regional level, the Commission has relied on such processes when evaluating filings to help ensure that the recovery of costs associated with transmission facilities recovered through Commission-jurisdictional rates is just and reasonable.[70]

---

[69] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 51.

[70] *See, e.g., Transmission Technology Solutions, LLC, et al. v. Cal. Indep. Sys. Operator Corp.*, 135 FERC ¶ 61,077, at P 84 (2011) (rejecting complaint regarding

(continued…)

80. In some transmission planning regions, a similar level of analysis is undertaken by public utility transmission providers at the regional level, resulting in the development of a regional transmission plan that identifies those transmission facilities that are needed to meet the needs of stakeholders in the region. This occurs, for example, in each of the existing RTO and ISO regions, which, we note, serve over two-thirds of the nation's consumers.[71] In other transmission planning regions, however, as permitted by Order No. 890, public utility transmission providers use the regional transmission planning process as a forum to confirm the simultaneous feasibility of transmission facilities contained in their local transmission plans. We conclude that it is necessary to have an affirmative obligation in these transmission planning regions to evaluate alternatives that may meet the needs of the region more efficiently or cost-effectively. Given the potential impact such investments could have on rates for Commission-jurisdictional service, we

---

California ISO transmission planning process and stating "we find that CAISO reasonably concluded that PG&E's project is ultimately the most prudent and cost-effective solution. We find that for each of the incumbent and non-incumbent proposed projects, CAISO adequately considered lower cost alternatives, selected economically efficient solutions, accounted for more than just capital costs, and considered additional project benefits.").

[71] *See IRC Brings Value to Reliability and Electricity Markets*, *available at* http://www.isorto.org/site/c.jhKQIZPBImE/b.2603917/k.B00F/About.htm. As discussed in section V below, to the extent existing transmission planning processes satisfy the requirements of this Final Rule, public utility transmission providers need not revise their OATTs and, instead, should describe in their compliance filings how the relevant requirements are satisfied by reference to tariff sheets already on file with the Commission.

conclude it is necessary to act at this time to enhance the transmission planning-related requirements imposed in Order No. 890.

81. In the absence of the reforms implemented below, we are concerned that public utility transmission providers may not adequately assess the potential benefits of alternative transmission solutions at the regional level that may meet the needs of a transmission planning region more efficiently or cost-effectively than solutions identified by individual public utility transmission providers in their local transmission planning process. For example, proactive cooperation among public utility transmission providers within a transmission planning region could better identify transmission solutions to more efficiently or cost-effectively meet the reliability needs of public utility transmission providers in the region. Further, regional transmission planning could better identify transmission solutions for reliably and cost-effectively integrating location-constrained renewable energy resources needed to fulfill Public Policy Requirements such as the renewable portfolio standards adopted by many states. Similarly, the development of transmission facilities that span the service territories of multiple public utility transmission providers may obviate the need for transmission facilities identified in multiple local transmission plans while simultaneously reducing congestion across the region. Under the existing requirements of Order No. 890, however, there is no affirmative obligation placed on public utility transmission providers to explore such alternatives in the absence of a stakeholder request to do so. We correct that deficiency

in this Final Rule.

82. Based on our review of the record and comments in this proceeding, we also require each public utility transmission provider to amend its OATT to explicitly provide for consideration of transmission needs driven by Public Policy Requirements in both local and regional transmission planning processes. As the Commission noted in the Proposed Rule, existing transmission planning processes generally were not designed to account for, and do not explicitly consider, transmission needs driven by Public Policy Requirements. While transmission planning processes in some regions have evolved to reflect compliance with Public Policy Requirements, our review of the comments indicates that some transmission planning processes do not consider transmission needs driven by Public Policy Requirements.[72] As a result, some regions are struggling with how to adequately address transmission expansion necessary to, for example, comply with renewable portfolio standards. These difficulties are compounded by the fact that planning transmission facilities necessary to meet state resource requirements must be integrated with existing transmission planning processes that are based on metrics or tariff provisions focused on reliability or, in some cases, production cost savings.

83. As the Commission explained in the Proposed Rule, consideration of Public Policy

[72] For example, PJM acknowledges in its comments that under its existing transmission planning process, it cannot build transmission to anticipate the development of future generation, including renewable energy resources, that are not associated with specific generator interconnection requests.

Requirements raises issues similar to those raised in the Commission's discussion in Order No. 890 of the economic planning studies transmission planning principle.[73] When conducting transmission planning to serve native load customers, a prudent transmission provider will not only plan to maintain reliability and consider whether transmission upgrades or other investments can reduce the overall costs of serving native load, but also consider how to plan for transmission needs driven by Public Policy Requirements.[74] Therefore, we conclude that, to avoid acting in an unduly discriminatory manner against transmission customers that serve other loads, a public utility transmission provider must consider these same transmission needs for all of its transmission customers. Moreover, given that consideration of transmission needs driven by Public Policy Requirements could facilitate the more efficient and cost-effective achievement of those requirements, we conclude the reforms adopted herein are necessary to ensure that rates for Commission-jurisdictional services are just and reasonable.

84. Turning to the commenters opposed to these reforms, we are not persuaded by

[73] In Order No. 890, the Commission intended the economic planning studies principle to be sufficiently broad to identify solutions that could relieve transmission congestion or integrate new resources and loads, including facilities to integrate new resources and loads on an aggregated or regional basis. Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 523.

[74] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 63.

those who argue that any problems with existing transmission planning are local in nature and that the Commission should not undertake comprehensive, generic reform. As we explain above in the section on the general need for the reforms in this Final Rule, the Commission need not make specific factual findings to promulgate a generic rule to ensure rates, terms and conditions of jurisdictional services are just and reasonable and not unduly discriminatory or preferential.[75] As for those commenters that argue that the Commission should allow existing regional transmission planning processes to mature before acting, we believe that the discussion above illustrates that the requirements of the *pro forma* OATT are inadequate to ensure the development of more efficient or cost-effective solutions to regional needs. As we explained in section II above, while transmission planning processes have improved since the issuance of Order No. 890, we are concerned that the existing Order No. 890 requirements regarding transmission planning, as well as cost allocation, are insufficient to ensure that the evolution of transmission planning processes will occur in a manner that ensures that the rates, terms and conditions of jurisdictional services are just and reasonable and not unduly discriminatory or preferential. At the same time, in response to North Carolina Agencies, we do not intend our reforms to preclude the ability of states to actively plan at the local level.

[75] *See discussion supra* section II.C.

2. Legal Authority for Transmission Planning Reforms[76]

a. Commission Proposal

85. In the Proposed Rule, the Commission explained that the proposed reforms in the areas of regional transmission planning and interregional transmission coordination are intended to correct deficiencies in transmission planning and cost allocation processes so that the transmission grid can better support wholesale power markets and thereby ensure that Commission-jurisdictional services are provided at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential. The Commission also noted that the Proposed Rule builds on Order No. 890, in which the Commission required each public utility transmission provider to have a coordinated, open, and transparent regional transmission planning process, among other things, in order to remedy opportunities for undue discrimination in the provision of transmission services.[77]

b. Comments

86. Several commenters argue that the Commission has adequate statutory authority to

[76] As noted above, because the legal authority concerns raised by commenters with regard to both our regional transmission planning reforms and our interregional transmission coordination reforms are so closely related, we address these concerns together in this section of the Final Rule.

[77] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 1-2.

undertake the planning reforms in the Proposed Rule.[78] Iberdrola Renewables contends that the Commission has a firm legal basis to adopt the proposed reforms and has already relied on its authority to require regional transmission planning efforts in Order No. 890. In response to comments arguing that the Proposed Rule oversteps the Commission's authority, Exelon states that the proposed coordination reforms are well within the Commission's statutory authority to remedy the potential for undue discrimination in transmission planning activities, citing FPA sections 205 and 206, as well as *New York v. FERC*.[79] ITC Companies' reply comments also argue that the Commission has the legal authority to implement its proposals, citing the Commission's plenary authority over interstate transmission under FPA section 201 and noting that courts have broadly defined transmission in interstate commerce due to the interconnected nature of the transmission grid. Multiparty Commenters agree that the proposed reforms are within the Commission's plenary authority, and they believe that the Proposed Rule properly identifies deficiencies in transmission planning and cost allocation, and that requirements for transmission planning and cost allocation are necessary for fully competitive wholesale markets and thus fall squarely within the Commission's jurisdiction.

87. In response to those asserting that the Commission cannot require interregional

[78] *E.g.*, Iberdrola Renewables; 26 Public Interest Organizations; Exelon; ITC Companies; LS Power; and Multiparty Commenters.

[79] 535 U.S. 1 (2002).

agreements to coordinate planning because of section 202(a)'s voluntary coordination language, commenters assert that such arguments are contrary to precedent affirming Order Nos. 888 and 2000. Exelon notes that *Public Utility District No. 1 of Snohomish County v. FERC*,[80] which affirmed Order No. 2000, found that mandatory RTO rules did not run afoul of section 202(a). ITC Companies also assert that section 202(a) does not prohibit interregional planning agreements, contrary to some comments. Multiparty Commenters also argue that section 202 does not impose a limitation on the Commission's section 206 jurisdiction. In addition, commenters such as ITC Companies and Multiparty Commenters argue that the proposals do not preempt state jurisdiction over siting decisions. 26 Public Interest Organizations argue that the FPA requires the Commission to address identified transmission planning deficiencies.

88. Some commenters argue that the Commission may consider public policy requirements. Exelon disagrees with those asserting that the Commission cannot require public utility transmission providers to consider the impacts of public policies under federal and state laws and regulations, and argues that the Commission is not establishing an independent obligation to satisfy such public policy requirements. Exelon states that courts have consistently recognized the Commission's need to adjust its regulation under

[80] 272 F.3d 607 (D.C. Cir. 2001).

the FPA to meet the changing needs of the industry.[81] LS Power explains that the proposal regarding public policy requirements is not an effort to pursue those goals but rather to ensure that transmission service is offered at just and reasonable rates. EarthJustice argues that, contrary to commenters challenging the Proposed Rule with respect to the consideration of public policy requirements, the Commission did not propose to infringe on state jurisdiction. EarthJustice argues that there is substantial evidence to support the Commission's conclusions in the Proposed Rule.[82]

89. Some commenters, however, assert that the Commission lacks jurisdiction to mandate the transmission planning reforms included in the Proposed Rule.[83] These commenters cite to section 202(a) of the FPA, which provides that coordination and interconnection arrangements are to be left to the voluntary action of public utilities. California ISO points to *Central Iowa Power Coop. v. FERC*,[84] which held that, in light of the voluntary nature of coordination under FPA section 202(a), the Commission's

[81] Exelon (citing *New York v. FERC*, 535 U.S. 1 (2002)), *Transmission Access Policy Study Group v. FERC*, 225 F.3d 667 (D.C. Cir. 2000), and *Public Util. Dist. No. 1 of Snohomish Cty v. FERC*, 272 F.3d 607 (D.C. Cir. 2001).

[82] EarthJustice (citing *Louisiana Pub. Serv. Comm'n v. FERC*, 551 F.3d 1042, 1045 (D.C. Cir. 2008)).

[83] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; California ISO; ColumbiaGrid; Nebraska Public Power District; North Carolina Agencies; and Sacramento Municipal Utility District.

[84] 606 F.2d 1156 n. 36 (D.C. Cir. 1979) (*Central Iowa*).

authority under FPA section 206 does not include the authority to require modifications to an otherwise just and reasonable tariff or jurisdictional agreement simply because the Commission has concluded that alternative terms and conditions would better promote the interconnection and coordination of transmission facilities.

90. Several commenters state that the Commission's statutory authority is limited with respect to transmission siting decisions.[85] North Carolina Agencies assert that, with the exception of the Commission's limited backstop authority under FPA section 216, transmission planning and expansion fall strictly within the purview of state regulatory agencies and the Proposed Rule takes into account neither the Commission's lack of authority nor the long-standing authority of the states. Some commenters also explain that the states have authority with respect to integrated resource planning.[86]

91. Several others state that the Commission should confirm that transmission planning, even with the reforms adopted by this Final Rule, continues to be driven by the needs of load-serving entities.[87] Entities such as Ad Hoc Coalition of Southeastern Utilities, APPA, and Nebraska Public Power District point to FPA section 217(b)(4) as

[85] *E.g.*, North Carolina Agencies; Florida PSC; Illinois Commerce Commission; and Nebraska Public Power District.

[86] *E.g.*, Alabama PSC; Ad Hoc Coalition of Southeastern Utilities; Nebraska Public Power District; Florida PSC; and Commissioner Skop.

[87] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; National Rural Electric Coops; Transmission Access Policy Study Group; and APPA.

the only provision in the FPA that charges the Commission with transmission planning responsibilities, expressing concern that the proposed transmission planning reforms might be read to imply a greater focus on interests of stakeholders other than load-serving entities. National Rural Electric Coops argue that Order No. 890 struck an appropriate balance among interests and should be preserved.[88] APPA argues that the failure to address section 217 makes the Proposed Rule legally deficient. Additionally, several commenters contend the Commission's proposal is inconsistent with section 217, which they state recognizes the primacy of a franchised utility's obligation to do what is needed to fulfill its obligation to service, including the implementation of state-authorized plans for transmission construction.[89]

92. In response, ITC Companies contend that the Proposed Rule is compatible with section 217 regarding the needs of load-serving entities to fulfill their service obligations. They note that section 217 does not mandate the planning of transmission in interstate commerce based on state integrated resource plans or require that the Commission disregard the needs of renewable power producers or other generators.

---

[88] Additionally, National Rural Electric Coops request that the Commission to confirm that transmission planning, even with any reforms the Commission adopts in this rulemaking, will continue to be driven in the first instance by the needs of load-serving entities. Transmission Access Policy Study Group makes a similar request.

[89] *E.g.*, Edison Electric Institute; Large Public Power Council; Nebraska Public Power; and Xcel.

93. Some commenters argue that the Commission lacks statutory authority to consider broad public policies.[90] Several commenters cite to *NAACP v. FPC*[91] for the proposition that the primary purpose of the Commission's statutory mission is to ensure reliable service at just and reasonable rates, and that Congress' direction to the Commission to act in furtherance of the public interest was not a broad license to promote the general welfare. Nebraska Public Power District and Ad Hoc Coalition of Southeastern Utilities add that the Commission has recognized this limitation in addressing its responsibility to consider environmental policy objectives under the National Environmental Policy Act.[92] PSEG Companies argue that the Commission's proposed reforms related to Public Policy Requirements are legally flawed. PSEG Companies state that the Commission's section 206 authority is not unbounded, citing to *California Independent System Operator Corp. v. FERC*,[93] where the court held that the Commission was not empowered to remove members of CAISO's board of directors under section 206. Further, PSEG Companies argue that there is no evidence to support the Commission's claims of undue

[90] *E.g.*, Southern Companies; Ad Hoc Coalition of Southeastern Utilities; Nebraska Public Power District; and Large Public Power Council.

[91] *National Ass'n for the Advancement of Colored People v. FPC*, 425 U.S. 662 (1976).

[92] Nebraska Public Power District.

[93] 372 F.3d 395 (D.C. Cir. 2004) (*CAISO v. FERC*).

discrimination under section 206.

94. Some commenters state that the Commission has not provided enough reasoning or adequate detail for the Proposed Rule so that parties can comment meaningfully on it, as required by section 553 of the Administrative Procedure Act (APA).[94] The commenters who argue this make three basic claims. They maintain that it is unclear from the Proposed Rule: (1) whether the Commission proposes that regional and interregional plans will serve as the basis for (a) future orders requiring utilities to undertake construction consistent with the plans or (b) orders compelling utilities to defer to nonincumbent utilities in connection with the construction of transmission facilities needed for reliability purposes; (2) what public policies must be incorporated in transmission plans, or in what manner such policies should be reflected; and (3) what rate mechanism the Commission would employ to allocate costs incurred by nonincumbent transmission providers to entities with whom they have no service or contractual relationship.[95]

[94] *E.g.*, Nebraska Public Power District Comments (citing 5 U.S.C. 553, *Florida Power & Light Co. v. U.S.*, 846 F.2d 765, 771 (D.C. Cir. 1988), *Connecticut Light and Power Co. v. NRC*, 673 F.2d 525, 530 (D.C. Cir. 1982)); Large Public Power Council; Salt River Project Comments (citing *United Mine Workers or America v. MSHA*, 407 F.3d 1250, 1259 (D.C. Cir. 2005)).

[95] *E.g.*, Large Public Power Council and Nebraska Public Power District.

95. In addition, Electricity Consumers Resource Council and the Associated Industrial Groups argue that the Proposed Rule may represent a departure from the Commission's regulations under section 35.35(i)(ii), which establishes a rebuttable presumption that "[a] project that has received construction approval from an appropriate state commission or state siting authority," applying the specified criteria, qualifies as being prudently incurred.[96] Southern Companies argue that, because the Proposed Rule did not identify what it would take to satisfy the public policy requirement, the proposal would violate the Due Process Clause's "fair notice" requirement.

96. Indianapolis Power & Light questions whether the Commission has satisfied FPA section 206 requirements, arguing that the Commission has not yet found that existing transmission planning (and cost allocation) provisions are unjust and unreasonable and that it has not "fixed" the rate or practice that it finds to be unjust and unreasonable.[97]

97. To ensure that any Final Rule will not directly or indirectly require a state or municipality to impair or violate private activity bond rules under section 141 of the Internal Revenue Code, City of Los Angeles Department of Water and Power urges the Commission to include in the Final Rule the following statement: "All regional and interregional transmission plans and cost allocation methodologies must include a

[96] 18 CFR 35.35(i)(ii).

[97] Indianapolis Power & Light (citing *Electrical Dist. No. 1 v. FERC*, 774 F.2d 490, 492-93 (D.C. Cir. 1985)).

statement that municipal and public power participants are not required to take any action that would violate or impair a private activity bond rule for purposes of section 141 of the Internal Revenue Code of 1986, or any successor statute or regulation." Large Public Power Council makes a similar comment. In its reply comments, APPA states that City of Los Angeles Department of Water and Power raises a practical and legal issue regarding the participation of public power systems in transmission planning and cost allocation activities, and APPA agrees that the statement suggested by City of Los Angeles Department of Water and Power would foster public power systems' participation in such processes.

98. Nebraska Public Power District states that as long as it participates in regional and interregional transmission planning through the SPP, it is able to commit to enter into regional planning through the SPP tariff, but cannot make such commitments outside of its present RTO membership. Nebraska Public Power District states that it is unclear what commitments may be called for in any transmission planning agreements, such as whether these agreements: (1) will carry with them specified or unanticipated liability; and/or (2) may include an obligation to defer to regional or interregional transmission plans that could, in Nebraska Public Power District's judgment, interfere with what must be done to remain compliant with state law.

c. Commission Determination

99. We conclude that we have authority under section 206 of the FPA to adopt the

reforms on transmission planning in this Final Rule. These reforms are intended to correct deficiencies in transmission planning and cost allocation processes so that the transmission grid can better support wholesale power markets and thereby ensure that Commission-jurisdictional services are provided at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential. Moreover, these reforms build on those of Order No. 890, in which the Commission reformed the *pro forma* OATT to, among other things, require each public utility transmission provider to have a coordinated, open, and transparent regional transmission planning process. As we explained in Order No. 890, we found that the existing *pro forma* OATT was insufficient to eliminate opportunities for undue discrimination, including such opportunities in the context of transmission planning.[98] We conclude that the reforms adopted in this Final Rule are necessary to address remaining deficiencies in transmission planning and cost allocation processes so that the transmission grid can better support wholesale power markets and thereby ensure that Commission-jurisdictional transmission services are provided at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential. We note that no party sought judicial review of the Commission's authority under Order No. 890 to adopt those reforms that we seek to enhance and improve upon here.

[98] *See, e.g.*, Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 422.

100. We disagree that section 202(a) of the FPA precludes us from adopting the transmission planning reforms contained in this Final Rule. Section 202(a) reads, in relevant part, as follows:

> For the purpose of assuring an abundant supply of electric energy throughout the United States with the greatest possible economy and with regard to the proper utilization and conservation of natural resources, the Commission is empowered and directed to divide the country into regional districts for the voluntary interconnection and coordination of facilities for the generation, transmission, and sale of electric energy. . . .[99]

Section 202(a) requires that the interconnection and coordination, i.e., the coordinated operation, of facilities be voluntary. That section does not mention planning, and nothing in it can be read as impliedly establishing limits on the Commission's jurisdiction with respect to transmission planning.

101. Transmission planning is a process that occurs prior to the interconnection and coordination of transmission facilities. The transmission planning process itself does not create any obligations to interconnect or operate in a certain way. Thus, when establishing transmission planning process requirements, the Commission is in no way mandating or otherwise impinging upon matters that section 202(a) leaves to the voluntary action of public utility transmission providers. As we discuss herein, section 202(a) refers to the coordinated operation of facilities.

[99] 16 U.S.C. 824(a).

102. Several commenters who argue that section 202(a) prohibits our proposal rely primarily on *Central Iowa* for support.[100] In *Central Iowa*, a party argued that the Commission should have used its authority under section 206 of the FPA to compel greater integration of the utilities in the Mid-Continent Area Power Pool (MAPP) than MAPP members had proposed. In seeking this goal, the party in question sought to have the Commission require MAPP participants "to construct larger generation units and engage in single system planning with central dispatch."[101] The court held that given "the expressly voluntary nature of coordination under section 202(a)," the Commission was not authorized to grant that request.[102]

103. The court in *Central Iowa* was thus presented with a request that the Commission require an enhanced level of, or tighter, power pooling. Section 202(a) was relevant to the problem at issue in *Central Iowa* because the operation of the system through power pooling is its central subject matter. We, on the other hand, are focused in this proceeding on the transmission planning process, which is distinct from any specific system operations. Nothing in this Final Rule is tied to the characteristics of any specific form of system operations, and nothing in it requires any changes in the way existing operations are conducted. This Final Rule simply requires compliance with certain

[100] *E.g.*, ColumbiaGrid; Sacramento Municipal Utility District; and California ISO.

[101] *Central Iowa*, 606 F. 2d 1156 at 1166.

[102] *Id.* at 1168.

general principles within the transmission planning process regardless of the nature of the operations to which that process is attached. The court's interpretation of section 202(a) with respect to system operations is therefore irrelevant here.

104. Commenters point to dicta in *Central Iowa* based on section 202(a)'s legislative history that, they state, suggests that Congress intended that any coordination by public utilities with respect to transmission planning be voluntary. *Central Iowa* cites to, but does not quote directly, the legislative history to support the conclusion that "Congress was convinced that 'enlightened self-interest' would lead utilities to engage voluntarily in power planning arrangements, and it was not willing to mandate that they do so."[103] The language from the legislative history is as follows:

> The committee is confident that enlightened self-interest will lead the utilities to cooperate with the commission and with each other in bringing about the economies which can alone be secured through the planned coordination which has long been advocated by the most able and progressive thinkers on this subject.[104]

105. In response, we note that section 202(a) does not mention the transmission planning process, and nothing in that section causes one to conclude that it was intended to address the transmission planning process that is the subject of this proceeding. There

---

[103] *Id.*

[104] *See Otter Tail Power Co. v. United States*, 410 U.S. 366, 374 (1973) (citing S.Rep.No.621, 74th Cong., 1st Sess. 49).

is thus no basis to resort to legislative history for further clarification.[105] Moreover, even if resorting to legislative history was appropriate in this context, we note that this passage from the legislative history also does not refer to the transmission planning process that is the subject of this Final Rule. Instead, the legislative history refers to "planned coordination," i.e., to the pooling arrangements and other aspects of system operation that are the underlying focus of section 202(a). It is in this sense that *Central Iowa* must be understood when it refers to engaging "voluntarily in power planning arrangements." The "planned coordination" mentioned in the legislative history cited in *Central Iowa* means "planned coordination" of the operation of facilities, not the planning process for the identification of transmission facilities. In short, neither *Central Iowa* nor the legislative history cited in that case involves or applies to the planning process for transmission facilities. Rather they deal with the coordinated, i.e., shared or pooled, operation of facilities after those facilities are identified and developed. By contrast, this Final Rule deals with the planning process for transmission facilities, a separate and distinct set of activities that occur before the operational activities that are the underlying focus of section 202(a).

106. Similarly, section 202(a) has no bearing on whether the Commission can mandate

[105] *See, e.g., Connecticut Nat'l Bank v. Germain*, 503 U.S. 249, 253-54 (1992) ("[I]n interpreting a statute a court should always turn first to one, cardinal canon before all others. We have stated time and again that courts must presume that a legislature says in a statute what it means and means in a statute what it says there." (citations omitted)).

requirements on regional and interregional cost allocation. The cost allocation requirements of this Final Rule do not mandate that any entity engage in any interconnection or coordination of facilities in contravention of the requirement in section 202(a) that these matters be left to the voluntary decisions of the entities in question. Section 202(a) does not address matters involved in cost allocation.

107. We acknowledge that there is longstanding state authority over certain matters that are relevant to transmission planning and expansion, such as matters relevant to siting, permitting, and construction. However, nothing in this Final Rule involves an exercise of siting, permitting, and construction authority. The transmission planning and cost allocation requirements of this Final Rule, like those of Order No. 890, are associated with the processes used to identify and evaluate transmission system needs and potential solutions to those needs. In establishing these reforms, the Commission is simply requiring that certain processes be instituted. This in no way involves an exercise of authority over those specific substantive matters traditionally reserved to the states, including integrated resource planning, or authority over such transmission facilities. For this reason, we see no reason why this Final Rule should create conflicts between state and federal requirements.

108. We disagree with the commenters who argue that this Final Rule is inconsistent

with or precluded by, or legally deficient for failing to rely on, section 217 of the FPA.[106] Our approach in this Final Rule is to build on the requirements of Order No. 890 of ensuring open and transparent transmission planning processes to evaluate proposed transmission projects, a goal that does not conflict with FPA section 217. Indeed, we believe that this Final Rule is consistent with section 217 because it supports the development of needed transmission facilities, which ultimately benefits load-serving entities. The fact that this Final Rule serves the interests of other stakeholders as well does not place it in conflict with section 217. We thus cannot agree with Ad Hoc Coalition of Southeastern Utilities that we should ensure that our transmission planning and cost allocation reforms give systematic preference to any particular set of interests. Section 217 does not require this result. It only requires that we use our authority in a way that facilitates planning and expansion of transmission facilities to meet the reasonable needs of load-serving entities. We have indicated that we will follow a flexible approach that accommodates the needs and characteristics of particular regions, and we are confident that this approach can address the needs of load-serving entities in

[106] Section 217(b)(4) of the FPA specifies that: "The Commission shall exercise the authority of the Commission under this Act in a manner that facilitates the planning and expansion of transmission facilities to meet the reasonable needs of load-serving entities to satisfy the service obligations of the load-serving entities, and enables load-serving entities to secure firm transmission rights (or equivalent tradable or financial rights) on a long-term basis for long-term power supply arrangements made, or planned, to meet such needs." 16 U.S.C. 824q(b)(4).

the Southeast and elsewhere.

109. We also disagree with commenters who argue that we lack jurisdiction to require the consideration of transmission needs driven by Public Policy Requirements in the transmission planning process. In requiring the consideration of transmission needs driven by Public Policy Requirements, the Commission is not mandating fulfillment of those requirements. Instead, the Commission is acknowledging that the requirements in question are facts that may affect the need for transmission services and these needs must be considered for that reason. Such requirements may modify the need for and configuration of prospective transmission facility development and construction. The transmission planning process and the resulting transmission plans would be deficient if they do not provide an opportunity to consider transmission needs driven by Public Policy Requirements.

110. Our disagreement with commenters on this point can be best explained by considering the case that they use to support their arguments, *NAACP v. FPC.* In that case, the Court found that the Commission did not have power under the FPA or the Natural Gas Act (NGA) to construe its obligation to promote the public interest under those statutes as creating "a broad license to promote general public welfare."[107]

[107] *NAACP v. FERC*, 425 U.S. 662 at 668.

Specifically, the Court found that the Commission's duty to promote the public interest under the FPA and NGA "is not a directive to the Commission to seek to eradicate discrimination," and it thus did not authorize the Commission to promulgate rules prohibiting the companies it regulates from engaging in discriminatory employment practices merely because the statutes pertain to matters affected with a public interest.[108] The Commission is doing nothing analogous when specifying that transmission needs driven by Public Policy Requirements be taken into account in the transmission planning process.

111. Requiring the development of a regional transmission plan that considers transmission needs driven by Public Policy Requirements cannot be construed as pursuing broad general welfare goals that extend beyond matters subject to our authority under the FPA. Public Policy Requirements can directly affect the need for interstate transmission facilities, which are squarely within the Commission's jurisdiction. Moreover, we are not specifying the Public Policy Requirements that must be considered in individual local and regional transmission planning processes.[109] This further confirms that, in requiring that the transmission planning process include the evaluation of potential solutions to identified transmission needs driven by Public Policy

[108] *Id.* at 670.

[109] *See infra* section III.A.4.

Requirements, the Commission is simply requiring the consideration of facts that are relevant to the transmission planning process. In doing so, it is neither pursuing nor enforcing any specific policy goals.

112. Other commenters cite *CAISO v. FERC* for the proposition that the Proposed Rule extends beyond our authority under the FPA. In that case, the court found that the Commission did not have authority under section 206 of the FPA to direct the California ISO to alter the structure of its corporate governance, concluding that the choosing and appointment of corporate directors is not a "practice … affecting [a] rate" within the meaning of the statute.[110] The court explained that the Commission is empowered under section 206 to assess practices that directly affect or are closely related to a public utility's rates and "not all those remote things beyond the rate structure that might in some sense indirectly or ultimately do so."[111] Unlike the corporate governance matters at issue in that proceeding, the transmission planning activities that are the subject of this Final Rule have a direct and discernable affect on rates. It is through the transmission planning process that public utility transmission providers determine which transmission facilities will more efficiently or cost-effectively meet the needs of the region, the development of which directly impacts the rates, terms and conditions of jurisdictional service. The rules

[110] *CAISO v. FERC*, 372 F.3d 395 at 403.

[111] *Id.*

governing the transmission planning process are therefore squarely within our jurisdiction, whether the particular transmission facilities in question are planned to meet reliability needs, address economic considerations, or meet transmission needs driven by a Public Policy Requirement.

113. We disagree with the commenters who argue that the Proposed Rule does not comply with the APA because the Proposed Rule does not provide enough reasoning or adequate detail to permit parties to comment meaningfully on it. Section 553(b)(3) of the APA requires that a notice of proposed rulemaking contain "either the terms or substance of the proposed rule or a description of the subjects and issues involved."[112] The purpose of the requirement is to ensure that "persons are 'sufficiently alerted to likely alternatives' so that they know whether their interests are 'at stake.'"[113] Courts have held in this connection that a "[n]otice of proposed rulemaking must be sufficient to fairly apprise interested parties of the issue involved. . . , but it need not specify every precise proposal which [the agency] may ultimately adopt as a rule."[114] We disagree with commenters arguing that this requires us to identify the issues that might be raised in future orders by the Commission should disputes arise as to the construction of

[112] 5 U.S.C. 553(b)(3).

[113] *Spartan Radiocasting Co., v. FCC*, 619 F.2d 314, 321 (4th Cir. 1980) (citing *South Terminal Corp. v. EPA*, 504 F.2d 646, 659 (1st Cir. 1974)).

[114] *Id.* 321-22 (citing *Consolidation Coal Co. v. Costle*, 604 F.2d 239, 248 (4th Cir. 1979)).

transmission facilities in the regional transmission planning process. This Final Rule is focused on ensuring that there is a fair regional transmission planning *process*, not substantive outcomes of that process.

114. We disagree with Southern Companies' argument that the Proposed Rule violated the fair notice requirement of the Due Process Clause because it did not identify how the Public Policy Requirements in the transmission planning process would be satisfied. As explained above, fair notice requires that we apprise parties of the issues involved. In this respect, all interested parties have had fair notice and an opportunity to comment on the Commission's proposed requirement regarding the consideration of transmission needs driven by Public Policy Requirements in the transmission planning process and to provide their perspectives, consistent with the notice and comment requirements of the APA. Moreover, the case that Southern Companies cite in support of their argument, *Trinity Broadcasting of Fla., Inc. v. FCC*,[115] is not on point. That case involved a denial by the Federal Communications Commission (FCC) of an application to renew a commercial television broadcast license that could have been renewed under a statutory preference in favor of minority-controlled firms. A majority of the applicant's board was made up of members of minority groups, but the FCC denied the application because the applicant had not satisfied its interpretation of minority control as *de facto* or "actual"

[115] 211 F.3d 618, 628 (D.C. Cir. 2000) (*Trinity Broadcasting*).

control of operations. The court found that the agency had not given sufficient notice of its interpretation of minority control to justify punishment in the form of denial of the application. Nothing analogous is occurring here. *Trinity Broadcasting* did not involve a rulemaking proceeding, as is the case here, but rather an adjudication that raised the issue of "[w]hat constitutes sufficiently fair notice of an agency's interpretation of a regulation to justify punishing someone for violating it?"[116] A rulemaking such as the present proceeding does not involve the assessment of penalties for failure to comply with a particular regulation, and therefore the notice that is required before penalties can be assessed has no relevance here.

115. We also disagree that this Final Rule may represent a departure from section 35.35(i)(ii) of the Commission's regulations, which establishes a rebuttable presumption that a transmission project that has received construction approvals from relevant state regulatory agencies satisfies Order No. 679's[117] requirement that the transmission project is needed to ensure reliability or reduce the cost of delivered power by reducing congestion. The rebuttable presumption of prudent investment provided for in section 35.35(i)(ii) applies only to Commission determinations with respect to incentive-based

[116] *Trinity Broadcasting*, 211 F.3d 618 at 619.

[117] *Promoting Transmission Investment through Pricing Reform*, Order No. 679, FERC Stats. & Regs. ¶ 31,222 (2006), *order on reh'g*, Order No. 679-A, FERC Stats. & Regs. ¶ 31,236, *order on reh'g*, 119 FERC ¶ 61,062 (2007).

rate treatments for investment in transmission infrastructure. The Proposed Rule does not "represent a departure" from this provision because the provision deals with matters that are not covered or affected by the Proposed Rule. Electricity Consumers Resource Council and Associated Industrial Groups therefore have not adequately explained why they believe the Proposed Rule represented such a departure.

116. With respect to Indianapolis Power & Light's assertion that the Commission has failed to satisfy FPA section 206, we conclude that we have met section 206's burden. Our review of the record demonstrates that existing transmission planning processes are unjust and unreasonable or unduly discriminatory or preferential. Specifically, we conclude that the record shows that, for the *pro forma* OATT (and, consequently, public utility transmission providers' OATTs) to be just and reasonable and not unduly discriminatory or preferential, it must be revised in the context of transmission planning to include the requirement that regional transmission planning processes result in the production of a regional transmission plan using a process that satisfies the specified Order No. 890 transmission planning principles and that provides an opportunity to consider transmission needs driven by Public Policy Requirements. We conclude that these reforms satisfy the section 206 standard because they help ensure just and reasonable rates and remove those remaining opportunities for undue discrimination.

117. Finally, with respect to the concerns raised by City of Los Angeles Department of Water and Power, APPA, Nebraska Public Power District, and others regarding the legal

issues associated with public power participation in the regional transmission planning processes, we make the following observations. First, as discussed in the section of this Final Rule addressing reciprocity, we reiterate that this Final Rule simply applies the reciprocity principles set forth in Order Nos. 888 and 890 regarding non-public utility transmission provider participation in transmission planning processes. Second, non-jurisdictional entities, unlike public utilities, may choose whether to join a regional transmission planning process and, to the extent they choose to do so, they may advocate for those processes to accommodate their unique limitations and requirements.

3. Regional Transmission Planning Principles

a. Commission Proposal

118. The Proposed Rule would require that each public utility transmission provider participate in a regional transmission planning process that produces a regional transmission plan and that meets the following transmission planning principles: (1) coordination; (2) openness; (3) transparency; (4) information exchange; (5) comparability; (6) dispute resolution; and (7) economic planning studies. This proposal did not include two of the Order No. 890 transmission planning principles, namely the cost allocation transmission planning principle and the regional participation transmission planning principle. More specifically, the Commission would require that each regional transmission planning process consider and evaluate transmission facilities and other non-transmission solutions that may be proposed and develop a regional transmission

plan that identifies the transmission facilities that more efficiently or cost-effectively meet the needs of public utility transmission providers, their customers and other stakeholders.[118]

119. The Proposed Rule also would provide that a merchant transmission developer that does not seek to use the regional cost allocation process would not be required to participate in the regional transmission planning process, although such a developer would be required to comply with all reliability requirements applicable to transmission facilities in the transmission planning region in which its transmission project would be located.[119] To reiterate, merchant transmission projects are defined as those for which the costs of constructing the proposed transmission facilities will be recovered through negotiated rates instead of cost-based rates. The Proposed Rule states that such a merchant transmission developer would not be prohibited from participating—and, indeed, is encouraged to participate—in the regional transmission planning process.[120]

b. Comments

120. Many commenters agree that the Commission should require public utility transmission providers to produce a regional transmission plan using a process that

[118] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 51.

[119] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at n.23.

[120] *Id.* P 99.

complies with the Order No. 890 transmission planning principles.[121] NextEra supports the Commission's proposal provided that a regional transmission planning process produces a regional transmission plan with identified transmission facilities to be built in the near-term. Iberdrola Renewables contends that the current piecemeal, generation-driven approach to transmission development is inefficient and ineffective and hinders development of renewable energy resources. Duke states that it supports the requirement that a regional transmission plan be produced through a regional transmission planning process. Maine PUC believes that in New England, the distinction between different types of transmission projects (i.e., reliability and market efficiency transmission facilities) has impeded the development of transmission facilities that would reduce congestion costs and provide greater access to low-cost supply, including renewable resources, and suggests that the Commission consider eliminating this distinction.

121. Most commenters addressing the proposed transmission planning reforms support the Commission's proposal to require public utility transmission providers to adopt several of the Order No. 890 transmission planning principles for the regional

[121] *E.g.*, Anabaric and PowerBridge; AWEA; City and County of San Francisco; DC Energy; Duke; Duquesne Light Company; East Texas Cooperatives; Energy Future Coalition Group; LS Power; MISO; National Grid; NEPOOL; New England States' Committee on Electricity; New England Transmission Owners; NextEra; Northern Tier Transmission Group; Ohio Consumers' Counsel and West Virginia Consumer Advocate Division; Wilderness Society and Western Resource Advocates; and Wisconsin Electric Power Company.

transmission planning process.[122] Some commenters ask the Commission to clarify that the existing Order No. 890 transmission planning principles would remain applicable to regional transmission planning processes.[123] Some commenters also seek clarification that individual transmission owners must comply with Order No. 890 transmission planning principles and have an OATT Attachment K on file with the Commission.[124] Transmission Dependent Utility Systems state that transmission owners must comply with Order No. 890 transmission planning principles even if they are planning local transmission projects in an RTO.

122. Several supporting the Proposed Rule stress that fair process, transparency, and robust stakeholder participation are important components of the transmission planning process.[125] PPL Companies state that all interested parties, especially those that may be allocated costs for a particular transmission project, should have an opportunity to provide meaningful input into the regional transmission planning process, and urge the Commission to require that historical and real-time data be made available to interested

[122] *E.g.*, ISO New England and SPP.

[123] *E.g.*, East Texas Cooperatives and Champlain Hudson.

[124] *E.g.*, Transmission Dependent Utility Systems and Old Dominion.

[125] *E.g.*, PPL Companies; DC Energy; Direct Energy; 26 Public Interest Organizations; Green Energy and 21st Century; Western Independent Transmission Group; City of Santa Clara; Natural Resources Defense Council; New Jersey Division of Rate Counsel; and Iberdola Renewables.

stakeholders. Transmission Dependent Utility Systems contend that transmission customers need to play an integral role in the regional transmission planning process. 26 Public Interest Organizations, Green Energy and 21st Century, and Western Independent Transmission Group state that transparency in transmission planning and access to models and data are critical to nonincumbent resources and grid infrastructure providers if these entities are to be effective participants in regional transmission plan development. Independent Energy Producers Association urges the Commission to emphasize that the openness, transparency, and inclusiveness criteria of Order No. 890 should apply to all phases of the transmission planning process. New Jersey Board suggests that transmission providers be required to state the baseline methodology on which load forecasts are based. However, Anbaric and PowerBridge suggest consideration of internal procedures to treat transmission project information as confidential, including protections to ensure that transmission projects that are not selected in the regional transmission plan will remain confidential.

123. Some commenters also address dispute resolution issues in the regional transmission planning process. City of Santa Clara believes that transmission planning processes should include an effective and meaningful dispute resolution process, including the ability to request Commission resolution of unresolved disputes. Transmission Access Policy Study Group argues that guidance from the Commission is needed to ensure that the dispute resolution process is useful, suggesting that use of

reasonable, nondiscriminatory criteria to minimize the potential for discriminatory results, particularly with regard to the inclusion or exclusion of project proposals in a regional transmission plan and the consideration of public policy objectives in the transmission planning process. Transmission Access Policy Study Group suggests that the Commission establish a backstop dispute resolution or expedited complaint process to have a forum for addressing disputes regarding transmission projects selected or not selected in regional transmission plans.

124. Some commenters recommend that the Commission continue to recognize regional flexibility with respect to transmission planning processes.[126] Kansas City Power & Light and KCP&L Greater Missouri supports the Proposed Rule's suggestion that the Commission would defer to each region to develop transmission planning processes that address regional needs, noting that each region has developed differently and that not all regions are at the same level of maturity. Northern Tier Transmission Group states that the Commission should provide flexibility as to the manner in which regional plans are produced, emphasize expected results rather than process, and clarify that the region may continue to rely on a "bottom-up" process in developing the plan. SPP recommends that transmission planning authorities be permitted to develop, through their stakeholder processes and in consultation with state regulatory commissions,

[126] *E.g.*, Kansas City Power & Light and KCP&L Greater Missouri; Edison Electric Institute; and WIRES.

strategies and metrics to achieve region-appropriate compliance with the Final Rule.

125. Many entities that support the Proposed Rule believe that the regional transmission planning process in which they participate already satisfies the proposed requirements.[127] ISO/RTO Council asks that the Final Rule reflect that ISOs and RTOs already satisfy the requirements and that no further demonstration or tariff language be required in a future compliance filing with the exception of any new or altered requirements imposed by the Final Rule. In response, 26 Public Interest Organizations agree that the proposed reforms should not modify or interfere with progress being made by transmission planners with transmission planning processes that comply with or exceed Order No. 890 requirements and that only those tariff provisions that are affected by the Final Rule need to be filed.

126. On the other hand, Iberdrola Renewables states that the Commission should make clear that reliance on existing institutions and approaches would be adequate only if they can effectively implement the Commission's goals of driving needed transmission infrastructure investment. To that end, it states that in areas not covered by RTOs or ISOs, new regional agreements would be needed to ensure that the transmission providers

[127] *E.g.*, Bonneville Power; Duke; Massachusetts Departments; California ISO; Sunflower and Mid-Kansas; MISO Transmission Owners; California Commissions; MISO; New England States' Committee on Electricity; Indianapolis Power & Light; Northeast Utilities; ISO New England; New York ISO; Southern Companies; and Long Island Power Authority.

in the region have a governance structure for undertaking the regional and interregional transmission planning obligations and a workable mechanism for sharing costs consistent with the cost allocation guidelines, and clarify the factors it would consider in determining whether a particular regional proposal or compliance filing has sufficiently broad regional support to merit any deference.

127. Some commenters ask the Commission to clarify the term "transmission planning region" as it relates to the requirements of the Proposed Rule.[128] Indianapolis Power & Light and Powerex ask the Commission to define "region" in a Final Rule and include a definition of transmission planning region in whatever regulations are promulgated. California Municipal Utilities state that they believe regional consolidation of transmission planning regions should not be forced and that more detail is needed from the Commission for its members to determine if current transmission planning processes meet the requirements of the Proposed Rule. Solar Energy Industries and Large-scale Solar contend that the Commission should ensure that, on the review of compliance filings, the scope of the self-selected planning regions does not create inadvertent planning seams that inhibit the development of transmission projects needed to meet public policy requirements established by state or federal laws or regulations.

128. Several commenters urge the Commission to clarify that existing ISOs and RTOs

[128] *E.g.*, NextEra; Clean Line; California Municipal Utilities; American Transmission; and Arizona Corporation Commission.

are considered regions for purposes of transmission planning.[129] However, ITC Companies state that RTO boundaries are not always the right ones for transmission planning, and ITC Companies are concerned that, given the focus of RTOs on developing and running energy markets, it might be difficult for RTOs to plan transmission from a truly independent perspective. Instead, ITC Companies suggest that the planning function be split off from the market function so that there is a truly independent planning authority. In reply, California ISO argues that ITC Companies' recommendation is tantamount to mandating the creation of new entities, which it argues the Commission cannot do. AWEA asks the Commission to clarify that more than one organized market could form a single region for transmission planning and cost allocation purposes.

129. Commenters express different views on defining transmission planning regions outside of the ISO and RTO context. MISO Transmission Owners suggest that, where ISOs or RTOs do not exist, the Commission should allow each transmission provider to propose its own definition of what it considers its transmission planning region. Further, they state that the Commission should not define the term "transmission planning region" to be any larger or broader than an RTO or ISO region. MISO states that public utility transmission providers not associated with existing RTOs should either be required to form transmission regional planning areas with each other or participate in regional

[129] *E.g.*, ISO/RTO Council; California ISO; MISO Transmission Owners; Indianapolis Power & Light; and NextEra.

transmission planning with an adjacent RTO. Some commenters ask the Commission to determine that, in non-RTO regions, a single transmission provider or utility family cannot serve as a transmission planning region.[130] Transmission Access Policy Study Group urges the Commission to specify that transmission planning regions in areas outside of RTOs include at least two transmission providers and be at least as large as the smaller of a state or one of NERC's Regional Entities. NextEra suggests that, in non-RTO areas, geographic scope should be determined by factors such as the level of interconnections between utilities, power flows, boundaries of existing NERC regions, and historical coordination practices.

130. Ad Hoc Coalition of Southeastern Utilities claim that the Proposed Rule makes several incorrect statements concerning what constitutes a region for transmission planning purposes in the Southeast.[131] They note that the Proposed Rule references both regional and interregional organizations and processes (including NERC regional entities) as being regional for purposes of the Proposed Rule and assert that a holding that only RTO regions are sufficiently encompassing to meet the proposed requirements would be arbitrary and capricious. Given that the Commission has previously recognized

[130] *E.g.*, AWEA; Clean Line; G&T Cooperatives; Integrys; and NextEra.

[131] In reply comments, South Carolina Office of Regulatory Staff state that it concurs with Ad Hoc Coalition of Southeastern Utilities' views regarding the uniqueness of transmission planning in the Southeast.

that the South Carolina Regional Transmission Planning (SCRTP) process complies with Order No. 890, and as such is a "regional transmission planning process," South Carolina Electric & Gas asks the Commission to clarify that the SCRTP constitutes a "regional transmission planning process" as contemplated by the Proposed Rule. Colorado Independent Energy Association supports the designation of WestConnect as a regional transmission planning organization for the purposes of transmission planning and development in Colorado and to make findings to that effect in this Final Rule. Florida PSC and Commissioner Skop argue that if the Commission adopts a definition of "region" that does not recognize Florida as a distinct transmission planning region, and Florida becomes part of a multistate region, then it is unclear what role the Florida PSC would retain, if any, over the transmission planning and cost allocation processes in Florida.[132]

131. Many commenters recommend that transmission providers should evaluate both transmission and non-transmission solutions during the regional transmission planning process.[133] 26 Public Interest Organizations and Dayton Power and Light assert that

[132] Additionally, Florida PSC and Commissioner Skop express concern about the lack of Florida-based commenters, noting that either Florida utilities joined a broader coalition of commenters or, as in the case of NextEra, did not comment from the perspective of its Florida-based utility. Florida PSC and Commissioner Skop ask the Commission to take the lack of Florida-specific points of view into account when it considers its proposals.

[133] *E.g.*, AWEA; California Commissions; Wisconsin Electric; Omaha Public

(continued…)

consideration of non-transmission solutions with all other resource options is needed to determine the most cost-effective way to meet grid needs. 26 Public Interest Organizations ask the Commission to establish minimum requirements for: what types of resources should be assessed; how assessments should be conducted; and what types of modeling and sensitivity analyses are needed to estimate and compare the costs and benefits of option, implementation timelines, and relative risks of various resource choices. New Jersey Board believes that transmission providers should provide peak load reduction data that demonstrate the effect of demand response and energy efficiency on baseline forecasts. MISO supports the consideration of non-traditional solutions so long as this process does not interfere with state authority over integrated resource planning. Western Grid Group and Pattern Transmission suggest that resource planning and transmission planning should be reintegrated.

132. On the other hand, Ad Hoc Coalition of Southeastern Utilities states that a requirement for regional transmission planning processes to consider both transmission and non-transmission solutions is inconsistent with transmission planning procedures in the Southeast. It explains that non-transmission solutions are typically considered in integrated resource planning and request for proposal processes during the current "bottom-up" transmission planning process. It states that including a generation resource

---

Power District; Dayton Power and Light; Eastern Environmental Law Center; Environmental NGOs; NRG; Vermont Electric; EarthJustice; and SPP.

as an alternative during the regional transmission planning process would convey a right of generation planning to the Commission that would be inconsistent with state law. Accordingly, it states that there are no transmission planning gaps in the Southeast that the Commission needs to address. In its reply comments, Ad Hoc Coalition of Southeastern Utilities argues that such a policy would be inappropriate because there would be winners and losers in any given state, such a "top-down" process would risk losing the emphasis on consumers that currently exists in the state-regulated processes. Ad Hoc Coalition of Southeastern Utilities, in responding to comments by Western Grid Group and Pattern Transmission, argues that transmission planning and resource planning in the Southeast have not diverged and that further reforms are unnecessary. Southern Companies agree.

133. MISO Transmission Owners ask the Commission to provide additional guidance regarding the meaning of "non-transmission solutions" and which of these solutions transmission providers are required to include in their transmission planning processes. MISO Transmission Owners state that if non-traditional solutions must be considered, then the Commission should clarify that they are required to participate in the transmission planning process on a similar basis as transmission projects.

134. Other commenters ask for clarification and guidance from the Commission on other transmission planning-related issues associated with the Proposed Rule. WIRES believes that the Commission should consider additional rules that promote consistent

transmission planning cycles, stakeholder procedures, action timelines, and criteria for evaluating project proposals. Transmission Access Policy Study Group also suggests that the Commission require regular updating of regional transmission plans, and require jurisdictional transmission providers to file, for public comment, a "planning report card" identifying the projects proposed during the transmission planning process, the projects approved and included in the regional transmission plan, and the projects that were proposed but excluded from the plan and the reasons those proposed projects were rejected. Transmission Access Policy Study Group states that the Final Rule should subject decisions as to which facilities are included in a regional transmission plan to justification and objective evaluation to prevent discrimination and unjust and unreasonable rates.

135. AEP asserts that a significant flaw in typical transmission planning processes is the failure to consider benefits beyond the near-term. Therefore, AEP recommends that the Commission direct each transmission planning region to develop a long-term plan that utilizes a 20-30 year planning horizon in the determination of need analysis (while still permitting RTOs to annually evaluate shorter-term projects needed to complement the long-term plan). AEP argues that the useful life of any transmission facility is likely to exceed 40 years and, consequently, the most efficient transmission planning process should cover a minimum span of 20 years, and cites to SPP's and California ISO's transmission planning processes, which use 20-year planning horizons.

136. Primary Power supports the concept that every transmission provider must participate in a regional transmission planning process where specific projects are determined to be in the public convenience and necessity, and urges the Commission to devise threshold requirements ensuring that transmission planners have a degree of independence from market participants that would promote equitable and economically supportable results in terms of which transmission facilities are built and who ultimately pays for them. Some commenters also ask the Commission to clarify that least-cost planning is a driver of the transmission planning process. Transmission Dependent Utility Systems state that both the regional and interregional transmission planning processes adopted by the Final Rule should include clarification that coordination of reliability and economic transmission planning includes identifying optimal solutions to congestion for all transmission customers and load-serving entities across the region. Transmission Dependent Utility Systems recommend that the Commission clarify this concept in the Final Rule and explicitly recognize a joint optimization requirement.

137. Solar Energy Industries and Large-scale Solar suggest that the Commission require holistic long-term planning on a regional basis, in which the interaction of proposed projects with other projects across the region, as well as the integration of renewable resources, distributed generation, and demand response is considered. Transmission Agency of Northern California asks the Commission to clarify that a regional transmission planning "process" need not be narrowly defined as participation in

a single set of procedures and that the transmission planning process need not serve every planning purpose. Arizona Corporation Commission seeks clarification on who would determine whether a transmission project is a reliability project within the context of the regional transmission planning process. Arizona Corporation Commission suggests that state-level entities, such as state utility commissions, should continue to determine whether a transmission project is a reliability project during line siting and/or determination of need proceedings. Additionally, it states that all proposed transmission projects should be freshly evaluated in each transmission planning cycle so that projects are aligned with transmission needs at the time and adequately incorporate current public policy requirements.

138. Some commenters seek assurance from the Commission that the needs of states and load-serving entities would be considered in the regional transmission planning process. NARUC states that the Final Rule should identify the states as key players in any transmission planning process, pointing to the primary role of states in transmission siting. E.ON emphasizes that the Commission should work to ensure that the Final Rule's planning requirements not give rise to new impediments to a local transmission owning utility's ability to efficiently satisfy customer needs under state service obligations. E.ON suggests that the Commission incorporate the following requirements in its Final Rule: regional and interregional transmission planning processes should be sufficiently flexible to accommodate the real-time requirements of a transmission owner

and operator's native load customers; and the transmission planning process should recognize that the obligation to serve still exists in a number of jurisdictions and that any regional plan or process needs to allow for the fact that it is that obligation that drives transmission planning.

139. Others are concerned about the applicability of the Proposed Rule to currently pending transmission projects. Atlantic Wind Connection seeks clarification that sponsored projects with a pending request for inclusion in a regional transmission plan should be studied under the requirements of the Final Rule without undue delay, including delays resulting from any proposed procedural requirements. Edison Electric Institute argues that the Final Rule should apply to projects only on a going-forward basis, and a project identified in an existing plan should not be subject to bumping in a revised transmission planning process filed in compliance with a Final Rule. Northeast Utilities states that the Final Rule should avoid harming projects already included in the transmission planning process.

140. Some commenters ask the Commission to establish a funding mechanism to allow interested parties that are not market participants to fully participate in the regional transmission planning process. 26 Public Interest Organizations assert that an essential element of robust and broadly supported regional planning is the participation of non-market participants and that this requires ongoing provider assistance. They state that, because non-market stakeholders have neither the financial resources nor staff expertise

to participate effectively in regional transmission plan development processes without special assistance, the Commission should direct transmission providers to facilitate participation of these stakeholders through a funding mechanism to cover reasonable technical assistance and other participation costs. They conclude that these costs can be rolled into the rates of the transmission service providers. Western Grid Group offers suggestions as to how a funding mechanism could be implemented. Additionally, EarthJustice and Environmental Groups urge the Commission to encourage meaningful public participation in the regional transmission planning process, arguing that non-market participation is vital to achieving just, reasonable, and non-discriminatory system plans, and explaining that substantial financial assistance is necessary to assure such meaningful participation.

141. Some commenters, such as AWEA and Transmission Access Policy Study Group, support a requirement that there be an obligation to construct projects identified in regional transmission plans. AWEA recognizes that, while regional and interregional cost allocation arrangements may alleviate some of the impediments to building transmission facilities, an obligation to build projects identified in the regional transmission plan in non-RTO regions would help ensure that transmission facilities ultimately are constructed. In its reply comments, First Wind supports AWEA's comments. Transmission Access Policy Study Group suggests that the Commission can stimulate the construction of new projects, without expanding transmission providers'

obligation to build. It suggests requiring development of a process to obtain construction commitments, with accountability for those commitments. Transmission Access Policy Study Group states that the Final Rule should include a timely post-plan process for: (1) securing commitments by transmission providers (or others) to build the transmission facilities identified in the regional plan; and (2) holding transmission providers and others that commit to construct transmission facilities included in the regional base model accountable for doing so.

142. On the other hand, Edison Electric Institute argues that the identification of transmission facilities in a transmission plan does not impose an obligation to build them. In addition, Salt River Project asserts that a transmission plan is not a specific blueprint of projects that must be built and states that regional planning provides the valuable service of comparing and contrasting individual potential projects with the decision to build any given project coming after the transmission planning process, with only those projects deemed superior getting built. Salt River Project states that not all projects identified by the plan should be or will be developed. Large Public Power Council points to statements in the Proposed Rule providing that the Commission's intention is not to require construction, and that this decision not to compel construction is grounded in limitations on the Commission's statutory authority.

143. A number of commenters address the issue of whether merchant transmission developers, i.e., those transmission developers that are not seeking regional cost recovery

for proposed transmission projects, should be required to participate in the regional transmission planning process. Some commenters state that the Commission should clarify in the Final Rule that merchant transmission developers should not be required to participate in the regional transmission planning process.[134] Clean Line states that, if ratepayers are not bearing development risk and the developer is not seeking regional cost allocation for its project, then it should not be required to participate in the regional transmission planning process. Allegheny Energy Companies note that, in PJM's regional transmission planning process, such merchant transmission developers are not required to participate if they do not wish to do so. New York ISO states that it supports the proposal to not require transmission developers that do not seek to take advantage of a regional transmission cost allocation mechanism to participate in the regional transmission planning process. LS Power states that it understands that merchant transmission developers that did not participate in the regional transmission planning process would still be required to provide to public utility transmission providers the information that is needed, for example, for the reliable operation of the transmission grid.

144. However, others support requiring merchant transmission developers to participate

[134] *E.g.*, Allegheny Energy Companies; Champlain Hudson; Clean Line; H-P Energy Resources; LS Power; and New York ISO.

in the regional transmission planning process.[135] APPA states that the reasons for engaging in coordinated planning extend well beyond eligibility for inclusion in the regional transmission cost allocation mechanisms, noting that the development of transmission projects is a time-consuming and expensive endeavor. APPA argues that it is important for transmission planners to know about and fully analyze all of the various transmission alternatives to ascertain the impact of existing and proposed projects on other regional transmission facilities. Transmission Access Policy Study Group is concerned that exempting merchant transmission developers from the regional transmission planning process could cause the mandatory process to plan around *ad hoc* merchant transmission projects and would undermine the benefits of regional transmission planning, such as the development of a right-sized grid, and creates the potential for free ridership. In reply to Clean Line, Edison Electric Institute states that viable merchant transmission projects must be included in the regional transmission planning process, because such projects may have significant reliability, operational, and economic impacts on the transmission system.

[135] *E.g.*, APPA; Large Public Power Council; Massachusetts Municipal and New Hampshire Electric; MISO Transmission Owners; National Rural Electric Coops; Nebraska Public Power District; New England States Committee on Electricity; Northern Tier Transmission Group; Ohio Consumers Counsel and West Virginia Consumer Advocate Division; Old Dominion Electric Cooperative; Six Cities; Transmission Agency of Northern California; Transmission Access Policy Study Group; and Transmission Dependent Utility Systems.

145. Finally, some commenters recommend that the Commission strongly encourage nonincumbent participation even in cases where they are not seeking regional cost recovery. California Commissions state that nonincumbent transmission developers that seek cost recovery via rolled-in rates should participate fully in the regional transmission planning process but believes that participation by merchant transmission developers that do not seek such cost recovery should be strongly encouraged to the extent feasible with regard to planning, but not to cost recovery. In its reply comments, Powerex notes that many commenters were opposed to exempting merchant transmission developers and thus recommended that the Commission encourage their participation in the regional transmission planning process.

c. Commission Determination

146. This Final Rule requires that each public utility transmission provider participate in a regional transmission planning process that produces a regional transmission plan and that complies with the transmission planning principles of Order No. 890 identified below. We determine that such transmission planning will expand opportunities for more efficient and cost-effective transmission solutions for public utility transmission providers and stakeholders. This will, in turn, help ensure that the rates, terms and conditions of Commission-jurisdictional services are just and reasonable and not unduly discriminatory or preferential.

147. Order No. 890 required public utility transmission providers to coordinate at the

regional level for the purpose of sharing system plans and identifying system enhancements that could relieve congestion or integrate new resources.[136] The Commission did not specify, however, whether such coordination with regard to identifying system enhancements included an obligation for public utility transmission providers to take affirmative steps to identify potential solutions at the regional level that could better meet the needs of the region. As a result, the existing requirements of Order No. 890 permit regional transmission planning processes to be used as a forum merely to confirm the simultaneous feasibility of transmission facilities contained in their local transmission plans. Consistent with the economic planning requirements of Order No. 890, regional transmission planning processes also must respond to requests by stakeholders to perform studies that evaluate potential upgrades or other investments that could reduce congestion or integrate new resources or loads on an aggregated or regional basis.[137] Again, no affirmative obligation was placed on public utility transmission providers within a region to undertake such analyses in the absence of requests by stakeholders. There is also no obligation for public utility transmission providers within the region to develop a single transmission plan for the region that reflects their determination of the set of transmission facilities that more efficiently or cost-effectively

[136] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 523.

[137] *Id.*

meet the region's needs.

148. We address these deficiencies in the requirements of Order No. 890 through this Final Rule, beginning with the requirement that public utility transmission providers participate in a regional transmission planning process that produces a regional transmission plan. Through the regional transmission planning process, public utility transmission providers will be required to evaluate, in consultation with stakeholders, alternative transmission solutions that might meet the needs of the transmission planning region more efficiently or cost-effectively than solutions identified by individual public utility transmission providers in their local transmission planning process. This could include transmission facilities needed to meet reliability requirements, address economic considerations, and/or meet transmission needs driven by Public Policy Requirements, as discussed further below. When evaluating the merits of such alternative transmission solutions, public utility transmission providers in the transmission planning region also must consider proposed non-transmission alternatives on a comparable basis. If the public utility transmission providers in the transmission planning region, in consultation with stakeholders, determine that an alternative transmission solution is more efficient or cost-effective than transmission facilities in one or more local transmission plans, then the transmission facilities associated with that more efficient or cost-effective transmission solution can be selected in the regional transmission plan for purposes of

cost allocation.[138]

149. We acknowledge that public utility transmission providers in some regions already meet or exceed this requirement.[139] As with other requirements in this Final Rule, our intent here is to establish a minimum set of obligations for public utility transmission providers that, as some commenters note, are not currently undertaking sufficient transmission planning activities at the regional level. We decline, however, to specify in this Final Rule a particular set of analyses that must be performed by public utility transmission providers within the regional transmission planning process. There are many ways potential upgrades to the transmission system can be studied in a regional transmission planning process, ranging from the use of scenario analyses to production cost or power flow simulations. We provide public utility transmission providers in each transmission planning region the flexibility to develop, in consultation with stakeholders, procedures by which the public utility transmission providers in the region identify and evaluate the set of potential solutions that may meet the region's needs more efficiently

[138] As discussed in section IV.F.6, below, we conclude that the issue of cost recovery associated with non-transmission alternatives is beyond the scope of this Final Rule, which addresses the allocation of the costs of transmission facilities.

[139] As noted above, to the extent existing transmission planning processes satisfy the requirements of this Final Rule, public utility transmission providers need not revise their OATTs and, instead, should describe in their compliance filings how the relevant requirements are satisfied by reference to tariff sheets already on file with the Commission. Moreover, to the extent necessary, we clarify that nothing in this Final Rule is intended to modify or abrogate governance procedures of RTOs and ISOs.

or cost-effectively. We will review such mechanisms on compliance, using as our yardstick the statutory requirements of the FPA, Order No. 890 transmission planning principles, and our precedent regarding compliance with the Order No. 890 transmission planning principles, and issue further guidance as necessary.[140]

150. Because of the increased importance of regional transmission planning that is designed to produce a regional transmission plan, stakeholders must be provided with an opportunity to participate in that process in a timely and meaningful manner. Therefore, we apply the Order No. 890 transmission planning principles to the regional transmission planning process, as reformed by this Final Rule. This will ensure that stakeholders have an opportunity to express their needs, have access to information and an opportunity to provide information, and thus participate in the identification and evaluation of regional solutions. Ensuring access to the models and data used in the regional transmission planning process will allow stakeholders to determine if their needs are being addressed in a more efficient or cost-effective manner. Greater access to information and

[140] In developing their compliance filings, public utility transmission providers and interested parties should review the requirements as set forth in Order No. 890, Order No. 890-A, and our orders on compliance filings submitted by public utility transmission providers for guidance on what each of these transmission planning principles requires. For example, as a starting point, a public utility transmission provider should review the orders addressing its own compliance filings and the compliance filings for public utility transmission providers in its region. We do not address these principles in detail here, except with respect to the consideration of non-transmission alternatives in the regional transmission planning process and other discrete issues raised by commenters.

transparency also will help stakeholders to recognize and understand the benefits that they will receive from a transmission facility in a regional transmission plan. This consideration is particularly important in light of our reforms that require that each public utility transmission provider have a cost allocation method or methods for transmission facilities selected in a regional transmission plan that reflects the benefits that those transmission facilities provide.

151. Specifically, the requirements of this Final Rule build on the following transmission planning principles that we required in Order No. 890: (1) coordination; (2) openness; (3) transparency; (4) information exchange; (5) comparability; (6) dispute resolution; and (7) economic planning.[141] In Order No. 890, we required that each public utility transmission provider adopt these transmission planning principles as part of its individual transmission planning process. In this Final Rule, we expand the Order No. 890 requirements by directing public utility transmission providers to adopt these requirements with respect to the process used to produce a regional transmission plan. We conclude that it is appropriate to do so to ensure that regional transmission planning

[141] We do not include the regional participation transmission planning principle and the cost allocation transmission planning principle here because we address interregional transmission coordination and cost allocation for transmission facilities selected in a regional transmission plan for purposes of cost allocation elsewhere in this Final Rule.

processes are coordinated, open, and transparent.[142] Accordingly, we require public utility transmission providers to develop, in consultation with stakeholders,[143] enhancements to their regional transmission planning processes, consistent with these transmission planning principles.

152. We conclude that, without the requirement to meet the Order No. 890 transmission planning principles, a regional transmission planning process will not have the information needed to assess the impact of proposed transmission projects on the regional transmission grid. Additionally, absent timely and meaningful participation by all stakeholders, the regional transmission planning process will not determine which transmission project or group of transmission projects could satisfy local and regional needs more efficiently or cost-effectively.

153. A number of commenters specifically address the treatment of non-transmission alternatives in the regional transmission planning process. Order No. 890's

[142] Although the explicit requirement for a public utility transmission provider to participate in a regional transmission planning process that complies with the Order No. 890 transmission planning principles identified above is new, we note that the existing regional transmission planning processes that many utilities relied upon to comply with the requirements of Order No. 890 may require only modest changes to fully comply with these Final Rule requirements.

[143] The term "stakeholder" is intended to include any party interested in the regional transmission planning process. This is consistent with the approach taken in Order No. 890. *See, e.g., Southern Co. Svcs., Inc.*, 127 FERC ¶ 61,282, at P 14-16 (2009).

comparability transmission planning principle requires that the interests of public utility transmission providers and similarly situated customers be treated comparably in regional transmission planning.[144] In response to Order No. 890, public utility transmission providers have identified in their transmission planning processes where, when, and how transmission and non-transmission alternatives proposed by interested parties will be considered. As noted in Order No. 890, the transmission planning requirements adopted here do not address or dictate which transmission facilities should be either in the regional transmission plan or actually constructed.[145] As also noted in Order No. 890, the ultimate responsibility for transmission planning remains with public utility transmission providers. With that said, the Commission intends that the regional transmission planning processes provide for the timely and meaningful input and participation of stakeholders in the development of regional transmission plans.[146]

154. We disagree with those commenters that assert that non-transmission alternatives only should be considered in the local transmission planning process. We recognize that generation, demand response, and energy efficiency options often are considered in local resource planning and that transmission often is planned as a last resort. Therefore, when local transmission plans are brought together in a regional transmission planning process

[144] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 494.

[145] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 438.

[146] *Id*. P 454.

to determine if a regional solution can better meet the needs of the region than the sum of local transmission plans, many opportunities for the use of alternative resources will already have been considered. Just as there may be opportunities for regional transmission solutions to better meet the needs of the region, the same could be true for regional non-transmission alternatives. However, the regional transmission planning process is not the vehicle by which integrated resource planning is conducted; that may be a separate obligation imposed on many public utility transmission providers and under the purview of the states.

155. While we require the comparable consideration of transmission and non-transmission alternatives in the regional transmission planning process, we will not establish minimum requirements governing which non-transmission alternatives should be considered or the appropriate metrics to measure non-transmission alternatives against transmission alternatives. Those considerations are best managed among the stakeholders and the public utility transmission providers participating in the regional transmission planning process.[147] However, we note that in Order Nos. 890 and 890-A, as well as in orders addressing related compliance filings, we have provided guidance regarding the requirements of the Order No. 890 comparability transmission planning

[147] We also deny, as beyond the scope of this proceeding, NRG's requests that we direct PJM to determine why its markets are not sending appropriate price signals and that we direct ISOs and RTOs to establish a "feedback loop."

principle.[148] Specifically, public utility transmission providers are required to identify how they will evaluate and select from competing solutions and resources such that all types of resources are considered on a comparable basis.[149]

156. We disagree with concerns raised by certain commenters that the Order No. 890 comparability transmission planning principle may interfere with integrated resource planning.[150] As discussed above, this Final Rule in no way involves an exercise of authority over those specific substantive matters traditionally reserved to the states, including integrated resource planning, or authority over siting, permitting, or

---

[148] *See, e.g.*, Order No. 890-A, FERC Stats. & Regs. ¶ 31,261 at P 216. *See also, e.g., California Indep. Sys. Operator Corp.*, 123 FERC ¶ 61,283 (2008); *East Kentucky Power Coop*., 125 FERC ¶ 61,077 (2008).

[149] *See, e.g., NorthWestern Corp.*, 128 FERC ¶ 61,040 at P 38 (2009) (requiring the transmission provider's OATT to permit sponsors of transmission, generation, and demand resources to propose alternative solutions to identified needs and identify how the transmission provider will evaluate competing solutions when determining what facilities will be included in its transmission plan); *El Paso Elec. Co.*, 128 FERC ¶ 61,063 at P 15 (2009) (same); *New York Indep. Sys. Operator, Inc.*, 129 FERC ¶ 61,044, at P 35 (2009) (same). In each of these cases, the Commission stated that tariff language could, for example, state that solutions will be evaluated against each other based on a comparison of their relative economics and effectiveness of performance. Although the particular standard a public utility transmission provider uses to perform this evaluation can vary, the Commission explained that it should be clear from the tariff language how one type of investment would be considered against another and how the public utility transmission provider would choose one resource over another or a competing proposal. *Northwestern Corp.*, 128 FERC ¶ 61,040 at P 38, n.31; *El Paso Elec. Co.*, 128 FERC ¶ 61,063 at P 15, n.25; *New York Indep. Sys. Operator, Inc.*, 129 FERC ¶ 61,044 at P 35, n.26.

[150] *E.g.*, Ad Hoc Coalition of Southeastern Utilities.

construction of transmission solutions.[151] In addition, on compliance with Order No. 890, each public utility transmission provider already has put into place regional transmission planning processes that provide for the evaluation of proposed solutions on a comparable basis.[152] In this Final Rule, the Commission is applying to regional transmission planning the comparability transmission planning principle stated in Order Nos. 890 and 890-A.[153]

157. We agree with commenters that public utility transmission providers should have flexibility in determining the most appropriate manner to enhance existing regional transmission planning processes to comply with this Final Rule. As a result, and consistent with our approach in Order No. 890, we will not prescribe the exact manner in which public utility transmission providers must fulfill the requirements of complying with the regional transmission planning principles. We allow public utility transmission providers developing the regional transmission planning processes to craft, in consultation with stakeholders, requirements that work for their transmission planning region. Consistent with this approach, we will not impose additional rules that would

[151] *See supra* section III.A.2.

[152] *See, e.g.*, Entergy OATT, Attachment K at § 3.12; Florida Power and Light OATT, Appendix 1 to Attachment K, §§ H and I; ISO New England OATT, Attachment K at § 4.2; Puget Sound Energy OATT, Attachment K at § 2; SPP OATT, Attachment O at § III.8.

[153] *See, e.g.*, *supra* notes 148-49.

detail consistent planning cycles, impose stakeholder procedures, establish timelines for evaluating regional transmission projects in the regional transmission planning process (including establishing a minimum long-term planning horizons), add any additional requirements to the Order No. 890 dispute resolution transmission planning principle, or establish other planning criteria beyond those in this Final Rule, as requested by some commenters. These are matters best suited to resolution by the public utility transmission providers and stakeholders in the transmission planning region. We also reject Anbaric and PowerBridge's suggestion that procedures be developed to treat transmission project information as confidential, outside of the Commission's Critical Energy Infrastructure Information (CEII) requirements and regulations, as this runs counter to the requirement that regional transmission planning processes be open and transparent.

158. Additionally, we note that a public utility transmission provider's regional transmission planning process may utilize a "top down" approach, a "bottom up" approach, or some other approach so long as the public utility transmission provider complies with the requirements of this Final Rule. Public utility transmission providers have flexibility in developing the necessary enhancements to existing regional transmission planning processes to comply with this Final Rule, based upon the needs and characteristics of their transmission planning region.

159. We also decline to impose obligations to build or mandatory processes to obtain commitments to construct transmission facilities in the regional transmission plan, as

requested by some commenters. The package of transmission planning and cost allocation reforms adopted in this Final Rule is designed to increase the likelihood that transmission facilities in regional transmission plans will move from the planning stage to construction. In addition, public utility transmission providers already are required to make available information regarding the status of transmission upgrades identified in transmission plans, including posting appropriate status information on its website, consistent with the Commission's CEII requirements and regulations.[154] To the extent an entity has undertaken a commitment to build a transmission facility in a regional transmission plan, that information should be included in such postings.[155] We determine that this obligation, together with the reforms we adopt in this Final Rule, are adequate without placing further obligations on public utility transmission providers.

160. The Commission also acknowledges the importance of identifying the appropriate size and scope of the regions over which regional transmission planning will be performed. We clarify that for purposes of this Final Rule, a transmission planning

[154] *See* Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 472.

[155] Nothing in this Final Rule limits public utility transmission providers from developing mechanisms to impose an obligation to build transmission facilities in a regional transmission plan, consistent with the requirements below regarding the treatment of nonincumbent transmission developers. Similarly, nothing in this Final Rule preempts or otherwise limits any such obligation that may exist under state or local laws or regulations.

region is one in which public utility transmission providers, in consultation with stakeholders and affected states, have agreed to participate in for purposes of regional transmission planning and development of a single regional transmission plan. As the Commission explained in Order No. 890, the scope of a transmission planning region should be governed by the integrated nature of the regional power grid and the particular reliability and resource issues affecting individual regions.[156] We note that every public utility transmission provider has already included itself in a region for purposes of complying with Order No. 890's regional participation transmission planning principle. We will not prescribe in this Final Rule the geographic scope of any transmission planning region. We believe that these existing regional processes should provide some guidance to public utility transmission providers in formulating transmission planning regions for purposes of complying with this Final Rule. However, to the extent necessary, we clarify that an individual public utility transmission provider cannot, by itself, satisfy the regional transmission planning requirements of either Order No. 890 or this Final Rule.

161. The Commission also clarifies that the obligation to participate in a regional transmission planning process that produces a regional transmission plan that meets the

[156] *See, e.g.*, Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 527.

seven transmission planning principles, is not intended to appropriate, supplant, or impede any local transmission planning processes that public utility transmission providers undertake. The objective of this Final Rule is to amend the requirements of Order No. 890 so that regional transmission planning processes not only continue to meet the transmission planning principles established in Order No. 890 but, additionally, produce a regional transmission plan.

162. With regard to comments that seek clarification as to the applicability of the requirements of this Final Rule to transmission projects currently being proposed in existing regional transmission planning processes, we clarify in section II.D above that the requirements of this Final Rule are intended to apply to new transmission facilities. Our intent is to enhance transmission planning processes prospectively to provide greater openness and transparency in the development of regional transmission plans. As also discussed in section II.D above, we recognize that this Final Rule may be issued in the middle of a transmission planning cycle, and we therefore direct public utility transmission providers to explain in their respective compliance filings how they intend to implement the requirements of this Final Rule. In response to comments requesting that the Commission mandate that public utility transmission providers include a funding mechanism to facilitate the participation of in the regional transmission planning process of interested entities that are not market participants, this Final Rule affirms the general approach the Commission took in Order No. 890 regarding the recovery of costs

associated with participation in the transmission planning process. There, the Commission acknowledged concerns regarding "how state regulators and other agencies will recover the costs associated with their participation in the planning process."[157] The Commission therefore directed public utility transmission providers to "propose a mechanism for cost recovery in their planning compliance filings" and stated that those proposals "should include relevant cost recovery for state regulators, to the extent requested."[158] We decline to expand that directive here to include funding for other stakeholder interests, as requested by certain commenters. However, we also note that, to the extent that public utility transmission providers choose to include a funding mechanism to facilitate the participation of state consumer advocates or other stakeholders in the regional transmission planning process, nothing in this Final Rule precludes them from doing so.

163. With regard to the participation of merchant transmission developers in the regional transmission planning process, we conclude that, because a merchant transmission developer assumes all financial risk for developing its transmission project and constructing the proposed transmission facilities, it is unnecessary to require such a developer to participate in a regional transmission planning process for purposes of

[157] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at n.339 and P 586.

[158] *Id.* n.339.

identifying the beneficiaries of its transmission project that would otherwise be the basis for securing eligibility to use a regional cost allocation method or methods.[159] However, we acknowledge the concern of some commenters that a transmission project proposed or developed by a merchant transmission developer has broader impacts than simply cost recovery. Because all electric systems within an integrated network are electrically connected, the addition or cancellation of a transmission project in one system can affect the nature of power flows within one system or on other systems.

164. We therefore conclude that it is necessary for a merchant transmission developer to provide adequate information and data to allow public utility transmission providers in the transmission planning region to assess the potential reliability and operational impacts of the merchant transmission developer's proposed transmission facilities on other systems in the region. We will allow public utility transmission providers in each transmission planning region, in consultation with stakeholders, in the first instance to propose what information would be required. Public utility transmission providers should include these requirements in their filings to comply with this Final Rule.

165. Although merchant transmission developers must provide information in the regional transmission planning process as discussed herein, to be clear, we emphasize that the transmission facilities proposed by a merchant transmission developer are not

[159] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 99.

subject to the evaluation and selection processes that apply to transmission facilities for which regional cost allocation is sought, as a merchant transmission developer is not seeking to be selected in the regional transmission plan for purposes of cost allocation. However, nothing in this Final Rule prevents a merchant transmission developer from voluntarily participating in the regional transmission planning process (beyond providing the information and data required above) even if it is not seeking regional cost allocation for its proposed transmission project. As we stated in the Proposed Rule, we encourage them to do so. In addition, nothing in this Final Rule limits or otherwise affects the responsibilities a merchant transmission developer may have to fund network upgrades caused by the interconnection of its project with the transmission grid.[160]

[160] We note that, to the extent a merchant transmission developer becomes subject to the requirements of FPA section 215 and the regulations thereunder, it also will be required to comply with all applicable obligations, including registration with NERC. Under section 215, all users, owners, or operators of the bulk power system must register with NERC for performance of applicable reliability functions. The registration with NERC will help ensure that merchant transmission developers provide all appropriate information to be used in transmission system planning and assessment studies. *See* 16 U.S.C. 824o(g) ("Reliability Reports—The ERO shall conduct periodic assessments of the reliability and adequacy of the bulk-power system in North America."); *see also Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval and Enforcement of Electric Reliability Standards,* Order No. 672, 71 FR 8662 (Feb. 17, 2006), FERC Stats. & Regs. ¶ 31,204, at P 803, *order on reh'g,* Order No. 672-A, 71 FR 19814 (Apr. 18, 2006), FERC Stats. & Regs. ¶ 31,212 (2006). Concerns regarding when NERC registration would be triggered should be addressed in a NERC registration process.

4. Consideration of Transmission Needs Driven by Public Policy Requirements[161]

a. Commission Proposal

166. The Proposed Rule would require that transmission needs driven by Public Policy Requirements be taken into account in the local and regional transmission planning process to ensure that each public utility transmission provider's transmission planning process supports rates, terms, and conditions of transmission service in interstate commerce that are just and reasonable and not unduly discriminatory or preferential. The Proposed Rule would require each public utility transmission provider to amend its OATT such that its local and regional transmission planning processes explicitly provide for consideration of Public Policy Requirements.[162] The Commission noted that this proposed requirement would be a supplement to, and would not replace, any existing requirements with respect to consideration of reliability needs and application of the Order No. 890 economic planning studies transmission planning principle in the transmission planning process.[163] If a public utility transmission provider believes that its existing transmission planning processes satisfy these requirements, then the Proposed

[161] *See supra* P 2 (defining Public Policy Requirements).

[162] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 64.

[163] *Id.*

Rule would require that the public utility transmission provider must make that demonstration in its compliance filing.[164]

167. The Proposed Rule would require each public utility transmission provider to coordinate with its stakeholders to identify Public Policy Requirements that are appropriate to include in its local and regional transmission planning processes.[165] The Proposed Rule stated that, after consulting with stakeholders, a public utility transmission provider may include in the transmission planning process additional public policy objectives not specifically required by state or federal laws or regulations.

168. The Proposed Rule sought comment on how planning criteria based on Public Policy Requirements should be formulated, including whether it would be more appropriate to use flexible criteria rather than "bright line" metrics when determining which transmission projects are to be included in a regional transmission plan, whether the use of flexible criteria would provide undue discretion as to whether a transmission project is included in a regional transmission plan, and whether the use of "bright line" metrics may inappropriately result in alternating inclusion and exclusion of a single transmission project over successive planning cycles and thus create inappropriate

[164] *Id.* P 66.

[165] *Id.* P 65.

disruptions in long-term transmission planning.[166]

b. Comments

169. In general, most commenters support the Commission's proposal that each public utility transmission provider must amend its OATT such that local and regional transmission planning processes explicitly provide for the consideration of public policy requirements established by state or federal laws or regulations that may drive transmission needs.[167] Support came from all sectors of the industry, including public utilities, municipal and cooperative utilities, renewable generators, transmission developers, state commissions, and consumer and public interest representatives. While most commenters support the proposal to include public policy requirements in

[166] *Id.* P 70.

[167] *E.g.*, Allegheny Energy Companies; American Transmission; Anbaric and PowerBridge; Arizona Corporation Commission; Arizona Public Service Company; Atlantic Grid; AWEA; California Commissions; California ISO; Clean Energy Group; Connecticut & Rhode Island Commissions; Consolidated Edison and Orange & Rockland; DC Energy; Delaware PSC; Dominion; Duke; Duquesne Light Company; EarthJustice; Exelon; First Wind; Iberdrola Renewables; Integrys; ISO New England; ISO/RTO Council; Maine PUC; Massachusetts Departments; Massachusetts Municipal and New Hampshire Electric; MISO; MISO Transmission Owners; National Audubon Society; National Grid; New England States' Committee on Electricity; New Jersey Board; New Jersey Division of Rate Counsel; New York PSC; NextEra; Northeast Utilities; Northern Tier Transmission Group; Ohio Consumers' Counsel and West Virginia Consumer Advocate Division; Old Dominion; Pacific Gas & Electric; Pattern Transmission; Pennsylvania PUC; PHI Companies; PJM; PUC of Nevada; San Diego Gas & Electric; Southern California Edison; Sunflower and Mid-Kansas; Transmission Dependent Utility Systems; Transmission Access Policy Study Group; Transmission Agency of Northern California; Western Grid Group; and Wind Coalition.

transmission planning processes, a number seek clarification or request that the Commission provide additional guidance.

170. With regard to what constitutes a public policy requirement, some commenters seek to limit the definition to state and federal laws and regulations[168] while others seek a more flexible approach. For example, Omaha Public Power District supports the Commission's proposal only if such public policy requirements are established by state or federal laws or regulations applicable to all entities in the relevant planning region. East Texas Cooperatives believes that Omaha Public Power District's proposal strikes a reasonable balance. Similarly, National Rural Electric Coops state that the Commission should not empower stakeholders to use the transmission planning process to impose and enforce new resource planning requirements that lack the sanction of state or federal law in the planning region. First Energy Service Company argues that only enforceable requirements that are embodied in state or federal law should be eligible for inclusion in transmission planning processes. Duke states that the Final Rule should make unambiguous that the public policy aspect of regional and interregional planning refers only to those transmission projects driven by the need to comply with state and/or federal laws, rules, and/or regulations and that it supports limiting the requirement to public policies that drive the need for transmission.

[168] *E.g.*, Omaha Public Power District; Exelon; First Energy Services; PJM; New York ISO; and Transmission Agency of Northern California.

171. Likewise, PJM states that the Commission should make clear that the responsibility of the transmission planner to plan for public policy criteria is triggered by the clear and formal identification of those public policy criteria identified by Congress or state policymakers through publicly issued laws or regulations and recognize that the transmission planner would need to refer to the states to reconcile conflicting policies that cannot both be reasonably accommodated under a cost-effective and efficient regional transmission plan. In their reply comments, APPA, PSEG Companies, ISO/RTO Council, and Illinois Commerce Commission also caution about transmission planners picking and choosing the public policies that would be considered in transmission planning processes.

172. In their reply comments, ISO/RTO Council suggest that the Final Rule make clear that public policy objectives are limited to those developed by federal or state executive, legislative, and regulatory bodies with authority to adopt such objectives, that ISOs and RTOs may defer to regional state committees on identifying and reconciling individual state public policy goals, that states should utilize the authority under section 216(i) of the FPA to enter into regional compacts to ensure that recommendations pass constitutional muster and otherwise have a suitable legal foundation, and that stakeholders should advocate means of implementing state public policy mandates to the states rather than to ISOs/RTOs.

173. Several comments focus on the role of states in the identification of public policy

requirements and what constitutes such a requirement. Many request that the Final Rule expressly acknowledge the role of the state regulatory agencies and governors.[169] For example, PUC of Nevada supports the Commission's concept to require that public policies be incorporated into transmission planning and states that the Final Rule should specify the role state regulatory commissions and governors play in ensuring that the transmission plan accurately reflects state policies and, where there are inconsistencies in the utility's interpretation of the state's public policy versus that of the state regulatory commissions and governors, the Commission should give deference to the regulatory commissions' and governors' interpretation. PUC of Nevada also notes that the Final Rule does not include an oversight mechanism.

174. New England States Committee on Electricity conditions its support for the Commission's proposal on states identifying the policies established in law and regulations to be considered in transmission analysis. New York PSC comments that the Commission should modify the process to allow states to identify which state-level policies should be included in the transmission planning process. It also asks the Commission to clarify that these policies may include public policies derived pursuant to such statutory or regulatory authority, such as those created pursuant to regulatory orders or state energy plans and to allow states to identify state-level policies for inclusion in

[169] *E.g.*, Connecticut & Rhode Island Commissions; Massachusetts Departments; PUC of Nevada; and New England States Committee on Electricity.

those plans, not stakeholders. In reply comments, California PUC also states that the Commission should not establish prescriptive criteria regarding what policy goals are to be included. City of Los Angeles Department of Water and Power states that the Commission's proposal should be expanded to include local laws and regulations, noting that many requirements of entities such as itself are grounded in such local mandates.

175. NARUC notes that states will not turn over their policy authority to planning entities for inclusion in a Commission tariff and states that, while it is valuable to have transmission planning processes incorporate public policy considerations, a Commission tariff cannot mandate particular policy approaches. NARUC explains that transmission planners should not be required to determine unwritten public policy requirements, and that the Final Rule should explicitly recognize the governmental role, particularly at the state level, in providing policy input into the transmission planning processes, rather than directing the planners to consult with all stakeholders. NARUC states that the Final Rule should make explicit that any provisions do not impede or interfere with state commission authority to accept or approve integrated resource plans, make decisions about generation, demand-side resources, resource portfolios, or to modify policy based on cost thresholds. East Texas Cooperatives, First Wind, and Florida PSC express their support for NARUC's position.

176. Connecticut & Rhode Island Commissions state that the Commission should not prescribe any particular public policy requirement that must be considered or excluded

from the transmission planning process. Moreover, they argue that the states, not transmission utilities and planners, must retain their jurisdiction as the ultimate arbiter on the issue of whether a transmission project is the most beneficial, lowest cost, or most prudent decision for achieving a state public policy goal. North Carolina Agencies assert that the regional transmission planning processes should not decide how to meet state and federal policy requirements, and that the FPA gives the Commission no authority to determine what resources should be used by load-serving entities, regardless of whether or not those resources are needed to meet public policy requirements.

177. Others seek more flexibility in defining what constitutes a public policy requirement.[170] For example, Pacific Gas & Electric asks that the Final Rule clarify that local and regional transmission planning processes for public utility transmission providers consider state or federal public policy objectives rather than identifying or referring to specific laws and regulations. NextEra seeks clarification that any type of legal or regulatory requirements affecting transmission development should be included in the transmission planning process, noting that the EPA has established a schedule for issuing of a host of Clean Air Act rules governing other emissions from electric generating units. Iberdrola Renewables states that any state and federal renewable portfolio requirements and any state and federal greenhouse gas emission reduction or

[170] *E.g.*, New Jersey Division of Rate Counsel and Integrys.

climate change policies, including requirements or standards that take effect in future years, should be considered in the transmission expansion plan. Atlantic Wind Connection states that the Commission should broaden the phrase "public policy requirements" used in the Proposed Rule to include public policy initiatives or something similar to reflect the broad, non-compulsory nature of the policy environment.

178. Several commenters, including some consumer advocates and public interest organizations, recommend that the Commission specify the state and federal policy requirements that utilities, must, at a minimum, take into account in their transmission planning processes.[171] Some suggest including: (1) renewable portfolio standards; (2) energy efficiency standards and mandates; (3) CO_2 emissions reduction targets/requirements; (4) NAAQS attainment and interstate air pollution reductions; (5) EPA utility sector regulations; and (6) federal and state land management, land use, wildlife conservation and zoning policies and procedures intended to facilitate the siting of renewable energy.[172] In its reply comments, EarthJustice endorses this view. 26 Public Interest Organizations state that comparable consideration of all resource options

[171] *E.g.*, EarthJustice; 26 Public Interest Organizations; and National Audubon Society.

[172] *E.g.*, Conservation Law Foundation; Energy Future Coalition Group; E.ON Climate & Renewables North America; Environmental Defense Fund; Environmental NGOs; Natural Resources Defense Council; Sonoran Institute; and Wilderness Society and Western Resource Advocates.

available to meet various public policy requirements is essential to minimizing utilities' opportunities for undue discrimination. Ohio Consumers' Counsel and West Virginia Consumer Advocate Division state that transmission providers should be required describe the role that each "public policy" would play in the transmission planning process. Michigan Citizens Against Rate Excess state that while both reliability and public policy requirements should be considered as part of the same plan, they should be analyzed separately and the transmission plan should explain how these projects may complement or contradict each other.

179. Commenters that believe that the Commission should take a broader view of what public policy requirements are to be considered by transmission providers and their stakeholders, argue, for example, that the transmission planning process must be sufficiently flexible to include reasonably foreseeable public policy objectives not yet explicitly required by existing law or regulation and also to consider "at risk" generation.[173] Atlantic Wind Connection suggests the adoption of an unambiguous requirement to plan transmission additions needed to accommodate public policy initiatives and suggests that the Commission require specific tariff provisions describing how transmission facilities that accommodate and facilitate public policy initiatives would be planned for and evaluated. AWEA states that the Commission should clarify

[173] *E.g.*, Iberdrola Renewables.

that public policy requirements are not to be narrowly construed and that expected future public policy requirements as well as existing ones should be considered.

180. However, in reply, a number of commenters take exception with the suggestion that possible or likely future public policies should be considered in the transmission planning process stating, among other things, that it could result in constantly moving targets, unfocused transmission planning, regulatory uncertainty, and the RTOs or the Commission assuming the roles of Congress and the states.[174] For example, Exelon argues that the Final Rule should specify that planning for public policy should not include aspirational goals. Likewise, Large Public Power Council's reply comments state that transmission planners should not be required to take into account anticipated public policies. Xcel also believes that the requirement to consider public policy directives in developing transmission plans should focus on established policies, rather than anticipated or potential future obligations.

181. Among those seeking flexibility and recognition of regional differences,[175] Edison Electric Institute and Northeast Utilities state that the Commission should allow flexibility in defining the types of public policy requirements; determining

[174] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Coalition for Fair Transmission Policy; East Texas Cooperatives; Large Public Power Council; National Rural Electric Coops; and New England States Committee on Electricity.

[175] *E.g.*, ISO/RTO Council; ISO New England; PJM; New York ISO; SPP; MISO; New York Transmission Owners; NEPOOL; and MISO Transmission Owners.

implementation details, such as the process to identify public policy requirements; and how transmission system needs would be selected once an appropriate public policy requirement is identified. Northern Tier Transmission Group states that to the extent that a transmission provider maintains an obligation to serve retail load, its merchant/load-serving function will identify and quantify the relevant public policy requirements, which will then be accounted for in its local transmission plan. Any additional public policy objectives should be at the discretion of regional planning groups. Transmission Access Policy Study Group states that the Final Rule should clarify the reference to state and federal policy requirements, so that it includes state regulatory commission orders and regulations and local governmental mandates on load-serving entities; and expressly identify FPA section 217(b)(4) as a federal public policy requirement that the regional transmission planning process must consider.

182. Other commenters have ideas on or questions about how public policy requirements are to be included and implemented. Exelon states that the Commission should adopt principles to help head off stalemates: (1) transmission planning must include likely retirements of plants subject to environmental regulations; (2) encompass only laws actually in effect in determining the impact on generation capacity; (3) require transmission planners to take into account all the actual terms of state and federal laws and regulations for which transmission expansion is planned; (4) require a region to show that its stakeholder-endorsed policy would not cause any harm or costs to other regions;

(5) the full cost of resources must be transparent and considered in the transmission planning process, based on sound economic principles; and (6) require that planning for renewable energy resources be done with the objective of minimizing total costs. MISO states that the proposal should be expanded to include a requirement to, when prudent, pursue appropriate transmission expansion initiatives to facilitate the compliance of public policy requirements by entities within the transmission provider's footprint that are subject to such requirements.

183. PJM states that the actual development of transmission to address public policy standards requires: (1) further direction as to how such standards should be reflected in implementable planning assumptions; and (2) a legally empowered coordination among states with shared policy agendas allowing regional projects to be sited and permitted because they are "needed" to meet the multistate collective's shared policy agenda. Old Dominion and Atlantic Wind Connection support PJM's suggested holistic approach to transmission planning. In response, however, Consolidated Edison and Orange & Rockland argue that PJM's comments do not adequately reflect the Proposed Rule's objective to respect regional methods and urge the Commission to reject PJM's top down approach.

184. Pattern Transmission states that the Commission should require public utility transmission providers to specify when transmission upgrade projects are categorized as public policy-driven projects and when the transmission facilities are considered solely

through the generator interconnection process.

185. Others offer for Commission consideration their desired outcomes from including Public Policy Requirements in regional transmission planning.[176] For example, Transmission Agency of Northern California seeks confirmation that simply characterizing a project's purpose as meeting a public policy requirement should not provide that project a presumption of inclusion in the regional transmission planning process. Transmission Access Policy Study Group states that the Commission should urge transmission providers to adopt a "no regrets" strategy that focuses on constructing transmission facilities needed under multiple potential power supply and public policy scenarios, which lead to a "right-sized" grid with greater flexibility to respond to changing technology, resource options, and customer needs. Old Dominion also asks that the Final Rule make clear that the directive to plan for public policy laws or regulations is for transmission planning only, not for design and construction or to improve power supply.

186. Western Grid Group states that, at a minimum, the Commission should require regional plans to address a planning horizon of at least 20 years and to evaluate environmental and economic constraints and public interest concerns over that horizon as a basis for the development of such plans. Powerex cautions that the consideration of

[176] *E.g.*, Pattern Transmission; Transmission Agency of Northern California; and Transmission Access Policy Study Group.

public policy factors not result in transmission planning and cost allocation processes that elevate the needs of certain customers over others in the transmission planning process and should preserve competitive wholesale power markets.

187. Commenters also offer ideas on timing and scope. Some commenters argue that only federal and state laws and regulations in effect during the transmission planning cycle should be considered as public policy requirements in the regional transmission planning process.[177] East Texas Cooperatives, however, believes that a better approach is to let participants in the transmission planning process advocate for their own needs and interests (which by necessity will reflect the need to comply with policies contained in applicable federal and state law), and then allow the transmission planning process to sort out these interests within the existing Order No. 890 transmission planning framework. In response to such comments, however, AEP contends that planning for only current regulatory requirements is too narrow a formulation that would result in underinvestment in transmission infrastructure. AEP suggests that the transmission planning process consider reasonably foreseeable future regulatory requirements given their likely impact on the power system, citing NERC's analysis of potential impacts of EPA regulations on generation.

[177] *E.g.*, National Rural Electric Coops; City of Santa Clara; Michigan Citizens Against Rate Excess; Exelon; East Texas Cooperatives; and Coalition for Fair Transmission Policy.

188. A number of commenters believe either that existing regional transmission planning processes already consider public policy requirements and thus OATT revisions may therefore be unnecessary.[178] East Texas Cooperatives state that they agree with the Commission's preliminary finding, but disagree as to the need for any revisions to the OATT as transmission planning already takes into account public policy requirements established by state or federal laws or regulations in accordance with Order No. 890's transmission planning requirements, as well as with Commission policy that has evolved over the years. Many commenters in ISO and RTO regions argue that the transmission planning processes administered by those entities already address or largely address public policy issues.[179] For example, New York ISO supports the Commission's proposal but states that existing transmission planning rules already provide for consideration of public policy requirements in many regions. Transmission Dependent Utility Systems recommend that the Commission clarify that nothing in the existing *pro forma* OATT prohibits the consideration of public policy requirements in the transmission planning processes and, to the extent a transmission provider believes its particular OATT does preclude such considerations, the Final Rule should direct

[178] *E.g.*, Washington Utilities and Transportation Commission; Alliant Energy; Xcel; Bonneville Power; Westar; Sacramento Municipal Utility District; National Rural Electric Coops; East Texas Cooperatives; WECC; WestConnect; Georgia Transmission Corporation; Southern Companies; and Ad Hoc Coalition of Southeastern Utilities.

[179] *E.g.*, New England Transmission Owners; Alliant Energy; and New York ISO.

compliance filings to remove the language allegedly prohibiting such consideration.

189. Some commenters raise additional concerns, including how public policy considerations would be incorporated into a transmission provider's local and regional transmission planning process including whether the proposal is intended to modify or incorporate generator interconnection requests into the "local and regional transmission planning process;" whether a project proposed to satisfy transmission needs driven by public policy requirements are to be planned for and considered separately from reliability and economic projects; whether regional transmission planning organizations are required to create a separate category of public policy-driven transmission projects or whether they are to be in concert with reliability and economic criteria during the transmission planning process.[180]

190. Coalition for Fair Transmission Policy is concerned that the Proposed Rule might be interpreted as requiring transmission planning processes to make decisions as to how best to meet applicable public policy requirements on behalf of those entities on whom the requirements are placed. Therefore, it states that decisions on how load-serving entities within regions should meet state or federal public policy requirements should continue to be made by those with responsibilities to meet the requirements, based on federal and state law and applicable regulations, and recommends that the Final Rule

[180] *E.g.*, NV Energy; Long Island Power Authority; and Bonneville Power.

make this clear.

191. PPL Companies state that basing transmission planning decisions on state public policy directives may lead to undue discrimination among generators and, thus, run afoul of the FPA requirement that all users of the transmission system be treated in a non-discriminatory manner. It states that the Commission should direct transmission planners to make sure that pre-existing rights are preserved and accommodated under the Proposed Rule's transmission planning principles, just as the Commission preserved grandfathered transmission contracts under Order No. 888 and grandfathered interconnection agreements under Order No. 2000.

192. New Jersey Board believes there needs to be recognition of planning for public policy goals in terms of reliability. It asserts that focusing solely on public policy goals as the driving force in the transmission planning process would raise issues as to which policy should receive the greatest emphasis, and would cause conflict in the transmission planning process over which goals to incorporate. New Jersey Board recommends that transmission plans incorporate public policy goals in a fashion that has these projects evaluated similarly for reliability and economic purposes.

193. Some commenters generally oppose the proposal to require public policy considerations in transmission planning.[181] PSEG Companies state that the

[181] *E.g.*, PSEG Companies; First Energy Service Company; Ad Hoc Coalition of

(continued…)

Commission's public policy planning approach should not be adopted, arguing that the proposal would result in public utility transmission providers establishing an unduly preferential practice favoring renewable energy resources over other types of resources. Finally, PSEG Companies are concerned that the proposal could result in overbuilding or underbuilding the transmission grid. Ad Hoc Coalition of Southeastern Utilities asserts that there is no dependable means to translate abstract notions of public policy into the transmission planning process, except to the extent it has a bearing on transmission demand. Energy Consulting Group states that interregional planning should not be used as an instrument of public policy but should incent development of transmission improvements to afford the public access to all types of generation that is economic and minimizes its power costs. APPA believes that any transmission provider wishing to incorporate specific state policy requirements or other objectives into its transmission planning protocols should do so through case-by-case tariff filings under FPA section 205.

194. Electricity Consumers Resource Council and the Associated Industrial Groups are concerned with mandatory interjection of state public policy considerations into the transmission planning process and how, in practice, this is expected to work, given public policy differences among states, and they are concerned that the Proposed Rule delegates

---

Southeastern Utilities; National Rural Electric Coops; Southern Companies; Large Public Power Council; Nebraska Public Power District; and Long Island Power Authority.

to ISOs and RTOs the authority to impose the public policy requirements of one state on another without sufficient democratic or procedural checks and balances.

195. Some commenters agree with the proposal to coordinate identification of public policy requirements. These commenters generally state that flexibility is needed given the regional variation in: public policy objectives; types and location of resources; and regional needs, provided that transmission providers seek input from state authorities and other stakeholders.[182] MISO Transmission Owners ask that the Commission not mandate what public policy requirements must be considered, but should allow individual transmission providers to work with stakeholders to identify public policy requirements applicable to the state(s) or region in which the transmission provider is located; they also state that transmission planning regions should not be required to plan for or contribute to the costs of enabling compliance with public policy requirements enacted outside of their region without the agreement of all regions affected.

196. Some commenters agree that public utility transmission providers should be required to specify the procedures and mechanisms for evaluating transmission projects proposed to achieve public policy requirements. 26 Public Interest Organizations assert that the Commission should require all transmission providers to incorporate certain best

[182] *E.g.*, American Transmission; Atlantic Grid; Consolidated Edison and Orange & Rockland; Edison Electric Institute; Energy Consulting Group; MISO Transmission Owners; NEPOOL; New England Transmission Owners; New York Transmission Owners; and Northeast Utilities.

practices in the OATT to achieve the Commission's goal. These include: (1) minimum coordination agreement requirements for plan development; (2) required actions to assure robust participation in regional plan development by non-market participant stakeholders; and (3) minimum requirements to ensure fair and comparable consideration of all options to meet public policy requirements. Clean Energy Group states that transmission planners should be required to identify the specific public policy goals that would be considered in the planning cycle after consultation with stakeholders, including state policy makers. Additionally, it states that transmission providers should be required to disclose and document how public policy considerations were taken into account.

197. Other commenters would like flexibility in this regard. Edison Electric Institute states that the Commission should not require transmission providers to identify in their tariff each specific public policy requirement that may be taken into consideration but should allow flexibility. ISO New England and Kansas City Power & Light and KCP&L Greater Missouri similarly argue that the Commission should specify that it would not become a requirement within the tariff to list each specific public policy requirement. However, in reply, Conservation Law Foundation argues that the policies should be reflected in the OATT and asks that the Final Rule hold planning authorities responsible for applying those policies that are germane to a given process or decision. In their reply comments, Maine Parties point to MISO tariff provisions that show that ISOs and RTOs can develop tariff provisions that include criteria for identifying public policy projects,

and request that the Commission be explicit about the role it expects ISOs and RTOs to play in identifying state and federal public policies and in identifying criteria for selecting projects.

198. In response to the Commission's question regarding the use of "bright line" metrics when evaluating potential transmission projects, the majority of commenters that provided input on this issue support a flexible approach.[183] They generally agree that transmission providers should be provided flexibility to take into account the multiple reliability, economic, and public policy-based benefits a single project may provide. They express concern that projects that address reliability, economic, and public policy initiatives may not be pursued because the transmission provider may not be allowed to include the project in the regional plan because of the technical failure to meet a bright line test. AWEA notes that existing transmission planning processes that rely on bright line criteria do not accommodate well the integration of renewable resources into the grid. NRECA states that bright line metrics are unnecessary because load-serving entities' planning requirements implicitly include established public policy requirements.

199. While expressing the need for flexibility, some commenters note that the Commission should establish in the Final Rule some level of specificity as to how the

[183] *E.g.*, Anbaric and PowerBridge; Atlantic Grid; AWEA; First Wind; Integrys; National Rural Electric Coops; New Jersey Division of Rate Counsel; New York ISO; New York Transmission Owners; NextEra; Northeast Utilities; Northern Tier Transmission Group; Organization of MISO States; PJM; SPP; WECC; and Westar.

regional plan should consider projects designed to meet public policy requirements. NEPOOL suggests that the Commission grant deference to the states in a planning region with regard to how they would want public policy requirements to be considered in the context of regional planning. SPP echoes this, stating that the Commission should afford transmission providers, state regulatory commissions, and stakeholders flexibility to develop strategies and metrics that appropriately consider the needs and reflect the existing structure of the transmission system in the region. First Wind recognizes that certain public policy considerations could require a bright line metric to ensure they be included in a regional plan, while others could be more general and flexible.

200. Others, however, argue that bright line metrics are necessary to avoid discrimination in the transmission planning process.[184] City and County of San Francisco and LS Power both assert that removing bright line criteria would lead to unfair results. City and County of San Francisco assert that without bright line criteria, end-users could be penalized because of different cost allocation methods associated with each distinct

[184] *E.g.*, City and County of San Francisco; LS Power; New Jersey Division of Rate Counsel; and Western Independent Transmission Group.

criterion.

201. Some commenters support a balanced approach of using both bright line and flexible metrics. While Organization of MISO States cautions against the establishment of rigid bright line metrics, it notes that an overly flexible approach could allow for higher cost projects than are actually needed. It states that the Commission should seek a reasonable balance by ordering transmission planners to start with defined criteria and then look further into more flexible options that could provide an optimal solution to a number of perceived needs. Dominion states that both flexible and bright line criteria may be needed for some multi-purpose projects. Dominion explains that the benefit of reliability projects must be assessed against bright line criteria. However, when considering other benefits, Dominion states that more flexibility is needed. Minnesota PUC and Minnesota Office of Energy Security recommend that bright line metrics be

used as a first pass in the transmission planning process, but more flexible criteria could be used to assess each project further.

202. Finally, there are some commenters that argue that the Commission's proposal may lead to undesirable outcomes. Large Public Power Council states that requiring each public utility transmission provider to coordinate with customers and other stakeholders to identify relevant state and federal laws and regulations would be unnecessary, potentially confusing, and ultimately counterproductive. Long Island Power Authority

states that the Proposed Rule did not identify how a regional transmission planning group encompassing multiple states is to decide which state's "public policy requirements" must be satisfied through the transmission planning process. It expresses concern that the apparent default solution of incorporating every state's public policy requirements into the transmission planning process to the extent feasible, may distort the transmission planning process, lead to over-construction of transmission facilities and consequently increase the costs to be allocated. Nebraska Public Power District states that the discretion that this approach would interject into the transmission planning process would seem to be an open door to potential discrimination, and a nightmare to enforce, as parties debate whether planning adequately responds to a variety of potentially competing policies.

c. Commission Determination

203. The Commission requires public utility transmission providers to amend their OATTs to describe procedures that provide for the consideration of transmission needs driven by Public Policy Requirements in the local and regional transmission planning processes.[185] As discussed in section II above, the reforms adopted below are intended to ensure that the local and regional transmission planning processes support the

[185] To the extent public utility transmission providers within a region do not engage in local transmission planning, such as in some ISO/RTO regions, the requirements of this Final Rule with regard to Public Policy Requirements apply only to the regional transmission planning process.

development of more efficient or cost-effective transmission facilities to meet the transmission needs driven by Public Policy Requirements, which will help ensure that the rates, terms and conditions of jurisdictional service are just and reasonable. Moreover, these reforms will remedy opportunities for undue discrimination by requiring public utility transmission providers to have in place processes that provide all stakeholders the opportunity to provide input into what they believe are transmission needs driven by Public Policy Requirements, rather than the public utility transmission provider planning only for its own needs or the needs of its native load customers. Our decision here to require transmission planning to include the consideration of transmission needs driven by Public Policy Requirements is supported by the numerous commenters who generally agree with the proposed reforms.[186]

[186] *E.g.*, Allegheny Energy Companies; American Transmission; Anbaric and PowerBridge; Arizona Corporation Commission; Arizona Public Service Company; Atlantic Grid; AWEA; California Commissions; California ISO; Clean Energy Group; Connecticut & Rhode Island Commissions; Consolidated Edison and Orange & Rockland; DC Energy; Delaware PSC; Dominion; Duke; Duquesne Light Company; EarthJustice; Exelon; First Wind; Iberdrola Renewables; Integrys; ISO New England; ISO/RTO Council; Maine PUC; Massachusetts Departments; Massachusetts Municipal and New Hampshire Electric; MISO; MISO Transmission Owners; National Audubon Society; National Grid; New England States' Committee on Electricity; New Jersey Board; New Jersey Division of Rate Counsel; New York PSC; NextEra; Northeast Utilities; Northern Tier Transmission Group; Ohio Consumers' Counsel and West Virginia Consumer Advocate Division; Old Dominion; Pacific Gas & Electric; Pattern Transmission; Pennsylvania PUC; PHI Companies; PJM; PUC of Nevada; San Diego Gas & Electric; Southern California Edison; Sunflower and Mid-Kansas; Transmission Dependent Utility Systems; Transmission Access Policy Study Group; Transmission

(continued…)

204. Under the existing requirements of Order No. 890, there is no affirmative obligation placed on public utility transmission providers to consider in the transmission planning process the effect that Public Policy Requirements may have on local and regional transmission needs.[187] We agree with the concerns of many commenters that, without having in place procedures to consider transmission needs driven by Public Policy Requirements, the needs of wholesale customers may not be accurately identified.[188] While we understand that some public utility transmission providers already do have processes in place to determine whether transmission needs reflect Public Policy Requirements, others do not. We correct this deficiency through the requirements below, which are intended to enhance, rather than replace, existing transmission planning obligations under Order No. 890. Moreover, as with other reforms adopted in this Final Rule, these requirements are intended to be an additional set of minimum obligations for public utility transmission providers and are not intended to preclude additional transmission planning related activities.

205. In response to commenters seeking greater clarity as to how transmission needs

---

Agency of Northern California; Western Grid Group; and Wind Coalition.

[187] In response to Transmission Dependent Utility Systems, we note that nothing in the existing *pro forma* OATT affirmatively prohibits consideration of the effect of Public Policy Requirements on transmission needs.

[188] *E.g.*, National Grid; NextEra; AWEA; Atlantic Grid; Delaware PSC; Anbaric and PowerBridge; and Conservation Law Foundation.

driven by Public Policy Requirements must be considered by public utility transmission providers, we clarify that by considering transmission needs driven by Public Policy Requirements, we mean: (1) the identification of transmission needs driven by Public Policy Requirements; and (2) the evaluation of potential solutions to meet those needs. We therefore direct public utility transmission providers to amend their OATTs to describe the procedures by which transmission needs driven by Public Policy Requirements will be identified in the local and regional transmission planning processes and how potential solutions to the identified transmission needs will be evaluated in the local and regional transmission planning processes. We discuss each of these requirements in turn.

206. First, public utility transmission providers must establish, in consultation with stakeholders, procedures under which public utility transmission providers and stakeholders will identify those transmission needs driven by Public Policy Requirements for which potential transmission solutions will be evaluated. Various commenters express concern that a public utility transmission provider should not have an open-ended obligation to undertake costly and time-consuming studies to evaluate the potential impact that every Public Policy Requirement might have on transmission development. As noted by Connecticut & Rhode Island Commissions, for example, entities subject to particular requirements may intend to meet them in ways that do not involve the planning of transmission within the local or regional transmission planning processes. In other

circumstances, there may be disagreement among the various entities subject to competing Public Policy Requirements as to whether it is appropriate to consider the impact of complying with those laws and regulations in the transmission planning process.

207. We do not in this Final Rule require the identification of any particular transmission need driven by any particular Public Policy Requirements. Instead, we require each public utility transmission provider to establish procedures for identifying those transmission needs driven by Public Policy Requirements for which potential transmission solutions will be evaluated in the local or regional transmission planning processes. As part of the process for identifying transmission needs driven by Public Policy Requirements, such procedures must allow stakeholders an opportunity to provide input, and offer proposals regarding the transmission needs they believe are driven by Public Policy Requirements. To the extent such procedures identify no transmission needs driven by a Public Policy Requirement, the relevant public utility transmission providers are under no obligation to evaluate potential transmission solutions.

208. We allow for local and regional flexibility in designing the procedures for identifying the transmission needs driven by Public Policy Requirements for which potential solutions will be evaluated in the local or regional transmission planning processes. The effects of Public Policy Requirements on transmission needs are highly variable based on geography, existing resources, and transmission constraints. We

therefore conclude that it is appropriate to require public utility transmission providers, in consultation with their stakeholders, to design the appropriate procedures for identifying and evaluating the transmission needs that are driven by Public Policy Requirements in their area, subject to our review on compliance. At a minimum, however, we require that all such procedures allow for input from stakeholders, including but not limited to those responsible for complying with the Public Policy Requirement(s) at issue and developers of potential transmission facilities that are needed to comply with one or more Public Policy Requirements.

209. We decline to require that transmission needs driven by Public Policy Requirements be identified by a particular entity or subset of stakeholders. However, all stakeholders must have an opportunity to provide input and offer proposals regarding the transmission needs they believe should be so identified, as discussed above. In other words, while the procedures adopted by public utility transmission providers in response to this Final Rule must allow all stakeholders to bring forth any transmission needs they believe are driven by Public Policy Requirements, those procedures must also establish a just and reasonable and not unduly discriminatory process through which public utility transmission providers will identify, out of this larger set of needs, those needs for which transmission solutions will be evaluated. Some public utility transmission providers might conclude, in consultation with stakeholders, to develop procedures that rely on a committee of load-serving entities, a committee of state regulators, or a stakeholder group

to identify those transmission needs for which potential solutions will be evaluated in the transmission planning processes.[189] Another example would be the case where a public utility transmission provider identifies such transmission needs itself on behalf of its customers, following consultation with stakeholders, including participating state regulators. However, to ensure that requests to include transmission needs are reviewed in a fair and non-discriminatory manner, we require public utility transmission providers to post on their websites an explanation of which transmission needs driven by Public Policy Requirements will be evaluated for potential solutions in the local or regional transmission planning process, as well as an explanation of why other suggested transmission needs will not be evaluated. We conclude that this posting requirement is necessary to provide the Commission and interested parties with information as to how the identification procedures are implemented by public utility transmission providers.

210. We decline in this Final Rule to require the identification of any particular set of transmission needs driven by any particular Public Policy Requirements in the local and regional transmission planning processes of public utility transmission providers. To the extent that implementation of the procedures required here results in a suggested

[189] As noted below, we strongly encourage states to participate actively in the identification of transmission needs driven by Public Policy Requirements. Public utility transmission providers, for example, could rely on committees of state regulators or, with appropriate approval from Congress, compacts between interested states to identify transmission needs driven by Public Policy Requirements for the public utility transmission providers to evaluate in the transmission planning process.

transmission need not being evaluated for potential solutions in the local or regional transmission planning process, the relevant public utility transmission provider(s) are under no obligation under this Final Rule to evaluate the potential effect of the associated Public Policy Requirement on transmission development. This includes proposals to evaluate the need for particular transmission facilities proposed by transmission developers to comply with Public Policy Requirements. While these entities may continue to offer their proposed transmission facilities in the local or regional transmission planning process as a potential solution to transmission needs, such proposals would not be evaluated in the transmission planning process as driven by a Public Policy Requirement.

211. With regard to the evaluation of potential solutions to the identified transmission needs driven by Public Policy Requirements, we again leave to public utility transmission providers to determine, in consultation with stakeholders, the procedures for how such evaluations will be undertaken, subject to the Commission's review on compliance and with the objective of meeting the identified transmission needs more efficiently and cost-effectively. [190] As noted in our discussion of regional transmission planning in section

[190] To the extent a public utility transmission provider determines that existing provisions of its OATT must be amended in order to implement its evaluation process, it may include such tariff revisions in its compliance filing. For example, evaluation of transmission needs driven by a particular Public Policy Requirement could require the gathering of additional information from interconnected generators regarding retirements

(continued…)

III.A above, there are many ways potential upgrades to the transmission system can be evaluated, ranging from the use of scenario analyses to production cost or power flow simulations. At a minimum, however, this process must include the evaluation of proposals by stakeholders for transmission facilities proposed to satisfy an identified transmission need driven by Public Policy Requirements.[191] However, as with any proposed solution offered in the local or regional transmission planning processes for transmission needs driven by reliability issues or economic considerations, there is no assurance that any proposed transmission facility will be found to be an efficient or cost-effective solution to meet local or regional needs.

212. In response to commenters that urge us to recognize the role of the states in transmission planning, especially as it relates to compliance with Public Policy Requirements, we clarify that nothing in this Final Rule is intended to alter the role of states in that regard. Through this Final Rule, we are requiring public utility transmission providers to provide an opportunity to all stakeholders, including state regulatory authorities, to provide input on those transmission needs they believe are driven by Public Policy Requirements, to the extent they are not already doing so. We are not dictating

---

or from network customers regarding resource preferences.

[191] This requirement is consistent with the existing requirements of Order Nos. 890 and 890-A which permit sponsors of transmission and non-transmission solutions to propose alternatives to identified needs. *See supra* note 149.

any substantive result with regard to compliance with Public Policy Requirements. In Order No. 890, the Commission stated its expectation that "all transmission providers will respect states' concerns" when engaging in the regional transmission planning process.[192] This is equally true with regard to the consideration of transmission needs driven by Public Policy Requirements. We strongly encourage states to participate actively in both the identification of transmission needs driven by Public Policy Requirements and the evaluation of potential solutions to the identified needs.

213. We therefore do not believe our reforms are inconsistent with state authority with respect to integrated resource planning, as suggested by some commenters. Indeed, we believe that the requirements imposed herein complement state efforts by helping to ensure that potential solutions to identified transmission needs driven by Public Policy Requirements of the states can be evaluated in local and regional transmission planning processes. To be clear, however, while a public utility transmission provider is required under this Final Rule to evaluate in its local and regional transmission planning processes those identified transmission needs driven by Public Policy Requirements, that obligation does not establish an independent requirement to satisfy such Public Policy Requirements. In other words, the requirements established herein do not convert a failure of a public utility transmission provider to comply with a Public Policy

[192] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 574.

Requirement established under state law into a violation of its OATT.

214. We do not require public utility transmission providers to consider in the local and regional transmission planning processes any transmission needs that go beyond those driven by state or federal laws or regulations or to specify additional public policy principles or public policy objectives as some commenters have suggested. Based on the record before us, we believe it is sufficient to ensure just and reasonable rates and to avoid the potential for undue discrimination to restrict the requirement for public policy consideration to state or federal laws or regulations that drive transmission needs. Likewise, we will not require restrictions on the type or number of Public Policy Requirements to be considered as long as any such requirements arise from state or federal laws or regulations that drive transmission needs and as long as the requirements of the procedures required herein are met.

215. Some commenters request that we specify EPA regulations or FPA section 217 as Public Policy Requirements driving potential transmission needs relevant for consideration in the transmission planning process. While we decline to mandate the consideration of transmission needs driven by any particular Public Policy Requirement, we intend that the procedures required above be flexible enough to allow for stakeholders to suggest consideration of transmissions needs driven by any Public Policy Requirement, including potential consideration of requirements under EPA regulations, FPA section 217, or any other federal or state law or regulation that drive transmission needs.

Because we are not mandating the consideration of any particular transmission need driven by a Public Policy Requirement, we disagree with PSEG Companies that we are favoring renewable energy resources over other types of resources.

216. We reiterate here and clarify a statement of the Proposed Rule that generated significant comment; that is, this Final Rule does not preclude any public utility transmission provider from considering in its transmission planning process transmission needs driven by additional public policy objectives not specifically required by state or federal laws or regulations.[193] By providing this clarification, we are neither affirmatively granting new rights to nor imposing an obligation on a public utility transmission provider. Instead, the statement is a recognition that a public utility transmission provider has, and has always had, the ability to plan for any transmission system needs that it foresees. Our recognition of this ability is not intended to limit or expand in any way the option that a public utility transmission provider has always had to plan for facilities that it believes are needed if it chooses to do so. We believe that public utility transmission providers, in consultation with stakeholders, are in the best position to determine whether to consider in a transmission planning process any public policy

[193] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 64. For example, a public utility transmission provider and its stakeholders are not precluded under this Final Rule from choosing to plan for state public policy goals that have not yet been codified into state law, which they nonetheless consider to be important long-term planning considerations.

objectives beyond those required by this Final Rule. We reiterate that this Final Rule creates no obligation for any public utility transmission provider or its transmission planning processes to consider transmission needs driven by a public policy objective that is not specifically required by state or federal laws or regulations. If public utility transmission providers, in consultation with stakeholders, do identify public policy objectives not specifically required by state or federal laws or regulations, we note that transmission facilities designed to meet these objectives may be eligible for cost allocation under the transmission planning process.

217. We note that identifying a set of transmission needs and projects for inclusion in a transmission planning study does not ensure that any particular transmission project will be in the regional transmission plan. Alternative solutions to the identified needs may prove better from cost, siting, or other perspectives. Similarly, elimination of a transmission project or need from the transmission planning process would not prevent any planner or developer from independently seeking to satisfy the need or develop the transmission project, but any resulting transmission facility would not be eligible for cost allocation under a regional cost allocation method or methods required under this Final Rule.

218. Some commenters have expressed concerns that the consideration of transmission needs driven by Public Policy Requirements in the transmission planning process will result in costs being assigned to regions that do not benefit from those requirements or to

regions that did not create the need for new transmission. We understand these commenters to be concerned that a requirement to consider transmission needs driven by Public Policy Requirements in the local and regional transmission planning processes will result in cross-subsidization of the costs of meeting Public Policy Requirements.

219. We clarify that any such consideration of transmission needs driven by Public Policy Requirements, to the extent that it results in new transmission costs, must follow the cost allocation principles discussed separately herein.[194] Particularly, the costs of new transmission facilities allocated within the planning region must be allocated within the region in a manner that is at least roughly commensurate with estimated benefits. [195] Those that receive no benefit from new transmission facilities, either at present or in a likely future scenario, must not be involuntarily allocated any of the costs of those facilities. That is, a utility or other entity that receives no benefit from transmission facilities, either at present or in a likely future scenario, must not be involuntarily allocated any of the costs of those facilities.

220. Further, we are not requiring that a separate class of transmission projects be created in the transmission planning process related to compliance with Public Policy

[194] *See* discussion *infra* section IV.

[195] *See* discussion *infra* section IV.E.2.

Requirements, although nothing in this Final Rule prohibits the development of a separate class of transmission projects if the public utility transmission provider and its stakeholders believe that it is appropriate to do so. Some public utility transmission providers might comply with this Final Rule by implementing procedures to consider transmission needs driven by Public Policy Requirements separately from transmission addressing reliability needs or economic considerations. Other public utility transmission providers might comply with this Final Rule by identifying and evaluating all transmission needs, whether driven by Public Policy Requirements, compliance with reliability criteria, or economic considerations. While we provide flexibility for public utility transmission providers to develop procedures appropriate for their local and regional transmission planning processes, we reiterate that all stakeholders must be provided an opportunity to provide input during the identification of transmission needs driven by Public Policy Requirements and the evaluation of potential solutions to the identified needs, as discussed above.

221. In response to Northern Tier Transmission Group, we understand that a public utility transmission provider with a native load obligation may already have addressed compliance with Public Policy Requirements in developing its resource assumptions to be used in the transmission planning process. In such circumstances, the procedures used to identify transmission needs driven by Public Policy Requirements should take that into account. Similarly, the evaluation of potential solutions to those transmission needs

identified in a local or regional transmission planning process should reflect the resource decisions of the transmission planning process.

222. The Proposed Rule stated that, if a public utility transmission provider believes that its existing transmission planning process already meets the requirements to consider Public Policy Requirements, then it may make that demonstration in compliance with the Final Rule.[196] Certain commenters question the need for these requirements altogether because they assert they are already obligated to follow all state or federal laws or regulations, including laws or regulations related to public policy objectives. Other commenters, particularly those in ISO and RTO regions, assert that the transmission planning processes administered by those entities already address public policy issues so their compliance obligation should be minimal. In this Final Rule, the Commission is expanding the requirements of the *pro forma* OATT to require that transmission planning processes affirmatively consider transmission needs driven by Public Policy Requirements. Each public utility transmission provider will have the opportunity to demonstrate compliance with these requirements by specifying the procedures in its local and regional transmission planning processes, whether existing or new, for identifying transmission needs driven by Public Policy Requirements and for evaluating potential solutions to meet those identified needs. As with other requirements of this Final Rule,

[196] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 66.

we decline here to prejudge any compliance filings or predetermine whether any public utility transmission provider may already be in compliance.

223. Finally, we considered the many comments on whether it is more appropriate to use flexible criteria in lieu of "bright line" metrics when determining which transmission projects are in the regional transmission plan. While we have in the past required adoption of a formulaic approach to applying such metrics,[197] we sought comment on this issue in the Proposed Rule to gain insight as to whether such a formulaic approach was appropriate or if providing additional flexibility was a more effective approach. Our review of the comments suggests that most commenters prefer flexible planning criteria for identifying transmission needs not only driven by Public Policy Requirements and evaluation of solutions to those identified needs, but also for the identification and evaluation of transmission needs related to reliability issues and economic considerations as well.[198] These commenters have convinced us that, although there are benefits to each kind of planning criteria, there is merit in allowing for flexible planning criteria to mitigate the possibility that bright line metrics may exclude certain transmission projects from long-term transmission planning.

224. Hence, we will permit public utility transmission providers to include within their

[197] *See, e.g.*, *PJM Interconnection, L.L.C.*, 119 FERC ¶ 61,265 (2007).

[198] *E.g.*, AWEA; PJM; New York ISO; SPP; WECC; and Westar.

compliance filings in response to this Final Rule any tariff revisions they believe necessary to implement flexible transmission planning criteria, including changes to existing bright line criteria. This could include procedures to address alternating inclusion and exclusion of a single transmission project in a regional transmission plan over successive planning cycles. Because such tariff revisions will be included as part of the compliance filings in response to this Final Rule, they will be submitted pursuant to section 206 of the FPA rather than under section 205. However, those with existing bright line criteria are not required to make this change if they do not wish to do so. As we evaluate the compliance filings to this Final Rule, we also will evaluate both bright line and flexible criteria for whether they permit unjust and unreasonable rates or undue discrimination through planning criteria and whether they will ensure fair consideration of transmission needs driven by Public Policy Requirements as well as by reliability needs and economic considerations.

B. Nonincumbent Transmission Developers

225. This part of the Final Rule addresses the removal from Commission-jurisdictional tariffs and agreements of provisions that grant a federal right of first refusal to construct transmission facilities selected in a regional transmission plan for purposes of cost allocation. To implement the elimination of such rights, we adopt below a framework that requires the development of qualification criteria and protocols to govern the submission and evaluation of proposals for transmission facilities to be evaluated in the

regional transmission planning process. We further require that any nonincumbent developer of a transmission facility selected in the regional transmission plan have an opportunity comparable to that of an incumbent transmission developer to allocate the cost of such transmission facility through a regional cost allocation method or methods. For purposes of this Final Rule, "nonincumbent transmission developer" refers to two categories of transmission developer: (1) a transmission developer that does not have a retail distribution service territory or footprint; and (2) a public utility transmission provider that proposes a transmission project outside of its existing retail distribution service territory or footprint, where it is not the incumbent for purposes of that project. By contrast, and as we explained in the Proposed Rule, an "incumbent transmission developer/provider" is an entity that develops a transmission project within its own retail distribution service territory or footprint.[199]

226. We conclude these reforms are necessary in order to eliminate practices that have the potential to undermine the identification and evaluation of more efficient or cost-effective alternatives to regional transmission needs, which in turn can result in rates for Commission-jurisdictional services that are unjust and unreasonable, or otherwise result in undue discrimination by public utility transmission providers. As discussed in detail below, our focus here is on the set of transmission facilities that are evaluated at the

[199] *See* Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at n.23.

regional level and selected in the regional transmission plan for purposes of cost allocation, and not on transmission facilities included in local transmission plans that are merely "rolled up" and listed in a regional transmission plan without going through a needs analysis at the regional level (and therefore, not eligible for regional cost allocation). Similarly, our reforms are not intended to affect the right of an incumbent transmission provider to build, own and recover costs for upgrades to its own transmission facilities, nor to alter an incumbent transmission provider's use and control of an existing right of way.

227. In developing the framework below, we have sought to provide flexibility for public utility transmission providers in each region to propose, in consultation with stakeholders, how best to address participation by nonincumbents as a result of removal of the federal right of first refusal from Commission-jurisdictional tariffs and agreements. However, we note that nothing in this Final Rule is intended to limit, preempt, or otherwise affect state or local laws or regulations with respect to construction of transmission facilities, including but not limited to authority over siting or permitting of transmission facilities. Public utility transmission providers must establish this framework in consultation with stakeholders and we encourage stakeholders to fully participate.

1. Need for Reform Concerning Nonincumbent Transmission Developers

a. Commission Proposal

228. As discussed above, Order No. 890 sought to reduce opportunities for undue discrimination and preference in the provision of transmission service. With regard to the transmission planning process, the Commission established nine transmission planning principles to prevent undue discrimination. However, Order No. 890 did not specifically address the potential for, or effect of, undue preference to incumbent utilities over nonincumbent transmission developers through practices applied within transmission planning processes. The Commission observed in the October 2009 Notice[200] that, as a result of existing practices in some areas, a nonincumbent transmission developer may lose the opportunity to construct its proposed transmission project to the incumbent transmission owner if that owner has a federal right of first refusal to construct any transmission facility in its service territory. The October 2009 Notice sought comment whether such a federal right of first refusal for incumbent transmission owners unreasonably impedes the development of merchant and independent transmission and, if so, how that impediment could be addressed.

229. Based on the comments received, the Commission determined that if a regional

[200] Federal Energy Regulatory Commission, Notice of Request for Comments; Transmission Planning Processes under Order No. 890; Docket No. AD09-8-000, October 8, 2009 (October 2009 Notice).

transmission planning process does not consider and evaluate transmission projects proposed by nonincumbents that regional transmission planning process cannot meet the Order No. 890 transmission planning principle of being "open." Moreover, the Commission stated that such regional planning process may not result in a cost-effective solution to regional transmission needs, and transmission projects in a regional transmission plan therefore may be developed at a higher cost than necessary.[201] As a result, regional transmission services may be provided at rates, terms and conditions that are not just and reasonable. In addition, the Commission determined in the Proposed Rule that there appeared to be opportunities for undue discrimination and preferential treatment against nonincumbent transmission developers within existing regional transmission planning processes. The Commission explained that, where an incumbent transmission owner has a federal right of first refusal, a nonincumbent transmission developer risks losing its investment to develop a transmission project that it proposed in the regional transmission planning process, even if the transmission project that the nonincumbent transmission developer proposed is in a regional transmission plan. The Commission noted that nonincumbent transmission developers may be less likely to participate in the regional transmission planning process under these circumstances.

230. To address these issues, the Commission proposed to reform provisions in public

[201] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 87-88.

utility transmission providers' OATTs or other agreements subject to the Commission's jurisdiction that establish a federal right of first refusal for an incumbent transmission provider with respect to transmission facilities that are in a regional transmission plan.

b. Comments

231. A number of commenters support the Commission's proposal to address federal rights of first refusal in Commission-jurisdictional tariffs and agreements.[202] For example, Federal Trade Commission states that the existence of a federal right of first refusal in jurisdictional tariffs and agreements reduces capital investment opportunities for potential nonincumbent developers by increasing their risk, encourages free ridership among incumbent developers, and creates a barrier to entry. A number of state utility commissions and consumer advocates agree, arguing that such provisions impede transmission development and that removing the provisions would provide a level

[202] *E.g.*, Federal Trade Commission; American Antitrust Institute; Ohio Consumers' Counsel and West Virginia Consumer Advocate Division; American Forest & Paper; DC Energy; Elmer John Tompkins; EIF Management; 26 Public Interest Organizations; and Boundless Energy; Pennsylvania PUC; Connecticut & Rhode Island Commissions; Northern California Power Agency; Eastern Massachusetts Consumer-Owned System; and Transmission Dependent Utility Systems; Arizona Corporation Commission; New Jersey Board; and California PUC; NextEra; AWEA; Anbaric and PowerBridge; Clean Line; LS Power; Northwest & Intermountain Power Producers Coalition; Pattern Transmission; FirstWind; Green Energy and 21st Century; Colorado Independent Energy Association; Enbridge; Primary Power; and Western Independent Transmission Group.

playing field for incumbent and nonincumbent transmission developers.[203]

232. For example, California Department of Water Resources states that competition among transmission providers that promotes efficiencies and innovation should be supported in regulatory policy and transmission planning. New Jersey Board, Connecticut & Rhode Island Commissions and Massachusetts Departments support the proposal to remove a federal right of first refusal, also stating that competition among project sponsors will result in lower cost approaches to meeting system needs. They caution, however, that equal rights must be followed by equal responsibilities and obligations at the federal, regional, state and local level. New England States Committee on Electricity contends that increased competition about which entity will build transmission facilities could help improve cost controls over time. Pennsylvania PUC supports the proposal to eliminate undue discrimination against nonincumbent transmission developers and the attempt to eliminate some of the barriers to full participation by nonincumbent transmission developers. Pennsylvania PUC cautions the Commission, however, to continue to respect Pennsylvania PUC's statutory responsibility to review and approve the siting of transmission projects located in Pennsylvania. Ohio Commission agrees that eliminating rights of first refusal has merit

[203] *E.g.*, Arizona Corporation Commission; Connecticut & Rhode Island Commissions; New England States Committee on Electricity; New Jersey Board; Massachusetts Departments; Ohio Consumers Counsel; Pennsylvania PUC; and West Virginia Consumer Advocate.

to the extent that parameters are established to ensure that ratepayers see cost savings and enhanced reliability. Ohio Consumers' Counsel and West Virginia Consumer Advocate Counsel state that eliminating barriers to participation can encourage additional transmission development that could be constructed at lower cost to consumers. Arizona Corporation Commission supports the removal of rights of first refusal, but states that it does not see this as having an impact on an incumbent utility's obligations to serve or affecting the transmission planning process currently utilized in Arizona.

233. Some commenters representing transmission-dependent and municipal utilities express support for the Commission's proposal.[204] Transmission Dependent Utility Systems state that a right of first refusal can prevent or delay construction of needed transmission facilities proposed by nonincumbent transmission developers and also can be used to block transmission access for generation resources that are not associated with the incumbent transmission provider. Northern California Power Agency states that any entity, whether an investor-owned utility, municipal entity, or independent developer, should have the right to propose, construct, and own transmission projects, subject to minimum safety and reliability requirements. Eastern Massachusetts Consumer-Owned System states that eliminating the right of first refusal should help open the door to

[204] *E.g.*, Eastern Massachusetts Consumer-Owned System; Northern California Power Agency; Transmission Agency of Northern California; and Transmission Dependent Utility Systems.

municipal utility participation in transmission ownership on a larger scale.

234. Others supporting the proposal include entities representing independent developers of transmission and generation.[205] NextEra states that allowing the right of first refusal to continue would impede development of innovative transmission solutions in that a transmission project is unlikely to advance very far if its developer cannot be confident that it can see the transmission project to its completion. Clean Line supports the elimination of the right of first refusal and states that encouraging the participation of nonincumbent transmission developers in the regional transmission planning process would increase competition and expand development, which can ultimately lead to lower costs for ratepayers. LS Power states that a right of first refusal and all other discriminatory rules should be eliminated from transmission planning processes inside and outside of RTOs and ISOs.[206] Pattern Transmission states that rights of first refusal and similar preferences favoring incumbent transmission owners do not result in transmission rates that are just and reasonable, are inherently preferential and unduly discriminatory, and suggests that the right of first refusal allows incumbent transmission

[205] *E.g.*, NextEra; AWEA; Anbaric and PowerBridge; Clean Line; LS Power; Northwest & Intermountain Power Producers Coalition; Pattern Transmission; FirstWind; Green Energy and 21st Century; Colorado Independent Energy Association; Enbridge; Primary Power; and Western Independent Transmission Group.

[206] LS Power citing *Primary Power, LLC,* 131 FERC ¶ 61,015 (2010) (*reh'g pending*); *Central Transmission, LLC v. PJM Interconnection L.L.C.*, 131 FERC ¶ 61,243 (2010).

owners to engage in gaming. Primary Power contends that removing a right of first refusal from all Commission-jurisdictional tariffs and agreements would provide an opportunity for a wider variety of technical and financial resources to participate in transmission infrastructure development. Western Independent Transmission Group contends that the ability of incumbent transmission owners to construct transmission projects proposed by other transmission developers under a right of first refusal is equivalent to the seizure of intellectual property.

235. Some commenters cite to examples that they believe show the benefits of removing barriers to competition by nonincumbent transmission developers. For example, Western Independent Transmission Group points to the success of Texas's Competitive Renewable Energy Zone planning process in supporting transmission development by nonincumbent developers. Also, Western Independent Transmission Group points to the Trans Bay Cable, Neptune, and Cross Sound Cable transmission projects, which were developed by nonincumbent transmission developers. Pattern Transmission cites the benefits associated with increased competition in the telecommunications and railroad industries, arguing that comparable benefits are available in the electric industry.

236. Some commenters supporting the Commission proposal argue that the record in this proceeding is sufficient to support taking action at this time. Primary Power states that Commission is "not required to make specific findings so long as the agency's

factual determinations are reasonable."[207] LS Power states that the Commission has legal authority to address discrimination against prospective transmission owners, it has a substantial record that rights of first refusal are unreasonable and result in undue discrimination, thus satisfying the *National Fuel* standard.

237. Commenters supporting the Proposed Rule generally contend that the elimination of rights of first refusal in Commission-jurisdictional tariffs and agreements would not be in conflict with the responsibilities of incumbent transmission providers, such as the obligation imposed under RTO and ISO membership agreements to build transmission facilities identified as needed in regional transmission plans.[208] These commenters state that, to the extent that an incumbent transmission owner feels unreasonably burdened by its obligations to build, a nonincumbent transmission developer would welcome the opportunity to respond to competitive solicitations to build the obligatory transmission projects. Such commenters further note that, as independent transmission developers build transmission projects and become transmission owners themselves, they also may be subject to appropriate obligations to build adjacent or connecting transmission

[207] Primary Power cites to *Transmission Access Policy Study Group v. FERC*, 225 F.3d 667, 688 (D.C. Cir. 2000).

[208] *E.g.*, Anbaric and PowerBridge; Green Energy and 21st Century; LS Power; Northwest & Intermountain Power Producers Coalition; Pattern Transmission; Primary Power; Transmission Agency of Northern California; and Western Independent Transmission Group.

facilities. Northwest & Intermountain Power Producers Coalition states that an incumbent's service obligation would come into play only if no alternative proposal is available to meet the identified need and that, where better alternatives are identified in the planning process, there is no good reason to prevent the better alternative from being constructed merely because the incumbent has an obligation to construct where a better alternative does not exist. Western Independent Transmission Group suggests that the obligation to build is a benefit, not a burden, because an incumbent transmission developer that constructs a transmission project pursuant to an obligation will receive full cost-of-service recovery, including a fair rate of return on its investment.

238. Others urge the Commission to provide thoughtful consideration to the potential impacts of its proposal.[209] Energy Future Coalition states that, while a right of first refusal should not give incumbent utilities the ability to block or stall construction of needed infrastructure within their service territories, or to inflate the costs of such projects, transmission goals will be frustrated if elimination of such provisions bogs down the transmission planning process. New England Transmission Owners state that, before taking action to eliminate any right of first refusal, the Commission should consider the unique way in which transmission projects are identified for development, the success of the current planning process, and the unique characteristics of the New

[209] *E.g.*, Energy Future Coalition; New England Transmission Owners; and MidAmerican.

England system that make the current process appropriate for this region. National Rural Electric Coops suggest that, prior to proceeding with the proposed reforms, the Commission consider adoption of principles to allow load-serving entities to participate in projects developed by traditional and independent transmission providers and to have the right to acquire an ownership participation in any project that it built within their service territories.

239. A number of commenters oppose any alteration of rights of first refusal in Commission-jurisdictional tariffs and agreements, arguing that there is insufficient evidence to justify removal of the right of first refusal.[210] Edison Electric Institute states that, on the contrary, there has been substantial evidence submitted to the Commission that a right of first refusal benefits consumers and results in lower rates, evidence that the Commission has not sought to rebut. Southern California Edison alleges that the Commission provides nothing more than speculative and vague statements that a right of first refusal may preclude nonincumbent transmission developers from participating in the regional transmission planning process and, in turn, affect rates for transmission service. ITC Companies contend that a right of first refusal is not the primary barrier to new market entrants and that they see no impediment to nonincumbent transmission

[210] *E.g.*, California ISO; SPP; CapX2020 Utilities; Edison Electric Institute; Southern California Edison; Indianapolis Power & Light; ITC Companies; MidAmerican; Oklahoma Gas & Electric; PSEG Companies Comments; and San Diego Gas & Electric.

developers pursuing development opportunities through a partnership model whereby right of first refusal rights are delegated. Oklahoma Gas & Electric notes that a number of transmission-only companies have announced significant transmission projects in SPP and, joined by MISO Transmission Owners, argues that it is premature for the Commission to determine that further reforms are needed to further encourage development.

240. Citing *National Fuel*,[211] some commenters argue that the Commission points to no evidence of actual discrimination or adverse impact on rates and that it must identify something more than theoretical possibilities to justify elimination of federal rights of first refusal.[212] Indicated PJM Transmission Owners assert that, if the Commission intends to rely solely on the effects of potential discrimination, in the absence of evidence of abuse, it must explain why the historical right of incumbent transmission owners to construct additions in their service territories so endangers open access to transmission service at just and reasonable rates as to justify a complete rearrangement of the relationship between public utilities, state regulators, and ultimate customers. MISO

[211] *National Fuel*, 468 F.3d 831.

[212] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Edison Electric Institute; Indicated PJM Transmission Owners; Large Public Power Council; MidAmerican; MISO Transmission Owners; Oklahoma Gas & Electric; PSEG Companies; Salt River Project; and San Diego Gas & Electric. Large Public Power Council also cites to *Associated Gas Distributors*.

Transmission Owners state that the Proposed Rule fails to demonstrate why the existing complaint procedures under section 206 do not protect third parties from such theoretical harm.

241. Many of these commenters argue that preserving a federal right of incumbent transmission owners to build within their service territories is the best method to achieve the Commission's overall transmission goals. Such commenters contend that incumbent transmission owners are better situated to build new transmission facilities.[213] For example, Oklahoma Gas & Electric argues that incumbent transmission owners are often in the best position to determine where new transmission is needed on their system. CapX2020 Utilities and MidAmerican state that load serving transmission providers have a long history and relationship with state regulatory bodies that brings value to getting needed transmission developed. Ad Hoc Coalition of Southeastern Utilities and Southern Companies contend that incumbent transmission owners are better situated to obtain any necessary approval from state regulators to recover the cost of transmission facilities through bundled retail tariffs and that nonincumbent developers may have no obligation or ability to do so, depriving the state of an opportunity to determine that the proposal is the most reliable and cost-effective alternative. Ad Hoc Coalition of Southern Utilities

[213] *E.g.*, PJM; CapX2020 Utilities; Edison Electric Institute; Georgia Transmission Corporation; MidAmerican; Omaha Public Power District; Pacific Gas & Electric; Sunflower and Mid-Kansas; and Transmission Access Policy Study Group.

adds that a nonincumbent developer's lack of a funding mechanism based on retail rates is a function of the state-based ratemaking process, not a preference for incumbent transmission owners.

242. Other commenters question the potential impact removal of a federal right of first refusal may have on transmission rates.[214] North Dakota & South Dakota Commissions argue that there is no evidence to suggest that nonincumbents are better situated to provide lower cost or more reliable service, and note that nonincumbents are not regulated by state commissions and not subject to state law obligations regarding reliability or state law oversight of their operations. Alabama PSC states concern that the proposed elimination of the incumbent's federal right of first refusal could increase costs to Alabama consumers. Edison Electric Institute argues that the Commission's proposal ignores longstanding policy that a public utility's investment is assumed to be prudent when a range of options are available, arguing that the Proposed Rule would have a reasonable rate depend upon the identity of the builder of the transmission facility.

243. Some commenters argue that any lower costs that result from competition to own and construct transmission projects is likely to be more than offset by inefficiencies

[214] *E.g.*, Alabama PSC; City of Santa Clara; Dominion; Edison Electric Institute; MidAmerican; Oklahoma Gas & Electric; PSEG Companies; Southern California Edison; Sunflower and Mid-Kansas; and Xcel.

created in the transmission planning process and a loss of economies of scale and scope.[215] Pacific Gas & Electric states that competition may have cost impacts to incumbent transmission owners relating to their obligation to maintain or improve reliability and security of the existing transmission system to comply with current and future reliability standards. Southern Companies contend that consumers bear the risk of nonincumbent developers declaring bankruptcy or becoming unable or unwilling to complete a transmission project, suggesting that the Commission require "step in" rights in such circumstances to facilitate an incumbent transmission owner's assumption of the project, should it voluntarily choose to do so. Transmission Dependent Utility Systems state that the proposal could raise costs by causing customers outside of an RTO/ISO region to pay both the full costs of the incumbent transmission provider's transmission system and the full incremental costs of any nonincumbent transmission projects necessary to serve its load.

244. Indicated PJM Transmission Owners assert that, even if a nonincumbent were to propose a less expensive transmission project for recovery through cost-based rates, there is no assurance that its final costs will be equal to or lesser than its estimate, or that it has a greater likelihood of staying within its cost estimate than an incumbent transmission owner. They contend that the Commission misapplies cost-effectiveness principles to

[215] *E.g.*, Dominion; PSEG Companies; North Dakota & South Dakota Commissions; and Oklahoma Gas & Electric Company.

non-rate matters beyond its authority, without factual or logical support. PPL Companies agree, arguing that consumers will bear the risk of cost overruns by nonincumbent transmission developers. California ISO notes that the Trans Bay Cable, cited by Western Independent Transmission Group, had significant cost overruns, and that the Neptune and Cross Sound Cable transmission projects were merchant transmission projects that, as direct current transmission lines, involved fewer concerns about system compartmentalization and fragmentation. Southern California Edison states that under the Proposed Rule, there does not appear to be any incentive for project participants to develop cost-efficient proposals because it is not clear if and how customer costs would be considered in project selection.

245. Several comments suggest that the proposal is based on a false assumption that providing for greater competition in the provision of transmission development will produce benefits to consumers.[216] They state that unlike generation, a competitive model cannot be adopted for wholesale transmission because customers have no meaningful alternative transmission provider and the development cycle for transmission is much longer than for generation. California ISO disagrees that the benefits of competition cited by Western Independent Transmission Group and Pattern Transmission are relevant to its transmission planning process. PPL Companies similarly argues that commenters

[216] *E.g.*, California ISO; Indianapolis Power & Light; Oklahoma Gas & Electric Company; and Pacific Gas & Electric.

arguing that eliminating the right of first refusal benefits competition misunderstand the nature of the transmission planning process, noting that RTO planning processes do not involve price competition or consumer choice. PPL Companies contend that eliminating the right of first refusal would not add choice for consumers since the transmission projects included in RTO plans are driven by needs, and not by proposals from incumbent or nonincumbent developers.

246. A number of commenters assert that removing a federal right of first refusal would complicate and undermine the transmission planning process.[217] Delaware PSC states that the Proposed Rule would fundamentally change the way transmission facilities are proposed, selected, and built, and requires thoughtful consideration of all its implications. MISO states that placing regional planners in a role of deciding who should build introduces a level of financial competition to the planning process that is fundamentally at odds with the high level of openness and collaboration under the current approach. Kansas City Power & Light and KCP&L Greater Missouri contend that the proposal would exacerbate an already complex and arduous process to study, plan and implement regional transmission infrastructure. Dominion states that eliminating a federal right of

[217] *E.g.*, AEP; Allegheny Energy Companies; Baltimore Gas & Electric; Dominion; Edison Electric Institute; First Energy Service Company; Indianapolis Power & Light; Kansas City Power & Light and KCP&L Greater Missouri; MidAmerican; MISO; MISO Transmission Owners; Pacific Gas & Electric; and Southern California Edison.

first refusal would create a model where competitively sensitive information will be withheld from open discussion, thus making the planning process less collaborative. Xcel agrees that the proposal could harm the planning process and that disagreements about transmission project selection could have negative impacts on state-level siting and routing approval processes.

247. Some commenters caution that implementation of the proposed reforms could have unintended consequences affecting reliability.[218] These commenters generally contend that eliminating federal rights of first refusal could cause, or exacerbate, operational and reliability challenges for transmission system operations and could produce operational issues as each transmission provider will have to coordinate with more entities to address specific reliability issues. Many of these commenters contend that increasing the number of entities involved in transmission ownership and grid operations would make coordination, maintenance, and service restoration more difficult by further fragmenting the transmission system, which they note has been a concern of the Commission in the past.

248. Several commenters contend that the right of first refusal is inextricably linked to the obligation to build imposed under RTO and ISO membership agreements, justifying

[218] *E.g.*, Baltimore Gas & Electric; California ISO; Edison Electric Institute; MidAmerican; Oklahoma Gas & Electric; Pacific Gas & Electric; PJM; PSEG Companies; Southern California Edison; and Xcel.

any difference in treatment between incumbent transmission owners and nonincumbent transmission developers.[219] These commenters generally argue that retention of an obligation to build without a corresponding right of first refusal would impose a serious and unjust and unreasonable burden on incumbent transmission owners and is in violation of the FPA. Some state commissions express concern that the Commission's proposal may undermine the ability of utilities to meet their load service obligations.[220] Other commenters state that it is important to maintain an obligation to build for its transmission owning members to ensure transmission projects needed for reliability can be developed promptly.[221] Some commenters contend that the Commission's proposed reforms would result in undue discrimination against incumbent utilities, giving nonincumbent transmission developers the opportunity to propose and build a transmission facility, whereas incumbents would be required to build any needed transmission facility, including those that may be abandoned or not completed by the

[219] *E.g.*, ISO New England; PJM; SPP; Federal Trade Commission; SPP; MISO Transmission Owners; Edison Electric Institute; Georgia Transmission Corporation; Indianapolis Power & Light; Large Public Power Council; Nebraska Public Power District; Arizona Public Service Company; Oklahoma Gas & Electric; MidAmerican; PSEG Companies; San Diego Gas & Electric; Southern California Edison; Tucson Electric; Xcel; Allegheny Energy Companies; Duke; Baltimore Gas & Electric; Dominion; E.ON; Exelon; Westar Integrys; and FirstEnergy Service Company.

[220] *E.g.*, Florida PSC; Minnesota PUC; and Minnesota Office of Energy Security.

[221] *E.g.*, ISO New England; MidAmerican; and MISO Transmission Owners.

nonincumbent developer.[222] Many of these commenters contend this would permit nonincumbent transmission developers to "cherry pick" only the most advantageous projects in terms of financial reward and development risk.[223] Southern California Edison contends that the Commission's proposal amounts to establishing a free call on a utility's capital without any return to compensate it for the time period in which that capital had to be held in reserve to meet a backstop obligation to build.

249. Several commenters express concern about the impact that removing a federal right of first refusal in Commission-jurisdictional tariffs and agreements may have on RTO and ISO participation.[224] For example, MISO states that the right of its transmission owner members to build transmission facilities identified through the planning process was, and remains, one of the key considerations for its transmission owners to have formed, and to remain a part of, the voluntary RTO. MISO Transmission Owners argue that the Proposed Rule would result in undue discrimination between transmission owners voluntarily participating in RTOs and transmission owners that have

[222] *E.g.*, Baltimore Gas & Electric; Edison Electric Institute; FirstEnergy Service Company; Large Public Power Council; MidAmerican; MISO Transmission Owners; PPL Companies; PSEG Companies; and Xcel.

[223] *E.g.*, Baltimore Gas & Electric; California ISO; CapX2020 Utilities; Indianapolis Power & Light; Oklahoma Gas & Electric; Southern California Edison; and Xcel.

[224] *E.g.*, MISO; MISO Transmission Owners; Edison Electric Institute; Alliant Energy; MidAmerican; and Indianapolis Power & Light.

not joined an RTO. MISO Transmission Owners state that, without a right to construct new transmission facilities within their own systems, a transmission owner could experience substantial erosion of its revenues over time as a result of RTO participation. MISO Transmission Owners add that construction obligations and rights in RTOs and ISOs have been carefully designed to ensure that RTOs, ISOs, and their members can comply with all applicable state and federal service obligations and reliability standards. Southern Companies state that the Commission should clarify that the reforms relating to nonincumbent transmission developers do not apply in non-RTO regions. On the other hand, Transmission Agency of Northern California emphasizes that the Commission's proposal to remove a right of first refusal from all Commission-approved tariffs and agreements should apply in both non-RTO/ISO and RTO/ISO regions.

250. Some commenters argue that the existence of native load and state franchise obligations further distinguish incumbent transmission owners from nonincumbent transmission developers, justifying retention of federal rights of first refusal.[225] These commenters assert that nonincumbent developers are not similarly situated because they

[225] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Edison Electric Institute; Large Public Power Council; MISO Transmission Owners; Nebraska Public Power District; Xcel; PPL Companies; and Xcel. In support, Ad Hoc Coalition of Southeastern Utilities cites to *California Indep. Sys. Operator Corp.*, 119 FERC ¶ 61,076, at P 369 (2007); *Calpine Oneta Power, L.P.*, 116 FERC ¶ 61,282, at P 36 (2006); and *Sebring Utils. Comm'n v. FERC*, 591 F.2d 1003, 1009 n.24 (5th Cir. 1979). MISO Transmission Owners also cite to *S. Cal. Edison Co.*, 59 FPC 2167, 2185-86 (1977).

can select the transmission projects they wish to pursue and ignore those they deem too risky or insufficiently profitable, unencumbered by a "duty to serve" requiring the construction and maintenance of facilities necessary to render reliable, cost-effective service to customers in their service territories. For example, Baltimore Gas & Electric states that it and others view their licensed obligations to protect their service territory from power outages as being paramount over their mere financial interests. Edison Electric Institute and MISO Transmission Owners argue that differing state law obligations have been found to be legitimate factors in determining that two entities are not similarly situated.[226] San Diego Gas & Electric contends that removal of federal rights of first refusal raises constitutional concerns since, as regulated entities, public utility transmission providers are entitled under well-established law to receive a reasonable rate of return on their investment in transmission infrastructure in discharging their state-mandated service obligations.[227]

251. A number of commenters suggest that the Commission consider partial elimination of federal rights of refusal.[228] Many of these commenters endorse SPP's

[226] Edison Electric Institute and MISO Transmission Owners cite to *Town of Norwood v. FERC*, 202 F.3d 392, 403 (1st Cir. 2000).

[227] San Diego Gas & Electric supports these assertions by citing *FPC v. Hope Natural Gas Co.*, 320 U.S. 591 (1944) and *Bluefield Water Works v. Public Serv. Comm'n*, 262 U.S. 679 (1923).

[228] *E.g.*, California PUC; Transmission Dependent Utility Systems; SPP; AEP;

(continued…)

current mechanism, under which an incumbent utility has a 90-day time limit to exercise its right to construct a facility included in the regional transmission plan. AEP suggests that the Commission consider a phased approach, beginning with a time limit on the exercise of any right of first refusal and, if this does not substantially address the Commission's concerns, then consider further modification or elimination of the right of first refusal. AEP suggests that the Commission also could require each region to report back to the Commission within two years on its experience implementing the time-limited right of first refusal as a basis for the Commission to consider whether a fundamental change of the existing regional transmission planning process is needed. California PUC and Exelon argue that incumbent transmission owners should maintain the right of first refusal for reliability projects located within a single zone. Transmission Access Policy Study Group recommends that the Commission retain a limited right of first refusal that can be exercised only when the incumbent transmission provider forgoes transmission incentives for the project and offers meaningful joint ownership opportunities on reasonable terms. Other commenters disagree with proposals to maintain limited rights of first refusal, generally arguing that such proposals would

---

Iberdrola Renewables; Indianapolis Power & Light; ITC Companies; MidAmerican; Oklahoma Gas & Electric; Southern California Edison; Westar; Xcel; CapX2020 Utilities; and SPP.

perpetuate the entry barrier.[229]

252. Finally, some commenters suggest that the Commission engage in additional outreach on this issue before altering federal rights of first refusal.[230] They encourage the Commission to host a technical conference or initiate other proceedings so that all of these issues can be examined and potential solutions developed in a collaborative manner. Sunflower and Mid-Kansas contend that, if problems relating to a right of first refusal exist in a particular region, the issue should be addressed locally rather than imposing a one-size-fits-all solution across all regions.

c. Commission Determination

253. The Commission concludes that there is a need to act at this time to remove provisions from Commission-jurisdictional tariffs and agreements that grant incumbent transmission providers a federal right of first refusal to construct transmission facilities selected in a regional transmission plan for purposes of cost allocation.[231] Failure to do

[229] *E.g.*, American Antitrust Institute; Anbaric and PowerBridge; LS Power; NextEra; Pattern Transmission; and Western Independent Transmission Group.

[230] *E.g.*, Delaware PSC; NextEra; San Diego Gas & Electric; and Tucson Electric.

[231] As explained in more detail in section III.B.3below, the Commission purposely refers to "federal rights of first refusal" in this Final Rule because the Commission's action on this issue in this Final Rule addresses only rights of first refusal that are created

(continued…)

so would leave in place practices that have the potential to undermine the identification and evaluation of more efficient or cost-effective solutions to regional transmission needs, which in turn can result in rates for Commission-jurisdictional services that are unjust and unreasonable or otherwise result in undue discrimination by public utility transmission providers. The Commission addresses the need for eliminating such practices in this section and, in the sections that follow, our legal authority to do so and the procedures by which public utility transmission providers must implement the removal of federal rights of first refusal from Commission-jurisdictional tariffs and agreements.

254. As the Commission recognized in Order Nos. 888 and 890, it is not in the economic self-interest of public utility transmission providers to expand the grid to permit access to competing sources of supply.[232] In Order No. 890, the Commission required greater coordination in transmission planning on a regional level to remedy the potential for undue discrimination by transmission providers that have an incentive to

---

by provisions in Commission-jurisdictional tariffs or agreements. Nothing in this Final Rule is intended to limit, preempt, or otherwise affect state or local laws or regulations with respect to construction of transmission facilities, including but not limited to authority over siting or permitting of transmission facilities. This Final Rule does not require removal of references to such state or local laws or regulations from Commission-approved tariffs or agreements.

[232] Order No. 888, FERC Stats. & Regs. at 31,682; Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 524.

avoid upgrading transmission capacity with interconnected neighbors where doing so would allow competing suppliers to serve the customers of the public utility transmission provider.[233] Although basing its actions on its authority to remedy undue discrimination, the Commission found that "[t]he coordination of planning on a regional basis will also increase efficiency through the coordination of transmission upgrades that have region-wide benefits, as opposed to pursuing transmission expansion on a piecemeal basis."[234]

255. In response to Order No. 890, regions across the country have implemented transmission planning processes that allow for consideration of alternative transmission projects proposed at the regional level to determine if they better meet the region's needs.[235] The evaluation of alternative transmission solutions at the regional level is often referred to as "top down" planning.[236] In some regions, heavy emphasis is placed on "top down" regional planning for all or certain classes of transmission facilities. In other regions, local transmission plans are developed in which individual public utility transmission providers within the region identify solutions to their own local needs prior

[233] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 524.

[234] *Id.*

[235] *See* Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 494; Order No. 890-A, FERC Stats. & Regs. ¶ 61,297 at P 215-16. Sponsors of generation and demand response solutions are provided comparable opportunities to offer their proposals in the regional transmission planning process. *Id.*

[236] *See, e.g.*, Pacific Gas & Electric Initial Comments describing top down planning.

to the "top down" consideration of regional alternatives. This is often referred to as "bottom up, top down" planning.[237] Although the relative weight placed on "bottom up" or "top down" processes varies by region, all of these existing processes allow at some point for transmission project developers to offer alternative solutions for evaluation on a comparable basis pursuant to criteria that is set forth in the public utility transmission providers' OATTs.[238] By requiring the comparable evaluation of all potential transmission solutions, the Commission has sought to ensure that the more efficient or cost-effective solutions are in the regional transmission plan.[239]

256. The Commission is concerned that the existence of federal rights of first refusal may be leading to rates for jurisdictional transmission service that are unjust and unreasonable. Allowing federal rights of first refusal to remain in Commission-jurisdictional tariffs and agreements would undermine the consideration of potential transmission solutions proposed at the regional level. Just as it is not in the economic self-interest of public utility transmission providers to expand transmission capacity to

---

[237] *See, e.g.*, Large Public Power Council Initial Comments describing bottom up planning.

[238] *See, e.g.*, Entergy OATT, Attachment K at § 3.12; Florida Power and Light OATT, Appendix 1 to Attachment K, §§ H and I; ISO New England OATT, Attachment K at § 4.2; Puget Sound Energy OATT, Attachment K at § 2; SPP OATT, Attachment O at § III.8.

[239] *See, e.g.*, *Northwestern Corp.*, 128 FERC ¶ 61,040, at P 38 (2009); *El Paso Electric Co.*, 128 FERC ¶ 61,063, at P 15 (2009); *New York Independent System Operator, Inc.*, 129 FERC ¶ 61,044, at P 35 (2009).

allow access to competing suppliers, it is not in the economic self-interest of incumbent transmission providers to permit new entrants to develop transmission facilities, even if proposals submitted by new entrants would result in a more efficient or cost-effective solution to the region's needs. We conclude that an incumbent transmission provider's ability to use a right of first refusal to act in its own economic self-interest may

discourage new entrants from proposing new transmission projects in the regional transmission planning process.

257. Federal rights of first refusal exacerbate these problems by, as the Federal Trade Commission and other commenters explain, creating a barrier to entry that discourages nonincumbent transmission developers from proposing alternative solutions for consideration at the regional level. Many commenters note that significant investment is needed to support the development of a successful transmission project, yet there is a disincentive for a nonincumbent transmission developer to commit its resources to a potential transmission project when it runs the risk of an incumbent transmission provider exercising its federal right of first refusal once the benefits of the transmission project are demonstrated. The Commission recognizes that removing federal rights of first refusal in Commission-jurisdictional tariffs and agreements will not eliminate all obstacles to transmission development that may exist under state or local laws or regulations and, therefore, may not address all challenges facing nonincumbent transmission development

in those jurisdictions. It does not follow, however, that the Commission should leave in place federal rights of first refusal. Moreover, the number of state commission commenters supporting the Commission's proposal indicate that, at a minimum, there is interest in those jurisdictions to explore the benefits of nonincumbent transmission development.

258. The Commission shares the concerns of some commenters that elimination of federal rights of first refusal from Commission-jurisdictional tariffs and agreements, if not implemented properly, could adversely impact the collaborative nature of current regional transmission planning processes. The Commission addresses these concerns in section III.B.3 by modifying and clarifying the proposed framework for implementing our reforms, including elimination of the proposed requirement to allow a transmission developer to maintain for a defined period a right to build and own a transmission facility. In addition, this Final Rule does not require removal of a federal right of first refusal for a local transmission facility, as that term is defined herein.[240] The Commission disagrees with commenters asserting that reforming federal rights of first refusal would fundamentally alter regional transmission planning processes. Public utility transmission providers already are required to evaluate whether alternative transmission solutions proposed by other developers better meet the needs of the region.

[240] *See* definition *supra* section II.D of this Final Rule.

Therefore, existing regional transmission planning processes have mechanisms in place to weigh various alternatives against one another. Indeed, this is the fundamental nature of "bottom-up, top-down" transmission planning, in which local needs and solutions are combined within a region and analyzed to determine whether regional solutions would be more efficient or cost-effective than the local solutions identified by individual public utility transmission providers.[241]

259. The Commission understands that the degree to which existing transmission planning processes will be impacted by the elimination of federal rights of first refusal will vary by region, just as the current mechanisms used to evaluate competing transmission projects vary by region. For example, the public utility transmission providers in a region may, but are not required to, use competitive solicitation to solicit projects or project developers to meet regional needs. To the extent a region already has in place processes to rely on market proposals or competitive solicitations when identifying solutions to the region's needs, such existing processes may require relatively modest modifications to provide nonincumbent transmission providers with the opportunity to propose and construct transmission projects, consistent with state and local

[241] Similarly, the Commission believes that concerns regarding the cost-effectiveness of nonincumbent transmission development are misplaced. For one solution to be chosen over another in the transmission planning process, there must be an evaluation of the relative economics and effectiveness of performance for each alternative. *See, e.g., New York Independent System Operator, Inc.*, 129 FERC ¶ 61,044 at P 35, n.26.

laws and regulations. In regions relying more heavily on local planning with less robust mechanisms to identify alternative transmission solutions at the regional level, more effort may be needed to implement the Commission's reforms. Within the implementation framework adopted below, the Commission provides each region with the flexibility necessary to identify the modifications to existing transmission planning processes that may be required as a result of removing federal rights of first refusal from Commission-jurisdictional tariffs and agreements.

260. The Commission is not persuaded to abandon our proposed reforms to federal rights of first refusal based on arguments that incumbent transmission providers are better situated to build and operate transmission facilities. While we acknowledge that incumbent transmission providers may have unique knowledge of their own transmission systems, familiarity with the communities they serve, economies of scale, experience in building and maintaining transmission facilities, and access to funds needed to maintain reliability, we do not believe removing the federal right of first refusal diminishes the importance of these factors. An incumbent public utility transmission provider is free to highlight its strengths to support transmission project(s) in the regional transmission plan, or in bids to undertake transmission projects in regions that choose to use solicitation processes. However, we do not believe that, just because an incumbent public utility transmission provider may have certain strengths, a nonincumbent transmission

developer should be categorically excluded from presenting its own strengths in support of its proposals or bids.

261. Various commenters argue that federal rights of first refusal are inextricably tied to obligations to build placed on incumbent transmission providers, such as those under RTO and ISO member agreements. We acknowledge that a public utility transmission provider may have accepted an obligation to build in relation to its membership in an RTO or ISO, but we do not believe that obligation is necessarily dependent on the incumbent transmission provider having a corresponding federal right of first refusal to prevent other entities from constructing and owning new transmission facilities located in that region. There are many benefits and obligations associated with membership in an RTO or ISO and an obligation to build at the direction of the RTO or ISO is only one aspect of the agreement. While implementation of reforms to federal rights of first refusal may change the package of benefits and burdens currently in place for transmission owning members of RTOs and ISOs, we find that such changes are necessary to correct practices that may be leading to rates for jurisdictional transmission service that are unjust and unreasonable.

262. Some commenters also contend that the federal right of first refusal is necessary for incumbent transmission providers to develop transmission facilities needed to comply with a reliability standard or an obligation to serve customers. We clarify that our actions today are not intended to diminish the significance of an incumbent transmission

provider's reliability needs or service obligations. Currently, an incumbent transmission provider may meet its reliability needs or service obligations by building new transmission facilities that are located solely within its retail distribution service territory or footprint. The Final Rule continues to permit an incumbent transmission provider to meet its reliability needs or service obligations by choosing to build new transmission facilities that are located solely within its retail distribution service territory or footprint and that are not submitted for regional cost allocation. Alternatively, an incumbent transmission provider may rely on transmission facilities selected in a regional transmission plan for purposes of cost allocation. Our decision today does not prevent an incumbent transmission provider from continuing to propose transmission projects for consideration in the regional transmission planning process and to receive regional cost allocation if those projects are selected in a regional transmission plan for such purposes, even if they are located entirely within its retail distribution service territory or footprint,

263. Given that incumbent transmission providers may rely on transmission facilities selected in a regional transmission plan for purposes of cost allocation to comply with their reliability and service obligations, delays in the development of such transmission facilities could adversely affect the ability of the incumbent transmission provider to meet its reliability needs or service obligations. To avoid this result, in section III.B.3 below, we require each public utility transmission provider to amend its OATT to describe the circumstances and procedures under which public utility transmission providers in the

regional transmission planning process will reevaluate the regional transmission plan to determine if delays in the development of a transmission facility selected in a regional transmission plan for purposes of cost allocation require evaluation of alternative solutions, including those the incumbent transmission provider proposes, to ensure the incumbent can meet its reliability needs or service obligations.

264. One function of the regional transmission planning process is to identify those transmission facilities that are needed to meet identified needs on a timely basis and, in turn, enable public utility transmission providers to meet their service obligations. Given the familiarity incumbent transmission providers have with their own systems, we expect that they will continue to participate actively in the regional transmission planning process to share their unique perspectives regarding whether various potential solutions meet particular needs of their systems. To the extent an incumbent transmission provider has concerns that a regional transmission alternative does not address the identified reliability needs or service obligations that would allow it to serve its customers reliably to meet state or local laws, whether upon initial evaluation or, as relevant, subsequent reevaluation, it can make such concerns known so that all relevant information regarding a regional transmission alternative can be considered.

265. The Commission disagrees that elimination of federal rights of first refusal would result in discrimination against incumbent transmission providers in favor of nonincumbent transmission developers. Once a member of an RTO or ISO, a

nonincumbent transmission developer will be subject to the relevant obligations that apply to the RTO or ISO members. While it is true that the obligation of nonincumbent transmission developers to expand their transmission facilities, once within an RTO or ISO, may apply to fewer transmission facilities than those of an incumbent with a large footprint, and that some incumbent transmission providers may be subject to different requirements under state and local laws, it does not follow that eliminating federal rights of first refusal amounts to discrimination in favor of nonincumbent transmission developers. Rather, we are merely removing a barrier to participation by all potential transmission providers. With regard to concerns that our reforms will discourage entities from joining or maintaining membership in RTOs and ISOs, we note that a variety of factors must be weighed when evaluating the benefits and burdens of RTO/ISO membership. In addition, we reject Southern Companies' request that we clarify that the reforms related to nonincumbent transmission developers do not apply in non-RTO regions; the reforms apply equally to public utility transmission providers in all regions. The Commission believes that the modifications and clarifications provided below with regard to the framework under which transmission developers will participate in the transmission planning process will alleviate some of the concerns expressed by commenters.

266. We are not persuaded by commenters who argue that the reliability of the transmission system is a function of the number of public utility transmission providers

of that system. In fact, to enhance reliability, among other reasons, public utility transmission providers have historically connected to the transmission systems of others, as well as jointly owned transmission facilities, and have therefore developed experience, protocols, and business models for coordinated operations with multiple transmission providers, operators, and users. Moreover, many of the same commenters that raise reliability concerns also suggest that nonincumbent transmission developers instead pursue the merchant model of development, which similarly increases rather than decreases the number of transmission providers within a region. All providers of bulk-power system transmission facilities, including nonincumbent transmission developers, that successfully develop a transmission project, are required to be registered as functional entities and must comply with all applicable reliability standards.[242] Together with the additional requirements we adopt in section III.B.4 below, the Commission finds these protections sufficient to support our decision here to eliminate the federal rights of first refusal contained in Commission-jurisdictional tariffs and agreements.

267. The Commission recognizes that there may be circumstances when an incumbent transmission provider may be called upon to complete a transmission project that it did not sponsor. For example, a situation may arise where an incumbent transmission provider is called upon to complete a transmission project that another entity has

[242] 18 CFR Part 39.2(a) (2011).

abandoned. There also may be situations in which an incumbent transmission provider has an obligation to build a project that is selected in the regional transmission plan for purposes of cost allocation but has not been sponsored by another transmission developer. We clarify that both of these situations would be a basis for the incumbent transmission provider to be granted abandoned plant recovery for that transmission facility, upon the filing of a petition for declaratory order requesting such rate treatment or a request under section 205 of the FPA. In addition, the Commission addresses reliability concerns that may arise under those circumstances below.

268. For the foregoing reasons, and in light of the evaluation procedures required in section III.B.3 below, the Commission finds that there is sufficient justification in the record to implement the requirements regarding rights of first refusal contained in Commission-jurisdictional tariffs or agreements. The Commission is not required to identify specific evidence to justify our actions today. Our task in this respect is to show that there is "'ground for reasonable expectation that competition may have some beneficial impact.'"[243] Although the Commission has previously accepted, in some cases, and rejected, in others, a federal right of first refusal, we find more persuasive in light of the comments in this proceeding, the Commission's reasoning in rejecting the federal right of first refusal. In particular, the Commission rejected a right of first refusal

[243] *Wisconsin Gas Company v. FERC*, 770 F.2d 1144, 1158 (D.C. Cir. 1985) (citing *FCC v. RCA Communications, Inc.*, 346 U.S. 86, 96 (1953)).

based on an expectation that "[t]he presence of multiple transmission developers would lower costs to customers."[244] We have carefully considered the record in the proceeding and therefore find further procedures to evaluate the need for the reforms adopted herein to be unnecessary.

269. Finally, we disagree with San Diego Gas & Electric that the elimination of a federal right of first refusal raises concerns under *FPC v. Hope Natural Gas Co.* and *Bluefield Water Works v. Public Serv. Comm'n*. As San Diego Gas & Electric notes, these cases stand for the principle that utilities are entitled to receive a reasonable return on their investment. They do not, however, speak to the issue of who may make an investment. They thus require only that a utility receive a reasonable rate of return on the investments that it makes, not that the utility receive a preferential right to make those investments.

2. Legal Authority To Remove a Federal Right of First Refusal

a. Commission Proposal

270. In the Proposed Rule, the Commission explained that the existing planning process

[244] *Cleco Power LLC*, 101 FERC ¶ 61,008 at P 117 (2002), *order terminating proceedings*, 112 FERC ¶ 61,069 (2005); *see also Carolina Power and Light Co.*, 94 FERC ¶ 61,273 at 62,010, *order on reh'g*, 95 FERC ¶ 61,282 at 61,995 (2001) (finding that a federal right of first refusal would unduly limit the planning authority and present the possibility of discrimination by self-interested transmission owners, potentially reduce reliability, and possibly precluding lower cost or superior transmission facilities or upgrades by third parties from being planned and constructed).

may not result in a cost-effective solution to regional transmission needs and transmission projects that are in a regional transmission plan therefore may be developed at a higher cost than necessary. The Commission stated that the result may be that regional transmission services may be provided at rates, terms and conditions that are not just and reasonable.[245] The Commission also stated that it may be unduly discriminatory or preferential to deny a nonincumbent public utility transmission developer that sponsors a project that is in a regional transmission plan the rights of an incumbent public utility transmission developer that are created by a public utility transmission provider's tariffs or agreements subject to the Commission's jurisdiction. Under these circumstances, the Commission noted that nonincumbent transmission developers may be less likely to participate in the regional transmission planning process. The Commission stated that, if the regional transmission planning process does not consider and evaluate transmission projects proposed by nonincumbents, it cannot meet the principle of being "open."

b. Comments Regarding the Commission's Authority To Implement the Proposal

271. Several commenters argue that the Commission has adequate statutory authority to undertake the reforms in the Proposed Rule.[246] Some of the commenters supporting the

[245] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 87-88.

[246] *E.g.*, Iberdrola Renewables; 26 Public Interest Organizations; Exelon; ITC Companies; LS Power; Multiparty Commenters; and Primary Power.

Commission's proposal to eliminate federal rights of first refusal from Commission-jurisdictional tariffs and agreements specifically addressed the scope of the Commission's authority under section 206 of the FPA. Primary Power contends that the Commission is authorized under section 206 to remove or limit the right of first refusal, which is a rule, practice, or contract condition subject to its jurisdiction. Primary Power states that, while the proposal to eliminate the right of first refusal represents a change in the Commission's policy of tolerance or occasional acceptance of the right of first refusal, this change in policy is justified as in the public interest. Primary Power argues that rights of first refusal are creatures of regulated services that are subject to federally-regulated tariffs and, therefore, proponents of rights of first refusal must find some independent legal basis for the property rights they seek to protect.

272. LS Power argues that the Commission has a duty to stamp out all forms of discrimination in the form of a right of first refusal, whether written in the OATT or other agreement, or simply as part of a long-standing bias arising from a closed planning process. LS Power contends that eliminating rights of first refusal is a critical step toward true competition in the electric industry, and essential to ensuring that new transmission infrastructure is provided to consumers at just and reasonable rates. LS Power notes that the Commission has historically required the elimination of provisions

that are anticompetitive on their face.[247] Joined by American Forest & Paper, LS Power further argues that elimination of a federal right of first refusal would not be inconsistent with existing state laws, noting the support for the Commission proposal by a number of state commissions submitting comments.

273. Other commenters contend that the Commission does not have the legal authority to implement the proposed reforms related to rights of first refusal in Commission-jurisdictional tariffs or agreements. Some commenters argue that the FPA does not give the Commission the authority to address discrimination between incumbent and nonincumbent transmission developers, arguing that the FPA's protection against undue discrimination is concerned with the protection of consumer interests and does not extend to nonincumbent transmission developers.[248] Ad Hoc Coalition of Southeastern Utilities states that precedent shows that the rights of competitors are neither protected nor contemplated in FPA section 205(b)'s proscription against undue discrimination.[249]

[247] LS Power (citing *Gulf States Utils. Co.*, 5 FERC ¶ 61,066 (1978)).

[248] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Large Public Power Council; Nebraska Public Power District; Omaha Public Power District; Xcel; and Indicated PJM Transmission Owners (citing *Grand Council of the Crees v. FERC*, 198 F.3d 950, 956 (D.C. Cir. 2000)).

[249] Ad Hoc Coalition of Southeastern Utilities cites to *Brunswick Corp. v. Pueblo*

(continued…)

Edison Electric Institute agrees, arguing that an undue discrimination analysis in the context of the right of first refusal provisions and planning processes is unsupportable, explaining that such provisions are not rates, terms, and conditions of a service that a transmission owner provides to its customers. Edison Electric Institute states that the Commission previously has not taken the step of characterizing transmission planning as an obligation or service to non-customers to facilitate their competing efforts to own transmission facilities. Edison Electric Institute further states that the comparability analysis for undue discrimination could not apply because ownership is not a service that a transmission owner provides to itself.

274. Indicated PJM Transmission Owners contend that the undue discrimination concerns underlying Order. No. 888, regarding access to transmission facilities for loads and for competing suppliers of wholesale electricity, are not present here. Indicated PJM Transmission Owners argue the Commission does not and cannot find that relying on incumbent transmission owners to build necessary upgrades to their systems discriminates either in the terms of service available to different classes of transmission customers or in the terms upon which wholesale sellers and buyers gain access to the transmission system.

Bowl-O-Mat, Inc., 429 U.S. 477, 487-89 (1977), *Cargill, Inc. v. Montfort of Colorado, Inc.*, 479 U.S. 104, 115-17 (1976), *City of Frankfort v. FERC*, 678 F.2d 699, 707 (7th Cir. 1982).

275. Some commenters analogize to the Commission's jurisdiction under section 205 of the FPA, arguing that there are only two types of undue discrimination actionable under section 205: treating similar customers differently or affording similar treatment to dissimilar customers.[250] Some of these commenters assert that the court in *City of Frankfort v. FERC*[251] noted that section 205 provisions focus on the fair treatment of customers. Similarly, Nebraska Public Power District states *Public Service Commission of Indiana*[252] stands for the proposition that the antidiscrimination policy in section 205(b) is violated where one consumer has its rates raised significantly above what other similarly situated consumers are paying.

276. Other commenters also argue that the Commission lacks general jurisdiction over the siting, construction, or ownership of transmission facilities, matters they assert Congress intentionally left to the states, as demonstrated by a comparison between the FPA and the Natural Gas Act.[253] Commenters assert that the proposal to adopt rules

---

[250] *E.g.*, Nebraska Public Power District; Large Public Power Council; and MISO Transmission Owners. Some of these commenters cite to *Alabama Elec. Coop., Inc. v. FERC*, 684 F.2d 20, 27-28 (D.C. Cir. 1984), *Sacramento Mun. Util. Dist. v FERC*, 474 F.3d 797, 802 (D.C. Cir. 2007), *City of Vernon v. FERC*, 845 F.2d 1042, 1046 (D.C. Cir. 1988), *Ohio Power Co. v. FERC*, 744 F.2d 162, 165 n.3 (D.C. Cir. 1984), and *"Complex" Consol. Edison Co. v. FERC*, 165 F.3d 992, 1012 (D.C. Cir. 1999).

[253] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Nebraska Public Power

(continued…)

governing who can build transmission within an incumbent transmission owner's zone exceeds the authority conferred upon the Commission under the FPA to regulate the terms and conditions of service and, in essence, create a federal franchise for transmission service.[254]

277. Other commenters argue that the Commission is provided only limited backstop siting authority under section 216 of the FPA, a grant of authority that the courts have emphasized is subservient to the primary jurisdiction of the states.[255] Oklahoma Gas & Electric Company argues that, in enacting section 215 of the FPA, Congress expressly declined to grant the Commission the authority to require the construction of facilities or the expansion of the grid. PPL Companies contend that the Commission's jurisdiction under FPA sections 210 and 211 to order existing utilities to enlarge their facilities, if necessary to permit transmission service or interconnection, can be invoked only pursuant to specific procedures and after specific findings are made.

District; Oklahoma Gas and Electric Company; Omaha Public Power District; PPL Companies; Large Public Power Council; Xcel; Indianapolis Power & Light; Edison Electric Institute; Indicated PJM Transmission Owners; and Virginia State Corporation Commission. Indicated PJM Transmission Owners cite to *Altamont Gas Transmission Co. v. FERC*, 92 F.3d 1239, 1248 (D.C. Cir. 1996).

[254] *E.g.*, PPL Companies and PSEG Companies.

[255] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Indicated PJM Transmission Owners; Oklahoma Gas & Electric Company; and PPL Companies. Indicated PJM Transmission Owners cite to *Piedmont Envtl. Council v. FERC*, 558 F.3d 304 (4th Cir. 2009).

278. Oklahoma Gas & Electric Company asserts that, for the Commission to extend its jurisdiction over actions that indirectly affect activity otherwise governed by the states, the Commission must show that the action in question has a direct and significant effect on jurisdictional rates. Oklahoma Gas & Electric Company argues that the courts are unwilling to allow the Commission to regulate activity if, in so doing, the Commission is directly regulating activity that was specifically reserved for the states.[256] Oklahoma Gas & Electric Company cites to *National Association of Regulatory Utility Commissioners v. FERC*, 475 F.3d 395, 401 (D.C. Cir. 2004), where the court found that Commission regulations related to generator interconnection procedures bore a close enough relationship to its authority over jurisdictional transmission services that the exercise of jurisdiction over interconnection service was permissible.

279. Commenters opposing the Commission's proposed reforms generally reject the notion that the Commission is acting only to eliminate the federal right of first refusal, stating that the Proposed Rule would go much farther by regulating the protocols for determining the entity responsible to construct an upgrade. Indicated PJM Transmission Owners argue that, to the extent a state-created right is reflected in an RTO or ISO tariff or agreement, it cannot then be converted by the Commission into a federal based right

[256] Oklahoma Gas & Electric Company (citing *Northwest Central Pipeline Corp. v. State Corp. Comm'n of Kansas*, 489 U.S. 493 (1989); *Connecticut Dept. of Pub. Util. Control v. FERC*, 569 F.3d 477, 484 (D.C. Cir. 2009); *Mississippi Indus. v. FERC*, 808 F.2d 1525, 1542-43 (D.C. Cir. 1987)).

that the Commission can eliminate by its own regulation. Indicated PJM Transmission Owners assert that the fact that the transmission provider may be an RTO or ISO does not expand the Commission's jurisdiction because the transmission owner is still the public utility that makes and supports financial investments. They argue that the Commission cannot use such a voluntary association to require utilities to surrender their statutory rights, in accordance with *Atlantic City Electric Co. v. FERC*.[257]

280. Other commenters similarly agree that not every provision of a Commission-jurisdictional rate schedule or tariff governs the terms and conditions of jurisdictional services.[258] For example, PPL Companies argues that there are numerous provisions in agreements required to be filed with the Commission that are not rates or other terms or conditions that affect rates, such as provisions addressing force majeure and indemnification. PPL Companies and others point to provisions in transmission owner agreements or RTO operating agreements that establish governance as an example of terms that are beyond the Commission's jurisdiction.[259] Indicated PJM Transmission Owners argue that, consistent with *CAISO v. FERC*, section 206 is not implicated because the building and owning of an upgrade is not a practice or contract that affects a

[257] 295 F.3d 1 (D.C. Cir. 2002) (*Atlantic City*).

[258] *E.g.*, Oklahoma Gas & Electric; and PPL Companies. In support, Oklahoma Gas & Electric Company cites to *PSI Energy, Inc.*, 55 FERC ¶ 61,254, at 61,811 (1991), *reh'g denied*, 56 FERC ¶ 61,237 (1991).

[259] PPL Companies (citing *CAISO v. FERC*, 372 F.3d 395 (D.C. Cir. 2004)).

rate, charge, or classification for transmission. Indicated PJM Transmission Owners argue that regulation of the determination of which entity constructs transmission additions and expansions is a regulation of whether the utility can provide a service at all, not the rate for the service. Indicated PJM Transmission Owners explain that *CAISO v. FERC* noted that the FPA provides the Commission with limited power regarding corporate governance in section 305, which involves interlocking directorates, and this supports the proposition that section 206 was not intended to reach such matters.[260]

281. Indicated PJM Transmission Owners contend that each of the choices a utility's management makes potentially constitutes a "practice" that eventually affects rates insofar as the utility seeks to recover the resulting costs. If the Commission concludes that an investment or other business decision is the product of imprudent management, Indicated PJM Transmission Owners contend that the Commission has authority to consider denying recovery of excessive costs resulting from that decision, not to supplant the public utility's management's decision-making authority.[261] Joined by FirstEnergy Service Company, Indicated PJM Transmission Owners argue that a fundamental

[260] In addition, FirstEnergy Service Company states that the court in *CAISO v. FERC* explained that a more expansive interpretation of "practice" would allow the Commission to regulate a range of subjects that the court considered to be plainly beyond the Commission's authority.

[261] Indicated PJM Transmission Owners (citing *Town of Norwood v. FERC*, 80 F.3d 526, 531 (D.C. Cir. 1996)).

premise of the FPA is that a utility has a right to recover prudently incurred costs, and a corollary of this principle is that a utility must have the right to decide whether to make those investments.[262]

282. Indicated PJM Transmission Owners disagree with the Commission's statement that the regional transmission planning processes that do not consider and evaluate of projects proposed by nonincumbent transmission developers cannot meet the principle of being "open." They argue that the Commission cannot, by relying upon nondiscrimination principles, bootstrap authority it does not have for mandating the sponsorship model. Citing *Office of Consumers' Counsel v. FERC*,[263] Indicated PJM Transmission Owners argue that the Commission cannot redefine the transmission planning principles adopted in Order No. 890 to encompass matters that were never contemplated when it was issued. Indicated PJM Transmission Owners assert that nothing about the transmission owners' construction rights and obligations prohibits parties from participating in the process or proposing transmission projects. They state that the Commission has offered no rationale for concluding that the requirement of

[262] Indicated PJM Transmission Owners (citing *Mo. ex. rel. Southwestern Bell Tel. Co. v. Pub. Serv. Comm'n*, 262 U.S. 276, 289 n.1 (1923)). Indicated PJM Transmission Owners also note that Congress did provide similar authority in laws that parallel the FPA, such as section 402 of the Transportation Act of 1920, and sections 5 and 7 of the Natural Gas Act.

[263] *Office of Consumers' Counsel v. FERC*, 655 F.2d 1132, 1148 (D.C. Cir. 1980).

openness must be redefined to include a new sponsorship model.

283. National Grid notes that the rights and obligations of transmission owners in New England to own and construct transmission facilities or upgrades located within or connected to their existing electric systems were extensively litigated in the proceeding where the Commission found that ISO New England satisfied the requirements to be an RTO. National Grid states that in that proceeding, the Commission-approved contractual language in Section 3.09 of ISO New England's Transmission Operating Agreement providing that, absent agreement of ISO New England and the participating transmission owners to an amendment to these provisions, they will be subject to the *Mobile-Sierra* doctrine. Therefore, National Grid argues that the subject provisions cannot be modified by the Commission unless it finds they are contrary to the public interest. It submits that there is no evidence to meet this high standard. National Grid requests that Commission should either clarify that Commission-approved rights to build of transmission owners like those in New England would not be affected by the proposed NOPR requirements, or modify those requirements in the Final Rule to allow transmission owners in New England to continue to meet regional needs under the existing planning process.

c. Commission Determination

284. The Commission determines that it has the authority under section 206 of the FPA to implement the reforms adopted to eliminate provisions in Commission-jurisdictional tariffs and agreements that grant federal rights of first refusal to incumbent transmission

providers with respect to the construction of transmission facilities selected in a regional transmission plan for purposes of cost allocation. The Commission's remedial authority under FPA section 206 of the FPA is broad and allows us to act, as we do here, to revise terms in jurisdictional tariffs and agreements that may cause the rates, terms or conditions of transmission service to become unjust and unreasonable or unduly discriminatory or preferential.[264] As explained in the preceding section, granting incumbent transmission providers a federal right of first refusal with respect to transmission facilities selected in a regional transmission plan for purposes of cost allocation effectively restricts the universe of transmission developers offering potential solutions for consideration in the regional transmission planning process. This is unjust and unreasonable because it may result in the failure to consider more efficient or cost-effective solutions to regional needs and, in turn, the inclusion of higher-cost solutions in the regional transmission plan. It is squarely within our authority under FPA section 206 to correct this deficiency.

285. A federal right of first refusal is, in the language of section 206(a), a "rule, regulation, practice, or contract" affecting the rates for jurisdictional transmission service. Where the Commission finds that such rules, regulations, practices or contracts are "unjust, unreasonable, unduly discriminatory, or preferential," the Commission must determine "the just and reasonable rate, charge, classification, rule, regulation, practice,

[264] *Associated Gas Distributors*, 824 F.2d 981, 1008 (D.C. Cir. 1985).

or contract to be thereafter observed and in force, and shall fix the same by order." In light of our finding above that federal rights of first refusal in favor of incumbent transmission providers deprive customers of the benefits of competition in transmission development, and associated potential savings, the Commission is compelled under section 206(a) to take corrective action here. The court in *CAISO v. FERC* explained that the Commission is empowered under section 206 to assess practices that directly affect or are closely related to a public utility's rates and "not all those remote things beyond the rate structure that might in some sense indirectly or ultimately do so."[265] The Commission here is focused on the effect that federal rights of first refusal in Commission-approved tariffs and agreements have on competition and in turn the rates for jurisdictional transmission services. As explained in greater depth below, these matters fall directly within the ambit of the court's interpretation of a practice affecting rates.

286. In addition, federal rights of first refusal create opportunities for undue discrimination and preferential treatment against nonincumbent transmission developers within existing regional transmission planning processes. The Commission has long recognized that it has a responsibility to consider anticompetitive practices and to

[265] *CAISO v. FERC*, 372 F.3d 395 at 403.

eliminate barriers to competition.[266] Indeed, the Supreme Court has said that "the history of Part II of the Federal Power Act indicates an overriding policy of maintaining competition to the maximum extent possible consistent with the public interest."[267] In requiring the elimination of federal rights of first refusal from Commission-jurisdictional tariffs and agreements, we are acting in accordance with our duty to maintain competition.

287. Eliminating a federal right of first refusal in Commission-jurisdictional tariffs and agreements does not, as some commenters contend, result in the regulation of matters reserved to the states, such as transmission construction, ownership or siting. The reforms are focused solely on public utility transmission provider tariffs and agreements subject to the Commission's jurisdiction. While many commenters indicate that they disagree with these statements, none of them has explained adequately how our actions will override or conflict with state laws or regulations. The Commission acknowledges that there may be restrictions on the construction of transmission facilities by nonincumbent transmission providers under rules or regulations enforced by other jurisdictions. Nothing in this Final Rule is intended to limit, preempt, or otherwise affect state or local laws or regulations with respect to construction of transmission facilities,

[266] *Gulf States Utils. Co.*, 5 FERC ¶ 61,066 at 61,098.

[267] *Otter Tail Power Co. v. United States*, 410 U.S. 366 at 374 (1973).

including but not limited to authority over siting or permitting of transmission facilities. It does not follow that the Commission has no authority to remove such restrictions in the tariffs or agreements subject to its jurisdiction.

288. The Commission disagrees with commenters arguing that the effect of a federal right of first refusal on jurisdictional rates is too tenuous to support action. These commenters argue that the holding of *CAISO v. FERC*,[268] prevents us from treating a federal right of first refusal as a practice that affects transmission rates. In that case, the court held that the Commission has no authority to replace the selection method or membership of the governing board of the California ISO, which had been established under state law.[269] The court found that such internal governance practices were too remote from the California ISO's rate structure to be considered practices that affect rates for purposes of section 206 and, as a result, rejected the Commission's attempt to impose governance requirements that conflicted with state law.[270]

289. Here, however, the Commission is focused on the effect that federal rights of first refusal in Commission-approved tariffs and agreements have on the rates for jurisdictional transmission services and on undue discrimination. This extends well beyond the internal corporate governance matters at issue in *CAISO v. FERC*. The

[268] 372 F.3d 395 at 399.

[269] *CAISO v. FERC*, 372 F.3d 395 at 398.

[270] *Id.* at 403.

federal rights of first refusal at issue in this proceeding can have the effect of limiting the identification and evaluation of potential solutions to regional transmission needs and, as a result, increasing the cost of transmission development that is recovered from jurisdictional customers through rates. The selection of transmission facilities in a regional transmission plan for purposes of cost allocation is therefore, unlike corporate governance matters, directly related to costs that will be allocated to jurisdictional ratepayers.

290. Other commenters rely on *Mo. ex. rel. Southwestern Bell Tel. Co. v. Pub. Serv. Comm'n* for the proposition that, because a utility has a right to recover prudently incurred costs, it has a corollary right to decide whether to incur those costs, which the Commission cannot violate by eliminating a federal right of first refusal. In that case, the court explained that a utility's right to make investment decisions is grounded in the business judgment rule, which prevents courts from substituting their judgment on the prudence of investment decisions for that of corporate directors and officers.[271] Nothing in that case, however, supports a claim to an exclusive right to make investments under a federal right of first refusal, only the need to defer to business judgment when investment decisions are in fact made. In removing a federal right of first refusal from Commission-jurisdictional tariffs and agreements, the Commission is drawing no conclusion regarding

[271] *See Mo. ex. rel. Southwestern Bell Tel. Co. v. Pub. Serv. Comm'n*, 262 U.S. 276, 289 (1923).

the prudence of any investment decision, nor is the Commission seeking to determine which particular entity should construct any particular transmission facility. The effect of these reforms is to allow more types of entities to be considered for potential construction responsibility, not to make choices among those transmission developers or their proposed transmission facilities.

291. The Commission therefore determines that these reforms regarding elimination of federal rights of first refusal from Commission-jurisdictional tariffs and agreements are not prevented by state law or otherwise limited by the FPA. In directing the removal of a federal right of first refusal from Commission-jurisdictional tariffs and agreements, the Commission is not ordering public utility transmission providers to enlarge their transmission facilities under sections 210 or 211 of the FPA, nor making findings related to our authorities under section 215 or 216. Similarly, nothing in our actions today is inconsistent with our obligations under section 217. Indeed, section 217(b)(4) directs the Commission to exercise its authority "in a manner that facilitates the planning and expansion of transmission facilities to meet the reasonable needs of load serving entities to satisfy [their] load serving obligations." Greater participation by transmission developers in the transmission planning process may lower the cost of new transmission facilities, enabling more efficient or cost-effective deliveries by load serving entities and increased access to resources.

292. We decline to address at this time the merits of National Grid's arguments that

section 3.09 of the ISO New England Transmission Operating Agreement establishes a federal right of first refusal that can be modified only if the Commission makes the findings that National Grid contends are required by application of the *Mobile-Sierra* doctrine. [272] We find that the record is not sufficient to address the specific issues raised by National Grid in this generic proceeding. Moreover, we generally do not interpret an individual contract in a generic rulemaking, and we are not persuaded to do so here given the limited record developed so far on section 3.09. Thus, we conclude that these arguments, including National Grid's argument as to the applicable standard of review, are better addressed as part of the proceeding on ISO New England's compliance filing pursuant to this Final Rule, where interested parties may provide additional information.

3. Removal of a Federal Right of First Refusal from Commission-Jurisdictional Tariffs and Agreements

a. Commission Proposal

293. In the Proposed Rule, the Commission sought comment on a framework to eliminate from a transmission provider's OATT or agreements subject to the Commission's jurisdiction provisions that establish a federal right of first refusal for an

[272] In support of its argument, National Grid cites *ISO New England, Inc.*, 109 FERC ¶ 61,147, at P 78 (2004). In that order, the Commission stated, "We will grant Mobile-Sierra treatment, as requested by the Filing Parties. Section 3.09 provides direction to the Transmission Owners and the ISO-NE RTO to follow planning procedures contained in the ISO-NE RTO OATT. As such, this provision will have no adverse impact on third parties or the New England market."

incumbent transmission provider with respect to transmission facilities that are included in a regional transmission plan. The Commission proposed to require each public utility transmission provider to revise its OATT to: (1) establish appropriate qualification criteria for determining an entity's eligibility to propose a project in the regional transmission planning process, whether that entity is an incumbent transmission owner or a nonincumbent transmission developer; (2) include a form by which a prospective project sponsor would provide information in sufficient detail to allow the proposed project to be evaluated in the regional transmission planning process, and provide a single, specified date by which proposals must be submitted; (3) describe a transparent and not unduly discriminatory or preferential process used by the region for evaluating whether to include a proposed transmission facility in a regional transmission plan; (4) remove, along with corresponding changes in any other Commission-jurisdictional agreement, provisions that establish a federal right of first refusal for an incumbent transmission provider and include a description of how the regional transmission planning process provides a right to construct a selected project to the project sponsor, including potential modifications to proposed projects; (5) provide the right to develop a project for a defined period of time if not initially included in a regional transmission plan; and, (6) provide a comparable opportunity for incumbent and nonincumbent

transmission project developers to recover the cost of a transmission facility through a regional cost allocation method.[273]

294. Under this framework, the Commission proposed that neither incumbent nor nonincumbent transmission facility developers should, as a result of a Commission-approved OATT or agreement, receive different treatment in a regional transmission planning process. The Commission stated that both should share similar benefits and obligations commensurate with that participation, including the right, consistent with state or local laws or regulations, to construct and own a transmission facility that it sponsors in a regional transmission planning process and that is selected in the regional transmission plan. The Commission proposed that the tariff changes to implement these proposed reforms would be developed through an open and transparent process involving the public utility transmission provider, its customers, and other stakeholders.

295. Given the interrelated nature of comments regarding the first two and the remaining four elements of the Commission's proposed framework, the Commission groups comments accordingly and then turns to addressing the comments collectively.

b. Comments Regarding Developer Qualification and Project Identification

296. A number of commenters address issues related to the first two aspects of the Commission's proposed framework, governing mechanisms by which entities could

[273] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 90-96.

propose a project in the regional transmission planning process.[274] San Diego Gas & Electric contends that any qualification criteria for potential transmission developers should address all of the technical and financial capabilities necessary for the entity to support the transmission project, if approved, for its expected lifetime, including provisions of security and insurance, as well as other requirements, such as those relating to the proponent's capital structure. Wind Coalition agrees that transmission project developers should be required to satisfy certain financial standards to ensure that they can properly construct and maintain their proposed projects. According to Wind Coalition, the experience of the Competitive Renewable Energy Zones in ERCOT has demonstrated the need for a selection procedure that provides for: clearly defined standards for selection; selection within a reasonable time period; and a definite beginning and ending date to avoid unnecessary delay in selection and construction and to prevent a strategy of delay or gamesmanship.

297. Most commenters that weighed in on this issue urge the Commission not to adopt a one-size-fits-all set of requirements and, instead, allow each region to develop criteria

[274] *E.g.*, American Transmission; Connecticut & Rhode Island Commissions; Federal Trade Commission; Integrys; ISO-NE; Large Public Power Council; MidAmerican; Massachusetts Departments; NEPOOL; New England States Committee on Electricity; New England Transmission Owners; New Jersey Board; NextEra; Northeast Utilities; and Western Independent Transmission Group.

appropriate for the region.[275] A number of commenters, however, encourage the Commission to identify the types of criteria that must be addressed to codify expectations and ensure that all entities are operating under the same requirements.[276] Old Dominion recommends that the following criteria be used to evaluate proposers of projects: financial viability; technical expertise; authority or ability to obtain and meet all necessary regulatory requirements, including condemnation where necessary; and an exit strategy to address how the facilities can or will be transferred if an entity is no longer able to meet financial or other obligations associated with the project. PJM supports a requirement that each project developer demonstrate that it has received up-front authority to site its project from the relevant states because, without such authority, it would be fruitless to designate a project to the prospective project developer. In reply, however, Atlantic Wind Connection disagrees with PJM, instead suggesting that developers receive state siting approval within a reasonable time after selection of the project in a regional transmission plan.

298. While many commenters endorse requiring project developers to meet qualification criteria showing their financing and technical capabilities, some argue that

[275] *E.g.*, New York ISO; Transmission Agency of Northern California; California Commissions; Arizona Public Service Company; Northeast Utilities; and SPP.

[276] *E.g.*, Edison Electric Institute; California ISO; Pacific Gas & Electric; Exelon; Southern California Edison; Southern Companies; PJM; and National Grid.

the rules cannot be one-sided against nonincumbents so as to amount to a backdoor right of first refusal.[277] LS Power states, for example, that an entity that is financially qualified but is deemed to not be technically qualified should be permitted to partner with a technically qualified entity. Pattern Transmission states that, if a transmission provider determines that a project developer does not meet the qualification criteria, it should be required to provide the rationale for that determination to the applicant in writing so that any future attempt to meet the qualification criteria will be better informed. Other commenters express concern that the qualification criteria not be so onerous that they cannot be readily satisfied by existing transmission owners.[278] APPA and Transmission Access Policy Group suggest that qualification criteria be crafted in a way that supports a variety of ownership arrangements, including joint ownership by public power systems.

299. Some commenters oppose or otherwise raise concerns regarding the use of qualification criteria to determine eligibility to propose projects in the regional transmission planning process.[279] PPL Companies state that RTOs do not have experience in evaluating the capabilities of nonincumbent transmission developers and

[277] *E.g.*, Anbaric and PowerBridge; LS Power; and Pattern Transmission; and Primary Power. Anbaric and PowerBridge cite to *New England Indep. Transmission Co., L.L.C.*, 118 FERC ¶ 61,127 (2007).

[278] *E.g.*, New York ISO; Transmission Agency of Northern California; California Commissions; Arizona Public Service Company; Northeast Utilities; and SPP.

[279] *E.g.*, PPL Companies; Indianapolis Power & Light; and Pacific Gas & Electric.

that both the establishment and application of the criteria are likely to result in disputes and litigation. Indianapolis Power & Light states that, because incumbents have existing state obligations to serve, incumbent transmission owners should be deemed to meet any qualification criteria without any additional showing. Pacific Gas & Electric similarly argues that qualification criteria should take into consideration the ability of incumbent transmission owners to provide cost and efficiency benefits that may not be available from a single-project transmission owner, such as in obtaining siting and permitting approvals.

300. Several commenters address the use of a form to obtain information from prospective transmission developers as to projects submitted for evaluation in the regional transmission planning process.[280] LS Power asks the Commission to set forth the requisite project information required in such a form, subject to any region or transmission provider obtaining Commission approval to modify such requirements. California ISO suggests that, notwithstanding its general opposition to the elimination of federal rights of first refusal, any requirements imposed on project developers to submit information in support of a proposal should include the submission of sufficient study results evidencing a *prima facie* case that the project is needed. Exelon contends that project proposals should be required to include technical analyses demonstrating that they

[280] *E.g.*, California ISO; Edison Electric Institute; LS Power; and Transmission Agency of Northern California.

meet the region's requirements and that a developer should not be provided with any priority rights without such supporting documentation. Transmission Agency of Northern California asks the Commission to clarify that the evaluation form should be developed in the regional transmission planning process and that a project developer would not be required to submit separate and distinct forms to each public utility transmission provider that participates in a given regional transmission planning process.

301. LS Power supports the proposal for public utility transmission providers to identify a specified date by which to submit proposed transmission projects, generally arguing that a submission deadline would promote orderly and fair consideration of projects.[281] Others oppose the proposal, generally arguing that existing transmission planning processes are iterative in nature.[282] For example, New England States Committee on Electricity states that establishing such a deadline could have the unintended consequence of discouraging discussion of emerging needs and alternative ways to meet them. It suggests that the Commission leave such procedural matters to the regions for consideration. Some commenters express concern that the Commission's proposal invites gaming, creating an incentive to propose a host of projects so that

[281] *E.g.*, LS Power.

[282] *E.g.*, Edison Electric Institute; California ISO; ISO New England; NEPOOL; Northeast Utilities; New England States Committee on Electricity; and National Rural Electric Coops.

individual entities may obtain their own time-based rights of first refusal to develop proposals.[283] LS Power disagrees in reply, arguing that such concerns could be addressed by requiring transmission developers to post a reasonable deposit, which could be based in part on the total estimated cost to develop the annual plan and the number of transmission projects evaluated in the plan, to avoid new projects being filed in an effort to prevent others from developing them.

c. Comments Regarding Project Evaluation and Selection

302. Commenters also address the remaining four aspects of the Commission's proposed framework for eliminating federal rights of first refusal, relating to mechanisms to evaluate, select and recover the costs of projects proposed in the regional transmission planning process. Most commenters support the proposal that each public utility transmission provider participate in a regional transmission planning process that evaluates the proposals submitted through a transparent and not unduly discriminatory or preferential process.[284] For example, Duke and National Grid state that existing regional

[283] *E.g.*, Edison Electric Institute; Exelon; MISO Transmission Owners; California ISO; ISO New England; NEPOOL; Northeast Utilities; New England States Committee on Electricity; and National Rural Electric Coops.

[284] *E.g.*, Federal Trade Commission; PUC of Nevada; Massachusetts Departments; New England States Committee on Electricity; California Commissions; Connecticut & Rhode Island Commissions; LS Power; FirstWind; National Grid; Western Independent Transmission Group; Transmission Agency of Northern California; Northern California

(continued…)

transmission planning processes already evaluate proposed projects through an open process described in the relevant public utility transmission providers' OATTs.

303. Several commenters suggest that regional flexibility is needed when determining the procedures by which transmission projects are evaluated and selected.[285] For example, Connecticut & Rhode Island Commissions and Massachusetts Departments state that ensuring equal rights and obligations of incumbent and nonincumbent transmission developers would raise a number of questions that will need to be addressed through the stakeholder process, including how projects and developers are selected, how non-transmission alternatives will be evaluated, how rights of way are negotiated, and how to address cost overruns. They state that the Final Rule should recognize the many issues that would arise following the proposed change and allow the stakeholder process flexibility to identify and develop solutions to these challenges. Western Independent Transmission Group suggests the use of an independent third-party observer may be necessary to oversee the evaluation and selection of competing transmission projects to give market participants and the Commission assurance that the process is fairly and efficiently managed.

Power Agency; Pattern Transmission; American Transmission; California State Water Project; Anbaric and PowerBridge; PPL Companies; Green Energy and 21st Century; Duke; and Old Dominion.

[285] *E.g.*, Connecticut & Rhode Island Commissions; National Grid; New England States Committee on Electricity; KCP&L; Edison Electric Institute; and WIRES.

304. A number of commenters characterize the Commission's proposal as implementing a sponsorship model that conflicts with the collaborative nature of current transmission planning processes.[286] North Dakota & South Dakota Commissions state that the sponsorship paradigm will turn current transmission planning processes into an unmanageable free for all, undermining the effective evaluation of potential transmission solutions. Integrys and Southern Companies contends that sponsorship rights may do more harm than good and will defeat the objective of an orderly and systematic planning and construction process, increasing disputes, creating queuing problems, disrupting existing OATT processes, harming reliability, and resulting in a loss of flexibility. Baltimore Gas & Electric argues that those that want to claim sponsorship rights also do not want to provide the RTO with discretion to deny their claim and that such entities could tie up transmission construction as long as they want until they ensure they are the builders. National Rural Electric Coops suggest that the Commission convene a technical conference to address complex implementation issues.

305. Southern Companies also question how transmission proposals submitted by nonincumbent transmission providers should be evaluated in the regional transmission planning process. Southern Companies state that the Proposed Rule could be viewed as

[286] *E.g.*, Baltimore Gas & Electric; Edison Electric Institute; Integrys; MISO Transmission Owners; North Dakota & South Dakota Commissions; PSEG Companies; PPL Companies; and Southern Companies.

permitting any qualified entity to sponsor projects at the regional level, where a "black box" evaluation process would be applied to determine the "winners." Southern Companies suggest that nonincumbent transmission developers be treated similarly to the integration of merchant generation so that state law would not be undermined. That is, Southern Companies recommend that, if a nonincumbent transmission developer has a proposal that the incumbent utility believes to be cost-effective and reliable, that developer would have to join with Southern Companies to petition the relevant state regulatory authorities for approval for construction and rate recovery.

306. Some commenters argue that the Commission should not require development of mechanisms that provide construction rights to nonincumbent transmission developers seeking to develop projects solely within an existing transmission owner's footprint or that use rights-of-way held by existing transmission owners.[287] For example, Edison Electric Institute asks the Commission to clarify that only an incumbent transmission owner should be allowed to propose local, single system facilities that are simply rolled up into a regional plan, as well as upgrades or modifications to facilities owned by an incumbent transmission provider, including reconductoring, tower change outs, additional facilities in existing substations, facilities in a right of way owned by the

[287] *E.g.*, Anbaric and PowerBridge; California Municipal Utilities; Edison Electric Institute; Exelon; Imperial Irrigation District; LS Power; PJM; and Southern California Edison.

incumbent, and new substations cut into existing lines. It argues that allowing nonincumbent transmission developers to perform upgrades to an incumbent transmission owner's transmission facilities could delay upgrades necessary to maintain system reliability and increase the costs of constructing and maintaining such transmission facilities. PJM agrees, arguing that existing transmission owners are in the best position to use their own resources. Imperial Irrigation District expresses concern regarding the potential impact of the Proposed Rule on contractual rights in existing joint ownership and operation agreements governing existing facilities. LS Power cautions that, to the extent the Commission provides for the retention of federal rights of first refusal for existing facilities, the limitations of such an exclusion must be clearly described in the OATT.

307. A number of commenters suggest that the Commission modify the proposal for sponsors of proposed transmission projects to retain the right to build projects of a similar scope for a defined period of time.[288] Bonneville Power states that this proposed reform creates the potential for increased litigation to determine whether an incumbent transmission owner's project is substantially similar to a previously proposed non-incumbent transmission developer's project. Xcel and others[289] contend that selection

[288] *E.g.*, California Municipal Utilities; Exelon; LS Power; Northern Tier Transmission Group; and Transmission Agency of Northern California.

[289] *E.g.*, Duke; PPL Companies; MidAmerican; and North Dakota and South

(continued…)

among similar projects for inclusion in the regional transmission plan is inherently subjective and, therefore, determining whether a project is a modification of a previously proposed project or sufficiently different to be considered a new project would be difficult. National Rural Electric Coops ask the Commission to clarify that the proposal does not prevent an incumbent transmission provider from making minor modifications to a competing transmission project to better meet the needs of the participants in the process.

308. Some commenters argue that the Commission should implement competitive bidding processes for selecting project developers instead of relying on a sponsor-based mechanism for determining construction rights.[290] For example, Transmission Access Policy Study Group contends that competitive bidding yields lower costs to consumers, includes mechanisms to limit cost overruns, and restricts the ability of winning bidders to transfer construction rights. It suggests that any competitive bidding process employed by the Commission favor projects that are jointly owned. California ISO states that its competitive solicitation framework for economic and public policy transmission projects meets the Commission's goals of ensuring development of cost-effective transmission facilities, providing ratepayer benefits, optimizing participation in the transmission

---

Dakota Commissions.

[290] *E.g.*, Transmission Access Policy Study Group; Pattern Transmission; and Indianapolis Power & Light.

planning process, and providing opportunities for nonincumbent transmission developers, although California ISO opposes the use of competitive solicitations for reliability projects. Edison Electric Institute and Ad Hoc Coalition of Southeastern Utilities contend that mandating competitive bidding would undermine existing transmission planning processes and allow nonincumbent developers to bid selectively only for advantageous projects. Pattern Transmission responds that such "cherry picking" concerns can be addressed through properly structured competitive bidding processes.

309. With regard to the period for which development rights could be retained, LS Power recommends that a transmission developer that sponsors a transmission project be permitted to retain the right to build or build and own the transmission project for a minimum of five years, while California Municipal Utilities suggest a period of two years. Others express concern with the impact of the Commission's proposal, generally arguing such a policy would encourage entities to submit multiple proposals to maximize potential development opportunities.[291] For example, National Rural Electric Coops suggest this would create an approach to transmission planning in which immutable transmission proposals compete against each other in a form of baseball arbitration (in which the arbitrator must pick one side's offer without modification), even if minor

[291] *E.g.*, Connecticut & Rhode Island Commissions; Indianapolis Power & Light; Indicated PJM Transmission Owners; Massachusetts Departments; National Rural Electric Coops; and Oklahoma Gas & Electric.

changes to one or more of the proposals would allow them to better meet the needs of consumers in the region. LS Power and Transmission Agency of Northern California disagree, arguing that objective rules can be established to identify when a modified project is the functional equivalent of a sponsored project.

310. Arizona Corporation Commission stresses that, in all cases, proposed transmission projects resubmitted for consideration must be freshly evaluated in each transmission planning cycle so that projects address current needs and requirements. Northern Tier Transmission Group recommends that a project that is not selected in the regional transmission plan must have similar performance characteristics and costs when resubmitted for consideration. California Municipal Utilities argue that a project sponsor should not receive a priority right during resubmission if the transmission project sponsor is only interested in selling that right.

311. Some commenters seek clarification of the obligations that would be imposed on nonincumbent transmission developers as a result of selection of its project for construction.[292] MISO Transmission Owners and New York Transmission Owners contend that, if the proposed reforms are implemented, the Commission should make clear that a nonincumbent transmission developer's right to participate in the

[292] *E.g.*, New York Transmission Owners; Edison Electric Institute; MISO Transmission Owners; Southern Companies; and Transmission Agency of Northern California.

transmission planning process must be accompanied by an obligation that it satisfy all the requirements expected of transmission developers in the regional transmission planning process. MISO Transmission Owners state that this clarification is particularly important because institutional investors may seek to invest in transmission facilities to earn the stable return on their investment that a rate-regulated business would provide but have no intention to become public utilities once the facility is placed into service and put under the functional control of an RTO. Minnesota PUC and Minnesota Office of Energy Security suggest that winning transmission projects, regardless of ownership type, should be subject to regulatory scrutiny to make sure that when completed the transmission project fulfills the needs initially ascribed to it and that the transmission project costs are consistent with the cost levels initially proposed.

312. Finally, commenters also address whether the selection of a transmission facility proposed by a nonincumbent transmission developer for inclusion in the regional transmission plan should be eligible for regional cost allocation.[293] Massachusetts Departments and Connecticut & Rhode Island Commissions agree with the basic principle, but argue that recovery should be determined by project criteria and not on the

[293] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; FirstEnergy Service Company; MISO Transmission Owners; New York ISO; Old Dominion; and SPP.

basis of the type of developer proposing the project. SPP and Old Dominion support the proposal, provided that the nonincumbent transmission developer is subject to the same responsibilities as incumbent transmission owners pursuant to the transmission planning requirements. MISO Transmission Owners raise the possibility that a nonincumbent project selected in the regional transmission planning process may be rejected by a state agency in favor of an incumbent transmission owner and question whether under this scenario an incumbent transmission owner would be required to build the project but would not be eligible for regional cost recovery. Ad Hoc Coalition of Southeastern Utilities assert that the proposal may conflict with state-based mandates, explaining that the majority of transmission costs in the Southeast are incurred to serve native load, and are included in rates established pursuant to state or local regulation.

d. Commission Determination

313. The Commission directs public utility transmission providers, subject to the modifications to the Proposed Rule discussed below and subject to the framework discussed and adopted below, to eliminate provisions in Commission-jurisdictional tariffs and agreements that establish a federal right of first refusal for an incumbent transmission provider with respect to transmission facilities selected in a regional transmission plan for purposes of cost allocation.

314. As explained in the preceding sections, the elimination of federal rights of first refusal from Commission-jurisdictional tariffs and agreements is necessary and

appropriate to ensure that rates for jurisdictional services are just and reasonable. However, based on the comments received in response to the Proposed Rule, the Commission modifies the specific requirements placed on public utility transmission providers to implement the proposal and provides clarification regarding those requirements to facilitate compliance.[294]

315. To place our actions in context, the Commission reiterates the existing requirements of Order No. 890 as implemented by public utility transmission providers. As noted by commenters, Order No. 890 already requires public utility transmission providers to have in place processes for evaluating the merits of proposed transmission solutions offered by potential developers.[295] To ensure comparable treatment of all resources, the Commission has required public utility transmission providers to include in their OATTs language that identifies how they will evaluate and select among competing solutions and resources.[296] This includes the identification of the criteria by which the

[294] The requirements adopted here apply only to public utility transmission providers that have provisions in their tariffs or other Commission-jurisdictional agreements granting a federal right of first refusal that is inconsistent with the requirements of this Final Rule. If no such provisions are contained in a public utility transmission provider's tariff or other Commission-jurisdictional agreement, it should state so in its compliance filing.

[295] *See* Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 494; Order No. 890-A, FERC Stats. & Regs. ¶ 61,297 at P 215-16.

[296] *See, e.g.*, *New York Independent System Operator, Inc.*, 129 FERC ¶ 61,044 at P 35.

public utility transmission provider will evaluate the relative economics and effectiveness of performance for each alternative offered for consideration.[297] Given that the regions already have processes in place to evaluate competing transmission projects in their transmission planning process, the fundamental question raised in the Proposed Rule is whether additional requirements are needed to ensure that these processes are not adversely affected by federal rights of first refusal. The Commission concludes that such requirements are necessary and, accordingly, adopts the framework set forth in the Proposed Rule with modification.

316. Opponents of the Commission's proposed elimination of federal rights of first refusal argue that this framework represents a fundamental shift in the way that transmission is planned in existing regional processes. These commenters contend that characterizing existing transmission owners as developers of sponsored transmission facilities that are to be evaluated on a comparable basis to proposals submitted by nonincumbent transmission developers transforms, in their view, the collaborative and iterative transmission planning process into a sponsorship-driven competition for new investment opportunities. As we explain elsewhere, the reforms adopted in this Final Rule build upon the requirements of Order No. 890 with respect to transmission planning. Public utility transmission providers already have put in place mechanisms to provide for

[297] *Id.*

comparative evaluation of competing solutions. We recognize that the mechanisms for evaluating proposals under this Final Rule will have greater implications because we are also requiring a just and reasonable and not unduly discriminatory process to grant to a transmission developer the ability to use the regional cost allocation method associated with each transmission facility selected in the regional transmission plan for purposes of cost allocation. However, we disagree that the reforms in the Proposed Rule, as modified herein, will make the planning process unmanageable, as suggested by some commenters.

317. Some of the concerns expressed by commenters appear to be driven by the phrasing used in the Proposed Rule to present the framework for removing federal rights of first refusal. There, the Commission stated that both incumbent and nonincumbent transmission developers should share similar benefits and obligations, including the right, consistent with state or local laws or regulations, to construct and own a transmission facility that it sponsors in a regional transmission planning process and that is selected in the regional transmission plan.[298] The Commission's focus in the Proposed Rule on sponsorship of proposed transmission facilities, whether by incumbent transmission providers or nonincumbent transmission developers, appears to have led many commenters to conclude that every transmission facility being planned by an incumbent transmission provider is, in effect, sponsored by that entity and, therefore, could no

[298] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 93.

longer be subject to a federal right of first refusal. The Commission clarifies that this was not the intent of the Proposed Rule, nor is it the intent of the requirements adopted in this Final Rule.

318. The Commission's focus here is on the set of transmission facilities that are evaluated at the regional level and selected in the regional transmission plan for purposes of cost allocation.[299] As Edison Electric Institute notes, in those regions relying on "bottom up" local transmission planning, a transmission facility that is in a public utility transmission provider's local transmission plan might be "rolled-up" and listed in a regional transmission plan to facilitate analysis at the regional level. However, the transmission facility from the local transmission plan might not have been proposed in the regional transmission planning process and might not have been selected in the regional transmission plan for purposes of cost allocation by going through an analysis in the regional transmission planning process. The Commission does not, in this Final Rule, require removal from Commission-jurisdictional tariffs and agreements of a federal right of first refusal as applicable to a local transmission facility, as that term is defined

[299] In order for a transmission facility to be eligible for the regional cost allocation methods, the region must select the transmission facility in the regional transmission plan for purposes of cost allocation. For those facilities not seeking cost allocation, the region may nonetheless have those transmission facilities in its regional transmission plan for information or other purposes, and then having such a facility in the plan would not trigger regional cost allocation.

herein.[300] .

319. In addition, the Proposed Rule emphasized that our reforms do not affect the right of an incumbent transmission provider to build, own and recover costs for upgrades to its own transmission facilities, such as in the case of tower change outs or reconductoring, regardless of whether or not an upgrade has been selected in the regional transmission plan for purposes of cost allocation.[301] In other words, an incumbent transmission provider would be permitted to maintain a federal right of first refusal for upgrades to its own transmission facilities. In addition, the Commission affirms that proposal here, and in response to commenters adds that our reforms are not intended to alter an incumbent transmission provider's use and control of its existing rights-of-way. That is, this Final Rule does not remove or limit any right an incumbent may have to build, own and recover costs for upgrades to the facilities owned by an incumbent, nor does this Final Rule grant or deny transmission developers the ability to use rights-of-way held by other entities, even if transmission facilities associated with such upgrades or uses of existing rights-of-way are selected in the regional transmission plan for purposes of cost allocation. The retention, modification, or transfer of rights-of-way remain subject to relevant law or regulation granting the rights-of-way.

---

[300] *See* definition *supra* section II.D of this Final Rule.

[301] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 97.

320. Through the reforms to regional planning required in this Final Rule, the Commission is seeking to ensure that a robust process is in place to identify and consider regional solutions to regional needs, whether initially identified through "top down" or "bottom up" transmission planning processes. Combined with the cost allocation and other reforms adopted in this Final Rule, implementation of this framework to remove federal rights of first refusal will address disincentives that may be impeding participation by nonincumbent transmission developers in the regional transmission planning process. The extent to which any existing regional transmission planning process must be changed to implement the framework set forth below will depend on the mechanisms used by the region to evaluate competing transmission projects and developers.

321. For example, this Final Rule permits a region to use or retain an existing mechanism that relies on a competitive solicitation to identify preferred solutions to regional transmission needs, and such an existing process may require little or no modification to comply with the framework adopted in this Final Rule.[302] In regions

[302] For example, the Commission has found that competitive solicitation processes can provide greater potential opportunities for independent transmission developers to build new transmission facilities. *See, e.g.*, *California Indep. Sys. Operator*, 133 FERC ¶ 61,224 (2010). However, the Commission declines to adopt commenter suggestions to mandate a competitive bidding process for selecting project developers. While the Commission agrees that a competitive process can provide benefits to consumers, we continue to allow public utility transmission providers within each region to determine for themselves, in consultations with stakeholders, what mechanisms are most appropriate to evaluate and select potential transmission solutions to regional needs.

relying primarily on “top down” mechanisms pursuant to which regional planners independently identify regional needs and more efficient and cost-effective solutions, existing procedures that allow for stakeholders to offer potential solutions for consideration could provide a foundation for implementing the framework below. In other regions emphasizing the development of local transmission plans prior to analysis at the regional level of alternative solutions, additional procedures may be required to distinguish between those transmission facilities that are proposed to be selected in the regional transmission plan for purposes of cost allocation and those that are merely “rolled up” for other purposes.

322. The Commission concludes that the framework adopted below provides sufficient flexibility for public utility transmission providers in each region to determine, in the first instance, how best to address the removal of federal rights of first refusal from Commission-jurisdictional tariffs and agreements. Because we are allowing for regional flexibility and encouraging stakeholders to participate fully in the implementation of this framework by public utility transmission providers, we decline to decide in this Final Rule to convene a technical conference to further explore issues related to federal rights of first refusal, as suggested by some commenters. With the foregoing background in mind, the Commission turns to the specific requirements of this framework below.

i. Qualification Criteria to Submit a Transmission Project for Selection in the Regional Transmission Plan for Purposes of Cost Allocation

323. First, the Commission requires each public utility transmission provider to revise its OATT to demonstrate that the regional transmission planning process in which it participates has established appropriate qualification criteria for determining an entity's eligibility to propose a transmission project for selection in the regional transmission plan for purposes of cost allocation, whether that entity is an incumbent transmission provider or a nonincumbent transmission developer. These criteria must not be unduly discriminatory or preferential. The qualification criteria must provide each potential transmission developer the opportunity to demonstrate that it has the necessary financial resources and technical expertise to develop, construct, own, operate and maintain transmission facilities.

324. The Commission agrees with commenters that qualification criteria are necessary, and that adoption of one-size-fits-all requirements would not be appropriate. It is important that each transmission planning region have the flexibility to formulate qualification criteria that best fit its transmission planning processes and addresses the particular needs of the region. Such criteria could address a range of issues raised by commenters, such as commitments to be responsible for operation and maintenance of a

transmission facility.[303] The Commission stresses, however, that appropriate qualification criteria should be fair and not unreasonably stringent when applied to either the incumbent transmission provider or nonincumbent transmission developers. The qualification criteria should allow for the possibility that an existing public utility transmission provider already satisfies the criteria and should allow any transmission developer the opportunity to remedy any deficiency. Within these general parameters, we leave it to each region to develop qualification criteria that are workable for the region, including procedures for timely notifying transmission developers of whether they satisfy the region's qualification criteria and opportunities to mitigate any deficiencies.[304]

---

[303] The Commission notes, however, that nothing in the qualification requirement of this Final Rule precludes a transmission developer from entering into voluntary arrangements with third parties, including any interested incumbent transmission provider, to operate and maintain a transmission facility. Similarly, nothing this Final Rule creates an obligation for an incumbent transmission provider to operate and maintain a transmission facility developed by another transmission developer. Additionally, nothing in the qualifications requirement of this Final Rule is intended to change any existing RTO or ISO procedure or practice regarding the operation of one or more existing transmission facilities.

[304] To be clear, the qualification criteria required herein should not be applied to an entity proposing a transmission project for consideration in the regional transmission planning process if that entity does not intend to develop the proposed transmission project. The Order No. 890 transmission planning requirements allow any stakeholder to

(continued…)

ii. Submission of Proposals for Selection in the Regional Transmission Plan for Purposes of Cost Allocation

325. Second, the Commission requires that each public utility transmission provider revise its OATT to identify: (a) the information that must be submitted by a prospective transmission developer in support of a transmission project it proposes in the regional transmission planning process; and (b) the date by which such information must be submitted to be considered in a given transmission planning cycle. The Commission declines to adopt the proposal to require a specific form to be developed for the purpose of submitting this information, given that the data to be submitted may not be easily reduced to entries on a form. To ensure consistency in the region, however, the Commission requires each public utility transmission provider that has its own OATT to have in that OATT the same information requirements as other public utility transmission providers in the same transmission planning region, as requested by Transmission Agency of Northern California.

326. These information requirements must identify in sufficient detail the information necessary to allow a proposed transmission project to be evaluated in the regional transmission planning process on a basis comparable to other transmission projects that

---

request that the transmission provider perform an economic planning study or otherwise suggest consideration of a particular transmission solution in the regional transmission planning process.

are proposed in the regional transmission planning process. They may require, for example, relevant engineering studies and cost analyses and may request other reports or information from the transmission developer that are needed to facilitate evaluation of the transmission project in the regional transmission planning process. Beyond these minimum requirements, the Commission provides each region with discretion to identify the information to be required, so long as such requirements are fair and not so cumbersome as to effectively prohibit transmission developers from proposing transmission projects, yet not so relaxed that they allow for relatively unsupported proposals. Whether the region wishes to require *prima facie* showings of need for a project, as suggested by the California ISO, should be addressed in the first instance by public utility transmission providers in consultation with stakeholders within the region. The Commission will review the resulting information requirements on compliance and provide further guidance at that time, if necessary.

327. The Commission disagrees that requiring the identification of a date by which information must be submitted for consideration in a given transmission planning cycle undermines the iterative nature of transmission planning or amounts to creation of a time-based federal right of first refusal. Without some reasonable limitation on the submission of new information, public utility transmission providers would never be able to complete the analysis needed to complete their region's transmission plan. However, each region may determine for itself what deadline is appropriate, including potentially the use of

rolling or flexible dates to reflect the iterative nature of their transmission planning processes. Given our decision to eliminate the proposed ongoing right to develop previously-sponsored transmission projects, the Commission believes it is not necessary to require here additional procedural protections such as the posting of deposits, as suggested by LS Power. To the extent stakeholders in a particular region believe such procedures have merit, they may consider them during the development of OATT proposals that comply with the requirement of this Final Rule.

iii. Evaluation of Proposals for Selection in the Regional Transmission Plan for Purposes of Cost Allocation

328. Third, the Commission requires each public utility transmission provider to amend its OATT to describe a transparent and not unduly discriminatory process for evaluating whether to select a proposed transmission facility in the regional transmission plan for purposes of cost allocation. This process must comply with the Order No. 890 transmission planning principles, ensuring transparency, and the opportunity for stakeholder coordination. The evaluation process must culminate in a determination that is sufficiently detailed for stakeholders to understand why a particular transmission project was selected or not selected in the regional transmission plan for purposes of cost allocation. In complying with this requirement, the Commission encourages public utility transmission providers to build on existing regional transmission planning processes that, consistent with Order Nos. 890 and 890-A, already set forth the criteria by

which the public utility transmission provider evaluates the relative economics and effectiveness of performance for alternative solutions offered during the transmission planning process.

329. In light of comments received in response to the Proposed Rule, we also require each public utility transmission provider to amend its OATT to describe the circumstances and procedures under which public utility transmission providers in the regional transmission planning process will reevaluate the regional transmission plan to determine if delays in the development of a transmission facility selected in a regional transmission plan for purposes of cost allocation require evaluation of alternative solutions, including those proposed by the incumbent transmission provider, to ensure the incumbent transmission provider can meet its reliability needs or service obligations. We appreciate that there are many sources of delay that could affect the timing of transmission development, and do not intend to require constant reevaluation of delays that do not materially affect the ability of an incumbent transmission provider to meet its reliability needs or service obligations. Our focus here is on ensuring that adequate processes are in place to determine whether delays associated with completion of a transmission facility selected in a regional transmission plan for purposes of cost allocation have the potential to adversely affect an incumbent transmission provider's ability to fulfill its reliability needs or service obligations. Under such circumstances, an incumbent transmission provider must have the ability to propose solutions that it would

implement within its retail distribution service territory or footprint that will enable it to meet its reliability needs or service obligations. If such other solution is a transmission facility, public utility transmission providers in the regional transmission planning process should evaluate the proposed solution for possible selection in the regional transmission planning process for purposes of cost allocation. As we have explained elsewhere in this Final Rule,[305] nothing herein restricts an incumbent transmission provider from developing a local transmission solution that is not eligible for regional cost allocation to meet its reliability needs or service obligations in its own retail distribution service territory or footprint.

330. The Commission appreciates that the selection of any transmission facility in the regional transmission plan for purposes of cost allocation requires the careful weighing of data and analysis specific to each transmission facility and, in some instances, may be difficult or contentious. While the Commission appreciates the challenges presented by such an evaluation, the requirement to engage in a comparative analysis of proposed solutions to regional needs has been in place since Order No. 890. The Commission encourages public utility transmission providers to consider ways to minimize disputes, such as through additional transparency mechanisms, as they identify enhancements to

[305] *See supra* P 256

regional transmission planning processes necessary to comply with this Final Rule.[306] The Commission declines, however, to mandate the use of independent third-party observers, as suggested by Western Independent Transmission Group. To the extent public utility transmission providers in consultation with other stakeholders in a region wish, they may propose to use an independent third-party observer and we will review any such proposal on compliance.

331. By requiring the evaluation of proposed transmission solutions in the regional transmission planning process, the Commission is not dictating that any particular proposals be accepted or that selected transmission facilities be constructed. Similar to the planning requirements of Order No. 890, the Commission requires the establishment of processes to evaluate potential solutions to regional transmission needs, with the input of interested parties and stakeholders. Whether or not public utility transmission providers within a region select a transmission facility in the regional transmission plan for purposes of cost allocation will depend in part on their combined view of whether the transmission facility is an efficient or cost-effective solution to their needs.[307] Moreover,

[306] Additionally, as described in section III.A, the requirements of the dispute resolution principle order of Order No. 890 apply to the regional transmission planning process as reformed by this Final Rule.

[307] As noted above, for one solution to be chosen over another in the regional transmission planning process, there should be an evaluation of the relative efficiency

(continued…)

the Commission anticipates that the processes for evaluating whether to select a proposed transmission facility in the regional transmission plan for purposes of cost allocation will vary from region to region, just as other aspects of the regional transmission planning processes may vary.

iv. Cost Allocation for Projects Selected in the Regional Transmission Plan for Purposes of Cost Allocation

332. The Commission also requires that a nonincumbent transmission developer must have the same eligibility as an incumbent transmission developer to use a regional cost allocation method or methods for any sponsored transmission facility selected in the regional transmission plan for purposes of cost allocation. More specifically, each public utility transmission provider must participate in a regional transmission planning process that provides that the nonincumbent developer has an opportunity comparable to that of an incumbent transmission developer to allocate the cost of such transmission facility through a regional cost allocation method or methods. As explained further in section IV.C, the cost of a transmission facility that is not selected in a regional transmission plan for purposes of cost allocation, whether proposed by an incumbent or by a nonincumbent transmission provider, may not be recovered through a transmission planning region's

---

and cost-effectiveness of each solution. If a nonincumbent transmission developer is unable to demonstrate that its proposal is the most efficient or cost-effective, given all aspects of its proposal, then it is unlikely to be selected as the preferred transmission solution within the regional transmission planning process for purposes of cost allocation.

cost allocation method or methods.

333. In the Proposed Rule, the Commission acknowledged that a proposed transmission project can be modified in the regional transmission planning process as needs and potential solutions are analyzed and, therefore, sought comment on whether to require a mechanism to identify the most similar project to one initially proposed to determine which developer should have the right to construct and own the facility. Although the Commission raised this issue in the context of processes of construction rights, similar issues are raised regarding the selection of a transmission facility in the regional transmission plan for purposes of cost allocation.

334. In light of the comments received in response to this aspect of the Proposed Rule, we are concerned that the proposed requirement to identify the most similar project to one initially proposed could conflict with the way potential solutions are evaluated and selected in some regions. For example, a requirement to identify proposals that are "most similar" to transmission projects in the regional transmission plan may be meaningless in a region that relies on market proposals or competitive solicitations to identify solutions to the region's needs. In other regions that rely on voluntary construction decisions for transmission facilities in a regional transmission plan, the linking of rights to construct to a determination of similarity may be meaningless. As discussed in the next section, in response to concerns such as these, we have decided not to adopt the proposal that would give a sponsor the federal right to construct and own a transmission facility it sponsored

consistent with state or local laws or regulations. Given this change, we do not adopt the proposal to require a mechanism to identify the most similar project to one initially proposed to determine which developer should have the right to construct and own the facility.

335. Instead, we adopt and clarify the requirement that a nonincumbent transmission developer of a transmission facility selected in the regional transmission plan for purposes of cost allocation have the same opportunity as an incumbent transmission developer to allocate the cost of such transmission facilities through a regional cost allocation method or methods. We require that each public utility transmission provider must participate in a regional transmission planning process that makes each transmission facility selected in the regional transmission plan for purposes of regional cost allocation eligible for such cost allocation. In other words, eligibility for regional cost allocation is tied to the transmission facility's selection in the regional transmission plan for purposes of cost allocation and not to a specific sponsor.

336. We also require that public utility transmission providers in a region establish, in consultation with stakeholders, procedures to ensure that all projects are eligible to be considered for selection in the regional transmission plan for purposes of cost allocation. This mechanism could be, for example, a non-discriminatory competitive bidding process. The mechanism a regional planning process implements could also allow the sponsor of a transmission project selected in the regional transmission plan for purposes

of cost allocation to use the regional cost allocation method associated with the transmission project. In that case, however, the regional transmission planning process would also need to have a fair and not unduly discriminatory mechanism to grant to an incumbent transmission provider or nonincumbent transmission developer the right to use the regional cost allocation method for unsponsored transmission facilities selected in the regional plan for purposes of cost allocation. There may also be other mechanisms, or combinations of mechanisms, that may comply with our requirements.

337. The Commission declines commenter requests to further define the particular obligations and responsibilities that may flow from selection of a nonincumbent transmission developer's proposal in the regional transmission plan for purposes of cost allocation. Nothing in this Final Rule is intended to change or limit any obligations that would apply to a nonincumbent transmission developer under state or local laws or under RTO or ISO agreements.

v. Rights to Construct and Ongoing Sponsorship

338. The Proposed Rule also sought comment on whether to include two additional features in a framework to implement the elimination of federal rights of first refusal: whether to require public utility transmission providers to revise their OATTs to contain a regional transmission planning process that provides a right to construct and own a transmission facility; and, whether to allow a transmission developer to maintain for a defined period of time its right to build and own a transmission project that it proposed

but that is not selected.[308] The Commission declines to adopt these aspects of the Proposed Rule.

339. In the preceding sections, the Commission adopted a framework in which, upon selection of a transmission facility in a regional transmission plan for purposes of cost allocation, the developer of that transmission facility (whether incumbent or nonincumbent) will have the ability to rely on the relevant cost allocation method or methods within the region should it desire to move forward with its transmission project. Nothing in this Final Rule preempts or limits any obligations or requirements that a nonincumbent transmission developer may be subject to under state or local laws or regulations or under RTO or ISO agreements.

340. With regard to ongoing sponsorship rights, the Commission concludes on balance that granting transmission developers an ongoing right to build sponsored transmission projects could adversely impact the transmission planning process, potentially leading to transmission developers submitting a multitude of possible transmission projects simply to acquire future development rights. The Commission appreciates that not granting such a right causes some risk for transmission developers in disclosing their transmission projects for consideration in the regional transmission planning process. That risk is outweighed, however, by the potentially negative impacts such a rule could have on

[308] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 95.

regional transmission planning.

4. Reliability Compliance Obligations of Transmission Developers

a. Comments Regarding Reliability Obligations

341. PSEG Companies and Indianapolis Power & Light contend that it is unclear how compliance with NERC reliability standards would be managed and whether and to what extent a third-party developer would be responsible for NERC compliance, coordination of outages, and whether it would need to become a member or transmission owner in an RTO. PSEG Companies also assert that third party developers are not regulated by state commissions and are not subject to state law obligations with respect to reliability and safety or state law oversight of their operations. Salt River Project argues that mandatory compliance with NERC reliability standards places added pressure on transmission owners and operators to be involved in every stage of planning, construction, and obligation. It asserts that the Proposed Rule was silent as to whether the proposed rules might work with respect to nonincumbent developers that are subsidized for the project but who then may not be interested or qualified to operate or own the facility, let alone comply with reliability standards. Indianapolis Power & Light also expresses concern that questions will remain regarding whether and to what extent a nonincumbent transmission developer is required to comply with NERC reliability standards. Other commenters respond that incumbent transmission owners and nonincumbent transmission

developers are subject to and have to meet the same reliability standards.[309]

b. Commission Determination

342. As discussed in section III.B.3 above, the Commission concludes that potentially increasing the number of asset owners through the elimination of a federal right of first refusal in Commission-jurisdictional tariffs and agreements does not, by itself, make it more difficult for system operators to maintain reliability. The Commission acknowledges, however, that a proposed transmission facility's impact on reliability is an important factor that is considered during evaluation of a proposed transmission facility for potential selection. We note that, when a nonincumbent transmission developer becomes subject to the requirements of FPA section 215 and the regulations thereunder, it will be required to comply with all applicable reliability obligations, as every other registered entity is required. As part of that process, all entities, incumbent and nonincumbents alike, that are users, owners or operators of the electric bulk power system must register with NERC for performance of applicable reliability functions.

343. However, if there are still concerns regarding the lack of clarity as to when compliance with NERC registration and reliability standards would be triggered, we conclude that the appropriate forum to raise these questions and request clarification is

[309] *E.g.*, City of Santa Clara; Federal Trade Commission; NextEra; Northern California Power Agency; Pattern Transmission; and Western Independent Transmission Group.

the NERC process.

344. The Commission is sensitive to the concerns of some commenters that contend that existing transmission providers run the risk of violating NERC reliability standards in the event that a nonincumbent transmission developer abandons a transmission facility meant to address a violation. To address such concerns, the Commission clarifies that, if a violation of a NERC reliability standard would result from a nonincumbent transmission developer's decision to abandon a transmission facility meant to address such a violation, the incumbent transmission provider does not have the obligation to construct the nonincumbent's project. Rather, the transmission provider must identify the specific NERC reliability standard(s) that will be violated and submit a NERC mitigation plan to address the violation. Provided the public utility transmission provider follows the NERC approved mitigation plan, the Commission will not subject that public utility transmission provider to enforcement action for the specific NERC reliability standard violation(s) caused by a nonincumbent transmission developer's decision to abandon a transmission facility .

C. Interregional Transmission Coordination[310]

345. This section of the Final Rule adopts several reforms to improve coordination

[310] We note that our use of the term "coordination" with regard to the identification and evaluation of interregional transmission facilities is distinct from the type of coordination of system operations discussed in connection with section 202(a) of the FPA. *See supra* section III.A.2.

among public utility transmission planners with respect to the coordination of interregional transmission facilities. Specifically, the Commission requires each public utility transmission provider, through its regional transmission planning process, to enhance existing regional transmission planning processes in the following ways.[311] First, the Commission requires the development and implementation of procedures that provide for the sharing of information regarding the respective needs of neighboring transmission planning regions, as well as the identification and joint evaluation by the neighboring transmission planning regions of potential interregional transmission facilities that address those needs. Second, to ensure that developers of interregional transmission facilities have an opportunity for their transmission projects to be evaluated, the Commission requires the development and implementation of procedures for neighboring public utility transmission providers to identify and jointly evaluate transmission facilities that are proposed to be located in both regions. Third, to facilitate the joint evaluation of interregional transmission facilities, the Commission requires the exchange of planning data and information between neighboring transmission planning regions at least annually. Finally, to ensure transparency in the implementation of the

[311] In the Proposed Rule, the Commission sometimes referred to the requirements of this section as "interregional transmission planning"; however, we believe that "interregional transmission coordination" better describes what we are requiring in this Final Rule and, therefore, we will refer herein to "interregional transmission coordination."

foregoing requirements, the Commission requires public utility transmission providers, either individually or through their transmission planning region, to maintain a website or e-mail list for the communication of information related to interregional transmission coordination.

346. Through these reforms, the Commission aims to facilitate the identification and evaluation of interregional transmission facilities that may resolve the individual needs of neighboring transmission planning regions more efficiently and cost-effectively. To accomplish these reforms, public utility transmission providers in each pair of transmission planning regions are directed to work through their regional transmission planning processes to develop the same language to be included in each public utility transmission provider's OATT that describes the procedures that a particular pair of transmission planning regions will use to satisfy the foregoing requirements. Alternatively, if the public utility transmission providers so choose, these procedures may be reflected in an interregional transmission planning agreement among the public utility transmission providers within neighboring transmission planning regions that is filed with the Commission.[312]

[312] We discuss the filing requirements for the same language to be included in each

(continued…)

1. Need for Interregional Transmission Coordination Reform[313]

a. Commission Proposal

347. In Order No. 890, the Commission found that, when transmission providers engage in regional transmission planning, they may identify solutions to regional needs that are more efficient than those that would have been identified if needs and potential solutions were evaluated only independently by each individual transmission provider.[314] In Order No. 890-A, the Commission reiterated that effective regional transmission planning must include coordination among transmission planning regions. To that end, the Commission required public utility transmission providers within each transmission planning region to coordinate as necessary to share data, information, and assumptions to maintain reliability and allow customers to consider resource options that span a

public utility transmission provider's OATT that describes the procedures that a particular pair of transmission planning regions will use to satisfy the interregional transmission coordination requirements as well as for any interregional transmission coordination agreements in the compliance section below. *See* discussion *infra* section III.C.3.e. of this Final Rule.

[313] Legal authority issues associated with the interregional transmission coordination reforms described herein are addressed in the discussion above concerning regional transmission planning. *See* discussion *supra* section III.A.2. of this Final Rule.

[314] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 524.

region.[315]

348. The Commission noted in the Proposed Rule that, within the Order No. 890 and 890-A framework, transmission providers in certain parts of the country have organized subregional transmission planning groups for the purpose of collectively developing transmission plans for facilities on their combined transmission systems. These subregional transmission plans are then analyzed at a regional level to ensure that, if implemented, they will be simultaneously feasible and meet reliability requirements. The Commission also acknowledged that some neighboring transmission planning regions have undertaken joint transmission planning pursuant to bilateral agreements.[316]

349. However, the October 2009 Notice observed that there are few processes in place to analyze whether alternative interregional solutions more efficiently or effectively would meet the needs identified in individual regional transmission plans. As part of the October 2009 Notice, the Commission posed several questions related to this issue, including whether existing transmission planning processes are adequate to identify and evaluate potential solutions to needs affecting the systems of multiple transmission providers. The Commission also sought comment as to what processes should govern the identification and selection of projects that affect multiple systems.

---

[315] Order No. 890-A, FERC Stats. & Regs. ¶ 31,261 at P 226.

[316] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 103.

350. In light of the comments received on this issue, the Commission in the Proposed Rule expressed concern that the lack of coordinated transmission planning processes across the seams of neighboring transmission planning regions could be needlessly increasing costs for customers of transmission providers, which may result in rates that are unjust and unreasonable and unduly discriminatory or preferential. The Commission noted that, in the few years since the issuance of Order No. 890, interest in multiregional transmission facilities has grown significantly.[317] Therefore, the Commission proposed reforms intended to improve coordination between neighboring transmission planning regions with respect to the evaluation of transmission facilities that are proposed to be located in both regions, as well as other possible interregional transmission facilities, to determine if such facilities address the needs of the transmission planning regions more efficiently or cost-effectively.[318]

b. Comments

351. Many commenters agree that there is a need to increase coordination in interregional transmission planning,[319] and identified a range of deficiencies in and

[317] The Commission cited two such recent multiregional projects. *Id.* n.46 (citing *Pioneer Transmission, LLC*, 126 FERC ¶ 61,281 (2009); *Green Power Express LP*, 127 FERC ¶ 61,031 (2009)).

(continued…)

opportunities for enhancement of existing interregional transmission coordination efforts. Several commenters state that a more defined and coordinated interregional transmission planning process is necessary. For example, AEP, joined by Integrys, contends that utility and regional transmission planning efforts have a limited geographic perspective and do not consider the benefits associated with interregional transmission projects in neighboring regions. Boundless Energy and Sea Breeze state that in the absence of RTOs and ISOs, and particularly in WECC, interregional transmission planning is ineffective, overly costly, and focuses on individual transmission projects with no relationship to the grid as a whole network or a smart grid.

352. Other commenters argue that there is no coordinated process between regions with respect to evaluating interregional transmission projects.[320] AEP and MidAmerican

---

Environmental Defense Fund; Exelon; Federal Trade Commission; First Energy Service Company; Integrys; ISO New England; ITC Companies; Kansas City Power & Light and KCP&L Greater Missouri; LS Power; Massachusetts Departments; MidAmerican; MISO; MISO Transmission Owners; Minnesota PUC and Minnesota Office of Energy Security; National Grid; Natural Resources Defense Council; NEPOOL; New York ISO; NextEra; Northeast Utilities; Old Dominion; Organization of MISO States; Pattern Transmission; Pennsylvania PUC; PHI Companies; Pioneer Transmission; Powerex; PSEG Companies; PUC of Nevada; San Diego Gas & Electric; Sonoran Institute; Sunflower and Mid-Kansas; Transmission Access Policy Study Group; Vermont Electric; Westar; Wilderness Society and Western Resource Advocates; WIRES; and Wisconsin Electric Power Company.

[320] *E.g.*, East Texas Cooperatives; AEP; Kansas City Power & Light and KCP&L Greater Missouri; Anbaric and PowerBridge; Edison Electric Institute; MISO Transmission Owners; TDU Systems; AWEA; and PSEG Companies.

specify that the lack of a coordinated process between transmission planning regions creates hurdles for projects (especially proposed extra high voltage facilities) that are unreasonably higher than those faced by intraregional transmission projects. MidAmerican contends that different regions have different planning protocols and rules for project evaluation and justification, and focus too narrowly on planning criteria that are limited to reliability, generator interconnection, and economic congestion relief to demonstrate the need for a project. It states that many transmission planning regions do not have joint planning protocols or other tariff authority under which an interregional project could be approved based on the total benefits that it provides to the planning regions; and that there is a lack of coordinated planning to identify the most economically efficient solutions. Transmission Dependent Utility Systems state that the ultimate objective of the Final Rule should be the development of a regional transmission plan that jointly optimizes solutions for transmission across the regions to allow access to economically-priced energy by all transmission providers and customers to best serve their native loads. 26 Public Interest Organizations state that without interregional coordination of planning assumptions and procedures, it may not be possible to develop regional transmission plans that the Commission can rely on to determine whether rates are just and reasonable.

353. Some other commenters state that improved interregional transmission

coordination would result in a more orderly and timely transmission planning process.[321] Pioneer Transmission indicates that improved interregional transmission planning would require planning regions to adopt broader planning goals and objectives, plan transmission and generation in a coordinated and cohesive fashion, and recognize that the benefits of interregional transmission projects will multiply and that their beneficiaries often expand over time.

354. Several commenters also discuss the positive impacts that the proposed interregional transmission planning requirements would have on renewable resources. For example, some state that these requirements would facilitate access to renewable energy and help meet state, federal and other renewable energy goals.[322] Pattern Transmission indicates that unless a formal interregional planning process is required, approval of transmission projects needed to allow load to access renewable resources will be difficult, particularly for remotely-located resources. Wind Coalition states that without interregional planning, location-constrained resources located in one region that could be cost-effectively accessed to serve the needs of an adjacent, or even more distant region, will not be available or may be accessed through a more expensive and less efficient transmission solution than would be possible with interregional transmission

[321] *E.g.*, First Wind; Solar Energy Industries; and Large-scale Solar.

[322] *E.g.*, Edison Electric Institute; AWEA; Clean Line; American Transmission; and Solar Energy Industries and Large-scale Solar.

planning.

355. Some commenters argue that seams issues have prevented efficient use of existing transmission infrastructure and adequate consideration of the needs of load-serving entities at the seams.[323] Several commenters cite difficulties they have had in the MISO and PJM, Entergy and SPP, PJM and New York ISO, and Pacific Northwest regions.[324] For example, East Texas Cooperatives state a lack of coordination between SPP and Entergy has hindered its ability to obtain network service for a new generating plant. Specifically, East Texas Cooperatives state that in 2009 they submitted a request to SPP for 335 MW of network service sourcing and sinking in SPP to access the Harrison County generating plant. When studying the request, SPP determined that it may cause impacts on Entergy's system. After multiple iterations of the SPP Aggregate Study Process and two Affected System Analysis were conducted, the Entergy system identified $30.7 million of upgrades necessary to facilitate the request, the cost of which were to be directly assigned to East Texas Cooperatives. East Texas Cooperatives identified several potential issues in the SPP and Entergy studies that appeared to stem, at least in part,

[323] *E.g.*, AEP; Anbaric and PowerBridge; Connecticut & Rhode Island Commissions; East Texas Cooperatives; Edison Electric Institute; Energy Consulting Group; MISO Transmission Owners; Northeast Utilities; and Omaha Public Power District.

[324] *E.g.*, Pennsylvania PUC; MidAmerican; Exelon; East Texas Cooperatives; PSEG Companies; and Powerex.

from a lack of queue coordination between Entergy and SPP. East Texas Cooperatives state that after significant effort on their part and additional study costs being incurred, which may not have been necessary with better coordination between Entergy and SPP, the cost of the necessary upgrades on the Entergy system was dramatically reduced. However, East Texas Cooperatives state that errors in SPP's planning studies and a lack of coordination between SPP and Entergy in addressing East Texas Cooperatives' network service request, resulted in a long delay in securing the necessary financing for the Harrison County project.

356. Similarly, ITC Companies state that it has been difficult to move forward on its Green Power Express project because there is no applicable planning process for projects that extend beyond the boundaries of a single RTO. Exelon states that its experience on the seam between MISO and PJM supports the contention that mandatory interregional planning is needed at this time. For instance, Exelon cites issues in studying and building transmission projects identified in the MISO's Regional Generation Outlet Study as necessary to deliver 35 GW of wind energy to load centers in the MISO. Exelon states that several of the projects are located in PJM, but will not be studied further by the MISO because MISO states that it has no authority to order its members or PJM members to build transmission on PJM's system. In addition, Exelon states that current coordination protocols between the MISO and PJM are failing to prevent increased congestion in PJM, resulting in deteriorating operations at the seam such as increased

transmission loading relief (TLR) events on the Commonwealth Edison system. PJM, however, disputes Exelon's assertions regarding both the cause and the total number of TLR events on the Commonwealth Edison system.

357. PSEG Companies recommend that where there is evidence of significant seams issues that affect operations, the Commission should require that the affected planning regions: (1) coordinate the planning of their systems, including sharing information needed to forecast, measure, and monitor impacts; and (2) form an agreement to address how the costs associated with cross-border impacts will be allocated that incorporates the "beneficiary pays" approach. Pennsylvania PUC states that the Commission's proposed interregional transmission planning requirements may help to improve interregional operational efficiency between RTOs.

358. Organization of MISO States and Pattern Transmission discuss the effect of improved interregional coordination between RTO and non-RTO regions. Organization of MISO States notes that the proposed requirements would enhance the incorporation of non-RTO regions into interregional transmission planning processes. According to Pattern Transmission, interregional transmission planning is particularly important in non-RTO and non-ISO regions, where the lack of a structured regional transmission planning process effectively restricts transmission development by nonincumbent developers to merchant transmission developers.

359. Transmission Dependent Utility Systems urge the Commission to adopt the

proposed interregional transmission planning reforms without delay as they are necessary to promote cost-effective interregional transmission planning and to remedy the unduly discriminatory exclusion of transmission customers that are load-serving entities from these activities. They assert that transmission providers have little incentive to develop transmission that would allow competing suppliers to serve customers and that in many regions, interregional transmission planning efforts are either nonexistent or are often implemented through bilateral agreements that provide no opportunity for active participation by transmission customers that are load-serving entities or other stakeholders.

360. Several commenters stress that the Commission's actions in this proceeding must not interfere with the ARRA-funded transmission planning initiatives.[325] Allegheny Energy Companies believe in the potential success of the ARRA-funded process. They state that the ARRA-funded interconnectionwide transmission planning initiatives may develop into a potential model for an open, interconnectionwide transmission planning process and in effect could help resolve some of the planning issues currently being encountered. Western Area Power Administration urges the Commission to consider the positive developments associated with the implementation of these initiatives while developing any Final Rule.

[325] *E.g.*, Indianapolis Power & Light; NARUC; PHI Companies; Pennsylvania PUC; PSC of Wisconsin; SPP; and Transmission Access Policy Study Group.

361. Some commenters argue that interregional transmission planning reforms are needed notwithstanding the ARRA-funded interconnectionwide transmission planning initiatives.[326] SPP states that the ARRA-funded process will not ensure that the most cost-effective solutions are implemented across planning regions or the entire interconnection. Transmission Dependent Utility Systems also contend that the ARRA-funded process does not address short-range needs for interregional projects and may have too wide of a geographic scope to conduct the bottom-up planning necessary to ensure that the needs of load-serving entities are met. AEP encourages the Commission to provide as much direction as possible to the planning authorities to ensure that the ARRA initiatives accomplish more than the cumulative assembly of the isolated plans of each region and planning entity.

362. Conversely, other commenters suggest that the Commission postpone imposing new requirements until after the ARRA-funded interconnection-wide transmission planning process is complete.[327] For example, Southwest Area Transmission Sub-Regional Planning Group encourages the Commission to support existing planning activities, postponing the proposal for additional requirements until after the ARRA-

[326] *E.g.*, SPP; Minnesota PUC and Minnesota Office of Energy Security; AEP; and Transmission Dependent Utility Systems.

[327] *E.g.*, Southwest Area Transmission Sub-Regional Planning Group; APPA; and Xcel.

funded interconnectionwide transmission planning initiatives are complete. ColumbiaGrid and ISO New England argue that their transmission planning processes already comply with the Commission's proposed requirements. The New England Transmission Owners support the Commission's interregional transmission planning objectives, but urge the Commission to give the ISO New England's existing interregional transmission planning process time to mature before imposing any new or additional requirements. PHI Companies argue that the Commission should require that existing interregional planning processes that meet the Commission's articulated principles be followed whenever the objectives of one region have the potential to impose burdens or costs on another region.

363. Other commenters oppose the Commission's proposed interregional transmission planning requirements, arguing they are unnecessary[328] or premature.[329] In particular, several commenters state that existing transmission planning processes in their regions (West, Southeast, Midwest) have led to significant progress and that there is no need for mandating that regions create interregional transmission planning agreements.[330] For

[328] *E.g.*, California ISO; ColumbiaGrid; Indianapolis Power & Light; National Rural Electric Coops; Southern Companies; and Washington Utilities and Transportation Commission.

[329] *E.g.*, Georgia Transmission Corporation; Salt River Project; and Southwest Area Transmission Sub-Regional Planning Group.

[330] *E.g.*, Salt River Project; Southwest Area Transmission Sub-Regional Planning

(continued…)

example, Southern Companies state that there already is an institution in place to provide interregional coordination in the Eastern Interconnection, namely the Eastern Interconnection Planning Collaborative. Salt River Project similarly states that it participates in robust and effective planning activities in the West, and provides an inventory of projects, including interregional lines that are being built as a result of coordination between regional and subregional planning groups. Southern Companies note that the Commission's proposed interregional transmission planning requirements are unnecessary as the deficiencies alleged by the Commission in the Proposed Rule are not applicable in the Southeast. Organization of MISO States expresses its view that the Commission should give the interconnectionwide Eastern Interconnection States Planning Council planning process some time to work before requiring the filing of any bi-regional interregional transmission planning agreements.

364. Salt River Project and Southwest Area Transmission contend that the proposed requirements are premature because the Commission did not provide specific examples of deficiencies and lack of coordination in the transmission planning process that support the need for the proposed requirements. They recommend that the Commission undertake a comprehensive and thorough inventory of existing planning processes and

---

Group; Xcel; California Commissions; San Diego Gas & Electric; NEPOOL; Northeast Utilities; New England Transmission Owners; Southern Companies; Washington Utilities and Transportation Commission; and Indianapolis Power & Light.

then use the demonstrable outcomes of these processes to identify any real barriers that would merit new rules or regulations. National Rural Electric Coops, Indianapolis Power and Light, and Transmission Agency of Northern California contend, in whole or part, that the Commission should pursue only additional reforms that address specific problems identified in the record from this proceeding, that mandatory coordination should occur on an as-needed basis where such efforts are likely to lead to substantial transmission development, and that any further reforms be targeted to specific problems.

365. Some commenters suggest that the Commission should allow Order No. 890 processes to develop further before imposing new interregional coordination requirements.[331] Xcel acknowledges the need for interregional planning and cost allocation mechanisms to support public policy mandates, but recommends that the Commission allow current voluntary interregional planning and cost allocation discussions to continue, rather than mandate the development of interregional agreements within a specified time frame.

366. Similarly, several commenters contend that interregional coordination should be

[331] *E.g.*, Washington Utilities and Transportation Commission; Georgia Transmission Corporation; and Xcel.

voluntary. Ad Hoc Coalition of Southeastern Utilities and Bonneville Power contend that the Commission should permit parties to pursue voluntary interregional transmission planning agreements. Ad Hoc Coalition of Southeastern Utilities states that it supports voluntary efforts of regional transmission processes to address facilities located in multiple regions. Similarly, North Carolina Agencies state that coordination among regions, as well as within a broadly defined region, should be voluntary. Bonneville Power states that the Commission has not demonstrated that the voluntary approach does not work in the Pacific Northwest or that it is not just and reasonable or that it is unduly discriminatory or preferential. It recommends that if the Commission mandates interregional transmission planning agreements, it should permit parties the discretion to pursue voluntary agreements for interregional planning in general, as well as for specific projects. Further, California ISO points to successful voluntary coordination efforts in the West by WECC and California Transmission Planning Group. California PUC, in its reply comments, supports California ISO's and Bonneville Power's views.

367. Other reply commenters disagree with these arguments. 26 Public Interest Organizations respond that the Commission is obligated under the FPA to ensure that changing system needs (such as state renewable portfolio standards and new federal environmental rules) and the consequences for systems outside of the RTO's footprint (such as loop flow) are justly and reasonably addressed, which requires interregional coordination. WIRES replies that interregional planning must be made mandatory and

subject to stronger Commission oversight and participation. WIRES states that experience demonstrates that, left to the voluntary cooperation of the parties, the transmission network will not be integrated as effectively as it could be, reliability and resource diversity will suffer, and seams and congestion issues will be unresolved.

c. Commission Determination

368. The Commission concludes that implementation of further reforms in the area of interregional transmission coordination activities are necessary at this time. As the Commission stated in the Proposed Rule, in the absence of coordination between transmission planning regions, public utility transmission providers may be unable to identify more efficient or cost-effective solutions to the individual needs identified in their respective local and regional transmission planning processes, potentially including interregional transmission facilities. Clear and transparent procedures that result in the sharing of information regarding common needs and potential solutions across the seams of neighboring transmission planning regions will facilitate the identification of interregional transmission facilities that more efficiently or cost-effectively could meet the needs identified in individual regional transmission plans.

369. Specifically, we agree with commenters, such as AEP, that the transmission planning requirements of Order No. 890 are too narrowly focused geographically and fail to provide for adequate analysis of the benefits associated with interregional transmission facilities in neighboring transmission planning regions. Our decision also is influenced

by those commenters that cite seams issues or difficulties they have encountered in coordinating the development of transmission facilities across the regions, including between RTOs and ISOs, as well as between an RTO or ISO and non-RTO or ISO region and among non-RTO regions. We are persuaded by those commenters who argue that additional interregional transmission coordination requirements would facilitate consideration of transmission needs driven by Public Policy Requirements by enabling the evaluation of interregional transmission facilities that may address those needs more efficiently or cost-effectively. We agree with Transmission Dependent Utility Systems' comments that interregional transmission coordination promotes cost-effective transmission development and facilitates transmission customer participation in interregional transmission coordination efforts.

370. Given the clear need for reform of existing interregional transmission coordination practices, we are not persuaded by arguments contending that reform is not necessary or is premature. While we recognize that significant progress with respect to the development of open and transparent transmission planning processes has been made around the country, the existing transmission planning processes nevertheless do not adequately provide for the evaluation of proposed interregional transmission facilities or the identification of interregional transmission facilities that could address transmission needs more efficiently or cost-effectively than separate regional transmission facilities.

Because such interregional transmission coordination helps to ensure that rates, terms, and conditions of jurisdictional service are just and reasonable and not unduly discriminatory or preferential by facilitating more efficient or cost-effective transmission infrastructure development, we conclude that the interregional transmission coordination reforms adopted in this Final Rule are necessary and should not be delayed.

371. Similarly, while we have considered the positive developments associated with the ARRA-funded transmission planning initiatives, we nevertheless agree with commenters who argue that the Commission should not postpone its proposed interregional transmission coordination reforms on account of these initiatives. While the ARRA-funded transmission planning initiatives represent a significant advancement in interconnectionwide transmission scenario analysis, they do not specifically provide for the ongoing coordination in the evaluation of interregional transmission facilities, which we conclude is necessary to ensure that rates, terms, and conditions of jurisdictional services are just and reasonable and not unduly discriminatory or preferential. As requested by commenters, however, we have extended the compliance deadline for the interregional coordination requirements of this Final Rule, as discussed in section V.A below. We encourage public utility transmission providers to continue their participation in these efforts and to explore opportunities to use the valuable information these efforts provide in their regional transmission planning and interregional transmission coordination efforts. We reiterate our intent to build upon, and not interfere with, the

ARRA-funded transmission planning initiatives in this Final Rule.

372. With regard to commenters' contentions that their existing interregional transmission coordination efforts already comply with the Proposed Rule's provisions or need more time to mature, we acknowledge that some transmission planning regions already may engage in interregional transmission coordination efforts that satisfy some of the requirements discussed below or are developing such efforts. The Commission is acting in this Final Rule to establish a minimum set of requirements that apply to all public utility transmission providers. If a public utility transmission provider believes that it participates in a regional transmission planning process that fulfills the interregional transmission coordination requirements adopted in this Final Rule, it may describe in its compliance filing how such participation complies with the requirements of this Final Rule.

373. We therefore disagree that the Commission should undertake additional investigation of the need for interregional coordination procedures or require them only on a case-by-case basis. The record in this proceeding is adequate to support our conclusion that the existing requirements of Order No. 890 are too narrowly focused geographically. Coordination of transmission planning activities by neighboring transmission planning regions will increase opportunities to identify interregional transmission facilities that address the needs of those regions more efficiently or cost-effectively. We thus see no need to adopt a case-by-case approach to our requirements.

We conclude that the interregional coordination obligations implemented in this Final Rule are necessary to establish a minimum set of requirements that are applicable to all public utility transmission providers.

2. Interregional Transmission Coordination Requirements

a. Interregional Transmission Coordination Procedures

i. Commission Proposal

374. In the Proposed Rule, the Commission proposed to require each public utility transmission provider through its regional transmission planning process to enter into agreements that include a detailed description of the process for coordination between public utility transmission providers in neighboring transmission planning regions with respect to transmission facilities that are proposed to be located in both regions, as well as interregional transmission facilities that are not proposed that could address transmission needs more efficiently than separate intraregional facilities.[332] While acknowledging that every transmission planning agreement could be tailored to best fit the needs of the transmission planning regions entering into the agreement, the Commission proposed that each public utility transmission provider ensure that certain elements are included in each

[332] The Commission discusses in subsection 3e below comments in response to the proposal for interregional transmission coordination activities to be memorialized in an agreement executed by multiple public utility transmission providers.

agreement.

375. Specifically, the Commission proposed that an interregional transmission planning agreement must include the following elements: (1) a commitment to coordinate and share the results of respective regional transmission plans to identify possible interregional facilities that could address transmission needs more efficiently than separate intraregional facilities (Coordination); (2) an agreement to exchange at least annually planning data and information (Data Exchange); (3) a formal procedure to identify and jointly evaluate transmission facilities that are proposed to be located in both regions (Joint Evaluation); and (4) a commitment to maintain a website or e-mail list for the communication of information related to the coordinated transmission planning process (Transparency).

376. With respect to the third proposed element, the Commission proposed that the transmission developer of a transmission project that would be located in two neighboring transmission planning regions must first propose its transmission project in the transmission planning process of each of those transmission planning regions. The Commission further proposed that such a submission would trigger a procedure established by the interregional transmission planning agreement, under which the transmission planning regions would coordinate their reviews of and jointly evaluate the proposed transmission project. The Commission proposed that such coordination and joint evaluation must be conducted in the same general timeframe as, rather than

subsequent to, each transmission planning region's individual consideration of the proposed transmission project. Finally, the Commission proposed that inclusion of the interregional transmission project in each of the relevant regional transmission plans would be a prerequisite to application of an interregional cost allocation method that satisfies the cost allocation principles set forth in the Proposed Rule.

ii. Comments

377. American Transmission supports requiring regions to make a commitment to coordinate and share the results of respective regional transmission plans to identify possible interregional transmission facilities that could address transmission needs more efficiently than separate intraregional facilities. However, American Transmission also recommends that the Commission require public utility transmission providers to specifically describe the process by which their planning regions will identify such interregional transmission facilities. East Texas Cooperatives suggest that the Commission clarify that it requires more than simple coordination (i.e., the sharing of information and plans), but also the establishment of an interregional transmission planning process intended to address and resolve seams issues.

378. Several commenters request that the Commission provide more detailed guidance

on the interregional transmission planning agreements.[333] MISO Transmission Owners similarly request that the Commission clarify its specific expectations for interregional coordination. SPP recommends that the Final Rule provide detailed guidance concerning the requirements for interregional transmission planning, including the goals and objectives of interregional transmission planning. Powerex states that the Commission should require each interregional transmission planning agreement to include a set of interregional planning goals that are concrete and outcome-based and that directly address the reliability problems that reduce efficiency. ITC Companies state that interregional transmission planning agreements should include the key criteria to be considered in the interregional planning process, based on the planning principles, and the cost allocation method that would apply to approved interregional projects.[334]

379. Old Dominion recommends that the Commission require public utility transmission providers and interregional planning entities, such as the Eastern Interconnection Planning Collaborative, to adopt transmission planning processes that: (1) identify the needs of multiple transmission systems based on scenario planning using a long-term planning horizon (e.g., 15 to 20 years); (2) conduct various scenario analyses

[333] *E.g.*, 26 Public Interest Organizations; MISO Transmission Owners; SPP; and Sunflower and Mid-Kansas.

[334] The cost allocation method that would apply to selected interregional transmission facilities is addressed in the cost allocation section below. *See* discussion *supra* section IV.E. of this Final Rule.

to identify the projects that best address reliability, economic, or demand response concerns; and (3) allow developers to compete to provide the "best" solution.

380. Some commenters support a more robust interregional transmission planning process than the interregional coordination requirements set forth in the Proposed Rule. For example, Energy Future Coalition states the interregional transmission planning process should include a rigorous and transparent analysis of a comprehensive set of considerations and alternatives and provide for "right-sizing" facilities to ensure the best possible use of existing corridors and minimize environmental impacts from new corridors.

381. A few commenters recommend that the Commission require interregional transmission planning processes to comply with the Order No. 890 planning principles.[335] Transmission Dependent Utility Systems contend that subjecting interregional transmission planning processes to the Order No. 890 planning principles would alleviate concerns about the limited size of some Order No. 890-compliant planning regions, which arose due to the lack of an opportunity for load-serving entities to participate in planning across seams, and would ensure that the most cost-effective solutions to constraints associated with seams are pursued. Old Dominion states that requiring interregional transmission planning processes to comply with the Order No. 890 planning

[335] *E.g.*, East Texas Cooperatives; ITC Companies; Old Dominion; Transmission Access Policy Study Group; and Transmission Dependent Utility Systems.

principles would ensure that information will flow between the regional and interregional transmission planning processes, so that stakeholders will have the information necessary to offer meaningful input at the interregional level and to inform discussions at the regional levels.

382. Energy Consulting Group states that transmission owners should be required to develop the transmission upgrades and expansions identified in the wide-area planning process within a mandated time frame. NextEra states that the Commission should require the interregional transmission planning process to result in an interregional transmission plan that includes interregional transmission facilities identified through the planning process. Boundless Energy and Sea Breeze contend that the Commission should strengthen interregional transmission planning processes by requiring implementation of interregional transmission plans and an implementing authority. MidAmerican expresses concern that proposed element 1 does not describe how the Commission intends neighboring planning regions to move those interregional projects identified towards construction, and recommends that the Commission require the identified interregional facilities to be included in local and regional transmission plans. Similarly, National Grid recommends that the Commission require consideration of procedures for adopting into regional plans any transmission upgrade identified as part of an interregional coordination process.

383. Southwest Area Transmission Sub-Regional Planning Group, however, states that

the Commission should clarify that interconnectionwide, regional, and interregional planning groups are not decision-making entities with the authority to direct developers or load-serving entities to develop any project. National Grid asks the Commission not to require the formation of new interregional planning entities, especially where interregional planning efforts are already underway.

384. NextEra also states that the Commission should require the interregional transmission planning process to result in an interregional transmission plan that includes longer-term objectives that have not yet resulted in proposals for specific facilities. Similarly, California Commissions state that plans should contain conceptual elements that have yet to materialize as specific transmission projects and contingent elements that may be needed under certain future scenarios so that a plan can evolve over time.

385. Solar Energy Industries and Large-scale Solar and Anbaric and PowerBridge urge the Commission to impose stronger requirements for interregional coordination for public policy and renewable energy projects. MidAmerican asks that the Commission clarify that consideration of public policy requirements is not limited to local and regional transmission planning processes but should be extended to interregional transmission coordination as well.

386. On the other hand, Energy Consulting Group contends that interregional transmission planning should provide an incentive for development of transmission facilities that provide access to economic generation resources that minimize power costs,

not act as an instrument of public policy. Energy Consulting Group also states that it is not clear that the proposed transmission planning processes will have a mechanism to address transmission service requests, and that a process for addressing such requests should be added to wide-area planning.

387. ITC Companies contend that interregional coordination should assure equal consideration for all drivers of transmission needs, including reliability, generator interconnection, and public policy requirements. National Grid requests that the Commission require interregional transmission planning efforts to consider transmission upgrades that could provide economic benefits to consumers in multiple regions and upgrades or modified operating practices that could result in more efficient use of the existing transmission system in addition to those transmission facilities needed to maintain reliability. Powerex states that the Final Rule should establish policies that encourage transmission customers to continue to purchase and invest in long-term transmission and that the Commission should ensure that it is sending proper signals for long-term investments in transmission by rejecting policies that erode the existing rights of firm transmission customers that have already made long-term investments in transmission service.

388. Organization of MISO States urges the Commission to encourage transmission planning regions to coordinate on issues besides transmission planning and cost allocation, such as interconnection and operational issues.

389. North Carolina Agencies state that coordination among regions, as well as within a broadly defined region, should complement, rather than substitute for, local and narrower regional planning processes. NEPOOL and Northeast Utilities state that the Proposed Rule's provisions, which reflect a "bottom up" planning approach, should be reflected in any Final Rule. Other commenters also support a "bottom up" approach to interregional transmission planning.[336]

390. Other commenters urge the Commission to ensure that the Final Rule does not infringe on state authority. California Commissions emphasize that rules pertaining to interregional transmission planning agreements and the resulting coordinated planning process must not diminish state control by shifting decision-making to the Commission and that states should be directly involved in the development of interregional transmission planning agreements and should have a strong role in their implementation. NARUC asserts that the interregional transmission planning process must continue to respect the role of state commissions in reviewing and guiding the planning process and the role of state authorities in ultimately siting any transmission lines.

391. Several commenters request that the Commission oversee the development and implementation of interregional transmission planning agreements and/or monitor the

[336] *E.g.*, Allegheny Energy Companies; East Texas Cooperatives; and ISO New England.

progress of interregional planning efforts.[337] For example, Organization of MISO States suggests that the Commission require an accountability and oversight element in interregional transmission planning agreements to ensure that such agreements are implemented as intended, perhaps utilizing the expertise of state commissions. American Transmission and MISO Transmission Owners state that public utility transmission providers and their stakeholders should be required to conduct periodic reviews of the effectiveness of their interregional transmission planning efforts and file informational reports with the Commission.

392. Federal Trade Commission acknowledges that the Commission's proposed interregional transmission planning requirements would require market participants that may be competitors to collaborate with each other in transmission planning, construction, ownership, and operation, but states that participants in the interregional transmission planning process should not view the antitrust laws as an impediment to their participation.

iii. Commission Determination

393. To remedy the potential for unjust and unreasonable rates for public utility transmission providers' customers, we adopt the interregional transmission coordination requirements discussed below. These interregional transmission coordination

[337] *E.g.*, Energy Future Coalition; Organization of MISO States; Transmission Dependent Utility Systems; and AWEA.

requirements obligate public utility transmission providers to identify and jointly evaluate interregional transmission facilities that may more efficiently or cost-effectively address the individual needs identified in their respective local and regional transmission planning processes.

394. In the Proposed Rule, the Commission set forth its proposed interregional transmission coordination requirements in the form of four elements to be included in an interregional transmission planning agreement. After reviewing the comments concerning interregional transmission coordination received in this proceeding, we find that these four elements are so extensively interconnected that it would be inappropriate to require that they be addressed as distinct elements, as was proposed in the Proposed Rule. Instead, we believe that these four elements are better represented as characteristics of interregional transmission coordination. Specifically, two of the proposed elements—Coordination and Joint Evaluation—embody the purpose of interregional transmission coordination: to coordinate and share the results of regional transmission plans to identify possible interregional transmission facilities that could address transmission needs more efficiently or cost-effectively than separate regional transmission facilities and to jointly evaluate such facilities, as well as to jointly evaluate those transmission facilities that are proposed to be located in more than one transmission planning region. The other two elements—Data Exchange and Transparency—are more appropriately described as part of the procedures through which effective interregional

transmission coordination is implemented.

395. Thus, the framework in which we present these requirements differs from that of the Proposed Rule. This Final Rule lays out the objectives of interregional transmission coordination followed by a discussion of the mechanics of interregional transmission coordination instead of four required elements. Here we address the requirements for interregional transmission coordination, the entities between which interregional transmission coordination must occur, and the transmission facilities to which the interregional transmission coordination requirements apply. Hence the discussion of Coordination and Joint Evaluation is here. We address in other sections below the mechanics of implementation, including a discussion of the procedures for joint evaluation, requirements for data exchange, transparency, stakeholder participation, and the required revisions to the OATT.

396. The Commission requires each public utility transmission provider, through its regional transmission planning process, to establish further procedures with each of its neighboring transmission planning regions for the purpose of coordinating and sharing the results of respective regional transmission plans to identify possible interregional transmission facilities that could address transmission needs more efficiently or cost-effectively than separate regional transmission facilities. Through adoption of this requirement, the Commission intends that neighboring transmission planning regions will enhance their existing regional transmission planning processes to provide for: (1) the

sharing of information regarding the respective needs of each region, and potential solutions to those needs; and (2) the identification and joint evaluation of interregional transmission facilities that may be more efficient or cost-effective solutions to those regional needs.[338] By requiring public utility transmission providers to undertake such interregional transmission coordination activities, the Commission and transmission customers will have greater certainty that the transmission facilities in each regional transmission plan are more efficient or cost-effective solutions to meeting transmission planning region's needs.

397. In response to the Proposed Rule, several commenters seek clarification from the Commission as to whether, for example, the Commission intends the formation of a new interregional transmission planning process or that certain types of facilities or objectives should be the focus of interregional transmission coordination. With the exception of the requirements for implementing interregional transmission coordination discussed herein, the Commission declines at this time to impose specific obligations as to how neighboring transmission planning regions must share information regarding their needs, and potential solutions to those needs, or identify and jointly evaluate interregional

[338] The same language must be included in each public utility transmission provider's OATT that describes the processes that a particular pair of transmission planning regions will use to satisfy the interregional transmission coordination requirements of this Final Rule. The filing requirements concerning this same language are discussed in the compliance section below. *See* discussion *infra* section VI.A. of this Final Rule.

transmission alternatives to those regional needs, as well as proposed interregional transmission facilities. Thus, we also decline to require the use of specific planning horizons or the performance of particular scenario analyses. While we appreciate commenters' desire for additional clarity on this point, the Commission believes it is appropriate to leave to the transmission planning regions in the first instance adequate discretion to allow for the development and implementation of interregional transmission coordination procedures that suit the needs of the neighboring transmission planning regions. In light of the varying approaches to transmission planning that are currently used by transmission planning regions across the country, providing further guidance at this time could inadvertently impose restrictions that are not appropriate for a particular transmission planning region.

398. However, we clarify in response to East Texas Cooperatives that the interregional transmission coordination requirements adopted do require that public utility transmission providers do more than simply commit to share their regional transmission plans and other transmission planning information. To comply with the requirements in this Final Rule, each public utility transmission provider, through its regional transmission planning process, must develop and implement additional procedures that provide for the sharing of information regarding the respective needs of each neighboring transmission planning region, and potential solutions to those needs, as well as the identification and joint evaluation of interregional transmission alternatives to those

regional needs by the neighboring transmission planning regions. On compliance, public utility transmission providers must describe the methods by which they will identify and evaluate interregional transmission facilities. While the Commission does not require any particular type of studies to be conducted, this Final Rule requires public utility transmission providers in neighboring transmission planning regions to jointly identify and evaluate whether interregional transmission facilities are more efficient or cost-effective than regional transmission facilities. Accordingly, the Commission requires that the compliance filing by public utility transmission providers in neighboring planning regions include a description of the type of transmission studies that will be conducted to evaluate conditions on their neighboring systems for the purpose of determining whether interregional transmission facilities are more efficient or cost-effective than regional facilities.

399. We decline to adopt the recommendations of those commenters that suggest that the Commission adopt a more robust, formalized interregional transmission planning process than the interregional transmission coordination requirements in the Proposed Rule, such as an interregional transmission coordination process that complies with the Order No. 890 transmission planning principles or that produces an interregional transmission plan. We clarify here that the interregional transmission coordination requirements that we adopt do not require formation of interregional transmission planning entities or creation of a distinct interregional transmission planning process to

produce an interregional transmission plan. Rather, our requirement is for public utility transmission providers to consider whether the local and regional transmission planning processes result in transmission plans that meet local and regional transmission needs more efficiently and cost-effectively, after considering opportunities for collaborating with public utility transmission providers in neighboring transmission planning regions. To the extent that public utility transmission providers wish to participate in processes that lead to the development of interregional transmission plans, they may do so and, as relevant, rely on such processes to comply with the requirements of this Final Rule.

400. While we acknowledge MidAmerican's concern that the Commission does not specify how interregional transmission facilities will be moved toward construction, we note that in the Proposed Rule, the Commission stated that, consistent with Order No. 890, the proposed regional transmission planning obligations do not address or dictate which investments identified in a transmission plan should be undertaken by public utility transmission providers.[339] We affirm that statement, and further note that Order No. 890 already requires that public utility transmission providers make available information regarding the status of transmission upgrades identified in their regional transmission plans in addition to the underlying transmission plans and related transmission studies.[340]

---

[339] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at n.59 (citing Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 438).

[340] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 472.

The Commission made clear in Order No. 890-A that transmission providers must make available to other stakeholders information regarding the progress and construction of transmission upgrades and transmission facilities.[341] To the extent neighboring transmission planning regions identify interregional transmission facilities of mutual benefit and have such transmission facilities in their individual regional transmission plans, these informational requirements will apply to the portions of the interregional transmission facilities within each of the individual region's transmission plans. We decline to require, as suggested by MidAmerican and National Grid, that every interregional transmission facility that is evaluated through the interregional transmission coordination procedures automatically be selected in a regional transmission plan for purposes of cost allocation. However, as discussed below, an interregional transmission facility must be selected in both of the relevant regional transmission plans for purposes of cost allocation in order to be eligible for interregional cost allocation pursuant to an interregional cost allocation method required under this Final Rule. Rather, we expect that information exchanged during the interregional coordination effort should inform discussions at the regional and local transmission planning level.

401. Moreover, in response to commenters, this Final Rule neither requires nor precludes longer-term interregional transmission planning, including the identification of

[341] Order No. 890-A, FERC Stats. & Regs. ¶ 31,261 at P 202.

conceptual or contingent elements,[342] the consideration of transmission needs driven by Public Policy Requirements,[343] or the evaluation of economic considerations.[344] Whether and how to address these issues with regard to interregional transmission facilities is a matter for public utility transmission providers, through their regional transmission planning processes, to resolve in the development of compliance proposals. However, the Commission agrees with North Carolina Agencies that interregional transmission coordination should complement local and regional transmission planning processes, and should not substitute for these processes. Consistent with the implementation requirements for interregional transmission coordination procedures discussed in section III.C.3.a. below, we clarify that interregional transmission coordination may follow a "bottom up" approach. In response to Energy Consulting Group, we neither require nor prohibit consideration by neighboring transmission planning regions of requests for transmission service or upgrades within the interregional transmission coordination procedures required in this Final Rule.

402. With respect to commenters' assertion that this Final Rule should not infringe on state authority, we emphasize here that the interregional transmission coordination requirements are not intended to infringe on state authority. We acknowledge the vital

[342] *See* California Commission.

[343] *See* MidAmerican.

[344] *See* Energy Consulting Group.

role that state agencies play in transmission planning and their authority to site transmission facilities. We strongly encourage state agencies to be involved in the development and implementation of the interregional transmission coordination procedures necessary to satisfy the interregional transmission coordination requirements adopted herein.

403. In response to commenters' requests that we monitor the implementation of the interregional transmission coordination requirements adopted in this Final Rule and the progress of interregional transmission coordination efforts, although the Commission believes that Commission oversight of compliance with this Final Rule and assessment of the adequacy of its measures is appropriate, the Commission does not intend to monitor coordination efforts so closely as to intrude in the interregional transmission coordination activities. It is not necessary for the Commission to decide the exact level of its monitoring at this time.

404. We also decline to require public utility transmission providers and their stakeholders to conduct periodic reviews of the effectiveness of their interregional transmission coordination efforts and file information reports with us, as suggested by American Transmission and MISO Transmission Owners. However, we do encourage such reviews. We also note that parties may utilize the dispute resolution provisions of the relevant public utility transmission provider's OATT or file a complaint with the Commission if they find that the interregional transmission coordination procedures

described in a public utility transmission provider's OATT are not being implemented properly.

b. Geographic Scope of Interregional Transmission Coordination

i. Commission Proposal

405. As noted above, the Commission proposed to require each public utility transmission provider through its regional transmission planning process to coordinate with the public utility transmission providers in each of its neighboring transmission planning regions within its interconnection to address transmission planning issues. The Commission noted that this does not require a public utility transmission provider to coordinate with a neighboring transmission planning region in another interconnection. However, the Commission also encouraged public utility transmission providers to explore possible multilateral interregional transmission coordination processes among several, or even all, transmission planning regions within an interconnection, building on processes developed through the ARRA-funded transmission planning initiatives.[345] The Commission proposed to require interregional coordination between public utility transmission providers in neighboring transmission planning regions with respect to transmission facilities that are proposed to be located in both regions, as well as interregional transmission facilities that are not proposed but that could address

[345] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 114-15.

transmission needs more efficiently than separate intraregional transmission facilities.[346]

ii. Comments

406. The Commission received a number of comments addressing the geographic scope of the proposed interregional coordination requirements, as well as the specific entities within the appropriate geographic scope that would be required to coordinate. Several commenters suggest that the Commission clarify how it defines regions for purposes of regional transmission planning to provide clarity as to how its proposed interregional transmission planning requirements will be implemented.[347] Transmission Dependent Utility Systems recommend that the Commission define regional boundaries if it appears that there is discrimination or inefficiencies in the planning process. Others urge the Commission not to change existing areas over which transmission planning is now coordinated among transmission planning regions.[348] For example, Integrys suggests that the Final Rule should preserve the existing mandate that PJM and the MISO constitute a single common market in the application of interregional transmission planning rules, and thus should be considered, at least for certain purposes, a single region subject to the interregional transmission planning and cost allocation rules.

---

[346] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 116.

[347] *E.g.*, Integrys; Transmission Dependent Utility Systems; and MISO Transmission Owners.

[348] *E.g.*, Integrys and National Grid.

407. New York Transmission Owners agree with the Commission's proposal to require that interregional transmission planning agreements between neighboring planning regions address transmission facilities that are proposed to be located in both regions. However, New York ISO states that this requirement should not preclude planning regions from considering other types of projects.

408. Several commenters either agree with the Commission's encouragement to extend interregional planning voluntarily beyond coordination between neighboring transmission planning regions so as to cover larger areas or an interconnection, or ask the Commission to require planning over such larger areas. ITC Companies state that, because some projects may involve more than two transmission planning regions, interregional planning also may need to involve more than two transmission planning regions. WECC suggests that because it already serves as a facilitator for interconnectionwide transmission planning and coordination in the Western Interconnection, it could provide a forum for facilitating multilateral transmission planning agreements. Federal Trade Commission recommends that the Commission institutionalize interconnectionwide transmission planning to incorporate relevant congestion, reliability, and environmental considerations and to reflect the geographic scope of power flows.

409. AWEA recommends that the Commission require public utility transmission providers to enter into multilateral, or even interconnectionwide, interregional transmission planning agreements. Similarly, Wind Coalition encourages the

Commission to consider extending its proposed interregional transmission planning requirements beyond adjacent planning regions to provide a process for accessing location-constrained resources located in more distant regions. Grasslands contends that the Commission should not limit its proposed interregional coordination requirements to neighboring transmission planning regions within the same interconnection. Without interregional transmission planning between the interconnections, Grasslands claims that transmission developers will not develop transmission facilities that will efficiently link the interconnections in the future.

410. Organization of MISO States cautions that, even with implementation of the proposed interregional transmission planning requirements, it may be difficult to require any non-RTO or non-ISO public utility transmission provider to act in the best interests of a geographic footprint beyond its own. Thus, it states that efforts such as the Eastern Interconnection States Planning Council, which would view projects over a geographic region larger than the RTO footprint, may be valuable.

411. Other commenters support the Commission's intent not to mandate interconnectionwide transmission planning,[349] offering among other things that mandating interconnectionwide planning would increase the difficulty of resolving local issues by making coordinated planning among transmission planning regions more

[349] *E.g.*, Indianapolis Power & Light; Transmission Access Policy Study Group; MISO Transmission Owners; New York ISO; and Organization of MISO States.

complex and risk frustrating the ARRA-funded interconnectionwide transmission planning initiatives.

412. American Transmission and MISO Transmission Owners state that with respect to planning activities in regions without an RTO or ISO, the Commission should provide guidance as to which entities would be required to coordinate with each other. Integrys states that the Commission might implement its proposed interregional transmission planning requirements in non-RTO regions by requiring transmission providers in such regions to form planning consortia that could operate within a region and/or between two or more regions. Indianapolis Power & Light suggests that the Commission clarify whether transmission providers would be required to coordinate with each individual entity or one planning region to coordinate with another planning region.

413. New York ISO states that the Commission should clarify that public utility transmission providers that are unable to reach interregional transmission planning agreements with neighboring Canadian systems will not be deemed out of compliance with the Final Rule.

414. MISO Transmission Owners state that the agreements should enable a region impacted by a proposed project located in a neighboring region to review the neighboring region's plans, and that the transmission planning regions subject to the agreement should agree on what level of impact is material, as well as how disputes between the parties will be resolved. Edison Electric Institute and Exelon likewise state that the Commission

should require that interregional transmission planning agreements address transmission facilities located in a single region that could have significant adverse impacts on the reliability of neighboring regions. Moreover, Exelon states that interregional transmission planning agreements should require that if a proposed project would result in any reliability violations or increased congestion on a neighboring system, these impacts must be mitigated before the project is approved.

iii. Commission Determination

415. We require each public utility transmission provider through its regional transmission planning process to coordinate with the public utility transmission providers in each of its neighboring transmission planning regions within its interconnection to implement the interregional transmission coordination requirements adopted in this Final Rule. This requirement is necessary to improve coordination of neighboring transmission planning regions' activities, facilitating the identification and joint evaluation of interregional transmission solutions that could meet local and regional transmission needs more efficiently or cost-effectively than separate regional transmission solutions alone.

416. The Commission declines to expand the interregional transmission coordination requirements adopted herein to require joint evaluation of the effects of a new transmission facility proposed to be located solely in a single transmission planning region. Although this Final Rule requires each regional transmission planning process to identify the consequences of a proposed new transmission facility in another transmission

planning region as we explain below in the discussion of Cost Allocation Principle 4,[350] we do not require that be done interregionally. To do so could have the effect of mandating interconnectionwide transmission planning, given that transmission facilities located within one transmission planning region often have effects on multiple neighboring systems, which could trigger a chain of multilateral evaluation processes. However, we believe that the exchange of planning data and information between neighboring transmission planning regions consistent with the interregional transmission coordination requirements of the Final Rule will assist transmission planners in understanding and managing the effects of a transmission facility located in one region upon another neighboring region. Further, although we decline to impose a joint evaluation by more than one region of a facility located solely in one transmission planning region, nothing in this Final Rule precludes public utility transmission providers from developing and proposing interregional processes for that purpose.[351]

417. While the Commission declines to require multilateral or interconnectionwide coordination in this Final Rule, we continue to encourage public utility transmission

[350] *See* discussion *infra* section IV.E.5. of this Final Rule.

[351] Moreover, the absence of such a requirement in this Final Rule does not affect any obligations public utility transmission providers may otherwise have to assess the effects of new transmission facilities on other systems, including but not limited to any other requirement of the OATT for interconnection studies, any requirement under the NERC reliability standards, and the requirements of Good Utility Practice.

providers to explore the possibility of multilateral interregional transmission coordination among several, or even all, transmission planning regions within an interconnection, building on the processes developed through the ARRA-funded transmission planning initiatives. The Commission agrees that imposing multilateral or interconnectionwide coordination requirements at this time could frustrate the progress being made in the ARRA-funded transmission planning initiatives. To the extent that stakeholders in those planning initiatives wish to continue these activities at the conclusion of the ARRA-funded transmission planning initiatives, we encourage them to explore how existing regional transmission planning processes and interregional transmission coordination procedures implemented under Order No. 890 and this Final Rule could be enhanced to provide for such transmission planning activities.

418. We decline to adopt Grasslands' recommendation that the Commission require interregional transmission coordination between transmission planning regions located in different interconnections. While we recognize that interregional transmission coordination between transmission planning regions in different interconnections could provide transmission planning benefits, such as increased power flows between interconnections, it may provide greater benefits for some pairs of neighboring transmission planning regions than for others due to geographical and operational limitations. Therefore, while we encourage public utility transmission providers to consider coordinating with neighboring transmission planning regions in different

interconnections where it would be helpful, we do not find it appropriate to require such coordination in this Final Rule.

419. In response to American Transmission and MISO Transmission Owners' request for guidance regarding the entities that they are required to coordinate with in neighboring regions without an RTO or ISO, we reiterate that we require each public utility transmission provider through its regional transmission planning process to coordinate with the public utility transmission providers in each of its neighboring transmission planning regions within its interconnection. Thus, interregional transmission coordination would occur between the public utility transmission providers in two neighboring transmission planning regions.

420. As discussed above in the regional transmission planning section,[352] the Commission declines to revisit how each transmission planning region defines itself, as requested by Integrys and Transmission Dependent Utility Systems. We also decline to adopt Integrys' suggestion that the Commission could implement its interregional transmission coordination requirements in non-RTO regions by requiring public utility transmission providers in such regions to form planning consortia. Public utility transmission providers are free to do so; however, we do not want to foreclose other approaches to meeting the interregional transmission coordination requirements in this

[352] *See supra* section III.A.3 of this Final Rule.

Final Rule.

421. We clarify for New York ISO that a public utility transmission provider will not be deemed out of compliance with this Final Rule if it attempts to and is unable to develop interregional transmission coordination procedures with neighboring transmission systems in another country.

3. Implementation of the Interregional Transmission Coordination Requirements

a. Procedure for Joint Evaluation

i. Comments

422. Several commenters express support for the Commission's proposal to require the development of a formal procedure to identify and jointly evaluate transmission facilities that are proposed to be located in neighboring transmission planning regions.[353] Some commenters seek clarification of this requirement. For example, Duke suggests that the Commission clarify whether it intends that only one joint interregional study will be performed for a proposed interregional project, regardless of the number of regions that are crossed, as multiple studies would result in an inefficient use of resources. ISO/RTO Council and PJM ask whether the Commission intends "joint evaluation" to mean coordination of stakeholder meetings and processes and/or the creation of a new set of

[353] *E.g.*, American Transmission; New York Transmission Owners; Northeast Utilities; and Transmission Dependent Utility Systems.

planning criteria and a new planning cycle. In addition, PJM requests clarification as to whether the Commission intends "joint evaluation" to be conducted consistent with an interregional agreement such as the PJM/MISO Joint Operating Agreement.

423. Several commenters urge the Commission to provide flexibility in developing and implementing planning agreements.[354] They state that although the Commission proposed to require that interregional transmission planning agreements include the four elements of interregional coordination, the Commission also encouraged every interregional transmission planning agreement to be tailored to best fit the needs of the regions entering into the agreement. ISO New England urges the Commission to allow flexibility for regions to define in their interregional transmission planning agreements what it means to "jointly evaluate" interregional projects.

424. In setting out the details of interregional coordination, PUC of Nevada urges the Commission to consider the ongoing efforts in the Western Interconnection to address interregional coordination. WestConnect Planning Parties state that any requirement to execute an interregional transmission planning agreement should respect the various organizational structures of existing regional and interregional planning processes, as well as allow signature by all formal participants in the interregional planning process instead of requiring "formation of a legal entity authorized to act on behalf of those

[354] *E.g.*, PUC of Nevada; New York ISO; and Dayton Power and Light.

participants."

425. Other commenters offer specific suggestions as to the design and implementation of interregional coordination procedures. Minnesota PUC and Minnesota Office of Energy Security argue that, for the studies of an entire project to be meaningful and informative, all transmission planning entities studying a project should be required to coordinate their information and studies. Pioneer Transmission recommends that the Commission require planning regions to evaluate interregional projects through a single, coordinated process. It believes that if projects are studied under separate procedures by each planning region, interregional coordination would be unnecessarily delayed and more expensive than if the project was studied under a single set of procedures. However, Connecticut & Rhode Island Commissions contend that the Commission should require that proposed interregional projects be independently processed through each applicable regional planning process before they are eligible for joint evaluation through interregional coordination procedures.

426. Old Dominion similarly recommends that coordinated analysis of interregional transmission facilities be accomplished through preliminary evaluation within existing regional transmission planning processes, followed by an evaluation of the project on an interregional basis. If the identified transmission facility is determined to meet interregional needs, the relevant transmission planning regions would incorporate the project into their regional transmission planning processes and further assess its effects

on regional needs. Old Dominion recommends that the Commission require this "feedback loop" so that local and regional transmission plans can be reconsidered once an interregional transmission plan has been developed. Similarly, New England States Committee on Electricity supports the Commission's proposed interregional coordination requirements provided that interregional projects will be identified and developed through the current approach that begins with and respects the regional transmission planning process and resulting regional transmission plan.

427. Several commenters suggest that the Commission should develop a *pro forma* interregional transmission planning agreement. NextEra suggests that such an agreement include the steps by which the regions and their stakeholders will identify the transmission facilities necessary to meet their needs. Otherwise, NextEra contends that the negotiation of such agreements is likely to be cumbersome. ITC Companies agrees that development of a *pro forma* interregional planning agreement would provide clarity regarding the Commission's minimum requirements and, if designed properly, could avoid replication of flaws in existing transmission planning processes that occurred in the PJM and MISO Joint Operating Agreement. In its reply comments, PJM agrees with ITC Companies that a more standardized planning process that includes a *pro forma* interregional planning agreement could improve coordination with respect to interregional facilities, and cautions that the Commission cannot simply recite regional differences as the basis for not establishing broader criteria. However, PJM contends that

ITC Companies' argument regarding the Joint Operating Agreement is likely premised on the fact that their project was not selected in the RTOs' respective regional transmission plans. In its reply, Southern California Edison argues that adopting a *pro forma* agreement is not workable because planning coordination differs significantly at each RTO/ISO and among vertically integrated utilities.

428. Pennsylvania PUC suggests that the joint operating agreement between PJM and MISO, which includes a section on coordinated regional transmission planning requirements, could serve as a model for neighboring transmission regions negotiating bilateral coordination agreements. Pennsylvania PUC warns, however, that the joint operating agreement between PJM and MISO may require improvement in both content and operation with regard to interregional transmission planning and construction.

429. PJM requests that, before requiring greater interregional coordination, the Commission clarify whether it will continue to allow regional differences in transmission planning processes or it intends to require greater standardization among regional planning processes to achieve interregional coordination. Old Dominion agrees, recommending that the Commission provide guidance addressing the extent to which regional differences can be modified to enhance interregional transmission planning—potentially by requiring an interim compliance measure where regions report to the Commission on their progress, identify differences in regional transmission planning and/or cost allocation, and request guidance where needed. Southern Companies states

on reply that, while they have no objection to the Commission encouraging additional coordination, the Commission should not attempt to mandate (directly or indirectly) uniformity or standardization. Other commenters urge flexibility to accommodate regional differences.[355]

430. Several commenters emphasize the need for more consistent data formats, modeling, planning assumptions, planning standards and protocols, and evaluation procedures and metrics (among other elements of and tools used in the transmission planning process) between transmission planning regions or for use in interregional transmission planning to ensure that the proposed reforms are effective.[356] East Texas Cooperatives cite examples of inconsistent metrics and assumptions that they contend have hindered effective interregional planning between SPP and Entergy, including the use of: (1) different metrics to calculate available flowgate capacity at the seams; (2) different planning horizons; and (3) different types of proposed transmission upgrades in the long-term models for granting transmission service. Exelon asks the Commission to require the use of the same modeling assumptions and planning criteria, which should reflect actual expected operating conditions, when studying the impacts of a proposed

[355] *E.g.*, California Commissions; Dayton Power and Light; and NARUC.

[356] *E.g.*, WIRES; Wisconsin Electric Power Company; Pioneer Transmission; Organization of MISO States; Pennsylvania PUC; 26 Public Interest Organizations; East Texas Cooperatives; and ITC Companies.

interregional transmission facility on the reliability and congestion of neighboring systems. WIRES argues for the establishment of common interregional planning protocols by the Commission that can be employed by planners and stakeholders to guide development of interregional agreements on data, assumptions, and procedures that will be the foundation of genuine interregional planning processes. ITC Companies also recommends that the Commission require common assumptions and goals for long-term planning. Minnesota PUC and Minnesota Office of Energy Security recommend that project sponsors be required to provide usable data to all transmission planning entities that must study their projects.

431. Several commenters express concern that interregional planning processes could occur at different times and argue that a timeline should be established such that all planning regions consider interregional projects using the same timeline.[357] MidAmerican argues that interregional planning should be undertaken on a common time horizon, such as 20 years or longer. Organization of MISO States recommends that the Commission consider requiring the establishment of deadlines for submitting an interregional project for joint evaluation to avoid any negative impacts on each individual transmission planning region's planning process. ISO New England, however, argues against requiring interregional projects to be evaluated simultaneously by both regions or

[357] *E.g.*, Indianapolis Power & Light; California ISO; Organization of MISO States; and Solar Energy Industries and Large-scale Solar.

in joint sessions of both regions' stakeholders, asking instead that sequential evaluation by each region be allowed. Pioneer Transmission opposes sequential evaluation and recommends that the Commission require that interregional transmission planning agreements include specific milestones to ensure that proposed interregional projects are evaluated in a timely manner. Pioneer Transmission cautions, however, that interregional projects already before a transmission planning region should not be required to start over, which could possibly delay the overall evaluation process. MISO Transmission Owners agree that the proposed requirement should not interfere with existing transmission planning cycles.

432. American Transmission and the MISO Transmission Owners further recommend that interregional coordination procedures must allow for "out-of-cycle" reviews of interregional projects to address reliability issues. However, Wisconsin Electric Power Company suggests that the Commission require that adjacent planning regions align the timelines of their regional transmission planning processes to facilitate interregional coordination.

433. Several commenters support the Commission's proposed requirement that a proposed interregional transmission project must be included in each relevant regional

transmission plan to be subject to the interregional cost allocation method.[358] Duke supports the proposed requirement subject to the acknowledgement that inclusion in a plan does not mean that a given project will be constructed. Connecticut & Rhode Island Commissions contend that a region should not be required to accept an allocation of a transmission facility's costs unless the region approved the facility in its planning process and has identified concrete benefits that would accrue to the region. Organization of MISO States asks the Commission to clarify what would happen if, after neighboring regions' joint evaluation of a proposed interregional project, the project were found to benefit one region, but not the other. New England States Committee on Electricity supports the Commission's approach to interregional coordination as long as interregional transmission projects sponsored by one region will not be imposed involuntarily on another region. However, Anbaric and PowerBridge suggest that, once selected to go ahead, an interregional transmission project should bypass the planning region's normal procedures and be assigned to an interregional team to expedite and oversee the project, to ensure timely development of the facilities.

434. First Wind suggests that a region from which renewable energy is to be exported may not experience reliability, economic, or public policy benefits as a result of an interregional transmission project and, thus, the exporting region may not include the

[358] *E.g.*, New York ISO; New York Transmission Owners; and Transmission Dependent Utility Systems.

project in its regional transmission plan. To ensure that renewable resources are able to access markets in which they can command the best price, First Wind suggests that the regional state committee representing the importing region be able to identify that an interregional transmission project is necessary to achieve public policy objectives and consequently have it included in the exporting region's regional transmission plan.

ii. Commission Determination

435. The Commission requires the development of a formal procedure to identify and jointly evaluate interregional transmission facilities that are proposed to be located in neighboring transmission planning regions. The establishment of a procedure by which a public utility transmission provider will identify and jointly evaluate is necessary for facilitating the identification of interregional solutions that may resolve each region's needs more efficiently or cost-effectively. As a result, the Commission and transmission customers will have greater certainty that the transmission facilities in each regional transmission plan are the more efficient and cost-effective solutions to meet the region's needs.

436. The Commission also requires the developer of an interregional transmission project to first propose its transmission project in the regional transmission planning processes of each of the neighboring regions in which the transmission facility is proposed to be located. The submission of the interregional transmission project in each regional transmission planning process will trigger the procedure under which the public

utility transmission providers, acting through their regional transmission planning process, will jointly evaluate the proposed transmission project. This joint evaluation must be conducted in the same general timeframe as, rather than subsequent to, each transmission planning region's individual consideration of the proposed transmission project. Finally, for an interregional transmission facility to receive cost allocation under the interregional cost allocation method or methods developed pursuant to this Final Rule, the transmission facility must be selected in both of the relevant regional transmission planning processes for purposes of cost allocation.

437. Some commenters such as ISO/RTO Council express concern that joint evaluation of proposed interregional transmission facilities could involve the creation of a new set of planning criteria, while others such as Exelon stress the need for greater consistency in planning criteria and modeling assumptions used by neighboring regions. As a general matter, we note that joint evaluation of a proposed interregional transmission facility cannot be effective without some effort by neighboring transmission planning regions to harmonize differences in the data, models, assumptions, planning horizons, and criteria used to study a proposed transmission project. We therefore direct, as part of compliance with the interregional transmission coordination requirements, that each public utility transmission provider, through its transmission planning region, develop procedures by which such differences can be identified and resolved for purposes of jointly evaluating the proposed interregional transmission facility. We leave to each

pair of neighboring regions, however, discretion in the way this requirement is designed and implemented and do not require that any particular planning horizons or criteria be used. In response to Minnesota PUC and Minnesota Office of Energy Security, we discuss in the opportunities for discrimination against non-incumbent transmission developers section the information that a transmission developer must provide to the transmission planning region in support of its transmission project proposal.[359]

438. Some commenters argue that the Commission should establish the timeframe within which regions must jointly evaluate interregional transmission projects. The Commission declines to specify a timeline for the interregional transmission coordination procedures or a deadline by which all interregional transmission projects must be submitted. Instead, the Commission expects public utility transmission providers in neighboring transmission planning regions to cooperate and develop timelines that allow for coordination and joint evaluation of interregional transmission projects in the same general time frame as each region's consideration of the transmission project. Furthermore, we disagree with those commenters that argue that there should be sequential evaluation of transmission projects, as opposed to evaluation on the regional and interregional levels in the same general time frame. However, we clarify for ISO New England that we will not require that interregional transmission projects be

[359] *See* discussion *supra* section III.B.3.d.ii.

evaluated simultaneously by both regions or in joint sessions of both regions' stakeholders.

439. Rather, we require that both regions conduct joint evaluation of an interregional transmission project in the same general timeframe. By same general time frame, the Commission expects public utility transmission providers to develop a timeline that provides a meaningful opportunity to review and evaluate through the interregional transmission coordination procedures information developed through the regional transmission planning process and, similarly, provides a meaningful opportunity to review and use in the regional transmission planning process information developed in the interregional transmission coordination procedures. Rather than provide further detailed guidance on this matter in this Final Rule that may unduly constrain the planning time line of each region for purposes of coordination with one or several neighboring regions, we prefer in the first instance to permit regions to develop appropriate timing arrangements with neighbors, which we will review on compliance.

440. American Transmission and the MISO Transmission Owners recommend that interregional transmission coordination procedures must allow for "out-of-cycle" reviews of interregional transmission projects to address reliability issues. The Commission believes that a requirement for ongoing constant reviews without regard to a defined planning cycle would be too burdensome. This Final Rule does not require such an "out-of-cycle" review, nor does it prohibit a region or a pair of regions from doing so, for

example if necessary to address a pressing reliability issue. Additionally, while the creation of a new planning cycle may be unnecessary, the Commission is requiring that coordination and joint evaluation must be conducted in the same general time frame as, rather than subsequent to, each transmission planning region's individual consideration of the proposed transmission project.

441. Furthermore, we decline to adopt suggestions to require adjacent transmission planning regions to align the timelines of their regional transmission planning processes. The Commission is providing flexibility, subject to certain requirements, in the design and implementation of procedures to govern the joint evaluation of interregional transmission facilities by neighboring transmission planning regions. To the extent public utility transmission providers in neighboring transmission planning regions identify changes to their regional transmission planning processes that are necessitated by implementation of interregional transmission coordination procedures, those transmission providers should implement those changes as part of their compliance filings submitted in response to this Final Rule.

442. In response to New England States Committee on Electricity's comment that interregional transmission coordination should begin with and respect the regional transmission planning process and resulting regional transmission plan, we note that we require in this Final Rule that the developer of a transmission project that would be located in more than one transmission planning region first must propose its transmission

project in the regional transmission planning process of each of those transmission planning regions. We expect each transmission planning region's review of that transmission project to be informed by and closely coordinated with the interregional transmission coordination procedures. Furthermore, the Commission did not propose in the Proposed Rule, and will not require in this Final Rule, that interregional transmission coordination procedures provide for the costs of an interregional transmission project sponsored by one transmission planning region to be involuntarily imposed on another transmission planning region.

443. Finally, the Commission agrees with Duke that having an interregional transmission facility in a regional transmission plan does not mean that it will be constructed. As in Order No. 890, the goal of this Final Rule is to establish procedures by which neighboring transmission planning regions will coordinate to jointly evaluate proposed transmission facilities, not to dictate which investment must be made or transmission projects must be built.[360] In response to Connecticut & Rhode Island Commissions, the Commission clarifies that public utility transmission providers in a transmission planning region will not be required to accept allocation of the costs of an interregional transmission project unless the region has selected such transmission facility in the regional transmission plan for purposes of cost allocation. That is, based on the

[360] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 438.

information gained during the joint evaluation of an interregional transmission project, each transmission planning region will determine, for itself, whether to select those transmission facilities within its footprint in the regional transmission plan for purposes of cost allocation. Whether a transmission planning region would decide to select an interregional transmission facility in its regional transmission plan likely would be driven by the relative costs and benefits of the transmission project to that region. The Commission believes this effectively provides the "feedback loop" sought by Old Dominion.

444. The Commission declines to adopt the suggestion by Anbaric and PowerBridge that an interregional transmission project resulting from the interregional transmission coordination procedures be allowed to bypass the relevant regions' transmission planning processes and be automatically assigned to an interregional team. However, we do not preclude the public utility transmission providers in a pair of transmission planning regions from creating a separate process for developing interregional transmission facilities that have been in each relevant transmission planning region's plan. Instead, we provide transmission planning regions with flexibility to determine how to address an interregional transmission project. We reiterate that, to be eligible for interregional cost allocation, the interregional transmission facility must be selected in the regional transmission plan for purposes of cost allocation in each of the transmission planning regions in which the transmission facility is proposed to be located.

445. Beyond the clarifications provided above, we decline to address the remaining requests to further delineate how neighboring transmission regions must jointly evaluate proposed interregional transmission facilities because such action could inadvertently impose requirements that are not appropriate for particular regions. Given the flexibility we have provided to public utility transmission providers in implementing the interregional transmission coordination requirements, the Commission determines it is unnecessary to adopt interim compliance requirements or other processes such as those suggested by Old Dominion.

446. We decline to adopt First Wind's suggestion that a transmission planning region should be required to include a transmission project intended to export renewable energy resources in its regional transmission plan if the regional state committee representing the importing region identifies the transmission project as necessary to achieve a public policy objective. As discussed above, whether an interregional transmission facility is to be selected in the regional transmission plan for purposes of cost allocation is a decision left to each transmission planning region. However, we will not preclude public utility transmission providers in neighboring transmission planning regions from voluntarily developing procedures such as those proposed by First Wind should they agree to do so as part of their interregional transmission coordination efforts.

447. In response to commenters' recommendations that the Commission provide for regional flexibility in developing and implementing interregional transmission

coordination, we reiterate the Commission's encouragement in the Proposed Rule that interregional transmission coordination procedures be tailored to best fit the needs of the public utility transmission providers in the regions involved while also meeting certain minimum requirements.[361]

448. Furthermore, as urged by PUC of Nevada, we are cognizant of existing interregional transmission coordination efforts and, by providing regional flexibility, intend to accommodate their various organizational structures, as suggested by WestConnect Planning Parties. Consistent with this approach, any public utility transmission provider that believes its existing interregional transmission coordination procedures, including those found in any interregional transmission planning agreement, already comply with the requirements of this Final Rule may indicate in its compliance filing how its existing procedures meet each requirement. If the existing procedures do not meet all of the requirements, the public utility transmission provider may propose revisions to its existing interregional transmission coordination procedures so that the procedures comply with this Final Rule.

449. Because we want to allow for regional flexibility, we decline to adopt commenters' suggestions that the Commission develop *pro forma* interregional

[361] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 117.

transmission coordination procedures or impose additional requirements as to what interregional transmission coordination should entail. As noted by Southern California Edison, planning coordination differs significantly at each RTO and ISO and among vertically integrated utilities, and we thus determine that *pro forma* interregional transmission coordination procedures are not appropriate at this time because it may not accommodate the differences among existing transmission planning regions. Moreover, the requirements that we adopt as interregional transmission coordination requirements in this Final Rule should be adequate guidance for public utility transmission providers.

450. We also note the Pennsylvania PUC's suggestion that the joint operating agreement between PJM and MISO, which includes a section on coordinated regional transmission planning requirements, could serve as a model for neighboring transmission planning regions negotiating bilateral coordination agreements. While we generally agree that various existing transmission planning agreements between regions may serve as models, we note that existing agreements reflect the needs of the regions that negotiated them. Thus, the Commission declines to require public utility transmission providers to adopt or model their coordination procedures on any particular agreement to coordinate transmission planning between two regions.

b. Data Exchange

i. Comments

451. American Transmission supports the Proposed Rule's requirement that

interregional transmission planning agreements include an agreement to exchange planning data and information at least annually. American Transmission states that this requirement would help ensure that neighboring regions are aware of planning considerations as well as any transmission issues in neighboring regions. It also recommends that the Commission establish a time frame for a neighboring transmission planning region to respond to a transmission provider's request for planning information and data. SPP recommends that the Commission require interregional transmission planning agreements to include the specific procedures for sharing such information rather than only an agreement to do so.

452. Several commenters state that this exchange should be required to occur more often than annually.[362] NextEra states that the Commission should require the exchange of planning data and information at least as frequently as warranted by any material developments that either affect any neighboring region or interregional facility or may influence any interregional transmission plan. Organization of MISO States recommends that the Commission modify this element to require exchange of planning data and information at least semi-annually because transmission planning analysis can change over the course of a planning cycle due in part to changing modeling results and stakeholder input. Minnesota PUC and Minnesota Office of Energy Security recommend

[362] *E.g.*, Minnesota PUC and Minnesota Office of Energy Security; NextEra; and Organization of MISO States.

that the Commission require planning data and information exchanges between transmission planning regions to occur semi-annually to account for those project proposals that are requested to be reviewed out-of-cycle.

453. Transmission Dependent Utility Systems and Pennsylvania PUC express concern that this proposed element does not consider differences in the planning processes of each region. For example, Transmission Dependent Utility Systems state that the proposed planning data and information exchange requirement may be inadequate to address interregional transmission infrastructure concerns, and that transmission providers and stakeholders should be permitted to determine the type and frequency of meetings and planning information exchanges. Likewise, Pennsylvania PUC states that this requirement should accommodate different transmission planning regions' planning cycles.

ii. Commission Determination

454. The Commission requires each public utility transmission provider, through its regional transmission planning process, to adopt interregional transmission coordination procedures that provide for the exchange of planning data and information at least annually. The sharing of data at least once a year will ensure that neighboring transmission planning regions are aware of each others' transmission plans and the assumptions and analysis that support such plans. In response to arguments that the Commission should require neighboring transmission planning regions to exchange data

more frequently, we note that this Final Rule provides that this information must be exchanged *at least* annually, thereby allowing each public utility transmission provider through its transmission planning region, the flexibility to decide to exchange information more frequently. If a pair of transmission planning regions anticipates that more frequent exchanges of planning data and information would improve interregional transmission coordination, then we encourage them to provide for such exchanges in their interregional transmission coordination procedures.

455. We agree with SPP that interregional transmission coordination procedures must include the specific obligations for sharing planning data and information rather than only an agreement to do so. A clear description of the procedures that will be used to exchange planning data and information will help the Commission, transmission customers, and other stakeholders to better determine if each public utility transmission provider is fulfilling its obligations consistent with this Final Rule. However, we will not dictate the specific procedures or the level of detail for the procedures pursuant to which planning data and information must be exchanged. Consistent with the comments of Transmission Dependent Utility Systems and Pennsylvania PUC, we allow each public utility transmission provider, through its transmission planning region, to develop procedures to exchange planning data and information, which we anticipate will reflect the type and frequency of meetings that are appropriate for each pair of regions and will accommodate each pair of region's planning cycles.

c. Transparency

i. Comments

456. Pennsylvania PUC supports the proposed requirement that interregional transmission planning agreements include a commitment to maintain a website or e-mail list for the communication of information related to the coordinated planning process. Duke requests the Commission clarify that information relating to the interregional transmission planning process can be maintained on an existing transmission provider's website or regional transmission planning website.

457. In addition, MISO Transmission Owners suggest that all transmission providers offering transmission service or interconnection service under a tariff (including a non-jurisdictional tariff) should be required to make publicly available their business practice manuals or other documentation specifically detailing the assumptions and criteria used in comparably evaluating all proposed transmission and generation projects, including the identification and treatment of third-party impacts.

ii. Commission Determination

458. The Commission requires public utility transmission providers, either individually or through their transmission planning region, to maintain a website or e-mail list for the communication of information related to interregional transmission coordination procedures. The Commission clarifies that information related to interregional transmission coordination may be maintained on an existing public utility transmission

provider's website or a regional transmission planning website. However, the information should be posted in such a way that stakeholders are able to distinguish between information related to interregional transmission coordination and information related to regional transmission planning.

d. Stakeholder Participation

i. Commission Proposal

459. In the Proposed Rule, the Commission did not specifically address the issue of stakeholder participation with regard to the coordination of transmission planning activities undertaken by neighboring transmission regions.

ii. Comments

460. Some commenters discuss the need for utilities and stakeholders to participate in the process of developing interregional planning agreements. Transmission Access Policy Study Group states that interregional transmission planning agreements must be inclusive, open, and collaborative. Both Transmission Access Policy Study Group and East Texas Cooperatives state that transmission dependent utilities should have the opportunity to participate in their development and implementation. Transmission Access Policy Study Group states that, without such a requirement, the Commission would not be fulfilling its responsibility under FPA section 217(b)(4) to facilitate planning to meet the needs of all load-serving entities. Wisconsin Electric Power Company requests that the Commission explicitly ensure that stakeholders have the

opportunity to participate in the development of these agreements.

461. Some commenters contend that the interregional transmission planning requirements described in the Proposed Rule could be significantly improved with respect to stakeholder participation. New York PSC states that the Commission should articulate that meaningful participation in the planning process is necessary, including the opportunity to provide input concerning how studies are conducted and solutions are identified. Transmission Dependent Utility Systems contend that it is just as important for transmission customers to be able to participate in interregional transmission planning as it is for them to be able to participate in regional transmission planning.

462. Integrys states that because stakeholder involvement and input is necessary to ensure proper planning and evaluation of projects, the Commission should adopt a stakeholder participation requirement in any Final Rule. Xcel states that the interregional coordination necessary to support the development of larger-scale, interregional transmission projects (particularly those that are needed to integrate renewable energy resources) must engage stakeholders, and especially state regulatory agencies, in the development of processes that address the specific needs and requirements of the participating regions. Without the involvement of state agencies, which ultimately decide which transmission facility will be built, Xcel contends that interregional transmission planning processes will not result in the construction of needed transmission.

463. Energy Future Coalition states that interregional transmission planning must be

both participatory and analytically robust by engaging all interested parties, including utilities, states, renewable generation developers, environmental interests, and consumer interests.

464. Some commenters express concern that, even if the proposed interregional transmission planning requirements provide for stakeholder participation, such participation can require significant resources from stakeholders. NARUC and Massachusetts Departments claim that limited human resources and budgets make it difficult for state commissions and other stakeholders to participate in additional transmission planning processes. Massachusetts Departments suggest that any Final Rule should take these challenges into account and consider mechanisms to address them. Similarly, California Commissions comment that states must have access to adequate resources to support state involvement in interregional coordination processes and that the Commission could consider requiring stakeholder support beyond that provided through the ARRA-funded interconnectionwide transmission planning initiatives.

iii. Commission Determination

465. We agree with those commenters that argue stakeholder participation is an important component in interregional transmission coordination to ensure the goals of improving coordination between neighboring transmission planning regions and identifying interregional transmission facilities that can address transmission needs more efficiently or cost-effectively than separate intraregional transmission facilities.

However, this Final Rule does not require the interregional transmission coordination procedure to meet the requirements of the planning principles required for local planning (under Order No. 890) and regional planning (under this Final Rule).[363] Because we require in this Final Rule that an interregional transmission facility must be selected in each relevant regional transmission plan for purposes of cost allocation to be eligible for interregional cost allocation, stakeholders will have the opportunity to participate fully in the consideration of interregional transmission facilities during the regional transmission planning process.[364] Furthermore, we believe that stakeholder participation in the various regional transmission planning processes will enhance the effectiveness of interregional transmission coordination. To facilitate stakeholder involvement, this Final Rule requires the public utility transmission providers to make transparent the analyses undertaken and determinations reached by neighboring transmission planning regions in the identification and evaluation of interregional transmission facilities.[365]

466. We also agree with commenters that discuss the importance of transmission customer and stakeholder participation in the development of the interregional transmission coordination procedures necessary to comply with the requirements in this

[363] Of course, nothing precludes public utility transmission providers in neighboring transmission planning regions from choosing to meet those requirements.

[364] *See* discussion *supra* P 150.

[365] This information must be made available subject to appropriate confidentiality protections and CEII requirements.

Final Rule. Therefore, we require that each public utility transmission provider give stakeholders the opportunity to provide input into the development of its interregional transmission coordination procedures and the commonly agreed-to language to be included in its OATT.

467. The Commission appreciates the concerns of NARUC and others regarding the effect budgetary limitations could have on effective stakeholder participation in interregional transmission coordination activities. As discussed above in the regional transmission planning section[366] and consistent with Order No. 890, to the extent that public utility transmission providers choose to include a funding mechanism to facilitate the participation of state consumer advocates or other stakeholders in the regional transmission planning process, nothing in this Final Rule precludes them from doing so.

e. Tariff Provisions and Agreements for Interregional Transmission Coordination

i. Commission Proposal

468. In the Proposed Rule, the Commission proposed to require that coordination between neighboring transmission planning regions be reflected in an interregional transmission planning agreement to be filed with the Commission.[367]

---

[366] *See* discussion *supra* section III.A.3.

[367] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 114.

ii. Comments

469. Several commenters express support for the Commission's proposal to require neighboring regions to enter into interregional transmission planning agreements.[368] They also emphasize, however, that planning regions should be able to structure planning agreements so that each region is a full, equal partner and no region can force projects or costs onto other regions in a manner that is inconsistent with the agreement. Edison Electric Institute further emphasizes that these planning agreements cannot replace strong interregional coordination to address interregional impacts.

470. Other commenters argue that the Commission should accept the submission of existing interregional agreements, with necessary modifications, to comply with the Final Rule.[369] American Transmission and MISO Transmission Owners state that when reviewing existing interregional agreements to determine their compliance with the Final Rule, if the Commission determines that modifications to these agreements are necessary, the public utility transmission providers and their stakeholders should be given the opportunity to address and submit revisions.

471. Some commenters suggest that interregional coordination procedures should be

[368] *E.g.*, National Grid; New York Transmission Owners; and Edison Electric Institute.

[369] *E.g.*, FirstEnergy Service Company; American Transmission; and MISO Transmission Owners.

incorporated into public utility transmission providers' OATTs. Ad Hoc Coalition of Southeastern Utilities suggests that as an alternative to the interregional agreement, the Commission should consider adopting an additional planning principle that permits public utility transmission providers to explain how they address the types of matters that the Proposed Rule would require to be included in such interregional agreements. ColumbiaGrid further contends that transmission providers in the Western Interconnection should be required to include in their OATTs only the regional planning group and WECC processes and information regarding their existing relationship, and that they should not be required to divert resources to developing formal agreements to be filed with the Commission. Bonneville Power suggests that the Commission require transmission providers to include coordination requirements as part of the transmission planning processes outlined in their OATTs, but without specific details about how individual projects would be planned and developed. It states that this would allow transmission providers to enter into voluntary agreements and to focus on developing higher priority projects. Transmission Dependent Utility Systems state that each public utility transmission provider's interregional transmission planning process should be included in the OATT, subject to effective Commission and stakeholder scrutiny on an ongoing basis.

472. California ISO also contends the proposed requirements are problematic for the ISO in that it would not be able to develop an interregional transmission planning

agreement applicable to all of its neighboring balancing authority areas because many of its neighboring balancing authorities have different legal charters and are subject to different laws, regulations, and requirements.

473. Several commenters raised concerns about the proposed interregional transmission planning agreements with respect to non-jurisdictional transmission providers. Western Area Power Administration requests that the Final Rule acknowledge that interregional transmission planning-related agreements would need to account for the status and statutory requirements of non-public utility transmission providers before they may be executed. Large Public Power Council states its members will commit to voluntarily participate in interregional transmission planning processes, but that its members have limited authority to enter into agreements that include, among other things, an obligation to pay construction costs or a requirement to defer to regional or interregional planning authorities. Omaha Public Power District states that it plans to participate voluntarily in an interregional transmission planning process, but notes that its agreements to do so would not be subject to the Commission's jurisdiction or enforcement. Nebraska Public Power District expresses the same concerns regarding the lack of clarity in the commitments that it would be required to make as a result of the proposed interregional transmission planning agreements. Nebraska Public Power District also commits to participate in interregional transmission planning processes; however, it contends that it cannot make such commitment outside of its current RTO membership and the related

protection against violating state law and that its authority to enter into binding agreements is limited consistent with state sovereignty.[370]

474. Several commenters argue that the Commission should require non-jurisdictional entities to comply with the proposed interregional transmission planning requirements. Westar states that power flows on a non-jurisdictional entity's system can affect facilities in a jurisdictional entity's system, and vice-versa. Similarly, MISO Transmission Owners state that requiring non-jurisdictional entities to participate would ensure effective interregional transmission planning and coordination and address seams issues. NextEra states that to facilitate broad-based participation by all relevant entities, the Commission should invoke its authority under FPA section 211A to require unregulated transmitting utilities to participate in the interregional transmission planning process.

iii. Commission Determination

475. In light of the comments received, the Commission declines to require that coordination between the public utility transmission providers in pairs of neighboring transmission planning regions be reflected in a formal interregional transmission planning agreement filed with the Commission, as was proposed in the Proposed Rule. Instead, as recommended in part by Ad Hoc Coalition of Southeastern Utilities, ColumbiaGrid,

[370] Comments addressing specific statutory provisions that may limit non-jurisdictional participation in this regard are addressed in the discussion of the Commission's legal authority to undertake reforms regarding regional transmission planning. *See* discussion *infra* section III.A.2 of this Final Rule.

Bonneville Power, and Transmission Dependent Utility Systems, we require that the public utility transmission providers in each pair of neighboring transmission planning regions, working through their regional transmission planning processes, must develop the same language to be included in each public utility transmission provider's OATT that describes the interregional transmission coordination procedures for that particular pair of regions.[371] Alternatively, if the public utility transmission providers so choose, these procedures may be reflected in an interregional transmission coordination agreement filed on compliance for approval by the Commission.[372]

476. We find that implementing the interregional transmission coordination requirements in this Final Rule through their incorporation in each public utility transmission provider's OATT, instead of requiring an interregional transmission

[371] Consistent with the approach taken in Order Nos. 890 and 890-A, public utility transmission providers may use web-posted business practice manuals to describe planning-related processes. *See* Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 1653; Order No. 890-A, FERC Stats. & Regs. ¶ 31,261 at P 990.

[372] However, even if a public utility transmission provider voluntarily enters into such an agreement, its OATT must still provide enough description for stakeholders to follow how interregional transmission coordination will be conducted, with links included to the actual agreement where the details can be found. *See United States Dep't of Energy - Bonneville Power Admin.*, 124 FERC ¶ 61,054, at P 65 (2008) (requiring Avista, Puget and Bonneville Power "to provid[e] additional detail in their Attachment Ks on the WECC's [Transmission Expansion Planning Policy Committee's] process or providing direct links (i.e., URLs) to the appropriate documents on the WECC website where the processes to coordinate information and planning efforts [between several regional planning groups] are discussed").

planning agreement, will fulfill our objective to improve interregional transmission coordination and provide adequate transparency with regard to the obligations imposed on public utility transmission providers. Further, commenters persuade us that this approach would facilitate the participation of non-public utility transmission providers in an interregional transmission coordination efforts.

477. In response to commenters' arguments that the Commission should accept the submission of existing interregional agreements on compliance, we agree provided the compliance filing explains how the existing agreement satisfies the requirements of this Final Rule. The Commission will address the adequacy of such an existing agreement on compliance.

478. We decline to adopt Bonneville Power's recommendation that these procedures omit specific details about how individual transmission projects would be planned and developed, because we require each set of interregional transmission coordination procedures to include a formal procedure to identify and jointly evaluate transmission facilities that are proposed to be located in both transmission planning regions.

479. We do not find convincing California ISO's argument that it will be problematic for it to develop interregional transmission coordination procedures with all of its neighboring balancing authority areas due to the differences among them. Just as reliable transmission operation of interconnected transmission systems requires coordination among neighboring utilities and regions—some of which is required by mandatory

reliability standards, transmission planning of interconnected transmission systems requires some degree of coordination among neighboring utilities and regions. We conclude that this Final Rule provides for sufficient regional flexibility to allow the California ISO to develop in cooperation with its neighboring balancing authority areas interregional transmission coordination procedures that accommodate their differences.

480. We agree with commenters that interregional transmission coordination should be structured in such a way that no public utility transmission provider in a transmission planning region should be permitted to force transmission projects or costs onto another region contrary to the agreed upon interregional transmission coordination procedures

incorporated into the relevant public utility transmission providers' OATTs pursuant to this Final Rule.

481. Because we are implementing the interregional transmission coordination requirements adopted in this Final Rule through incorporation of the same language into each public utility transmission provider's OATT rather than through formal agreements, we find comments presenting concerns that non-public utility transmission providers are unable to be party to interregional transmission planning agreements to be moot. Furthermore, we do not believe that it is necessary to address here those commenters that ask us to require non-public utility transmission providers to participate in interregional transmission coordination efforts. We believe such concerns are premature, as we are

encouraged by the non-public utility transmission providers who expressed their intent to participate in interregional transmission coordination efforts in their comments in response to the Proposed Rule. Additional discussion of non-public utility transmission provider participation in the reforms adopted in this Final Rule, including the interregional transmission coordination requirements, is in the reciprocity section below.[373]

IV. Proposed Reforms: Cost Allocation

482. The Commission requires, as part of this Final Rule, that each public utility transmission provider have in its OATT a method, or set of methods, for allocating the costs of new transmission facilities selected in the regional transmission plan ("regional cost allocation"); and that each public utility transmission provider within a transmission planning region develop a method or set of methods for allocating the costs of new interregional transmission facilities that two (or more) neighboring transmission planning regions determine resolve the individual needs of each region more efficiently and cost-effectively ("interregional cost allocation"). The OATTs of all public utility transmission providers in a region must include the same cost allocation method or methods adopted by the region. Each of the regional cost allocation and interregional cost allocation methods must adhere to the respective general cost allocation principles as set forth

[373] *See* discussion *infra* section V.B.

below.[374] Subject to these general cost allocation principles, public utility transmission providers in consultation with stakeholders have the opportunity to develop the appropriate cost allocation methods for their new regional and interregional transmission facilities. In the event that no agreement among public utility transmission providers in a region or pair of regions can be reached, the Commission will use the record in the relevant compliance filing proceeding(s) as a basis to develop a cost allocation method or methods that meets the Commission's requirements.

483. The requirements established below are designed to work in tandem with the transmission planning requirements established above to identify more appropriately the benefits and the beneficiaries of new transmission facilities so that transmission developers, planners and stakeholders can take into account in planning who would bear the costs of transmission facilities, if constructed.

A. Need for Reform Concerning Cost Allocation

1. Commission Proposal

484. In the Proposed Rule, the Commission noted that its responsibility under sections 205 and 206 of the FPA to ensure that transmission rates are just and reasonable and not

[374] For purposes of this Final Rule, a regional transmission facility is a transmission facility located entirely in one region. The Proposed Rule sometimes called such a facility a regional facility and sometimes an intraregional facility. An interregional transmission facility is one that is located in two or more transmission planning regions. A transmission facility that is located solely in one transmission planning region is not an interregional transmission facility.

unduly discriminatory or preferential is not new, nor is the Commission's recognition of the cost causation principle. However, the Commission explained that the circumstances in which it must fulfill its statutory responsibilities change with developments in the industry, such as changes with respect to the demands placed on the grid. For example, the expansion of regional power markets has led to a growing need for new transmission facilities that cross several utility, RTO, ISO or other regions. Similarly, the increasing adoption of state resource policies, such as renewable portfolio standards, has contributed to the rapid growth of renewable energy resources that are frequently remote from load centers.

485. The Commission stated that challenges associated with allocating the cost of transmission appear to have become more acute as the need for transmission infrastructure has grown. The Commission noted that constructing new transmission facilities requires a significant amount of capital and, therefore, a threshold consideration for any company considering investing in transmission is whether it will have a reasonable opportunity to recover its costs. The Commission explained, however, that there are few rate structures in place today that provide both for analysis of the beneficiaries of a transmission facility that is proposed to be located within a transmission planning region that is outside of an RTO or ISO, or in more than one transmission planning region, and for corresponding allocation and recovery of the facility's costs. The Commission stated that lack of such rate structures creates

significant risk for transmission developers that they will have no identified group of customers from which to recover the cost of their investment. With regard to cost allocation within RTO or ISO regions, the Commission noted that cost allocation issues are often contentious and prone to litigation because it is difficult to reach an allocation of costs that is perceived as fair, particularly for RTOs and ISOs that encompass several states.

486. The Commission further noted that the risk of the free rider problems associated with new transmission investment is particularly high for projects that affect multiple utilities' transmission systems and therefore may have multiple beneficiaries. With respect to such projects, any individual beneficiary has an incentive to defer investment in the hopes that other beneficiaries will value the project enough to fund its development. The Commission explained that, on one hand, a cost allocation method that relies exclusively on a participant funding approach,[375] without respect to other beneficiaries of a transmission facility, increases this incentive and, in turn, the likelihood that needed transmission facilities will not be constructed in a timely manner. On the other hand, if costs would be allocated to entities that will receive no benefit from a

[375] Under a participant funding approach to cost allocation, the costs of a transmission facility are allocated only to those entities that volunteer to bear those costs. The Proposed Rule cited several examples of regions relying principally or exclusively on the participant funding approach to cost allocation. Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 128.

transmission facility, then those entities are more likely to oppose selection of the facility in a regional transmission plan for purposes of cost allocation or to otherwise impose obstacles that delay or prevent the facility's construction.

487. In light of these challenges and recent developments affecting the industry, the Commission stated concern that existing cost allocation methods may not appropriately account for benefits associated with new transmission facilities and, thus, may result in rates that are not just and reasonable or are unduly discriminatory or preferential.[376] The Commission proposed the cost allocation requirements discussed in further detail below to address this concern.

2. Comments on Need for Reform

488. A number of commenters generally support the cost allocation requirements proposed by the Commission.[377] For example, ITC Companies state that the Commission has correctly concluded that reform with respect to transmission cost allocation methods is necessary. AWEA argues that issues related to cost allocation impede transmission development required to address increased demand, meet national

[376] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 148-54.

[377] *E.g.*, Transmission Access Policy Study Group; AWEA; Northeast Utilities; ITC Companies; Energy Future Coalition Group; MidAmerican; MISO; NextEra; E.ON Climate Renewables North America; Exelon; Iberdrola Renewables; WIRES; Western Grid Group; and Pennsylvania PUC.

energy and environmental goals, and create an intelligent, secure, and reliable transmission network. Clean Line argues that implementation of a cost allocation method is critical to the development of new infrastructure. Multiparty Commenters argue that a fair allocation of the costs of new transmission can be facilitated by acknowledging that the cost of transmission is a small portion of the delivered cost of electricity, generally ten percent or less, whereas the costs of a single project may be significant for the builders of that project. Solar Energy Industries urge the Commission to use its authority to alleviate impediments to building new transmission lines for renewable energy and other system needs to promote a robust competitive market that will benefit consumers and the environment.

489. Many commenters also support aligning transmission planning and cost allocation more closely.[378] Transmission Dependent Utility Systems state that it is virtually impossible to separate transmission planning from transmission cost allocation. Exelon argues that fair, efficient, and legal cost allocation should follow the manner in which its system is planned. Integrys agrees with linking cost allocation rules with transmission planning, but cautions that the transmission planning process is not a substitute for the

[378] *E.g.*, Atlantic Grid; ITC Companies; Sunflower and Mid-Kansas; MISO; Pennsylvania PUC; PHI Companies; Colorado Independent Energy Association; Energy Future Coalition Group; PSC of Wisconsin; CapX2020; and Wind Coalition.

cost allocation process.

490. A number of commenters supporting closer alignment between planning and cost allocation state that existing ISO and RTO transmission planning and cost allocation processes already may satisfy the proposal to align transmission planning and cost allocation more closely.[379] AEP and SPP believe that their existing transmission planning and cost allocation processes satisfy many of the Commission's proposed requirements. Similarly, MISO Transmission Owners state that cost allocation in MISO is already closely tied to the transmission planning process. Organization of MISO States points to MISO filings that address cost allocation issues.

491. WIRES asks the Commission to ensure that the planning process not be unduly influenced by those that seek to redirect potential cost allocation liability. Illinois Commerce Commission believes it is unduly discriminatory for a state to be required to bear costs for transmission expansion projects under a cost sharing arrangement but have no decisional authority for projects outside their state. Where a regional state committee exists, Illinois Commerce Commission recommends that a process be carved out by which the regional state committee's board of directors has the opportunity to review and decide on the reasonableness of each of the RTO's proposed transmission expansion projects for which regional cost allocation would apply.

[379] *E.g.*, SPP; AEP; MISO Transmission Owners; Organization of MISO States; California PUC; and Pacific Gas & Electric.

492. A number of commenters express concern with the Commission's proposal to impose generic regional and interregional cost allocation requirements.[380] Some commenters argue specifically that there is no need for the Commission's proposed cost allocation reforms.[381] For example, Northern Tier Transmission Group argues that the Proposed Rule does not present a factual basis for expanding the scope of the cost allocation requirement to every project contained in a regional transmission plan. It requests that the Commission confirm that the Proposed Rule is not intended to apply to existing transmission projects covered by existing tariff-based and contract-based cost allocation procedures. If the Proposed Rule is intended to apply to all new transmission projects in a region's transmission plan, Northern Tier Transmission Group urges that the Proposed Rule be rejected. It also is concerned that shifting the burden of cost allocation for every project onto the regional transmission planning process will create an unnecessary burden on a region's collective transmission providers. Westar states that the transmission planning selection process is critical to ensure that only transmission

[380] *E.g.*, Arizona Public Service Company; Bonneville Power; California Transmission Planning Group; Tucson Electric; Western Area Power Administration; California Commissions; California ISO; Eastern Massachusetts Consumer-Owned System; New York PSC; Coalition for Fair Transmission Policy; Connecticut & Rhode Island Commissions; Large Public Power Council; National Grid; and Southern California Edison.

[381] *E.g.*, Ad Hoc Coalition; Southern Companies; Salt River Project; and Nebraska Public Power District.

projects that meet the various regional requirements are constructed and their costs recovered as part of tariff rates.

493. North Carolina Agencies contend that the Commission has not established that current cost allocation methods are unjust and unreasonable. Nebraska Public Power District argues that the Proposed Rule does not contain any record evidence demonstrating the need for generic rate reform and states that transmission investment has substantially increased in recent years. Salt River Project argues that the primary barriers to renewable resource development are delays and denial of siting and other permits, not transmission funding. California Municipal Utilities suggest that fewer remote resources are needed because more local renewable resources are being developed and, therefore, the need for cost allocation reforms must be re-examined. Indianapolis Power and Light believes that existing tariff requirements and ongoing proceedings will achieve the Commission's stated objective without the uncertainty of a parallel rulemaking process.

494. MEAG Power responds to Multiparty Commenters' assertion regarding the cost of transmission expansion by arguing that investments of the size actually needed to build out the transmission system, if allocated to load, would raise its native load customers' transmission costs dramatically. Sacramento Municipal Utility District states that, even if Multiparty Commenters' assertion were true, it is irrelevant to the establishment of a just

and reasonable transmission rate whether it comprises a small or large portion of the cost of delivered power.[382] Large Public Power Council raises arguments similar to those raised by both MEAG Power and Sacramento Municipal Utility District.

3. Commission Determination

495. The Commission concludes that it is necessary and appropriate to adopt the cost allocation requirements described in further detail below for public utility transmission providers. The Commission finds that, without these minimum requirements in place, cost allocation methods used by public utility transmission providers may fail to account for the benefits associated with new transmission facilities and, thus, result in rates that are not just and reasonable or are unduly discriminatory or preferential.

496. In Order No. 890, the Commission found that there is a close relationship between transmission planning, which identifies needed transmission facilities, and the allocation of costs of the transmission facilities in the plan.[383] The Commission explained that knowing how the costs of transmission facilities would be allocated is critical to the development of new infrastructure because transmission providers and customers cannot be expected to support the construction of new transmission unless they understand who

[382] Sacramento Municipal Utility District (citing *Farmers Union Central Exchange v. FERC*, 734 F.2d 1486, 1508 (D.C. Cir. 1984)).

[383] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 557.

will pay the associated costs.[384] In light of that relationship, the Commission directed public utility transmission providers to identify the cost allocation method or methods that would apply to transmission facilities that do not fit under previously existing rate structures.[385] After several rounds of compliance filings, the Commission accepted various public utility transmission providers' proposals as in compliance with Order No. 890. Particularly in transmission planning regions outside of the RTO and ISO footprints, several of the cost allocation methods that the Commission accepted relied exclusively on a participant funding approach to cost allocation.[386] The Commission did not address cost allocation for interregional transmission facilities in Order No. 890.

497. We conclude that, in light of changes within the industry and the implementation of other reforms in this Final Rule, the existing requirements of Order No. 890 are no longer adequate to ensure rates, terms and conditions of jurisdictional service are just and reasonable and not unduly discriminatory or preferential. While the existing cost allocation methods may have sufficed in the past, as we note above, the circumstances in

---

[384] *Id.*

[385] *Id.* P 558.

[386] *See, e.g.*, *El Paso Electric Co.*, 124 FERC ¶ 61,051 (2008); *Xcel Energy Services, Inc. - Public Service Co. of Colorado*, 124 FERC ¶ 61,052 (2008); *South Carolina Electric & Gas Co.*, 127 FERC ¶ 61,275 (2009). *Entergy Services, Inc.*, 127 FERC ¶ 61,272 (2009). *See also Avista Corp.*, 128 FERC ¶ 61,065 (2009); *Idaho Power Co.*, 128 FERC ¶ 61,064 (2009).

which the Commission must fulfill its statutory responsibilities change with developments in the electric industry, such as changes with respect to the demands placed on the transmission grid. The comments in this proceeding make clear that the pace of change has accelerated in recent years, such as the expansion of regional power markets, which has led to a growing need for transmission facilities that cross several utility, RTO, ISO or other regions. The industry's continuing transition also has enabled greater utilization of resources (e.g., reserve sharing) resulting in, among other effects, broader diffusion of the benefits associated with transmission facilities. Additionally, the increasing adoption of state resource policies, such as renewable portfolio standard measures, has contributed to rapid growth of renewable energy resources that are frequently remote from load centers, and thus a growing need for transmission facilities to access remote resources, often traversing several utility and/or ISO/RTO regions.

498. The challenges associated with allocating the cost of transmission appear to have become more acute as the need for transmission infrastructure has grown. Within RTO or ISO regions, particularly those that encompass several states, the allocation of transmission costs is often contentious and prone to litigation because it is difficult to reach an allocation of costs that is perceived by all stakeholders as reflecting a fair distribution of benefits. In other regions, few rate structures are currently in place that reflect an analysis of the beneficiaries of a transmission facility and for the corresponding cost allocation of the transmission facility's cost. Similarly, there are few rate structures

in place today that provide for the allocation of costs of interregional transmission facilities.

499. We agree with many commenters that the lack of clear *ex ante* cost allocation methods that identify beneficiaries of proposed regional and interregional transmission facilities may be impairing the ability of public utility transmission providers to implement more efficient or cost-effective transmission solutions identified during the transmission planning process. Under the regional transmission planning and interregional transmission coordination requirements adopted in this Final Rule,[387] public utility transmission providers, in consultation with stakeholders, will identify, evaluate, and determine the set of transmission facilities that will meet the combined needs of the region or neighboring pairs of regions, respectively. This necessarily includes a determination by the region that the benefits associated with that set of transmission facilities outweigh the costs. Failing to address the allocation of costs for these transmission facilities in a way that aligns with the evaluation of benefits through the transmission planning process could lead to needed transmission facilities not being built, adversely impacting ratepayers.

500. In general and as discussed elsewhere in this Final Rule, the Commission requires a public utility transmission provider to participate in a regional transmission planning

[387] *See* discussion *supra* sections III.A and III.C.

process and to coordinate transmission planning with public utility transmission providers in neighboring transmission planning regions in a manner that aligns transmission planning and cost allocation processes. Additionally, the OATTs of all public utility transmission providers in a region must include the same cost allocation method or methods adopted by the region. As some commenters point out, transmission facilities that are in a transmission plan to achieve a specific purpose or purposes, such as to avoid an impending violation of a Reliability Standard, address economic considerations, or enable compliance with Public Policy Requirements. Because such purposes involve the identification of expected beneficiaries, either explicitly or implicitly, establishing a closer link between transmission planning and cost allocation will ensure that rates for Commission-jurisdictional service appropriately account for benefits associated with new transmission facilities.

501. We recognize that identifying which types of benefits are relevant for cost allocation purposes, which beneficiaries are receiving those benefits, and the relative benefits that accrue to various beneficiaries can be difficult and controversial. We believe that a transparent transmission planning process is the appropriate forum to address these issues. By linking transmission planning and cost allocation through the transmission planning process, we seek to increase the likelihood that transmission facilities in regional transmission plans are actually constructed.

502. Turning to specific comments on this topic, we are not persuaded to adopt Illinois

Commerce Commission's proposal for separate review and decision by a committee of state regulators on the reasonableness of proposed transmission expansion projects for which regional cost allocation would apply. As explained above,[388] this Final Rule builds on Order No. 890's requirement that a public utility transmission provider have open and transparent transmission planning processes in which we encourage states or state committees to be involved. Additionally, as required by this Final Rule, through the transmission planning process, the public utility transmission providers and other parties, including state regulators, will have opportunities to participate in the identification of transmission needs. We decline, however, to mandate veto rights for state committees, but do not preclude public utility transmission providers from proposing such mechanisms on compliance if they choose to do so.[389]

503. In response to Northern Tier Transmission Group's concern that applying the new cost allocation requirements to existing transmission projects covered by existing tariff-based and contract-based cost allocation procedures will shift costs and create unnecessary burdens, we clarify that the cost allocation requirements of this Final Rule

[388] *See* discussion *supra* section III.A.

[389] For example, Entergy's OATT allows Entergy's committee of state regulators to add a project to Entergy's transmission plan upon unanimous vote of the committee members. *See Entergy Arkansas, Inc.*, 133 FERC ¶ 61,211 (2010).

apply only to new transmission facilities[390] selected in regional transmission plans for purposes of cost allocation.

B. Legal Authority for Cost Allocation Reforms

1. Commission Proposal

504. The Commission explained in the Proposed Rule that, to ensure that transmission rates are just and reasonable, the costs of jurisdictional transmission facilities must be allocated in a way that satisfies the "cost causation" principle. It noted that the D.C. Circuit defined the cost causation principle stating that "it has been traditionally required that all approved rates reflect to some degree the costs actually caused by the customer who must pay them."[391] Moreover, the Commission noted that while the cost causation principle requires that the costs allocated to a beneficiary be at least roughly commensurate with the benefits that are expected to accrue to it,[392] the D.C. Circuit has explained that cost causation "does not require exacting precision in a ratemaking agency's allocation decisions."[393]

505. The Commission explained that, while costs generally have been allocated through

---

[390] *See* discussion *supra* P 161.

[392] *Illinois Commerce Commission*, 576 F.3d 470 at 476-77 ("We do not suggest that the Commission has to calculate benefits to the last penny, or for that matter to the last million or ten million or perhaps hundred million dollars.").

[393] *MISO Transmission Owners*, 373 F.3d 1361 at 1371.

voluntary agreements, the cost causation principle is not limited to such arrangements. If it were, the Commission could not address free rider problems associated with new transmission investment and could not ensure that transmission rates are just and reasonable and not unduly discriminatory. The Commission stated that it may determine that an entity is a beneficiary of a transmission facility even if it has not entered a voluntary arrangement with the public utility transmission provider that is seeking to recover the costs of that transmission facility.

506. The Commission noted that it has expressed a willingness to make such a determination, as when presented with concerns about parallel path flow.[394] In such cases, a public utility transmission provider may propose a transmission service rate that would account for unauthorized use of its system.[395] The Commission noted that it has cautioned against the hasty submittal of such unilateral filings and prefers resolution of

[394] The Commission has described the phenomenon of parallel path flow as follows: "In general, utilities transact with one another based on a contract path concept. For pricing purposes, parties assume that power flows are confined to a specified sequence of interconnected utilities that are located on a designated contract path. However, in reality power flows are rarely confined to a designated contract path. Rather, power flows over multiple parallel paths that may be owned by several utilities that are not on the contract path. The actual power flow is controlled by the laws of physics which cause power being transmitted from one utility to another to travel along multiple parallel paths and divide itself along the lines of least resistance. This parallel path flow is sometimes called 'loop flow.'" *Indiana Michigan Power Co. and Ohio Power Co.*, 64 FERC ¶ 61,184, at 62,545 (1993).

[395] *See, e.g.*, *Amer. Elec. Power Svc. Corp.*, 49 FERC ¶ 61,377, at 62,381 (1989) (*AEP*).

parallel path flow issues on a consensual, regional basis.[396] If necessary, however, it would permit recovery of costs from a beneficiary in the absence of a voluntary arrangement.

507. The Commission also stated that it has affirmatively required costs of transmission facilities to be allocated to beneficiaries in the absence of a voluntary arrangement in a series of orders involving MISO and PJM. Specifically, the Commission explained that it directed MISO and PJM to develop cost allocation methods for new facilities in one of their footprints that benefit entities in the other's footprint.[397] It subsequently conditionally accepted a proposal by MISO and PJM on the grounds that it "more accurately identifies the beneficiaries and allocates the associated costs."[398]

508. The Commission noted that courts have accepted the application of the cost

---

[396] *Id*.; *see also Southern California Edison Co*., 70 FERC ¶ 61,087, at 61,241-42 (1995).

[397] *Midwest Indep. Transmission Sys. Operator, Inc*., 109 FERC ¶ 61,168, at P 60 (2004) (citing *Midwest Indep. Transmission Sys. Operator, Inc*., 106 FERC ¶ 61,251, at P 56-57 (2004)). The Commission noted that MISO and PJM had committed in a Joint Operating Agreement to develop such a method for allocating the costs of certain facilities through their joint regional planning committee. *Id*. The Commission did not base the above-noted directive on the existence of the Joint Operating Agreement, which MISO and PJM developed to comply with a previous Commission directive. *See Alliance Cos*., 100 FERC ¶ 61,137, at P 48, 53 (2002).

[398] *Midwest Indep. Transmission Sys. Operator, Inc*., 113 FERC ¶ 61,194, at P 10 (2005). *See also Midwest Indep. Transmission Sys. Operator, Inc.*, 122 FERC ¶ 61,084 (2008); *Midwest Indep. Transmission Sys. Operator, Inc*., 129 FERC ¶ 61,102 (2009).

causation principle in this way. For example, the D.C. Circuit addressed this issue in connection with a MISO proposal to recover administrative costs through a charge that would apply to transmission loads subject to MISO's OATT rates.[399] The court found that the Commission's system-wide benefits analysis met the requirements of the cost causation principle, that is, to compare "the costs assessed against a party to the burdens imposed or benefits drawn by that party."[400]

2. Comments on Legal Authority

509. Several entities comment in support of the Commission's legal authority to allocate costs of new transmission facilities based on a beneficiary pays approach.[401] AEP asserts that the Commission's proposed cost allocation principles comport with the legal requirements on cost allocation articulated by the U.S. Court of Appeals for the Seventh Circuit in *Illinois Commerce Commission v. FERC*.[402] Further, AEP states that while the courts have found that the allocation of transmission expansion costs in rates must follow the "cost causation" principle, the courts have explained that all beneficiaries

[399] *MISO Transmission Owners*, 373 F.3d 1361. The D.C. Circuit stated that the subject costs "are primarily MISO's startup expenses – particularly those pertaining to the MISO Security Center – and certain expenses pertaining to the creation and administration of MISO's open access tariff." *Id*. at 1369.

[400] *Id*. at 1367.

[401] *E.g.*, Iberdrola Renewables; 26 Public Interest Organizations; Exelon; ITC Companies; LS Power; and Multiparty Commenters.

[402] 576 F.3d 470 (7th Cir. 2009) (*Illinois Commerce Commission*).

"cause" costs for the purpose of applying this principle. Thus, from AEP's perspective, the Commission's proposal to require allocation of costs to beneficiaries is fully consistent with the legal precedent. Iberdrola Renewables and American Transmission agree. American Transmission cautions, however, that care be taken in how precisely the costs of a transmission project are linked to beneficiaries, given that the benefits and beneficiaries of a particular project may change over time, particularly in the case of a large project that provides regional and interregional benefits. Allegheny Energy Companies state that although the *Illinois Commerce Commission* decision found that the Commission did not provide sufficient evidence to justify adoption of the postage-stamp cost allocation method in PJM, it did not reject the method outright, instead requiring the Commission only to provide further justification assuring that this method results in a just and reasonable rate that satisfies the principle that rates required to be paid by a customer must have some relationship to the costs caused or benefits received by that customer.

510. LS Power asserts that there is nothing in the FPA that precludes the Commission from allocating costs incurred by one transmission provider in a region to entities nominally taking service under the tariffs of other transmission providers, or to those other transmission providers themselves for the benefits they receive with respect to their own uses of the regional transmission grid. On the contrary, it explains that allocating costs only to customers located within the corporate boundaries of the utility that owns the transmission facilities will over-allocate costs to such customers and allow other

beneficiaries to become free riders. LS Power concludes that the Commission has exclusive jurisdiction over interstate transmission services, and therefore, the authority and the responsibility to define interstate transmission services—here regional transmission services—and to identify the beneficiaries of those services that are responsible for costs incurred by regional transmission providers.

511. Illinois Commerce Commission agrees with the Commission's decision that, when applying the cost causation principle, the Commission may allocate costs of a transmission facility to a beneficiary identified through an appropriate process, such as a Commission-approved transmission planning process, even if that beneficiary has not entered into a voluntary arrangement with a public utility that is seeking to recover the costs of that facility. However, it asserts that the process must take into account the restrictions on allocation to beneficiaries set forth in *Illinois Commerce Commission*, in which cost causers are primary, and beneficiaries may be taken into account only to the extent that, without the developer's expectation of receiving revenues from such a party, the project "might not have been built, or might have been delayed." Illinois Commerce Commission asserts that an unduly discriminatory socialization of costs based on speculation that uncertain future costs will offset the discrimination does not support a finding of just and reasonable rates.[403]

[403] In reply, PPL Companies assert that Illinois Commerce Commission overstates

(continued…)

512. A number of commenters agree that a free rider problem exists in transmission development and that the Commission should bring certainty to cost allocation rules to address this concern.[404] NextEra states that any project that provides benefits to entities, other than the sponsoring entity, creates an incentive for an individual beneficiary to defer investment in hopes that others will fund the project's development, and this has led to stalemate and delay. Federal Trade Commission agrees that the lack of rate structures to allocate the costs of needed transmission, and the free rider problem that arises when project beneficiaries seek to shift transmission construction costs onto others, add uncertainty and conflict to the debate over what transmission to build and how to pay for it. Sunflower and Mid-Kansas state that the free rider problem can be an issue regionally, but is likely to prove more intractable for interregional cost allocation. Boundless Energy and Sea Breeze state that cost allocation has to deal with the free rider issue when multiple utilities are involved because then an independent entity with a proposal that provides system benefits across a larger region may find that beneficiaries will not

---

Illinois Commerce Commission, arguing that the court did not interpret the cost causation principle to require that costs be allocated on a narrow definition of "cause" that ignores benefits received by customers.

[404] *E.g.*, Gaelectric North America; Atlantic Grid; Multiparty Commenters; Primary Power; Pennsylvania PUC; NextEra; Federal Trade Commission; Sunflower and Mid-Kansas; Boundless Energy and Sea Breeze; and LS Power.

contract for their portion of the benefits.

513. Several commenters argue that it is unlawful for transmission developers to recover costs from entities to which they do not provide service.[405] Some commenters contend that the Commission ignores that privity of contract existed between the entities involved in the cases that it cites to support its proposal[406] and that the Commission's authority under the FPA is premised on a utility having a contractual relationship or a tariff to provide service to its customers.[407] Nebraska Public Power District asserts that the *Mobile-Sierra* cases support this view.[408]

514. Sacramento Municipal Utility District asserts that there is a distinction between allocating costs among a public utility transmission provider's customers without their

[405] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Nebraska Public Power District; Salt River Project; and Sacramento Municipal Utility District.

[406] *E.g.*, Ad Hoc Coalition of Southeastern Utilities (citing Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 144); Salt River Project (citing Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 164).

[407] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Salt River; and Nebraska Public Power District.

[408] Nebraska Public Power District (citing *United Gas Pipeline Co. v. Mobile Gas Corp.*, 350 U.S. 332 (1955); *FPC v. Sierra Pac. Power Co.*, 350 U.S. 348 (1956)).

voluntary agreement (such as the roll-in of the costs of the transmission provider's bulk transmission system) and allocating them to entities that are not the transmission provider's customers. It argues that *AEP* and similar cases[409] do not establish a right to assess costs of facilities to non-customers and that it is a perversion of the statutory scheme to suggest that an entity could build a transmission facility and then claim that because power generated or scheduled by non-customers flowed over the facility, it was entitled to be compensated by them. Southern Companies note that no complaint was filed in response to *AEP*, and the case therefore does not support the idea that allocation of costs to non-customers is lawful. Northern Tier Transmission Group maintains that even if the Commission has authority to permit allocation of costs to an entity that does not take service from the transmission provider that collects the costs, it has not complied with the common law requirements necessary to delegate that authority to transmission providers.

515. Sacramento Municipal Utility District asserts that the cases that the Commission cites dealing with the allocation of costs between RTOs when new facilities in one of their footprints benefits entities in the other's footprint do not apply here.[410] It argues

[409] In addition to *AEP*, Sacramento Municipal Utility District cites *Sierra Pacific Power Co.*, 85 FERC ¶ 61,314 at 62,235 (1998); *Sierra Pacific Power Co.*, 86 FERC ¶ 61,198 at 61,698 (1999); *Vermont Elec. Power Co.*, 44 FERC ¶ 61,098, at 61,275 (1988).

[410] *Midwest Indep. Transmission Sys. Operator, Inc.*, 122 FERC ¶ 61,084;

(continued…)

that in those cases, cross-border facility costs were allocated to each RTO as a whole, after which project costs were recovered by the RTO through its own intra-RTO cost allocation. Sacramento Municipal Utility District states that customers in these cases were not being billed for service taken from entities with which those customers had no

contract or applicable tariff, but rather were being billed by their own transmission providers.

516. Sacramento Municipal Utility District takes issue with the Commission's reliance on *MISO Transmission Owners* for the proposition that the cost causation principle allows allocation of at least some types of costs to beneficiaries that are not customers of the public utility that is seeking cost recovery. It states that in that case, MISO was the public utility seeking cost recovery, and the costs in question were not levied directly on the entities in question. Instead, the MISO transmission owners – existing customers under the MISO tariff – had challenged whether the cost allocation reflected in their rates was reasonable. Sacramento Municipal Utility District contends that all the court decided was that the Commission had reasonably allocated MISO's operating costs to the transmission owners based on their use of MISO-controlled transmission facilities to deliver power to entities that were not subject to the MISO tariff and on the benefits that

---

Midwest Indep. Transmission Sys. Operator, Inc., 109 FERC ¶ 61,168; *Midwest Indep. Transmission Sys. Operator, Inc.*, 113 FERC ¶ 61,194.

MISO Transmission Owners derived from that delivery.[411]

517. Sacramento Municipal Utility District asserts that the Commission's position on joint rates supports its position that a contractual customer relationship is a precondition for the allocation of transmission costs. It states that the Commission's position is that, absent evidence that two systems were in fact acting as one, the Commission cannot mandate the use of a single joint rate. Sacramento Municipal Utility District argues that if the Commission cannot mandate joint rates when this condition is not met even where a customer takes service from both utilities, it cannot mandate that an entity pay rates charged by a utility with which it has no contractual or tariff-based customer relationship.[412]

518. ColumbiaGrid argues that the Commission cannot use its authority to force customers to pay for additional benefits that go beyond their existing service. It states that a court has held that under section 5 of the Natural Gas Act, the Commission may

[411] *See also* Southern Companies and ColumbiaGrid.

[412] Sacramento Municipal Utility District cites to *Ft. Pierce Utilities Comm'n v. FERC*, 730 F.2d 778 (D. C. Cir. 1984) (*Fort Pierce*); *Richmond Power & Light v. FERC*, 574 F.2d 610 (D.C. Cir. 1978) ("purchasers are always free to subscribe to the services of willing utilities at the separate rates"); *Alabama Power Co. v. FERC*, 993 F.2d 1557, 1565 (D. C. Cir. 1993) (affirming order directing joint rate between holding company members who the Commission found were acting as one); *see also Illinois Power Co.*, 95 FERC ¶ 61,183, at 61,644 (2002) (approving single joint rate across Alliant and MISO systems but recognizing that, in the absence of an agreement between these utilities, there would not be a single rate).

reject unjust and unreasonable rates and prescribe a new just and reasonable rate, but it may not require distributors to accept or to pay for additional service.[413] ColumbiaGrid maintains that this shows that costs cannot be recovered from entities that are not customers receiving jurisdictional service. ColumbiaGrid argues that *Illinois Commerce Commission* does not support the allocation of costs in the absence of an approved rate or a contractual relationship between transmission owners and presumed beneficiaries, and it maintains that the Commission's reliance on this case to extend the cost causation principle to cover any entity that may be said to benefit from a project is misplaced.

519. Southern Companies argue that while the Proposed Rule acknowledges the fundamental role of cost causation, it proceeds to nullify the "but for" element that is intrinsic to any determination of cost causation. Southern Companies argue that the primary beneficiary of a transmission improvement is the customer that made the request that "causes" the improvement in question. They argue that the Proposed Rule seems to attack cost causation by concluding that a participant funding approach is not permissible.

520. Several commenters maintain that in their experience, free rider problems do not exist and that such concerns may be speculative.[414] Ad Hoc Coalition of Southeastern

[413] ColumbiaGrid cites to *Exxon Mobil Corp. v. FERC*, 430 F.3d 1166 (D.C. Cir. 2005) (*Exxon Mobil Corp.*).

[414] *E.g.*, Southern Companies; California Municipal Utilities; Transmission

(continued…)

Utilities states that cost socialization is not needed to protect against the inequities of free ridership. It interprets the Commission's reference to the free rider problem as referring to the relatively cost-free transmission that may be provided to entities that take advantage of oversized investments made by others.

521. Southern Companies suggest that if any such problems exist, they are a product of local or regional factors that do not require a national solution. E.ON argues that free rider problems do not exist in the context of reliability or public policy transmission projects, and participant funding of such projects does not exacerbate the free rider problem.

522. Some commenters argue that, even if free rider problems exist, they can either be solved without resort to broad cost allocation or are beyond the Commission's authority.[415] Alternatively, Illinois Commerce Commission states that while a free rider problem does exist, it is impossible to solve in practice, and the negative consequences of allocating costs too broadly will be greater than allocating costs more narrowly to cost causers and direct, quantifiable beneficiaries. Dominion similarly asserts that while broad cost allocation may eliminate free ridership, it may result in some entities paying

---

Agency of Northern California; and Columbia Grid.

[415] *E.g.*, Nebraska Public Power District and Sacramento Municipal Utility District.

disproportionate costs.

523. Alabama PSC states that it would be improper to require citizens of Alabama to pay for the costs of transmission facilities in other areas of the country where there is high congestion and which are not necessary to provide service in Alabama. It maintains that this violates the principle of cost causation and the requirement that facilities be "used and useful" before being incorporated into a consumer's rates. Indianapolis Power & Light argues that it is inconsistent with cost causation principles to subsidize a state's generation decisions (e.g., a state's renewable portfolio standard), and states should not be able to pass the cost of compliance with their requirements on to other jurisdictions. ELCON agrees and states that a claim of generalized system benefits, such as an amorphous reliability improvement, does not justify regionalized charges. Instead, ELCON asserts that there must be a tangible, nontrivial benefit supported by substantial evidence. ELCON also maintains that disallowing export charges or other forms of cost transfer to beneficiaries in other planning regions will result in unjust and discriminatory rates.

524. Coalition for Fair Transmission Policy states that the Commission lacks authority to require consideration of broad public policy benefits that cannot be measured or projected within a transmission providers' planning horizon. It maintains that allowing the allocation of costs that are not required to maintain reliability, relieve congestion, or to meet mandated public policy requirements is beyond the Commission's core mission.

525. Ad Hoc Coalition of Southeastern Utilities states that in the Southeast, only North Carolina has a renewable portfolio standards requirement, and there is no suggestion that a regional mechanism for funding transmission is needed to satisfy this requirement. It thus sees no reason to discontinue providing cost recovery for regional transmission projects from the entities that choose to use them.

526. ColumbiaGrid argues that at least with respect to non-RTO regions (where there are no regional service tariff rates), directing public and non-public utilities to adopt a specific cost allocation method in advance could infringe upon a utility's right to propose rates under section 205 of the FPA.[416] The California ISO maintains that the Commission does not have the authority to compel rate filings in the first instance, and it can require a filing only if it shows that the existing rate does not meet the requirements of section 206.[417] California ISO argues that the Commission cannot fulfill this requirement with regard to cost allocation for regional and interregional facilities because there are no existing contracts or rates for such services. The Commission may at most issue guidance on whether future filings will meet statutory requirements.

527. Southern Companies assert that where vertically integrated transmission providers

[416] ColumbiaGrid bases this claim on *Atlantic City Electric Co. v. FERC*, 295 F.3d 1 (D.C. Cir. 2002) (*Atlantic City*).

[417] Similarly, Northern Tier Transmission Group argues that the Commission must justify, under section 206, modifying the cost allocation process that it already accepted for its members.

plan their transmission systems from the bottom up under state supervision and recover most of their costs for transmission facilities through bundled rates, the Proposed Rule's mandates cannot be implemented without preempting or undermining state law. Southern Companies state that the Commission should revise its proposed reforms and explain how they can be implemented while respecting existing processes for bundled retail ratemaking. Southern Companies assert that they recover only approximately 15 percent of their transmission revenue requirements under a federal OATT, with the remaining 85 percent being recovered in state-regulated bundled rates. They state that the latter cost recovery is not an issue of federal comparability, and a nonincumbent would, at best, be allowed to recover only 15 percent of its transmission costs under a federal OATT, with the rest requiring state approval. Southern Companies maintain that as a practical matter, a nonincumbent cannot have "comparable" cost recovery without a long-term contract from Southern Companies that has appropriate state commission approval for purposes of retail rate recovery.

528. Transmission Access Policy Study Group urges the Commission to address allocation of costs of transmission projects that go beyond existing boundaries of an RTO or individual transmission providers where the transmission grid is integrated. It recommends that the Commission recognize that it has the authority to order joint, non-pancaked rates where transmission systems are integrated. Sacramento Municipal Utility District argues in response that the Commission cannot require joint rates unless two

adjoining transmission systems are not just integrated, but effectively operate as a single system. Large Public Power Council agrees. Ad Hoc Coalition of Southeastern Utilities argues that the statutory right of utilities to set their rates may not be easily set aside, and that imposing a joint, non-pancaked rate structure on utilities would do exactly that.

529. Florida PSC is concerned that the Commission's proposal may circumvent its authority over rates for transmission infrastructure that serves retail load because the Proposed Rule appears to allow entities seeking to construct merchant transmission projects to recover project costs from Florida ratepayers through a Commission-approved cost allocation process. North Carolina Agencies argue that the Final Rule should recognize the indispensible role of state regulatory authorities and should apply only to unbundled transmission rates. Northwestern Corporation (Montana) states that entities seeking to recover costs without approval from state public utilities commissions face the risk of cost disallowance.

3. Commission Determination

530. We conclude that we have the legal authority to adopt the cost allocation reforms required by this Final Rule. Numerous commenters challenge our authority to require allocation of transmission costs to beneficiaries that do not have a contractual or formalized customer relationship with the entity that is collecting the costs. These challenges are based primarily on the commenters' analysis of various Commission and court cases. Some commenters have made arguments that speak directly to provisions of

the FPA, but none of these assertions reach convincing conclusions. For instance, Ad Hoc Coalition of Southeastern Utilities states that "[u]tilities filing for rate changes under FPA section 205 ask the Commission to approve changes in rates charged *to their customers*" and that "the Commission's authority is, in all cases, based on the premise that a utility has a contractual relationship to provide service to its customers."[418] However, section 205 does not specify any such limitation and no commenter has shown where it is expressed elsewhere in the FPA. Instead, commenters generally appear to agree with Ad Hoc Coalition of Southeastern Utilities that the "FPA is structured on the *assumption* that rates subject to [Commission] approval are supported by a contractual agreement."[419]

531. The merit of this argument depends, of course, on how the FPA is in fact structured, and an examination of the relevant provisions of the statute shows that it is not structured in a way that would justify this argument. On the contrary, the Commission's jurisdiction is clearly broad enough to allow it to ensure that all beneficiaries of services provided by specific transmission facilities bear the costs of those benefits regardless of their contractual relationship with the owner of those transmission facilities. As discussed further below, this comports fully with the specific characteristics of

[418] Ad Hoc Coalition of Southeastern Utilities Comments at 60-61 (emphasis in original).

[419] *Id.* at 60 (emphasis supplied).

transmission facilities and transmission services, and our actions today are necessary to fulfill our statutory duty of ensuring rates, terms and conditions of jurisdictional service are just and reasonable and not unduly discriminatory or preferential. We thus turn first to the language of the statute itself.

532. Section 201(b)(1) of the FPA gives the Commission jurisdiction over "the transmission of electric energy in interstate commerce." The Commission's jurisdiction therefore extends to the rates, terms and conditions of transmission service, rather than merely transactions for such transmission service specified in individual agreements. Moreover, section 201(b)(1) gives the Commission jurisdiction over "all facilities" for the transmission of electric energy, and this jurisdiction is not limited to the use of those transmission facilities within a certain class of transactions. As a result, the Commission has jurisdiction over the use of these transmission facilities in the provision of transmission service, which includes consideration of the benefits that any beneficiaries derive from those transmission facilities in electric service regardless of the specific contractual relationship that the beneficiaries may have with the owner or operator of these transmission facilities.

533. Neither section 205 nor section 206 of the FPA state or imply that an agreement is a precondition for any transmission charges. These statutory provisions speak of rates and charges that are "made," "demanded," "received," "observed," "charged," or "collected" by a public utility. Any such rates or charges must, of course, be accepted for

filing with the Commission under either section 205 or 206, but nothing in these sections precludes flows of funds to public utility transmission providers through mechanisms other than agreements between the service provider and the beneficiaries of those transmission facilities.

534. Transmission services create an opportunity for free ridership because the nature of power flows over an interconnected transmission system does not permit a public utility transmission provider to withhold service from those who benefit from those services but have not agreed to pay for them. The Commission expressed concern over free ridership in Order No. 890, where it noted that "there are free rider problems associated with new transmission investment, such that customers who do not agree to support a particular project may nonetheless receive substantial benefits from it."[420]

535. In Order No. 890, the Commission recognized that the cost causation principle provides that costs should be allocated to those who cause them to be incurred and those that otherwise benefit from them. We conclude now that this principle cannot be limited to voluntary arrangements because if it were "the Commission could not address free rider problems associated with new transmission investment, and it could not ensure that rates, terms and conditions of jurisdictional service are just and reasonable and not unduly discriminatory. In fact, the courts have recognized this aspect of cost causation

[420] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 561.

quite independently of an analysis of the scope of our statutory jurisdiction over transmission.

536. The courts have acknowledged that cost causation involves "comparing the costs assessed against a party to the burdens imposed or benefits drawn by that party."[421] An approach to cost causation that is limited to voluntary arrangements such as participant funding has the effect of "focusing us on the most immediate and proximate cause of the cost incurred," and it precludes looking "at a host of contributing causes for the cost incurred (as ascertained by a review of those who benefit from the incurrence of the cost) and assign[ing] them liability too."[422] In short, a full cost causation analysis may involve "an extension of the chain of causation"[423] beyond those causes captured in voluntary arrangements. In other words, to identify all causes, we must to some degree begin with their effects, i.e., the benefits that they engender and then work back to their sources.

537. This point was acknowledged in the Seventh Circuit's characterization of cost causation in *Illinois Commerce Commission*. The Seventh Circuit states that:

> To the extent that a utility benefits from the costs of new facilities, *it may be said to have "caused" a part of those costs to be incurred*, as without

---

[421] *MISO Transmission Owners*, 373 F.3d 1361, at 1368 (internal citations omitted).

[422] *KN Energy*, 968 F.2d 1295 at 1302.

[423] *Id.*

> the expectation of its contributions the facilities might not have been built, or might have been delayed.[424]

The court fully recognized that, to identify causes of costs, one must to some degree begin with benefits. ColumbiaGrid argues that *Illinois Commerce Commission* does not support the Commission's position on cost allocation because the statement just cited is preceded by the statement that "[A]ll *approved* rates [must] reflect to some degree the costs actually caused by the customer who must pay them."[425] ColumbiaGrid maintains that this demonstrates the *Illinois Commerce Commission* "does not support the [Proposed Rule's] approach of allocating costs in the absence of an approved rate or a contractual relationship between transmission owners and presumed beneficiaries."[426] What this argument fails to recognize is that the point ColumbiaGrid contests was not before the court in *Illinois Commerce Commission*, and the Commission's jurisdiction over transmission, as outlined above, is broad enough to approve rates based on the court's characterization of cost causation.[427] In other words, there is nothing in what the

---

[424] *Illinois Commerce Commission*, 576 F.3d 470 at 476 (emphasis supplied).

[425] ColumbiaGrid Comments at 29 (citing *Illinois Commerce Commission*, 576 F.3d 470 at 476 (emphasis supplied by ColumbiaGrid)).

[426] *Id*.

[427] This point applies equally to Sacramento Municipal Utility District's objection that the other Commission and court cases pertaining to MISO cited in the Proposed Rule are not on point because they involve instances where a customer relationship of some type had already been established, and that all that these cases dealt with was whether an allocation was just and reasonable. When Sacramento Municipal Utility District states

(continued…)

court said that can be viewed as preventing the Commission from dealing with the free rider problem. Indeed, by emphasizing the relationship between beneficiaries identified and cost allocation, the court's ruling supports greater attention to that issue. Finally, we note that under this Final Rule, transmission planning regions are not required to analyze the distribution of benefits on an entity-by-entity basis; nothing in this Final Rule precludes the regions from doing so, provided that they satisfy the cost allocation

principles adopted herein. We now turn to other individual comments that involve these issues.

538. Southern Companies' argument that the primary beneficiary of a transmission facility is the customer that made the request that causes the improvements to be planned and constructed tends to blur the distinction between benefits and burdens. As discussed above, the courts have acknowledged that distinction as relevant to cost allocation and the requirements in this Final Rule are consistent with that distinction. To the extent that

---

that "the cost allocation methods approved by FERC in the MISO cases rested on the understanding that 'the ultimate costs allocated to [MISO] or PJM for a so-called cross-border allocation project will be recovered by each RTO pursuant to the applicable provisions of their tariffs,'" it is ignoring substance in favor of form. It is focusing on the formal mechanisms through which costs are collected, not the underlying substance of the cost allocation itself. *See* Sacramento Municipal Utility District Comments at 14 (citing *Midwest Indep. Transmission Sys. Operator, Inc.*, 113 FERC ¶ 61,194 at P 4). The mechanism for recovering a rate does not change the identity of the provider who is in fact recovering it.

commenters are supporting participant funding as a regional cost allocation method, we address those comments below.[428]

539. We disagree with Sacramento Municipal Utility District and Southern Companies that *AEP* applies only in exceptional circumstances and does not support our position here. In that case, the Commission expressed a preference for a voluntary resolution of the problem that loop flow represented, a position that is consistent with our findings here. The Commission's authority is not limited in principle by cases where the Commission expresses a preference not to exercise that authority. We also disagree with Sacramento Municipal Utility District that our reforms represent a perversion of the statutory scheme in which an entity could build a transmission facility and then simply claim a right to payment for benefits from beneficiaries with which it has no contractual or tariff relationship. As we state above, the Commission's jurisdiction is broad enough to allow it to ensure that beneficiaries of service provided by specific transmission facilities bear the costs of those benefits regardless of their contractual relationship with the owner of those transmission facilities. Our cost allocation reforms are tied to our transmission planning reforms, which require that, to be eligible for regional cost allocation, a proposed new transmission facility first must be selected in a regional transmission plan for purposes of cost allocation, which depends on a full assessment by

[428] *See* discussion *infra* section IV.F.2.

a broad range of regional stakeholders of the benefits accruing from transmission facilities planned according to the reformed transmission planning processes. As such, the public utility transmission providers in the regional transmission planning process identify the beneficiaries who will pay for the costs of the new transmission facility selected in a regional plan for purposes of cost allocation.

540. The fact that the Commission has supported parts of its argument through reference to cases in which privity of contract existed between public utilities and the entities from which costs were recovered does not affect this conclusion. [429] This issue was not before the court in any of these cases, and therefore the mere existence of privity of contract does not demonstrate the necessity of privity. In response to Nebraska Public Power District, we do not agree that the *Mobile-Sierra* doctrine has applicability here. We are dealing here with conditions under which costs can be recovered in rates, not conditions under which existing contracts rates can be altered.

541. Contrary to ColumbiaGrid's position, *Exxon Mobil Corp.* does not apply here. As ColumbiaGrid states, in *Exxon Mobil Corp.* the court held that the Commission may not require distributors to accept or pay for additional service. [430] Unlike the situation addressed in *Exxon Mobil Corp.*, the requirements of this Final Rule with respect to cost

[429] *See Midwest Indep. Transmission Sys. Operator, Inc.*, 109 FERC ¶ 61,168; *Alliance Cos.*, 100 FERC ¶ 61,137.

[430] *See Exxon Mobil Corp.*, 430 F.3d 1166, 1176-77 (D.C. Cir. 2005).

allocation do not "impose" any new service on beneficiaries.

542. We also note that our position on joint rates does not have any relevance here. The fact that the Commission cannot require two public utilities to charge a joint rate without evidence that their two systems are in fact acting as one does not preclude the Commission from permitting a single public utility to recover its costs from beneficiaries of the transmission facilities identified in the transmission planning process regardless of the formal customer relationships that exist prior to the time that cost allocation is authorized. We do not see how the conditions under which a joint rate can be imposed has any implications for the range of beneficiaries from which a single public utility can recover the costs of its transmission services, even when combined with recovery by other public utilities of related transmission facilities.

543. We disagree with Northern Tier Transmission Group that we are delegating any authority to transmission providers. All proposed cost allocation methods will be subject to Commission approval, and all specific allocations will be incorporated in rates that must be filed with and accepted by the Commission.

544. We agree with the Alabama PSC that citizens of Alabama should not be responsible for costs of transmission facilities from which they derive no benefits. Indeed, the Commission specified in the Proposed Rule as a principle of regional cost allocation that "[t]hose that receive no benefit from transmission facilities, either at

present or in a likely future scenario, must not be involuntarily allocated the costs of those facilities."[431] With respect to interregional transmission coordination, the Commission specified that a "transmission planning region that receives no benefit from an interregional transmission facility that is located in that region, either at present or in a likely future scenario, must not be involuntarily allocated any of the costs of that facility."[432] In addition, "[c]osts cannot be assigned involuntarily under this rule to a transmission planning region in which that facility is not located."[433] These cost allocation principles are adopted in this Final Rule, and its requirements thus conform fully with the position taken by the Alabama PSC.

545. Contrary to the claims of Indianapolis Power & Light, the reforms instituted in this Final Rule neither authorize nor will lead to subsidization of generation decisions by different states. Beneficiaries in one state are not subsidizing anyone in another state when they are allocated costs that are commensurate with the benefits that accrue to them, even if the transmission facility in question was built in whole or part as a result of the other state's transmission needs driven by Public Policy Requirements. If no benefits accrue, the cost allocation principles we adopt below would prohibit the allocation of costs to the non-beneficiaries. If benefits do accrue, however, there are no less benefits

[431] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 164.

[432] *Id.* P 174.

[433] *Id.*

because Public Policy Requirements played a role in the decision to construct the transmission facility. We agree with ELCON that estimations of benefits require adequate support. We note, however, that benefits are not "amorphous" simply because costs are to be allocated "in a manner that is roughly commensurate with estimated benefits."[434] The courts have acknowledged the natural limits that accompany estimations made in the cost-allocation process.[435]

546. We disagree with Coalition for Fair Transmission Policy that the Proposed Rule can be read to imply that the Commission may require consideration of broad policy goals that are far afield from the Commission's core mission. This Final Rule requires that public utility transmission providers establish a process for identifying those transmission needs driven by Public Policy Requirements that are to be considered in the transmission planning process.[436] In doing this, we are simply acknowledging that such Public Policy Requirements are facts that may have consequences in the form of increasing or decreasing the demand for additional transmission facilities. We are not

[434] The Commission discusses in detail the application of this cost allocation principle below.

[435] *Illinois Commerce Commission*, 576 F.3d 470 at 476-77 ("We do not suggest that the Commission has to calculate benefits to the last penny, or for that matter to the last million or ten million or perhaps hundred million dollars."). *See also MISO Transmission Owners*, 373 F.3d 1361 at 1369 ("we have never required a ratemaking agency to allocate costs with exacting precision."); *Sithe*, 285 F.3d 1 at 5.

[436] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 4.

straying from our core mission when we acknowledge that these facts will affect matters that are central to that mission and accordingly require that they be considered in the transmission planning process, nor are we promoting any particular public policy by requiring a process to determine what, if any, transmission needs are driven by a Public Policy Requirement.[437]

547. Directing a public utility transmission provider to adopt a specific cost allocation method or methods in advance does not infringe upon a utility's right to propose rates under section 205 of the FPA. It simply requires that rate filings meet certain standards. ColumbiaGrid cites *Atlantic City* as supporting the contrary position. In that case, the court held that the Commission could not require that the PJM Transmission Owners Agreement be modified to eliminate a provision that allowed a public utility transmission owner to make a unilateral filing to make changes in rate design or terms and conditions of jurisdictional services. The court held that public utilities have an express right under section 205 to make such filings, and the Commission could not require them to relinquish it.[438] Nothing in this Final Rule has the effect of disenfranchising any individual or entity of rights under section 205 to make filings. The Commission regularly establishes standards for filings under section 205, and doing so does not negate

[437] *See* discussion *supra* section III.A.4.

[438] *Atlantic City*, 295 F.3d 16, at 21 (D.C. Cir. 2002).

any rights under that section.

548. In response to those commenters that argue that our cost allocation reforms will affect existing state jurisdiction over utility rates, it is not clear why cost allocations consistent with this Final Rule would affect state jurisdiction differently from existing cost allocations. In any event, we find that such arguments are premature. It is inappropriate for the Commission to decide such issues generically in a rulemaking, as such issues should be decided based on specific facts and circumstances, none of which are presented here.

549. In response to Transmission Access Policy Study Group, we note that the issue of joint rates is beyond the scope of this proceeding. This Final Rule requires the development of cost allocation methods for regional and interregional transmission facilities in connection with its planning reforms. As described in the cases that commenters cite in their responses to Transmission Access Policy Study Group, the issue of joint, non-pancaked rates involves matters that are considerably broader than our transmission planning-based cost allocation reforms. The Commission will consider any

calls for joint, non-pancaked rates on a case-by-case basis and in accordance with the principles established in these cases.

C. Cost Allocation Method for Regional Transmission Facilities

1. Commission Proposal

550. The Proposed Rule would require that every public utility transmission provider develop a method, or set of methods, for allocating the costs of new transmission facilities that are included in the transmission plan produced by the transmission planning process in which it participates. If the public utility transmission provider is an RTO or ISO, then the method or methods would be required to be set forth in the RTO or ISO tariff. In other transmission planning regions, each public utility transmission provider would be required to set forth in its tariff the method or methods for cost allocation used in its transmission planning region. This method or methods would have to satisfy six regional cost allocation principles, discussed below.

551. These regional cost allocation principles would apply only to the cost allocation method or methods for new transmission facilities selected in the regional transmission plan produced by the transmission planning process in which the public utility transmission provider participates. The Commission also stated that it did not intend to require a uniform cost allocation method that every region must adopt to allocate the costs of new regional transmission facilities that are eligible for cost allocation, but

instead recognized that regional differences may warrant distinctions in cost allocation

methods among transmission planning regions.[439]

552. The Commission stated in the Proposed Rule that with regard to a new transmission facility that is located entirely within one transmission owner's service territory, a transmission owner may not unilaterally invoke the regional cost allocation method to require the allocation of the costs of a new transmission facility to other entities in its transmission planning region. However, if the regional transmission planning process determines that a new facility located solely within a transmission owner's service territory would provide benefits to others in the region, allocating the facility's costs according to that region's regional cost allocation method or methods would be permitted.[440]

2. Comments on Cost Allocation Method in Regional Transmission Planning

553. A number of commenters generally support the Commission's proposal.[441] For example, ITC Companies support the promulgation of a comprehensive, holistic cost

[439] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 165.

[440] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 169.

[441] *E.g.*, MidAmerican; American Transmission; Clean Line; Dominion; East Texas Cooperatives; MISO; National Grid; NEPOOL; New York ISO; Multiparty Commenters; and WIRES.

allocation method generally applicable to new transmission facilities, citing SPP's highway/byway mechanism as a model.[442]

554. Other commenters express concern with the Commission's proposal to require the development of a cost allocation method for transmission facilities included in a regional transmission plan.[443] Bonneville Power asserts that mandatory regional cost allocation is not necessary to build new transmission in the Pacific Northwest, and such a requirement will lead to extended disputes and greater uncertainty. Bonneville Power contends that instead, voluntary participation, including participation in open seasons, is the best way to encourage the development of new transmission for renewables in the Pacific Northwest. California Commissions echo the sentiment that cost allocation has generally not been a major barrier to entry for new transmission in the West. California Commissions are concerned that the Commission may do more harm than good by moving aggressively and prescriptively on regional cost allocation methods that are not necessarily needed to support transmission development.

---

[442] The arguments in support of this proposal are implicit in the comment summaries under the discussion of other cost allocation proposals below. *See* discussion *infra* section IV.E.8. The term "highway/byway" refers to regionwide allocation of the cost of a new high voltage transmission facility and the allocation of the cost of a new lower voltage transmission facility to a defined portion of the region. *See Southwest Power Pool, Inc.*, 131 FERC ¶ 61,252 (2010).

[443] *E.g.*, Bonneville Power Administration; California Commissions; Eastern Massachusetts Consumer-Owned System; Xcel; and Western Area Power Administration.

555. Some commenters, such as Bonneville Power, California ISO, and Western Area Power Administration, express a preference for voluntary coordination and cost allocation of transmission facilities rather than mandatory cost allocation rules. Coalition for Fair Transmission Policy urges the Commission to consider whether it is prudent in all cases to require the filing of regional cost allocation methods by transmission providers in advance of projects being proposed, as not every project will fit into a particular model, and adherence to strict rules may deter rather than encourage the construction of needed new transmission facilities.

556. New York PSC indicates that it is uncertain as to whether the Commission intends to utilize a pre-established cost allocation methodology as an automatic right of cost recovery. Therefore, New York PSC requests that the Commission clearly indicate when a project would be entitled to cost recovery relative to receiving a cost allocation. Western Grid Group shares the view that the distinction between cost allocation and cost recovery is a pertinent issue. Arizona Public Service Company raises concerns about cost recovery in regions where no regional tariff mechanisms exist. In the absence of such a cost recovery solution, Arizona Public Service Company states that the Commission should not place the burden of recovery for third party developers on incumbent utilities that may be required to seek such recovery through state commissions for facilities that the incumbent utilities have not built and for which the incumbent utilities may be unable

to show benefit for their ratepayers.

557. MISO Transmission Owners agree that a transmission provider should not be able to invoke the regional cost allocation method unilaterally for a facility located entirely within its own service territory. However, they state that in the RTO context, facilities located solely within one transmission owner's service territory should be allocated in accordance with the Commission-accepted cost allocation method. MISO Transmission Owners state that the Proposed Rule should not be interpreted to indicate that single-zone facilities are no longer eligible for regional cost allocation if such allocation is permitted under an RTO or ISO tariff. Additionally, MISO Transmission Owners argue that the Commission should not permit this requirement to allow attempts to relitigate existing cost allocation method that apply to intra-zonal transmission facilities.

3. Commission Determination

558. We require that a public utility transmission provider have in place a method, or set of methods, for allocating the costs of new transmission facilities selected in the regional transmission plan for purposes of cost allocation. If the public utility transmission provider is an RTO or ISO, then the cost allocation method or methods must be set forth in the RTO or ISO OATT. In a non-RTO/ISO transmission planning region, each public utility transmission provider located within the region must set forth in its OATT the same language regarding the cost allocation method or methods used in its

transmission planning region. In either instance, such cost allocation method or methods must be consistent with the regional cost allocation principles adopted below.

559. We conclude that these regional transmission cost allocation requirements are necessary to ensure that rates, terms and conditions of jurisdictional service are just and reasonable and not unduly discriminatory or preferential. In the absence of clear cost allocation rules for regional transmission facilities, there is a greater potential that public utility transmission providers and nonincumbent transmission developers may be unable to develop transmission facilities that are determined by the region to meet their needs. Conversely, greater certainty as to the cost allocation implications of a potential transmission project will enhance the ability of stakeholders in the regional transmission planning process to evaluate the merits of the transmission project. Moreover, as we have established above, there is a fundamental link between cost allocation and planning, as it is through the planning process that benefits, which are central to cost allocation, can be assessed.

560. We do not specify here how the costs of an individual regional transmission facility should be allocated. However, while each transmission planning region may develop a method or methods for different types of transmission projects, such method or methods should apply to all transmission facilities of the type in question. Although we allow a different method or methods for different types of transmission facilities, as discussed below regarding regional Cost Allocation Principle 6, if public utility

transmission providers choose to propose a different cost allocation method or methods for different types of transmission facilities, each method would have to be determined in advance for each type of facility.

561. We disagree with California Commissions that our actions here are too aggressive and prescriptive and with Bonneville Power that adopting a mandatory cost allocation method will lead to extended disputes and greater uncertainty. We have stressed throughout this proceeding that we intend to be flexible and are open to a variety of approaches to compliance. By imposing the cost allocation requirements adopted here, the Commission seeks to enhance certainty for developers of potential transmission facilities by identifying, up front, the cost allocation implications of selecting a transmission facility in the regional transmission plan for purposes of cost allocation. This does not undermine the ability of market participants to negotiate alternative cost sharing arrangements voluntarily and separately from the regional cost allocation method or methods. Indeed, market participants may be in a better position to undertake such negotiations as a result of the public utility transmission providers in the region having evaluated a transmission project. The results of that evaluation, including the identification of potential beneficiaries of the transmission project, could facilitate negotiations among potentially interested parties.

562. In response to Coalition for Fair Transmission Policy, we require the development of a cost allocation method or a set of methods in advance of particular transmission

facilities being proposed so that developers have greater certainty about cost allocation and other stakeholders will understand the cost impacts of the transmission facilities proposed for cost allocation in transmission planning. The appropriate place for this consideration is the regional transmission planning process because addressing these issues through the regional transmission planning process will increase the likelihood that transmission facilities selected in regional transmission plans for purposes of cost allocation are actually constructed, rather than later encountering cost allocation disputes that prevent their construction.

563. With regard to comments regarding matters of cost recovery, we acknowledge that cost allocation and cost recovery are distinct. This Final Rule sets forth the Commission's requirements regarding the development of regional and interregional cost allocation methods and does not address matters of cost recovery. We disagree with Arizona Public Service Company, however that incumbent utilities may be unreasonably burdened by the potential of cost allocation for transmission facilities developed by third party developers. For any proponent of a transmission facility, whether an incumbent or a nonincumbent, to have the costs of a transmission facility allocated through the regional cost allocation method or methods, its transmission facility first must be selected in the regional transmission plan for purposes of cost allocation. This in turn requires a determination that the transmission project is an efficient or cost-effective solution pursuant to the processes the transmission providers in the region have put in place,

including consultation with stakeholders. Therefore, the benefits of any such transmission project should have been clearly identified prior to the allocation of any related costs.

564. With respect to cost allocation for a proposed transmission facility located entirely within one public utility transmission owner's service territory, we find that a public utility transmission owner may not unilaterally apply the regional cost allocation method or methods developed pursuant to this Final Rule. However, a proposed transmission facility located entirely within a public utility transmission owner's service territory could be determined by public utility transmission providers in the region to provide benefits to others in the region and thus the cost of that transmission facility could be allocated according to that region's regional cost allocation method or methods.

565. In response to MISO Transmission Owners' concerns regarding relitigation of existing Commission-approved transmission cost allocation methods, the Commission declines here to prejudge whether any such existing cost allocation methods comply with the requirements of this Final Rule. To the extent MISO Transmission Owners believe that to be the case with their region, they may take such positions during the development of compliance proposals and during Commission review of compliance filings. However, we reiterate here that our cost allocation reforms apply only to new transmission facilities that are selected in a regional transmission plan for purposes of cost allocation and, therefore, do not provide grounds for relitigation of cost allocation

decisions for existing transmission facilities.

D. Cost Allocation Method for Interregional Transmission Facilities

1. Commission Proposal

566. The Proposed Rule would require that each public utility transmission provider within a transmission planning region develop a method for allocating the costs of a new interregional transmission facility between the two neighboring transmission planning regions in which the facility is located or among the beneficiaries in the two neighboring transmission planning regions. This common method would have to satisfy six interregional cost allocation principles, discussed below.

567. The Commission stated in the Proposed Rule that it would not apply the interregional cost allocation principles so as to require every pair of regions to adopt the same uniform approach to cost allocation for new interregional transmission facilities, but instead recognized that there may be legitimate reasons for the public utility transmission providers located in different pairs of neighboring transmission planning regions to adopt different cost allocation methods.[444]

2. Comments on Interregional Cost Allocation Reforms

568. A number of commenters generally support the proposal that each transmission provider have an interregional cost allocation method for facilities located in more than

[444] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 175.

one region.[445] NEPOOL states that it generally supports the proposal to require formal agreements between neighboring control areas that contain cost allocation methods for interregional projects, with such methods being subject to the principles specified in the Proposed Rule. East Texas Cooperatives support the application of the six proposed principles to interregional cost allocation methods. AEP states that getting these ground rules in place is essential to move forward on major interregional projects and to break down decades old barriers to these types of projects. Likewise, MidAmerican states that there is little if any coordination of transmission cost allocation between MISO and SPP regions and the MISO and MAPP regions and, as such, supports the Commission's efforts to create a more coordinated and effective way to allocate costs of new transmission facilities both within these planning regions and those linking adjacent planning regions.

569. Vermont Electric states that it welcomes the proposed requirement for interregional coordination and the Commission's attention to what it views as deficiencies in the ISO New England transmission planning process. Vermont Electric states that the Commission's proposed requirement for a standard cost allocation method applicable to interregional projects would prevent delays, reduce costs for project

[445] *E.g.*, AEP; Clean Line; MidAmerican; MISO; MISO Transmission Owners; NEPOOL; New England States Committee on Electricity; Northeast Utilities; Pennsylvania PUC; PSEG Companies; and Energy Consulting Group.

developers, and facilitate development of potentially valuable interregional projects.

570. A number of commenters question or express concern about the appropriateness of requiring the development of interregional cost allocation methods for future interregional transmission facilities in advance of a proposal for a specific interregional facility.[446] For example, SoCal Edison notes that voluntary coordination efforts are underway, and it argues that there is no reason to impose additional mandatory interregional coordination criteria or requirements. ISO New England supports the preservation of a voluntary, flexible approach to interregional cost allocation that recognizes regional differences. ISO New England also states that the Final Rule should either clarify the manner in which agreement on cost allocation would be signified by each of the two regions or provide for flexibility in recognition of the mechanisms that may be most appropriate in light of the internal transmission planning processes of the paired regions.

571. National Grid believes that interregional coordination agreements should include general cost allocation principles that will apply to interregional projects, but that it would not be beneficial to prescribe an interregional cost allocation method in advance of a specific interregional project. Similarly, New England Transmission Owners and New York Transmission Owners contend that, in light of the limited number of projects that

[446] *E.g.*, New York ISO; Coalition for Fair Transmission Policy; California ISO; and National Grid.

are likely to be identified through interregional coordination, the Commission should allow cost allocation issues to be decided in connection with individual projects instead of dictating a generic cost allocation method in advance.

572. Vermont Electric agrees, suggesting that the Commission impose an interregional requirement only to the extent regional planning organizations do not respond promptly and effectively to cost allocation issues applicable to interregional projects on a case-by-case basis. New York ISO recommends that the Commission require neighboring regions to include language in their tariffs setting forth their obligation to negotiate cost allocation rules for any interregional projects that are approved in their respective planning processes and that such rules must comply with the cost allocation principles established in the Final Rule.

573. Similarly, Transmission Agency of Northern California cautions against requiring the development of cost allocation principles between planning regions prior to the need for such coordination. California ISO and Indianapolis Power & Light also argue that the requirement for a mandatory advanced agreement on cost allocation before knowing the specific facts and circumstances of an interregional project is neither appropriate nor effective. Indianapolis Power & Light also states that it would be better to postpone development of such agreements until a specific interregional project has been proposed.

574. California ISO states that the Commission should not mandate an interregional cost allocation method or methods because the existing case-by-case determination of

cost allocation for interregional transmission facilities has worked well in the West. California ISO states that different parties will bring different interests to the table, and different circumstances may warrant different approaches to interregional cost allocation. However, California ISO states that regardless of what the Commission concludes on this issue, it should retain in the Final Rule the concept that inclusion of an interregional transmission project in each of the relevant regional transmission plans would be a prerequisite to applying an interregional cost allocation principle.[447] California ISO argues that this is necessary to ensure equitable cost allocation.

575. Edison Electric Institute states that flexibility is especially important for multistate projects with a large number of likely beneficiaries. It states that flexibility also is important for different regions in developing interregional cost allocation methods, including methods that provide for a case-by-case evaluation of projects in lieu of using prescribed cost allocation formulas. Edison Electric Institute states that the Commission should allow a region to propose the evaluation of alternative cost-effective projects that would result in lower costs to the region's consumers.

576. Edison Electric Institute also asks the Commission to be clear in the Final Rule about whether and how existing interregional cost allocation mechanisms and those under development in various regions will be affected, if at all. Transmission Dependent Utility

[447] *See also*, *e.g.*, Connecticut & Rhode Island Commissions.

Systems and Xcel support the proposed requirement, but request that the Commission not disrupt or disturb the methods already in place. New England Transmission Owners state that the Commission should permit New England and New York to move forward to develop coordinated interregional coordination based on the principles in their current agreement.

577. SPP seeks clarification, consistent with Order No. 890, that transmission owning members of RTOs and ISOs can comply with the proposed interregional cost allocation mandates through their participation in the RTO or ISO and the interregional agreements executed by the RTO or ISO, rather than requiring them to negotiate with their neighbors to develop separate arrangements.

3. Commission Determination

578. We require a public utility transmission provider in a transmission planning region to have, together with the public utility transmission providers in its own transmission planning region and a neighboring transmission planning region, a common method or methods for allocating the costs of a new interregional transmission facility among the beneficiaries of that transmission facility in the two neighboring transmission planning regions in which the transmission facility is located. [448] As we discuss further below, the

[448] A group of three or more transmission planning regions within an interconnection —or all of the transmission planning regions within an interconnection— may agree on and file a common method or methods for allocating the costs of a new

(continued…)

cost allocation method or methods used by the pair of neighboring transmission regions can differ from the cost allocation method or methods used by each region to allocate the cost of a new interregional transmission facility within that region. For example, region A and region B could have a cost allocation method for the allocation of the costs of an interregional transmission facility between regions A and B (the interregional cost allocation method) that could differ from the respective regional cost allocation method that either region A or region B uses to further allocate its share of the costs of an interregional transmission facility. In an RTO or ISO region, the method must be filed in the OATT. In a non-RTO/ISO transmission planning region, the common cost allocation method or methods must be filed in the OATT of each public utility transmission provider in the transmission planning region. In either instance, such cost allocation method or methods must be consistent with the interregional cost allocation principles adopted below.

579. As with our regional cost allocation requirements above, we are requiring interregional cost allocation requirements to remove impediments to the development of transmission facilities that are identified as needed by the relevant regions. We conclude that the absence of clear cost allocation rules for interregional transmission facilities can

---

interregional transmission facility. However, the Commission does not require such multiregional provisions among more than two neighboring transmission planning regions.

impede the development of such transmission facilities due to the uncertainty regarding the allocation of responsibility for associated costs. This may, in turn, adversely affect rates for jurisdictional services, causing them to become unjust and unreasonable or unduly discriminatory or preferential.

580. As in the case of regional cost allocation, we do not require a single nationwide approach to interregional cost allocation but instead allow each pair of neighboring regions the flexibility to develop its own cost allocation method or methods consistent with the interregional cost allocation principles adopted in this Final Rule. We also clarify that we do not require each transmission planning region to have the same interregional cost allocation method or methods with each of its neighbors. Each pair of transmission planning regions may develop its own approach to interregional cost allocation that satisfies both transmission planning regions' needs and concerns, as long as that approach satisfies the interregional cost allocation principles. Our intention is to preserve the ability of each pair of transmission planning regions to plan for future development of interregional transmission projects that will be beneficial to both transmission planning regions.

581. We do not specify here how the costs for an individual interregional transmission facility should be allocated. However, while transmission planning regions can develop a different cost allocation method or methods for different types of transmission projects, such a cost allocation method or methods should apply to all transmission facilities of the

type in question. Although we allow a different cost allocation method or methods for different types of transmission facilities, as discussed below regarding Interregional Cost Allocation Principle 6, if public utility transmission providers choose to propose a different cost allocation method or methods for different types of transmission facilities, each cost allocation method would have to be determined in advance for each type of transmission facility. Also, we adopt the requirement that an interregional transmission facility must be in the relevant regional transmission plans to be eligible for interregional cost allocation pursuant to the interregional cost allocation method or methods.

582. Additionally, a central underpinning to our reforms in this Final Rule is the closer alignment of transmission planning and cost allocation. As we discuss above in the section on interregional transmission coordination,[449] an interregional transmission facility must be selected in both of the relevant regional transmission planning processes for purposes of cost allocation in order to be eligible for interregional cost allocation pursuant to a cost allocation method required under this Final Rule. This is designed, among other things, to allow for adequate stakeholder review of the interregional transmission facility before the relevant portion of the facility is in a regional transmission plan.[450] This process could be undermined if a transmission facility that is

[449] *See* discussion *supra* section III.C.

[450] *See* discussion *supra* section III.C.

located and reviewed only within one regional transmission planning process, could nevertheless have its costs allocated to potential beneficiaries in another region that may not have had an adequate opportunity to review the need for the transmission facility and make the resulting beneficiary determinations. As we make clear in our discussion of Cost Allocation Principle 4,[451] costs may be assigned on a voluntary basis under this Final Rule to a transmission planning region in which an interregional transmission facility is not located. Given this option, regions are free to negotiate interregional transmission arrangements that allow for the allocation of costs to beneficiaries that are not located in the same transmission planning region as any given interregional transmission facility.

583. With respect to existing interregional transmission coordination and cost allocation agreements, we do not opine here on whether such agreements satisfy the interregional transmission coordination requirements and cost allocation principles of this Final Rule.[452] To the extent that a public utility transmission provider believes such an agreement satisfies these requirements in whole or in part, that public utility transmission provider should describe in its compliance filing how the relevant requirements are

[451] *See* discussion *infra* section IV.E.5.

[452] Public utility transmission providers may continue to enter into such agreements as a means of complying with this Final Rule, but any such agreements that are incorporated into the public utility transmission provider's OATT by reference must be consistent with or superior to this Final Rule.

satisfied by reference to tariff sheets on file with the Commission.

584. We also clarify in response to commenters that the requirement to coordinate with neighboring regions applies to public utility transmission providers within a region as a group, not members within an RTO or ISO acting individually. Therefore, within an RTO or ISO, the RTO or ISO would develop an interregional cost allocation method or methods with its neighbors on behalf of its public utility transmission owning members.

E. Principles for Regional and Interregional Cost Allocation

1. Use of a Principles-Based Approach

a. Commission Proposal

585. For the cost allocation method or methods to be just and reasonable and not unduly discriminatory or preferential, the Proposed Rule would require that each cost allocation method satisfy six general cost allocation principles, as set out in the following subsections. The Commission proposed six regional cost allocation principles for each cost allocation method for regional transmission facilities included in the regional transmission plan for purposes of cost allocation and six analogous interregional cost allocation principles for each cost allocation method for a new transmission facility that is located in two neighboring transmission planning regions and is accounted for in the interregional transmission coordination process.

586. Specifically, the Proposed Rule would require that each RTO or ISO (on behalf of its transmission owning members) or the individual public utility transmission providers

in a non-RTO/ISO transmission planning region to demonstrate through a compliance filing that its cost allocation method or methods for new transmission facilities satisfy the following regional cost allocation principles:

> (1) The cost of transmission facilities must be allocated to those within the transmission planning region that benefit from those facilities in a manner that is at least roughly commensurate with estimated benefits.[453] In determining the beneficiaries of transmission facilities, a regional transmission planning process may consider benefits including, but not limited to, the extent to which transmission facilities, individually or in the aggregate, provide for maintaining reliability and sharing reserves, production cost savings and congestion relief, and/or meeting public policy requirements established by state or federal laws or regulations that may drive transmission needs.[454]

---

[453] *See Illinois Commerce Commission*, 576 F.3d 470 at 476-77 (stating that "[w]e do not suggest that the Commission has to calculate benefits to the last penny, or for that matter to the last million or ten million or perhaps hundred million dollars"). *See also MISO Transmission Owners*, 373 F.3d 1361 at 1369 (stating that "we have never required a ratemaking agency to allocate costs with exacting precision"); *Sithe*, 285 F.3d 1 at 5.

[454] As discussed above, the Commission proposed to require each public utility transmission provider to amend its OATT such that its local and regional transmission planning processes explicitly provide for consideration of Public Policy Requirements established by state or federal laws or regulations that drive transmission needs. As discussed above, we adopt this requirement in this Final Rule.

(2) Those that receive no benefit from transmission facilities, either at present or in a likely future scenario, must not be involuntarily allocated the costs of those facilities.

(3) If a benefit to cost threshold is used to determine which facilities have sufficient net benefits to be included in a regional transmission plan for the purpose of cost allocation, it must not be so high that facilities with significant positive net benefits are excluded from cost allocation. A transmission planning region or public utility transmission provider may want to choose such a threshold to account for uncertainty in the calculation of benefits and costs. If adopted, such a threshold may not include a ratio of benefits to costs that exceeds 1.25 unless the transmission planning region or public utility transmission provider justifies and the Commission approves a greater ratio.

(4) The allocation method for the cost of a regional facility must allocate costs solely within that transmission planning region unless another entity outside the region or another transmission planning region voluntarily agrees to assume a portion of those costs.[455] However, the transmission planning process in the

[455] In addition, the Commission preliminarily found that this principle does not affect the cross-border cost allocation methods developed by PJM and MISO in response to Commission directives related to their intertwined configuration. *Midwest Indep. Transmission Sys. Operator, Inc.*, 113 FERC ¶ 61,194, at P 10; *Midwest Indep. Transmission Sys. Operator, Inc.*, 122 FERC ¶ 61,084; *Midwest Indep. Transmission Sys.*

(continued…)

original region must identify consequences for other transmission planning regions, such as upgrades that may be required in another region and, if there is an agreement for the original region to bear costs associated with such upgrades, then the original region's cost allocation method or methods must include provisions for allocating the costs of the upgrades among the entities in the original region.

(5) The cost allocation method and data requirements for determining benefits and identifying beneficiaries for a transmission facility must be transparent with adequate documentation to allow a stakeholder to determine how they were applied to a proposed transmission facility.

(6) A transmission planning region may choose to use a different cost allocation method for different types of transmission facilities in the regional plan, such as transmission facilities needed for reliability, congestion relief, or to achieve public policy requirements established by state or federal laws or regulations. Each cost allocation method must be set out clearly and explained in detail in the compliance filing for this Final Rule.[456]

Operator, Inc., 129 FERC ¶ 61,102. As noted above, we adopt this finding in this Final Rule.

[456] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 164.

587. The Proposed Rule required each cost allocation method to comply with the following interregional cost allocation principles:

(1) The costs of a new interregional facility must be allocated to each transmission planning region in which that facility is located in a manner that is at least roughly commensurate with the estimated benefits of that facility in each of the transmission planning regions. In determining the beneficiaries of interregional transmission facilities, transmission planning regions may consider benefits including, but not limited to, those associated with maintaining reliability and sharing reserves, production cost savings and congestion relief, and meeting public policy requirements established by state or federal laws or regulations that may drive transmission needs.

(2) A transmission planning region that receives no benefit from an interregional transmission facility that is located in that region, either at present or in a likely future scenario, must not be involuntarily allocated any of the costs of that

facility.[457]

(3) If a benefit-cost threshold ratio is used to determine whether an interregional transmission facility has sufficient net benefits to qualify for interregional cost allocation, this ratio must not be so large as to exclude a facility with significant positive net benefits from cost allocation. The public utility transmission providers located in the neighboring transmission planning regions may choose to use such a threshold to account for uncertainty in the calculation of benefits and costs. If adopted, such a threshold may not include a ratio of benefits to costs that exceeds 1.25 unless the pair of regions justifies and the Commission approves a higher ratio.

(4) Costs allocated for an interregional facility must be assigned only to transmission planning regions in which the facility is located. Costs cannot be assigned involuntarily under this rule to a transmission planning region in which that facility is not located. However, the interregional planning process must identify consequences for other transmission planning regions, such as upgrades that may be required in a third transmission planning region and, if there is an agreement among the transmission providers in the regions in which the facility is

[457] For example, a DC line that runs from a first transmission planning region, through a second transmission planning region, and into a third transmission planning region, with no tap in the second region, may not provide any benefits to the second region.

located to bear costs associated with such upgrades, then the interregional cost allocation method must include provisions for allocating the costs of the upgrades within the transmission planning regions in which the facility is located.

(5) The cost allocation method and data requirements for determining benefits and identifying beneficiaries for an interregional facility must be transparent with adequate documentation to allow a stakeholder to determine how they were applied to a proposed transmission facility.

(6) The public utility transmission providers located in neighboring transmission planning regions may choose to use a different cost allocation method for different types of interregional facilities, such as transmission facilities needed for reliability, congestion relief, or to achieve public policy requirements established by state or federal laws or regulations. Each cost allocation method must be set out and explained in detail in the compliance filing for this rule.

588. The Proposed Rule also states that public utility transmission providers will have the first opportunity to develop cost allocation methods for regional and interregional transmission facilities in consultation with stakeholders. In the event that no agreement can be reached, the Commission would use the record in the relevant compliance filing proceeding as a basis to develop a cost allocation method or methods that meets its proposed requirements.

b. Comments on Use of Principles-Based Approach

589. Many commenters generally support the use of cost allocation principles although this support is often expressed as part of general support for the Proposed Rule's six proposed cost allocation principles as a package.[458] For example, Dominion believes that by providing cost allocation principles linked to planning, the Commission has taken the correct approach without being overly prescriptive. Dayton Power and Light states that these principles help to reduce uncertainty and provide guidance to interested stakeholders. Energy Future Coalition Group states that the proposed principles follow the direction laid out by the court in the *Illinois Commerce Commission* case, and address legitimate concerns that have been raised by some opponents of broad cost allocation policy over the past two years. On the other hand, as discussed above,[459] some comments oppose any generic action on regional and interregional cost allocation and therefore do not support the use of cost allocation principles to support such action.

590. Almost all commenters urge the Commission not to adopt a "one-size-fits-all" approach to cost allocation and to retain regional and interregional flexibility.[460] For example, APPA and Transmission Agency of Northern California state that the

[458] *E.g.*, DC Energy; WIRES; Dominion; and Dayton Power and Light.

[459] *See* discussion *supra* section II.

[460] *E.g.*, Large Public Power Council; Kansas Corporation Commission; and Nebraska Public Power District.

Commission should not prescribe a uniform approach to interregional transmission cost allocation, and should allow for regional and interregional differences. Transmission Agency of Northern California states that this issue is being addressed at a level where local and regional differences can be addressed more fully, and that it supports the Proposed Rule's assumption that this ongoing process should not be disrupted by this rulemaking.

591. Several commenters ask the Commission to address the Proposed Rule's provision regarding "in the event that no agreement can be reached."[461] They contend that if the Commission adopts a rule providing that it would select a backstop cost allocation method in the event that stakeholders within a region cannot agree to a regional cost allocation method or if regions cannot agree on a cost allocation method for interregional projects, the Commission should provide additional guidance that would help stakeholders to reach agreement. For example, Multiparty Commenters request that the Commission clarify: the level of stakeholder agreement that is acceptable; what would be evidence of an impasse; whether the Commission will defer to the majority; and whether the Commission will extend the time in which to make compliance filings to afford more time to obtain an agreement. Similarly, for interregional cost allocation, Anbaric and PowerBridge recommend that the Commission stipulate a reasonable period

[461] *E.g.*, Anbaric and PowerBridge; AWEA; MidAmerican; Multiparty Commenters; and Southern Companies.

of time for regions to reach agreement on a proposed interregional cost allocation method.

592. Some commenters recommend that the Commission adopt an interregional default cost allocation method if regions cannot agree to such a method themselves, although they note that specific projects will involve unique facts and circumstances. Anbaric and PowerBridge believe that, if regions cannot agree on an interregional cost allocation method, the Commission could impose an agreement based on the facts and circumstances of the project. Massachusetts Municipal and New Hampshire Electric state that, even if an interregional default method is implemented, whether by mutual agreement or by Commission directive, disputes will arise about the application of that method to a given set of facts. Massachusetts Municipal and New Hampshire Electric suggest that the Commission can address these concerns by adopting expedited hearing procedures to be applied in such cases.

593. Other commenters suggest a variation on or alternative to the idea that the Commission adopt a default cost allocation method for regional and interregional cost allocation if stakeholders or regions cannot come to a consensus themselves.[462] Wind Coalition states that having a default cost allocation method would allow construction to

[462] *E.g.*, American Transmission; AWEA; NextEra; and Wind Coalition.

commence while an alternative cost allocation method is being developed, if needed. It states that this would be particularly needed for cross-border cost allocation because there are currently few interregional agreements on cost allocation. Wind Coalition also states that matching cost allocation with a proactive regional or interregional plan is important for justifying regional cost sharing.

594. Some commenters argue that, if a region or regions fail to agree on a method, the Commission should not select a default cost allocation method and also should not select a cost allocation method based on the record here.[463] APPA contends that adoption of a default cost allocation method or particular cost allocation principles or guidelines would influence the prospects for successful regional and interregional negotiation because stakeholders that support the default method will be unwilling to negotiate, knowing that if no agreement is reached, their preferred method will be adopted as the default. PSEG Companies argue that adoption of a single default cost allocation method would be inconsistent with the Proposed Rule's "beneficiary pays" approach. PSEG Companies believe that the "roughly commensurate" standard that the *Illinois Commerce Commission* decision requires will be satisfied only by happenstance under a default cost allocation method. PSEG Companies also disagree with comments by National Grid, AEP, and others that the Commission should institute a default cost allocation method for

[463] *E.g.*, APPA and PSEG Companies.

transmission planning regions that would apply regardless of the nature of the facilities planned (i.e., reliability or economic). PSEG Companies suggest that the Commission clarify how interregional cost allocation will be handled in the absence of an interregional agreement, and it should make clear that the existence of such an agreement is a prerequisite to the assignment of costs to another transmission planning region and its customers. PSEG Companies also state that, if certain regions decline to enter into interregional agreements, the Commission should adopt a "do not harm" standard applicable to such regions as a corollary principle, that is, no region may plan its system in a way that would impose costs on other regions.

595. Some commenters suggest a particular default method that the Commission should adopt if it decides to have a default cost allocation method, such as the SPP highway/byway mechanism.[464] However, other commenters express concern with establishing a "one-size-fits-all" default allocation method.[465] In particular, New England States Committee on Electricity and Identified New England Transmission Owners urge the Commission to reject recommendations to adopt the highway/byway mechanism as a default cost allocation method, instead asking the Commission to respect

[464] Several commenters suggested this method including AWEA, Multiparty Commenters, and NextEra.

[465] *E.g.*, Connecticut & Rhode Island Commissions; Kansas Corporation Commission; Salt River Project; WIRES; and Wisconsin Electric.

regional differences. Sunflower and Mid-Kansas submit that the Final Rule should provide for two-third regional (or interregional) allocation of costs and one-third to the ultimate sink zone for all network upgrades approved through an interregional plan that are needed for variable energy resource integration.

596. With respect to the question of whether the Commission should establish an interim cost allocation method until stakeholders have time to reach consensus, AWEA states that the current market structure and the mechanisms used to allocate costs between transmission providers outside organized market regions needs to mature further before transmission providers in many of these market regions will be able to fully comply with the Proposed Rule. It states that if transmission providers outside organized market regions cannot demonstrate a binding cost allocation method as envisioned by the Proposed Rule, it would be appropriate for the Commission to consider an interim method to address cost allocation in those regions, such as using an "intertie open season" to create a record about the appropriate allocation of costs.

597. NextEra suggests that, for non-RTO regions, regional cost recovery should be promoted by an adder on the transmission rates of public utility transmission providers (and extended to non-jurisdictional utilities via reciprocity). Southern Companies respond that this approach is not feasible because it does not address the fact that their OATT recovers only the share of the cost attributable to their provision of wholesale transmission service. Southern Companies state that even with an adder, third parties

would be limited to recovering approximately 15 percent of their transmission costs, which is comparable to Southern Companies' cost recovery.

598. Massachusetts Departments and MidAmerican state that the Commission should narrowly apply any authority it has to develop a cost allocation method only for specific projects rather than requiring an established mechanism for all projects. For instance, MidAmerican proposes that the Commission adopt a default cost allocation method that would be used only if the stakeholders fail to agree regarding a 500 kV or higher alternative current facility (except high voltage direct current projects) that is identified by the planning process as providing widespread benefits. In this limited case, Mid-American suggests that the Commission adopt a streamlined dispute resolution mechanism with a rebuttable presumption in favor of specified regional and interregional cost allocation methods. MidAmerican states that the record in the proceeding before the Commission on remand from the Seventh Circuit *Illinois Commerce Commission* opinion, demonstrates the reliability, economic, and societal benefits of 500 kV and above transmission, and it also documents that these benefits are realized regionwide whenever extra-high voltage transmission is deployed.

599. Wisconsin Electric states that it may be useful to consider the extent to which statewide stakeholder collaboratives could be effective in helping to resolve interstate cost allocation and cost recovery controversies. It points to California's Renewable Energy Transmission Initiative, which distinguishes stakeholders who are willing to work

in good faith to resolve a project from those who only oppose transmission for self-interested reasons. Northwestern Corporation (Montana) is concerned that the proposal could have uneconomic consequences in that a high-cost allocation solution could be involuntarily allocated to an unwilling entity that has a lower-cost solution. Northern Tier Transmission Group is also worried about the difficulties that would arise in the context of allocating costs to entities that are unwilling to incur them.

600. Some commenters state that the Commission should not close the door on existing or evolving processes.[466] Salt River Project states that requiring involuntary cost sharing would risk foreclosure of promising alternatives and superior options for reliable and least-cost service for customers. Salt River Project is also concerned that arbitrary solutions could result that fail to honor local and regional interests.

601. Dominion states that it is unlikely any imposed allocation method will generate uniform agreement or consensus so if competing principled approaches are proposed, the Commission should not make a ruling in favor of one over the other, but consider whether a blended approach could result in a just and reasonable solution. Southern Companies state that the policies of promoting the expansion of the transmission grid

[466] In addition, WIRES also notes that a default method where regional parties reach an impasse may look more attractive if the Commission's principles provide only generalized guidance. However, WIRES states that greater reliance on principled, up-front guidance for allocating the costs of transmission can provide a high degree of reassurance to parties engaged in negotiating a method. It states that only the Commission can provide this level of certainty.

would be better served by developing a set of reasonable cost allocation principles that would be used to develop a cost allocation method only when an actual, multi-jurisdictional project is pursued. With respect to interregional cost allocation, New York Transmission Owners argue that it is neither necessary nor reasonable for the Commission to impose an interregional cost allocation method if one is not agreed to by the regions.

602. Further, other commenters tell us that principles alone are not enough, and propose alternative solutions. These comments are summarized and addressed below in the discussion of the proposed cost allocation principles.

c. Commission Determination

603. The Commission requires each public utility transmission provider to show on compliance that its cost allocation method or methods for regional cost allocation and its cost allocation method or methods for interregional cost allocation are just and reasonable and not unduly discriminatory or preferential by demonstrating that each method satisfies the six cost allocation principles. Commission determinations on each cost allocation principle are set out in the subsections below. The six regional cost allocation principles apply to, and only to, a cost allocation method or methods for new regional transmission facilities selected in a regional transmission plan for purposes of cost allocation. The six analogous interregional cost allocation principles apply to, and only to, a cost allocation method or methods for a new transmission facility that is located in two neighboring

transmission planning regions and accounted for in the interregional transmission coordination procedure in an OATT. These cost allocation principles do not apply to other new transmission facilities and therefore do not foreclose the opportunity for a developer or individual customer to voluntarily assume the costs of a new transmission facility, as discussed further below in the Participant Funding subsection.

604. We adopt the use of cost allocation principles because we do not want to prescribe a uniform method of cost allocation for new regional and interregional transmission facilities for every transmission planning region. To the contrary, we recognize that regional differences may warrant distinctions in cost allocation methods among transmission planning regions. Therefore, we retain regional flexibility and allow the public utility transmission providers in each transmission planning region, as well as pairs of transmission planning regions, to develop transmission cost allocation methods that best suit the needs of each transmission planning region or pair of transmission planning regions, so long as those approaches comply with the regional and interregional cost allocation principles of this Final Rule.

605. The Commission recognizes that a variety of methods for cost allocation may satisfy a set of general principles. For example, a postage stamp cost allocation method may be appropriate where all customers within a specified transmission planning region are found to benefit from the use or availability of a transmission facility or class or group of transmission facilities, especially if the distribution of benefits associated with a

class or group of transmission facilities is likely to vary considerably over the long depreciation life of the transmission facilities amid changing power flows, fuel prices, population patterns, and local economic considerations.[467] Similarly, other methods that would allocate costs to a narrower class of beneficiaries may be appropriate, provided that the methods reflect an evaluation of beneficiaries and is adequately defined and supported by the transmission planning region or pairs of transmission planning regions.

606. In response to comments that request further detail from the Commission on what an appropriate cost allocation method would look like, we conclude that public utility transmission providers in each transmission planning region or pair of transmission planning regions must be allowed the opportunity to determine for themselves the cost allocation method or methods to adopt based on their own regional needs and characteristics, consistent with the six cost allocation principles. With the exception of the limitation on participant funding explained below, we decline to prejudge any particular method or set of methods generically in this Final Rule.

607. In the event of a failure to reach an agreement on a cost allocation method or methods, the Commission will use the record in the relevant compliance filing proceeding as a basis to develop a cost allocation method or methods that meets its proposed requirements. Public utility transmission providers must document in their

[467] We address comments below suggesting that the cost allocation principles be applied to require regional cost sharing for all transmission facilities at 345 kV or higher.

compliance filings the steps they have taken to reach consensus on a cost allocation method or set of methods to comply with this Final Rule, as thoroughly as practicable, and provide whatever information they view as necessary for the Commission to make a determination of the appropriate cost allocation method or methods. Each public utility transmission provider must make an individual compliance filing that includes its own proposed method or set of methods of allocating costs and explains how it believes its method or methods satisfy the cost allocation principles and is appropriate for its transmission planning region or pair of transmission planning regions. Groups of public utility transmission providers that agree on a proposed method or methods may make a coordinated filing or filings with their common views. The public utility transmission providers in each transmission planning region or pair of transmission planning regions will have the burden of demonstrating that sufficient effort has been made to comply with the requirements of this Final Rule.

608. Interested parties will be provided an opportunity to comment on these compliance filings, thereby creating a record on which the Commission could develop an appropriate cost allocation method or methods, or establish further procedures to do so. We do not impose other specific filing requirements for what the record should contain. As with any other proceeding before the Commission, should more information become necessary during the Commission's review process, the Commission may request more information from the parties at that time.

609. The Commission will consider in response to compliance filings all issues raised by commenters, such as what constitutes an impasse, whether there should be deference to the majority, and whether granting additional time for the region to continue negotiations would be appropriate. The procedural mechanisms used by the Commission in response to compliance filing(s) will depend on the nature of remaining disputes and what issues are still at stake that are preventing the public utility transmission providers in each transmission planning region or pair of transmission planning regions from reaching a consensus. The Commission will not prejudge the outcome of the dispute by stating at this time whether there should be deference to the views of any particular segment of stakeholders, as suggested by Multiparty Commenters.

610. We decline to adopt a default regional or interregional cost allocation method in this Final Rule. We decline to do so for reasons similar to the reasons we declined to impose a uniform cost allocation method for all transmission planning regions. Many factors may make it appropriate for different transmission planning regions to have different cost allocation methods. It thus would not be practical or reasonable for the Commission to establish such default methods. We agree with APPA and others that having a known default method would cause those who favor it not to negotiate in good faith for an alternative cost allocation method. For these same reasons, we will not establish an interim cost allocation method that applies between the time of the issuance of this Final Rule and the time when stakeholders reach a consensus.

611. The twelve regional and interregional proposed cost allocation principles are discussed below in pairs of six separate subsections. Because the proposed cost allocation principles for regional transmission facilities are very similar to the proposed cost allocation principles for interregional transmission facilities, almost all commenters discussed them together as if they were a single principle. Therefore, the Commission discusses the corresponding sets of cost allocation principles together and, except where otherwise indicated, the Commission determinations regarding each set of cost allocation principles apply to both the regional and interregional transmission facilities in a regional transmission plan for purposes of cost allocation. The cost allocation principles in the Final Rule apply only to those new transmission facilities selected in a regional transmission plan for purposes of cost allocation and new transmission facilities subject to the cost allocation provision of the interregional coordination procedures in an OATT.

2. Cost Allocation Principle 1—costs allocated in a way that is roughly commensurate with benefits[468]

a. Comments

612. Many commenters generally support the Commission's first proposed cost allocation principle for both regional and interregional cost allocation, which provides that the costs of transmission facilities must be allocated to those that benefit in a manner

[468] For the full text of this principle, *see* P 586 for regional cost allocation and P 587 for interregional cost allocation.

at least roughly commensurate with the estimated benefits received.[469] For example, Transmission Access Policy Study Group states that the roughly commensurate standard appears to be consistent with the *Illinois Commerce Commission* decision and cost causation principles. Additionally, Westar states that transmission customers in a region should not pay for transmission projects that do not provide commensurate benefits and that only transmission projects that have been thoroughly reviewed in the regional process, show a benefit to the region and are approved by the transmission provider should be included in regional rates. Commenters also generally support the Proposed Rule's proposal to adhere to cost causation principles and also support a "beneficiaries pay" approach.[470] Dayton Power & Light comments that "beneficiaries pay" is the touchstone principle for cost allocation. American Forest & Paper argues that such an approach provides for better incentives for analysis of costs and alternatives.

613. Several commenters, however, support a broader definition of benefits and

[469] *E.g.*, Bay Area Municipal Transmission Group; Santa Clara; Consolidated Edison and Orange & Rockland; Transmission Access Policy Study Group; United States Senators Dorgan and Reid; Professor Ignacio Perez-Arriaga; New York ISO; New York PSC; New York Transmission Owners; Westar; City and County of San Francisco; Conservation Law Foundation; Energy Future Coalition Group; Solar Energy Industries; and EarthJustice.

[470] *E.g.*, Dayton Power & Light; Conservation Law Foundation; and American Forest & Paper.

beneficiaries.[471] NextEra argues that the Final Rule should mandate that planning processes consider various types of benefits, rather than leaving it to a transmission provider's discretion. Old Dominion asserts that adopting a narrow approach to assessing benefits for cost allocation purposes would ignore the broader benefits associated with maintaining and expanding the regional high voltage transmission system—such as more options when making resources decisions in regional markets. Old Dominion notes that restricting the cost causation benefits to a snapshot in time would be problematic for dynamic high voltage regional transmission facilities. National Grid supports a cost allocation method that takes into account both the quantitative and qualitative benefits of transmission. Xcel suggests that the Commission permit methods, such as SPP's highway/byway approach, which broadly allocate costs based on general determination of the benefits provided to a region and stakeholders. AWEA and Multiparty Commenters state that it does not make sense to use cost allocation mechanisms that look only at public policy requirements established by existing state or federal laws or regulations because transmission assets are used for 40 years or longer, and they encourage the Commission to clarify that the appropriate cost allocation mechanisms should take into account the benefits of transmission in addressing likely future public policy requirements as well as existing ones. American Antitrust Institute recommends

[471] *E.g.*, NextEra; AWEA; EarthJustice; and Atlantic Grid.

that the pro-competitive benefits of transmission be recognized.

614. PUC of Ohio recommends that the definition of beneficiary also should include those who gain from the ability to place electricity onto the grid. It states that load should not be solely burdened with the costs of the transmission grid; generation should be responsible for its fair share of the costs. Maine Parties agree, characterizing a beneficiary pays as more consistent with cost causation principles than a cost socialization method.

615. In response to comments supporting a broader definition of benefits, Powerex states that it disagrees that the Proposed Rule is intended to allow for allocation methods that could impose cross-subsidization and states that cost allocation methods for jurisdictional facilities must adhere to cost causation principles. Powerex argues that state or federal public policy requirements do not constitute evidence of a general or undifferentiated benefit to all market participants. Thus, Powerex argues, the Final Rule should emphasize that cost causation principles are and will remain the foundation of all acceptable cost allocation methods and make clear that the Commission rejects cost allocation proposals or outcomes that depart from this principle by promoting cross-subsidization.

616. PSEG Companies take issue with the Proposed Rule's suggestion that the determination of who constitutes a beneficiary may be based on an assessment of "likely future scenarios," arguing that regional planners should not be prognosticators and that

the more "scenarios" that are introduced, the more inexact and speculative their proposed plans and cost allocation determinations will become.

617. Dayton Power & Light seeks clarification of what it considers an ambiguity in regional and interregional Principle 1, which allows a regional transmission planning process to consider the extent to which facilities "in the aggregate" provide benefits.[472] Dayton Power & Light states that this language could be taken to mean that if the existing network benefits a utility, then that is a benefit that justifies the utility allocating to it the incremental costs created by a new transmission project located far away, even if the project did not provide incremental benefits. According to Dayton Power & Light, this result would be inconsistent with *Illinois Commerce Commission* decision.

618. Some commenters also request that the proposed principle be expanded so that the costs of transmission facilities are allocated to those within the planning region and adjacent planning regions that benefit from those facilities.

619. Some commenters request clarification regarding what constitutes "benefits" to be considered in any cost allocation method.[473] Alabama PSC states that the cost allocation proposals are too vague and potentially overbroad, and it requests that the Commission make clear that costs cannot be recovered from retail customers. WIRES requests that

---

[472] *See* Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 164, 174.

[473] *E.g.*, California Municipal Utilities; Northern Tier Transmission Group; Omaha Public Power District; Gaelectric; and Atlantic Grid.

the Commission articulate more clearly the definitions, presumptions, and methods associated with the beneficiary pays approach.

620. A number of commenters differ on what constitutes "benefits" and who constitutes "beneficiaries." Several commenters state concern that the definition of "benefits" could be interpreted too broadly, particularly with respect to transmission projects driven by public policy goals.[474] Atlantic Wind Connection requests clarification as to how the costs associated with public policy initiatives would be fairly assigned to beneficiaries, so that a results-oriented action plan emerges from the process. Transmission Access Policy Study Group argues that benefits are difficult to quantify and cautions the Commission against including generalized social or environmental benefits in cost allocation calculations. Transmission Access Policy Study Group and Colorado Independent Energy Association argue that production cost savings by itself is not sufficient to identify the universe of beneficiaries.[475] Transmission Access Policy Study Group argues, however, that the Commission should clarify that it will not accept cost allocation methods that assign costs regionally based on a presumption of some general, unquantified regional benefits or vague assertions of possible future benefits.

---

[474] *E.g.*, Florida PSC; Public Power Council; Transmission Dependent Utility Systems; and Coalition for Fair Transmission Policy.

[475] *E.g.*, Transmission Access Policy Study Group; and Colorado Independent Energy Association.

621. Some commenters raise similar concerns about the difficulty of quantifying benefits, and they suggest that benefits resulting in allocation of costs be direct, clear, and identifiable.[476] Other commenters also believe it is important to make sure cost allocation mechanisms do not favor long-line transmission development or artificially depress the value of local renewable resources.[477] In its reply comments, Ohio Consumers' Council agree that benefits should not be defined too broadly and recommends that the Commission strictly adhere to cost causation principles in implementing the Final Rule. Further, Ohio Consumers' Council suggests that the Commission uphold cost causation principles by requiring substantial evidentiary showings of benefits and costs prior to approving the imposition of regional or interregional transmission costs on consumers. With respect to interregional cost allocation, North Carolina Agencies contend that if the Commission assumes benefits too broadly, a public utility's retail customers may bear a share of costs based on the policy objectives of other states. Alabama PSC shares this concern. According to Western Area Power Administration, only the direct beneficiaries of a project, i.e., beneficiaries that make direct use of the facilities, should be counted as "beneficiaries," and to the extent

[476] *E.g.*, East Texas Cooperatives and G&T Cooperatives.

[477] *E.g.*, New England States Committee on Electricity; Nebraska Public Power District; Sacramento Municipal Utility District; California State Water Project; and Northeast Utilities.

that costs are allocated to such beneficiaries, only the costs associated with the least-cost method of achieving the benefits should be allocated. LS Power states that it is important for the Final Rule to acknowledge that the factors that drive transmission planning do not fully define the range of beneficiaries.

b. Commission Determination

622. The Commission adopts the following Cost Allocation Principle 1 for both regional and interregional cost allocation:

> Regional Cost Allocation Principle 1: The cost of transmission facilities must be allocated to those within the transmission planning region that benefit from those facilities in a manner that is at least roughly commensurate with estimated benefits. In determining the beneficiaries of transmission facilities, a regional transmission planning process may consider benefits including, but not limited to, the extent to which transmission facilities, individually or in the aggregate, provide for maintaining reliability and sharing reserves, production cost savings and congestion relief, and/or meeting Public Policy Requirements.[478]

[478] In the Proposed Rule, Regional Cost Allocation Principle 1 referred to "public policy requirements established by State or Federal laws or regulations that may drive transmission needs." As defined in P 2 of this Final Rule, we use "Public Policy

(continued…)

and

> Interregional Cost Allocation Principle 1: The costs of a new interregional transmission facility must be allocated to each transmission planning region in which that transmission facility is located in a manner that is at least roughly commensurate with the estimated benefits of that transmission facility in each of the transmission planning regions. In determining the beneficiaries of interregional transmission facilities, transmission planning regions may consider benefits including, but not limited to, those associated with maintaining reliability and sharing reserves, production cost savings and congestion relief, and meeting Public Policy Requirements.[479]

623. As discussed above,[480] requiring a beneficiaries pay cost allocation method or methods is fully consistent with the cost causation principle as recognized by the Commission and the courts. As the Commission stated in Order No. 890, the one factor

---

Requirements" in Regional Cost Allocation Principle 1 and throughout our discussion of the Cost Allocation Principles.

[479] We note that the phrase "individually or in the aggregate" is not contained in Interregional Cost Allocation Principle 1 because interregional transmission facilities are considered facility by facility by pairs of transmission planning regions, unless pairs of transmission planning regions choose to do otherwise.

[480] *See* discussion *supra* P 495 and section V.B.

that it weighs when considering a dispute over cost allocation is whether a proposal fairly assigns costs among those who cause the costs to be incurred and those who otherwise benefit from them.[481] Therefore, it is appropriate here to adopt a cost allocation principle that includes as beneficiaries those that cause costs to be incurred or that benefit from a new transmission facility.

624. However, the Commission is not prescribing a particular definition of "benefits" or "beneficiaries" in this Final Rule. In our view, the proper context for further consideration of these matters is on review of compliance proposals and a record before us. Moreover, allowing the flexibility to accommodate a variety of approaches can better advance the goals of this rulemaking. The cost allocation principles are not intended to prescribe a uniform approach, but rather each public utility transmission provider should have the opportunity to first develop its own method or methods. Also, we recognize that regional differences may warrant distinctions in cost allocation methods.

625. While some commenters express concerns that the definition of benefits could be interpreted too broadly or too narrowly, we do not believe that further defining "benefits" in this Final Rule is a necessary or appropriate means to ensure that this will not be the case. We expect that concerns regarding overly narrow or broad interpretation of benefits will be addressed in the first instance during the process of public utility transmission

[481] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 559.

providers consulting with their stakeholders. If such interpretations should emerge, we can more effectively ensure that the term is not given too narrow or broad a meaning by considering a specific proposal and a record than by attempting to anticipate and rule on all possibilities before the fact. This point applies equally to the comments that note the potential difficulties in quantifying benefits. We note in response to Transmission Access Policy Study Group, that any benefit used by public utility transmission providers in a regional cost allocation method or methods must be an identifiable benefit and that the transmission facility cost allocated must be roughly commensurate with that benefit. Western Area Power Administration takes the position that beneficiaries should be limited to those that it describes as making direct use of the transmission facilities in question, but this fails to acknowledge that other benefits may accrue to an interconnected transmission grid.

626. We agree with Powerex that a departure from cost causation principles can result in inappropriate cross-subsidization. This is why cost causation is the foundation of an acceptable cost allocation method. In response to PSEG Companies, we disagree that basing a determination of who constitutes a "beneficiary" on "likely future scenarios" necessarily would result in inexact and speculative proposed transmission plans and cost allocation methods. Scenario analysis is a common feature of electric power system planning, and we believe that public utility transmission providers are in the best position to apply it in a way that achieves appropriate results in their respective transmission

planning regions.

627. In response to Dayton Power & Light, the provisions of Regional Cost Allocation Principle 1 regarding determination of the beneficiaries of transmission facilities "individually or in the aggregate" refer only to cost allocation for new transmission facilities. The public utility transmission providers in a transmission planning region may propose a cost allocation method that considers the benefits and costs of a group of new transmission facilities, although they are not required to do so. We did not intend this language to be a finding that the benefits of existing transmission facilities in and of itself may justify cost sharing for new transmission facilities. We are not ruling on that matter in this Final Rule.

628. We also decline to expand, as requested by some commenters, the scope of beneficiaries for new transmission facilities such that costs may be involuntarily allocated to those within an adjacent planning region that benefit from those facilities. As discussed in adopting Cost Allocation Principle 4 below, the allocation of the cost of a transmission facility that is located entirely within one transmission planning region may not be subject to a regional cost allocation method or methods pursuant to this Final Rule that assigns some or all of the cost of that transmission facility to beneficiaries in another transmission planning region without reaching an agreement with those beneficiaries.

.[482]

629. Finally, if a non-public utility transmission provider makes the choice to become part of the transmission planning region and it is determined by the transmission planning process to be a beneficiary of certain transmission facilities selected in the regional transmission plan for purposes of cost allocation, that non-public utility transmission provider is responsible for the costs associated with such benefits.

3. Cost Allocation Principle 2—no involuntary allocation of costs to non-beneficiaries[483]

a. Comments

630. Most of the commenters that addressed proposed Cost Allocation Principle 2 support it.[484] Ad Hoc Coalition of Southeastern Utilities and Nebraska Public Power District state that while the proposition in Cost Allocation Principle 2 might seem self supporting, they understand that there are those who would encourage the Commission to mandate regional or even interconnectionwide cost sharing, but the Commission's decision to decline to do so is sensible.

631. Some commenters who express general support also express some concerns. For

[482] *See* discussion *infra* section IV.E.5.

[483] For the full text of this principle, *see* P 586 for regional cost allocation and P 587 for interregional cost allocation.

[484] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Nebraska Public Power District; Connecticut & Rhode Island Commissions; New England States Committee on Electricity; New York ISO; and New York PSC.

example, MISO Transmission Owners urge the Commission to ensure that this principle does not contribute to free rider problems.

632. Some commenters are concerned that the principle could be interpreted too narrowly or too broadly. For instance, NextEra asks that the Commission construe the "no benefit" standard narrowly by providing that there is a benefit if a customer receives any benefit from the transmission facility, including an economic, reliability, or public policy benefit, particularly at or above certain voltage levels, over a reasonable period of time.

633. Some commenters do not support the principle and raise concerns that the "no benefits" language in the principle will rarely, if ever, be applicable to any transmission customer.[485] East Texas Cooperatives argue that by protecting only those that receive no discernible benefit, this principle conflicts with court precedent stating that the Commission cannot approve a pricing scheme that requires utilities to pay for facilities from which its members derive only trivial benefits. East Texas Cooperatives states that Principle 2 does not go far enough, and the Commission should clarify that only those customers who are reasonably expected to receive non-trivial benefits can be allocated costs. Other commenters, such as E.ON and Public Power Council, are worried that there will be stranded costs if a planning process exaggerates the benefits resulting from a

[485] *E.g.*, Transmission Dependent Utility Systems and East Texas Cooperatives.

particular project. Public Power Council believes the Commission should permit cost allocations that mitigate the risk of stranded costs and give due consideration to the impact on ratepayers prior to allocating costs.

634. On the other hand, Xcel is concerned that the principle, taken at face value, gives parties the ability to "opt out" of cost allocation arising from specific projects even as it offers parties the opportunity to participate fully in the planning process. Xcel maintains that the Order No. 890 transmission planning process and the linkage between transmission planning and cost allocation render moot any participant's argument that it receives no benefit. Xcel argues that the Order No. 890 planning principles are designed to result in the best projects to meet the needs of the planning region, and therefore it is unlikely that participants in the planning process would produce a plan with a project or set of projects that do not provide benefits to stakeholders.

635. Alliant Energy asks whether the Commission intended that membership in an ISO or RTO eliminates the prohibition of cost allocation for transmission projects to those entities that do not benefit. Alliant Energy does not believe this was the Commission's intent, but is seeks clarification to confirm its view.

636. Alliant Energy also seeks clarification of the term "transmission facilities" within the context of this principle. It asks whether the Commission intended that the principle be applied on a project-by-project basis, within the context of the entire regional transmission plan, or something in between. Alliant Energy believes that such

evaluations should be done on a holistic basis, noting that some individual projects will benefit certain entities more than others but that the evaluation of benefits and costs within the context of a cost allocation determination could reasonably include the cumulative impact of a collection of projects.

b. Commission Determination

637. The Commission adopts the following Cost Allocation Principle 2 for both regional and interregional cost allocation:

> Regional Cost Allocation Principle 2: Those that receive no benefit from transmission facilities, either at present or in a likely future scenario, must not be involuntarily allocated any of the costs of those transmission facilities.[486]

and

> Interregional Cost Allocation Principle 2: A transmission planning region that receives no benefit from an interregional transmission facility that is located in that region, either at present or in a likely

[486] We added the words "any of" to the Regional Cost Allocation Principle 2 stated in the Proposed Rule to be consistent with interregional cost allocation Principle 2. We also added "transmission" before "facilities" to clarify the term in this Regional Cost Allocation Principle 2 and throughout our discussion of the Cost Allocation Principles.

> future scenario, must not be involuntarily allocated any of the costs of that transmission facility.

The principle expresses a central tenet of cost causation and is thus essential to proper cost allocation.

638. In response to MISO Transmission Owners that Principle 2 might contribute to free rider problems, we agree that it, like all the other principles adopted in this Final Rule, requires careful consideration and application to ensure that they are implemented appropriately in practice. In response to NextEra, we decline to establish a threshold voltage level to define which benefits would be ineligible for cost allocation in this Final Rule.

639. East Texas Cooperatives is concerned that the Commission is protecting only those that receive no benefits but not those who derive only trivial benefits. It cites the Seventh Circuit's statement in *Illinois Commerce Commission* that emphasized that the Commission is not authorized to approve cost allocation methods that require entities that receive no benefits or benefits that are trivial in relation to the costs to be borne. We note that the court used the term "trivial" in a relative sense, i.e., benefits that are trivial in relation to the costs assigned. This is implied in the concept of cost causation, and we therefore see no reason to amend the Principle 2 to include reference to it. Principle 1 requires that costs be allocated in a way that is roughly commensurate with the benefits received. This precludes an allocation where the benefits received are trivial in relation

to the costs to be borne. Any beneficiaries that believe that the application of the cost allocation method or methods would assign to them costs for benefits, which are trivial, in relation to those costs is free to make a FPA section 205 or 206 filing.

640. We also require that every cost allocation method or methods provide for allocation of the entire prudently incurred cost of a transmission project to prevent stranded costs. We disagree with Xcel that the Principle 2 gives parties the ability to opt out of a Commission-approved cost allocation for a specific transmission project if they merely assert that they receive no benefits from it. Whether an entity is identified as a beneficiary that must be allocated costs of a new transmission facility is not determined by the entity itself but rather through the applicable, Commission-approved transmission planning processes and cost allocation methods. Permitting each entity to opt out would not minimize the regional free rider problem that we seek to minimize in this Final Rule.

641. With respect to Alliant Energy's request for clarification regarding RTO or ISO membership, we clarify that all the cost allocation principles, including Cost Allocation Principle 2 apply the allocation of costs to all new transmission facilities selected in the regional transmission plan for purposes of cost allocation, including RTO and ISO regions. In response to Alliant Energy's request to clarify whether the Commission intended that the principle be applied on a project-by-project basis, within the context of the entire regional transmission plan, we reiterate that the public utility transmission providers in a transmission planning region may propose a cost allocation method or

methods that considers the benefits and costs of a group of new transmission facilities, although they are not required to do so. To the extent they propose a cost allocation method or methods that considers the benefits and costs of a group of new transmission facilities, and adequately support their proposal, Cost Allocation Principle 2 would not require a showing that every individual transmission facility in the group of transmission facilities provides benefits to every beneficiary allocated a share of costs of that group of transmission facilities. However, it is required that the aggregate cost of these transmission facilities be allocated roughly commensurate with aggregate benefits.

4. Cost Allocation Principle 3—benefit to cost threshold ratio[487]

a. Comments

642. Many commenters support the Commission's proposed Cost Allocation Principle 3, finding it to be a reasonable approach that would result in the construction of new transmission projects.[488] For example, ITC Companies states that the Commission's recommended cost threshold ratio is a necessary specification to prevent measures such as the sliding cost benefit ratio employed by MISO, which can require up to a 3 to 1 benefit to cost ratio for large regional long term transmission projects and which has served to frustrate the construction of market efficiency projects. American Transmission

[487] For the full text of this principle, *see* P 586 for regional cost allocation and P 587 for interregional cost allocation.

[488] *E.g.*, ITC Companies; American Transmission; Omaha Public Power District; PSEG Companies; and Six Cities.

believes that the Commission's proposal seems like a reasonable threshold that would likely result in projects actually being constructed.

643. Nonetheless, some commenters raise specific concerns. While generally supportive of the proposal, MISO Transmission Owners suggest that transmission providers and stakeholders in each planning region be permitted to develop a benefit to cost ratio that is appropriate for that region, provided that ratios are not set so high as to preclude any projects from being built. Similarly, MISO Transmission Owners argue that transmission providers and stakeholders should be permitted to develop appropriate criteria for defining benefits and costs. They also state that the Final Rule should indicate that any benefit to cost ratio for interregional transmission facilities should not supersede the ratio for a region's regional cost allocation. Transmission Dependent Utility Systems support this principle as a general concept, but they argue that it should be modified to ensure that the implementation of any cost benefit analysis is transparent to customers.

644. Several commenters oppose the use of a fixed benefit-cost threshold ratio.[489] A number of them stress the difficulties in quantifying benefits.[490] Some commenters argue that the Commission should focus on regional circumstances.[491] Northern Tier

[489] *E.g.*, Northeast Utilities; Connecticut & Rhode Island Commissions; and Michigan Citizens Against Rate Excess.

[490] *E.g.*, Xcel and Northern Tier Transmission Group.

[491] *E.g.*, Michigan Citizens Against Rate Excess; Xcel; and Massachusetts

(continued…)

Transmission Group suggests that the Commission's focus should be on defining the types of benefits to be measured and how to measure them, rather than establishing a set threshold. Massachusetts Departments are concerned that a failure to reflect the full menu of benefits that could be realized by a proposed project could distort the balance between costs and benefits, and could preclude some beneficial projects at the planning stage that would have otherwise been approved. NextEra requests that benefits for this assessment should cover only economic benefits identified with the project, and not reliability or public policy benefits, as those benefits cannot be quantified in a similar manner.

645. Some commenters would like the Commission to establish either a higher or a lower benefit-cost ratio threshold. New York PSC believes that the proposed threshold is extremely low and does not adequately account for uncertainty in cost estimates and potential cost overruns. Connecticut & Rhode Island Commissions and Massachusetts Departments agree. On the other hand, AWEA, Wisconsin Electric, and NextEra urge the Commission to lower the proposed threshold. AWEA argues that if the Commission adopts the proposed threshold, it should be applied as a ceiling to ensure fair treatment for projects that have broad benefits over time. MEAG Power responds to AWEA's argument for a lower threshold, arguing that AWEA's proposal would unfairly shift to

---

Departments.

customers all risks associated with project development.

b. Commission Determination

646. The Commission adopts the following Cost Allocation Principle 3 for both regional and interregional cost allocation:

> Regional Cost Allocation Principle 3: If a benefit to cost threshold is used to determine which transmission facilities have sufficient net benefits to be selected in a regional transmission plan for the purpose of cost allocation,[492] it must not be so high that transmission facilities with significant positive net benefits are excluded from cost allocation. A public utility transmission provider in a transmission planning region may choose to use such a threshold to account for uncertainty in the calculation of benefits and costs. If adopted, such a threshold may not include a ratio of benefits to costs that exceeds 1.25 unless the transmission planning region or public utility transmission provider justifies and the Commission approves a higher ratio.

[492] To ensure consistency in the use of terms in this Final Rule, Cost Allocation Principle 3 as stated in the Proposed Rule has been changed to refer to facilities "selected" in a regional transmission plan, ability of a "public utility transmission provider in a transmission planning region" to use a benefit to cost threshold, and potential Commission approval of a "higher" ratio.

and

> Interregional Cost Allocation Principle 3: If a benefit-cost threshold ratio is used to determine whether an interregional transmission facility has sufficient net benefits to qualify for interregional cost allocation, this ratio must not be so large as to exclude a transmission facility with significant positive net benefits from cost allocation.[493] The public utility transmission providers located in the neighboring transmission planning regions may choose to use such a threshold to account for uncertainty in the calculation of benefits and costs. If adopted, such a threshold may not include a ratio of benefits to costs that exceeds 1.25 unless the pair of regions justifies and the Commission approves a higher ratio.

647. Cost Allocation Principle 3 does not require the use of a benefit to cost ratio threshold. However, if a transmission planning region chooses to have such a threshold, the principle limits the threshold to one that is not so high as to block inclusion of many worthwhile transmission projects in the regional transmission plan. Further, it allows

[493] The phrase "net benefits to qualify for interregional cost allocation" differs from the language in regional cost allocation Principle 3 because there is no plan at the interregional level for which projects would be selected. The word "large" was changed to "high" to be consistent with the language in regional cost allocation Principle 3.

public utility providers in a transmission planning region to use a lower ratio without a separate showing and to use a higher threshold if they justify it and the Commission approves a greater ratio.

648. Allowing for a transparent benefit to cost ratio may help certain transmission planning regions to determine which transmission facilities have sufficient net benefits to be selected in the regional transmission plan for purposes of cost allocation. For example, public utility transmission providers in a transmission planning region may want to use such a ratio to account for uncertainty in the calculation of benefits and costs. However, by requiring that a benefit to cost ratio, if adopted, not exceed 1.25 to 1 unless the public utility transmission providers in a transmission planning region justify, and the Commission approves, a greater ratio, will ensure that the ratio is not so high that transmission facilities with significant positive net benefits that would otherwise be selected in the regional transmission plan for purposes of cost allocation are not excluded from the regional transmission plan for purposes of cost allocation despite a positive ratio. The Commission therefore rejects requests to adopt a higher or lower threshold ratio, as advocated by some commenters.

649. In response to specific comments on this principle, the Commission agrees that a benefit to cost ratio should not be set so high as to preclude certain beneficial transmission projects from being constructed. As such, the Commission finds (and several commenters agree) that a benefit to cost ratio of 1.25 to 1 to be a reasonable ratio

that will not act as a barrier to the development and construction of valuable new transmission projects. Furthermore, regarding comments requesting that the Commission decline to establish a benefit to cost threshold given the difficulty in quantifying benefits, we reiterate that the benefit to cost ratio threshold identified in this Final Rule applies only if the public utility transmission providers of a transmission planning region choose to use a benefit to cost ratio to determine which transmission facilities are selected in the regional transmission plan for purposes of cost allocation. They may decide to have no benefit to cost ratio threshold greater than one at all.

650. Furthermore, in response to MISO Transmission Owners, if the issue of whether any benefit to cost ratio threshold for an interregional transmission facility may supersede the ratio for a transmission planning region's regional transmission cost allocation should be presented to us on compliance, we will address it then based on the specific facts in that filing.

5. Cost Allocation Principle 4—allocation to be solely within transmission planning region(s) unless those outside voluntarily assume costs[494]

a. Comments

651. Nearly all entities that commented on proposed Cost Allocation Principle 4

[494] For the full text of this principle, *see* P 586 for regional cost allocation and P 587 for interregional cost allocation.

support it.[495] For example, NEPOOL states that it particularly supports Principle 4, citing New England's successful history of voluntarily planning, developing and allocating the costs of interregional projects with its neighbors. New York ISO agrees, stating that it would be appropriate to allow more expansive voluntary cost allocation arrangements, but would be premature and unrealistic to require all regions to adopt specific cost allocation methodologies on an *ex ante* basis that would be applicable to future situations as yet unknown.

652. However, some commenters raise specific concerns. East Texas Cooperatives argue that the restriction on the involuntary allocation of costs on an interregional basis should not be interpreted to prevent a transmission provider from proposing methods to capture the costs associated with the benefits enjoyed by exported energy. MISO Transmission Owners agree with this argument. The New England States Committee on Electricity states that interregional Principle 4 aligns with its view that any allocation method must not transfer costs to New England ratepayers to support development of facilities outside New England unless New England concludes that development of such facilities are the most cost-effective. Northeast Utilities states that it supports the

[495] *E.g.*, ISO New England; Nebraska Public Power District; NEPOOL; New York ISO; New York PSC; Northern California Power Agency; and New York Transmission Owners.

principle in so far as it limits the allocation of costs for interregional projects only to facilities located within neighboring regions.

653. Other commenters argue that the Commission should not limit the application of interregional cost allocation requirements to interregional projects, suggesting that transmission facilities located solely within one region may have benefits in other regions.[496] NextEra recommends modifying Principle 4 so that if transmission facilities within one region clearly benefit another region, the Commission would allow cost recovery by the transmission providers in the region providing the benefits to the other. NextEra maintains that without such a mechanism, the benefitting region would receive a windfall. According to PJM, basing the cost allocation on physical location rather than analyzing power flows, reduced congestion, or improved reliability, is untenable, would invite gaming of the routing and siting process to drive particular cost allocation results, would make negotiations on cost allocation among neighbors more difficult, is inconsistent with a beneficiary pays approach, and is contrary to the existing PJM-MISO interregional cost allocation method. As an alternative, PJM suggests providing for the cost allocation of transmission to all system users that benefit from the increased transfer capability that the new facility provides, thereby moving the decision from controversies surrounding particular generation sources to the future characteristics of the transmission

[496] *See, e.g.*, NextEra; MISO; and MISO Transmission Owners.

system, which is a subject that is more clearly within the Commission's authority and expertise.

654. Similarly, MISO seeks clarification that two or more regions may mutually designate transmission facilities located entirely within a single region as an interregional transmission facility and allocate costs accordingly, which is the approach taken in the current cross-border cost sharing arrangement between MISO and PJM. MISO, along with MISO Transmission Owners, argues that projects located entirely in one region may provide benefits to entities in the neighboring region.

655. Large Public Power Council states that its members cannot at this time commit to entering into interregional agreements regarding cost allocation. It notes that its members are creatures of state and municipal governments, and their authority to enter into binding arrangements is restricted.

656. Finally, the Coalition for Fair Transmission Policy sees an ambiguity in the Proposed Rule. It states that the Proposed Rule allows for costs to be allocated to a beneficiary even when the beneficiary has not entered into a voluntary arrangement to pay those costs, but proposed Cost Allocation Principle 4 states that costs cannot be allocated to an entity or region outside of the geographic boundaries of the planning region where the project is being constructed, absent a voluntary agreement.

b. Commission Determination

657. The Commission adopts the following Cost Allocation Principle 4 for both regional and interregional cost allocation:

> Regional Cost Allocation Principle 4: The allocation method for the cost of a transmission facility selected in a regional transmission plan[497] must allocate costs solely within that transmission planning region unless another entity outside the region or another transmission planning region voluntarily agrees to assume a portion of those costs. However, the transmission planning process in the original region must identify consequences for other transmission planning regions, such as upgrades that may be required in another region and, if the original region agrees to bear costs associated with such upgrades, then the original region's cost allocation method or methods must include provisions for allocating the costs of the upgrades among the beneficiaries in the original region.[498]

[497] The phrase "an intraregional facility" was replaced with "a transmission facility selected in a regional transmission plan" to be consisted with P 63-65 n this Final Rule.

[498] At the end of the sentence, "entities" has been changed to "beneficiaries" to be precise. Slight wording changes have been made to the last sentence in this regional cost allocation Principle 4 and interregional cost allocation Principle 4 to clarify the point being made.

and

> Interregional Cost Allocation Principle 4: Costs allocated for an interregional transmission facility must be assigned only to transmission planning regions in which the transmission facility is located. Costs cannot be assigned involuntarily under this rule to a transmission planning region in which that transmission facility is not located.[499] However, interregional coordination must identify consequences for other transmission planning regions, such as upgrades that may be required in a third transmission planning region and, if the transmission providers in the regions in which the transmission facility is located agree to bear costs associated with such upgrades, then the interregional cost allocation method must include provisions for allocating the costs of such upgrades among the beneficiaries in the transmission planning regions in which the transmission facility is located.[500]

---

[499] The first two sentences of interregional cost allocation Principle 4 differ from regional cost allocation Principle 4 because at the interregional level, there may be a scenario where a transmission facility is located in one transmission planning region but provides benefits to another transmission planning region. For example, if regions A and B plan an interregional transmission facility that they believe benefits region C, regions A and B cannot allocate costs of that facility to region C involuntarily.

[500] "Transmission facility" was changed to "upgrade" in each instance in this

(continued…)

658. Regarding the allocation of the cost of a transmission facility that is located entirely within one transmission planning region and that is intended to export electric energy from that transmission planning region to another transmission planning region, the public utility transmission providers in the exporting transmission planning region may not have a regional cost allocation method or methods pursuant to this Final Rule that assigns some or all of the cost of that transmission facility to beneficiaries in another transmission planning region without reaching an agreement with those beneficiaries. The public utility transmission providers in such transmission planning regions may, however, negotiate an agreement to share the transmission facility's costs with the beneficiaries in another transmission planning region, as they always have been free to do. Doing so is not inconsistent with Regional Cost Allocation Principle 4.

659. Regarding the allocation of the cost of an interregional transmission facility that is located in two or more neighboring transmission planning regions and that is intended to export electric energy from one such transmission planning region to the other transmission planning region, this Final Rule requires that the public utility transmission providers in each pair of transmission planning regions have an interregional cost allocation method or methods for sharing the cost of such transmission facilities.

---

sentence to make it consistent with the last sentence in regional cost allocation Principle 4. The end of the last sentence is revised to be consistent with Regional Cost Allocation Principle 4.

However, Interregional Cost Allocation Principle 4 does not permit the cost allocation method or methods for those two transmission planning regions to assign the cost of the transmission facility to beneficiaries in a third transmission planning region except where the beneficiaries in the third transmission planning region voluntarily reach an agreement with the two transmission planning regions in which the transmission line is located. They also may satisfy the requirements of this Final Rule by having an interregional cost allocation method or methods for more than two transmission planning regions, although this Final Rule does not require them to do so.

660. We decline to adopt NextEra's recommendation that we modify Principle 4 to allow cost allocation by the public utility transmission providers in one transmission planning region to beneficiaries in another transmission planning region.[501] We acknowledge that this Final Rule's approach may lead to some beneficiaries of transmission facilities escaping cost responsibility because they are not located in the same transmission planning region as the transmission facility. Nonetheless, the Commission finds this approach to be appropriate. For the reasons discussed herein, we are establishing a closer link between regional transmission planning and cost allocation, both of which involve the identification of beneficiaries. In light of that closer link, we find that allowing one region to allocate costs unilaterally to entities in another region

[501] *See* discussion *supra* section IV.D.

would impose too heavy a burden on stakeholders to actively monitor transmission planning processes in numerous other regions, from which they could be identified as beneficiaries and be subject to cost allocation. Indeed, if the Commission expected such participation, the resulting regional transmission planning processes would amount to interconnectionwide transmission planning with corresponding cost allocation, albeit conducted in a highly inefficient manner. The Commission is not requiring either interconnectionwide planning or interconnectionwide cost allocation.

661. MISO's and PJM's comments raise a similar issue that our proposed reforms inappropriately limit interregional cost allocation to those beneficiaries that are physically located in the transmission planning region in which the transmission facility is located. We find that this approach would raise the same concerns discussed immediately above.

662. We recognize that MISO and PJM have an existing cross-border cost allocation method that permits them, in certain cases, to allocate to one RTO the cost of a transmission facility that is located entirely within the other RTO, even if the facility does not cross the border between their two regions. Because MISO and PJM developed their cross-border allocation method in response to Commission directives related to MISO and PJM's intertwined configuration, we find that MISO and PJM are not required by this Final Rule to revise their existing cross-border allocation method in response to Cost Allocation Principle 4. If MISO and PJM believe their existing cross-border cost allocation method fulfills other principles discussed herein, they may explain that in the

filings they make in compliance with this Final Rule.

663. In response to Large Public Power Council, as we discuss below,[502] a non-public utility transmission provider seeking to maintain a safe harbor tariff must ensure that the provisions of that tariff substantially conform, or are superior to, the *pro forma* OATT as it has been revised by this Final Rule. However, it remains up to each non-public utility transmission provider whether it wants to maintain its safe harbor status by meeting the transmission planning and cost allocation requirements of this Final Rule.

664. We disagree with Coalition for Fair Transmission Policy's argument that there is an ambiguity in our reforms that allows for costs to be allocated to a beneficiary when the beneficiary has not entered into a voluntary arrangement to pay those costs, while also providing in Cost Allocation Principle 4 that the costs of transmission facilities in a regional transmission plan cannot be allocated to an entity in another transmission planning region, absent a voluntary agreement.

6. Cost Allocation Principle 5—transparent method for determining benefits and identifying beneficiaries[503]

a. Comments

665. Nearly all commenters that address this proposed principle supported it.[504] PSEG

[502] *See* discussion *infra* section V.B.

[503] For the full text of this principle, *see* P 586 for regional cost allocation and P 587 for interregional cost allocation.

[504] *E.g.*, SPP; Transmission Access Policy Study Group; and Transmission

(continued…)

Companies agree that there is a need for transparent cost allocation and that customers cannot be expected to support the construction of new transmission unless they understand who will pay the associated costs. Further, PSEG Companies state that it should be clear which customers are benefiting from and paying for system upgrades before they are built, as this will minimize after-the-fact debates and litigation.

666. Some commenters that support the principle caution that it will be difficult to determine costs and benefits with mathematical precision.[505] In light of such difficulties, Connecticut & Rhode Island Commissions suggest that transmission cost allocation methods be pragmatic. DC Energy raises concerns about the use of biased assessments, and it suggests that one method for improving the reliability of cost-benefit analyses is to require that only direct costs and benefits be considered in economic studies since they offer greater certainty. PSEG Companies agree with the proposed principle and suggest that for non-reliability projects, there should be a more definitive link between identified beneficiaries and the costs to be paid.

667. Several commenters raise specific issues with respect to the proposed principle. Transmission Dependent Utility Systems urge the Commission to recognize that

---

Dependent Utility Systems.

[505] *E.g.*, NextEra and Sunflower and Mid-Kansas.

transparency alone is insufficient without load serving entity involvement in the planning and development of the cost allocation method. Finally, MISO Transmission Owners argue that current RTO processes provide significant transparency.

b. Commission Determination

668. The Commission adopts the following Cost Allocation Principle 5 for both regional and interregional cost allocation:

> Regional Cost Allocation Principle 5: The cost allocation method and data requirements for determining benefits and identifying beneficiaries for a transmission facility must be transparent with adequate documentation to allow a stakeholder to determine how they were applied to a proposed transmission facility.

and

> Interregional Cost Allocation Principle 5: The cost allocation method and data requirements for determining benefits and identifying beneficiaries for an interregional transmission facility must be transparent with adequate documentation to allow a
>
> stakeholder to determine how they were applied to a proposed

interregional transmission facility.[506]

669. Requiring cost allocation methods and their corresponding data requirements for determining benefits and beneficiaries to be open and transparent ensures that such methods are just and reasonable and not unduly discriminatory or preferential. Furthermore, greater stakeholder access to cost allocation information will help aid in the development and construction of new transmission, as stakeholders will be able to see clearly who is benefiting from, and subsequently who has to pay for, the transmission investment. In addition, the Commission agrees that such access to information may avoid contentious litigation or prolonged debate among stakeholders.

670. As the Commission stated in the Proposed Rule, we recognize that identifying which types of benefits are relevant for cost allocation purposes, which beneficiaries are receiving those benefits, and the relative benefits that accrue to various beneficiaries can be difficult and controversial. However, the Commission finds that a transparent transmission planning process is the appropriate forum to address these issues, and by addressing these issues, there will be a greater likelihood that regions can build the new transmission facilities selected in the regional transmission plan for purposes of cost allocation.

671. We acknowledge the concerns that the method or methods for determining

[506] "Interregional" has been added before "transmission facility" at the end of the sentence to be precise.

benefits and beneficiaries must balance being pragmatic and implementable with being accurate and unbiased. Cost Allocation Principle 5 requires that the method or methods be known and transparent. As stakeholders participate in the development of such methods, their input should ensure that the method or methods ultimately agreed upon is balanced and does not favor any particular entity. In developing this method or methods, public utility transmission providers and their stakeholders are also free to consider suggestions, such as those made by DC Energy, that only direct costs and benefits should be considered in economic studies. We will not, however, opine on such suggestions at this time. Rather, the Commission will review such matters once the cost allocation method or methods are filed on compliance.

672. In response to MISO Transmission Owners, the Commission declines at this time to rule on whether any current RTO and ISO processes provide enough transparency to satisfy Cost Allocation Principle 5. Such determinations will be made upon the submittal of a compliance filing by any RTO or ISO.

7. Cost Allocation Principle 6—different methods for different types of facilities[507]

a. Comments

673. Many commenters generally support proposed Cost Allocation Principle 6, arguing that transmission projects are built for different purposes, such as for reliability or economic reasons, and different methods may therefore be appropriate.[508] Four G&T Cooperatives state that the planning regions should be given latitude to determine within reason the range of benefits that can be considered for cost allocation purposes, as well as the prioritization and relative value of such benefits. Pennsylvania PUC contends that cost allocation methods should maintain stable transmission rates that will be preferable both to the customers who pay the rates and the system planners who have to forecast future expenditures for the system. It argues that a cost allocation method should be flexible enough to accommodate different types of renewable energy from a diversity of sources, public policy changes, and potential shifts from older fossil fuel generation and development of other energy sources such as nuclear generation. Pennsylvania PUC also suggests that a cost allocation method be able to accommodate different types of facilities

[507] For the full text of this principle, *see* P 586 for regional cost allocation and P 587 for interregional cost allocation.

[508] *E.g.*, Indianapolis Power & Light; NEPOOL; Public Power Council; Northeast Utilities; New Jersey Board; E.ON; American Transmission; Dayton Power and Light; Delaware PSC; Dominion; New England States Committee on Electricity; and PSEG Companies.

such as those serving renewable and non-renewable generators, both economic and reliability projects, as well as specialized projects such as generator interconnection facilities. MISO Transmission Owners agree and state that the applicable method should be determined through the stakeholder planning process. Dayton Power & Light states that one method may be appropriate, such as the beneficiary-pays approach, but the method by which beneficiaries are identified may depend on the type of project involved. New Jersey Board also supports flexibility and states that further analysis must be completed to determine how best to allocate costs for transmission driven primarily by public policy requirements because the beneficiaries may differ markedly from the beneficiaries of transmission facilities built for reliability purposes.

674. PSEG Companies request that reliability and non-reliability projects be treated differently for cost allocation purposes, and they advocate adopting a voting mechanism for economic projects that would require that proposed economic upgrades be voted on by the entities that have been deemed to benefit from them and who in turn would be responsible for paying for them. National Grid, however, is concerned about the use of supermajority voting requirements for economic transmission projects. In response, Con Edison points favorably to New York ISO's supermajority voting requirements for economic transmission projects in its transmission planning process.

675. In its reply comments, PJM proposes a possible way to reconcile what it views as competing directives in the Proposed Rule regarding transmission planning and cost

allocation related to economic, reliability, and public policy projects. Economic and reliability projects would be included in one category, under which a beneficiary pays approach would match the planning purposes used (e.g., avoiding a violation of a reliability standard). Public policy projects would comprise the second category, under which the Commission would align the planning and cost allocation for such projects with regional action taken by states sharing similar public policy objectives. PJM suggests that regions could form interstate compacts to identify shared public policy goals and resource requirements and accept the allocation of costs associated with those projects. PJM further suggests a "safe harbor" to prevent states from having to absorb costs for public policy projects undertaken in other states.

676. Large Public Power Council believes that the interregional allocation of costs is a topic on which consensus is feasible only in the context of specific projects proposed by project developers to satisfy identified market needs.

677. Some commenters point to existing approaches as being adequate to meet this principle. Northeast Utilities states that a comprehensive approach using the current New England method should be appropriate. Northeast Utilities contends that the existing cost allocation rules in the ISO-New England OATT would meet the proposed requirements for regional cost allocation with the addition of a clearer cost allocation method for economic projects and a separately stated method for projects intended to meet public policy requirements.

678. Some commenters are concerned as to whether the Commission should allow different cost allocation methods for different facilities.[509] These commenters make several arguments: (1) new transmission facilities seldom serve one function and may provide general reliability and other benefits to the transmission system; (2) the benefits of a given project may vary over time; and (3) such designations have been the source of substantial delays and conflict as planning participants spend time and resources arguing over a project's designation.

679. Xcel states that while it does not oppose the concept of using different cost allocation mechanisms for projects with different drivers, it believes that an excessive amount of time is being spent splitting benefits into their component buckets. It argues that the appropriate focus of cost allocation methods instead should be determining the multiple benefits that any transmission projects provide to a planning region and its stakeholders. Xcel explains that one objective of the state transmission certification process is to ensure that, regardless of the initial driver, projects are ultimately scoped and right-sized to provide multiple benefits. Xcel thus argues that cost allocation methods should concentrate on identifying and measuring multiple benefits that transmission facilities provide, rather than developing a new cost allocation method for

[509] *E.g.*, ITC Companies; Multiparty Commenters; NextEra; and Wind Coalition.

each initial project driver.

680. Multiparty Commenters express concern that there could be a proliferation of cost allocation designs if the Commission allows different cost allocation methods for different types of facilities and for interregional and regional planning processes. They believe that this will lead to protracted disputes about the function of a transmission facility.

681. Transmission Dependent Utility Systems believe that Cost Allocation Principle 6 could place too much discretion in the hands of the transmission providers, particularly in non-RTO/ISO regions, and they urge the Commission to require transmission providers to make these decisions in collaboration with customers. They state that including load serving entities in these discussions would go a long way towards alleviating their concern with having a separate cost allocation method for facilities driven by public policy requirements.

682. Several commenters seek clarification of Principle 6. New York ISO seeks clarification that public utility transmission providers may adopt cost allocation methods for different types of transmission projects without creating a specific cost allocation mechanism applicable solely to public policy projects. New York ISO states that the Proposed Rule appears to contemplate this and contends that such a clarification would be appropriate, especially for regions such as New York that do not currently have a rule

requiring that public policy projects be constructed. New York ISO states that such cost allocation methods can and should be determined on a project-specific basis depending on the policy driving the agreed-upon transmission project.

683. Long Island Power Authority suggests that imposing a single regional cost allocation method for public policy driven projects may inhibit the development of transmission that facilitates the interconnection of renewable energy generation and would allocate costs of each public policy driven project to the same beneficiaries, leading to the assignment of duplicative costs to specific entities and to increases in rates that reduce, or possibly eliminate, an entity's ability to incur costs for its own renewable generation or energy efficiency goals. Long Island Power Authority therefore believes the Final Rule should not direct project costs to non-beneficiaries and not impose costs that prevent non-jurisdictional entities from satisfying their own lawful public policy goals.

684. Alliant Energy seeks clarification that for purposes of Principle 6 the terms "region" and "regional" cover the entire RTO or ISO footprint in the case where there is a Commission-approved planning region within an RTO or ISO, such as American Transmission within MISO. Alliant Energy contends that Principle 6 invites the opportunity for discrimination and unintended consequences if the Commission determines that a region could constitute a single transmission provider within the RTO or ISO footprint. It states that cost allocation policies within an RTO or ISO footprint

must be consistent.

b. Commission Determination

685. The Commission adopts the following Cost Allocation Principle 6 for both regional and interregional cost allocation:

> Regional Cost Allocation Principle 6: A transmission planning region may choose to use a different cost allocation method for different types of transmission facilities in the regional transmission plan, such as transmission facilities needed for reliability, congestion relief, or to achieve Public Policy Requirements.[510] Each cost allocation method must be set out clearly and explained in detail in the compliance filing for this rule.

and

> Interregional Cost Allocation Principle 6: The public utility transmission providers located in neighboring transmission planning regions may choose to use a different cost allocation method for different types of interregional transmission facilities, such as transmission facilities needed for reliability, congestion relief, or to

[510] "Public Policy Requirements" replaces "public policy requirements established by State or Federal laws or regulations that may drive transmission needs" as defined in P 2 of this Final Rule.

> achieve Public Policy Requirements.[511] Each cost allocation method must be set out clearly and explained in detail in the compliance filing for this rule.[512]

686. We agree with the Pennsylvania PUC and others that transmission planning regions should be afforded the opportunity to develop a different cost allocation method for different transmission project types.[513] The development of such cost allocation method, however, rests with the public utility transmission providers participating in regional transmission planning processes in consultation with stakeholders. Cost Allocation Principle 6 permits but does not require the public utilities in a transmission planning region to designate different types of transmission facilities, and it permits but does not require the public utilities in a transmission planning region that choose to designate different types of transmission facilities to have a different cost allocation method for each type. However, we clarify that if the public utilities choose to have a different cost allocation method for each type of transmission facility, there can be only

---

[511] "Public Policy Requirements" replaces "public policy requirements established by State or Federal laws or regulations that may drive transmission needs" as defined in P 2 of this Final Rule.

[512] The word "clearly" has been added to this sentence to make it consistent with the last sentence in regional cost allocation Principle 6.

[513] We note that a method, such as a highway-byway method for a reliability project, may itself further distinguish types of facilities, for example by voltage, and allocate costs differently for each type.

one cost allocation method for each type.

687. It may be appropriate to have different cost allocation methods for transmission facilities that are planned for different purposes or planned pursuant to different regional transmission planning processes, provided that these methods are applied consistently. In particular, in response to some commenters, we clarify that we are not requiring a distinct regional or interregional cost allocation method applicable solely to transmission facilities for Public Policy Requirements and that are selected in a regional transmission plan for purposes of cost allocation, but we allow it.

688. Moreover, as the Commission recognized in Order No. 890, states have a critical role with respect to transmission planning.[514] That role may be particularly important with respect to planning for transmission needs driven by Public Policy Requirements, where multiple states may be impacted by the selection (or cost) of a given transmission project needed to meet transmission needs driven by a particular state's Public Policy Requirement. Therefore, we strongly encourage states to participate actively not only in transmission planning processes in general, but specifically in the identification of transmission needs driven by Public Policy Requirements. We also note that agreements among states with respect to cost allocation may be particularly important for transmission facilities designed to meet transmission needs driven by Public Policy

[514] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 574.

Requirements. States could pursue such agreements in various forms, including a committee of state regulators or through a compact among states that receives appropriate approval from Congress.

689. We leave it to each transmission planning region or pair of transmission planning regions to propose on compliance whether, and how, to distinguish between types of transmission facilities. We also note that a public utility transmission provider together with other public utility transmission providers in a transmission planning region, and an RTO or ISO, which is itself a public utility transmission provider, may have a single cost allocation method for all proposed transmission facilities or different methods for different types of transmission facilities. For example, cost allocation methods may distinguish among transmission facilities that are driven by needs associated with maintaining reliability, addressing economic considerations, and achieving Public Policy Requirements, all of which would be required to be considered in the regional transmission planning process as explained in this Final Rule. The Commission recognizes that several transmission planning regions that have different cost allocation methods by type of transmission project currently have transmission planning procedures and cost allocation methods that refer only to the first two types of transmission projects. This Final Rule allows a public utility transmission provider through its participation in a transmission planning region to distinguish or not distinguish among these three types of transmission facilities, as long as each of the three types is considered in the regional

transmission planning process and there is a means for allocating the costs of each type of transmission facility to beneficiaries. In response to PSEG Companies, we clarify that a regional cost allocation method for one type of regional transmission facility or for all regional transmission facilities may include voting requirements for identified beneficiaries to vote on proposed transmission facilities.

690. However, a public utility transmission provider must have a regional cost allocation method for any transmission facility selected in a regional transmission plan for purposes of cost allocation. It may not designate a type of transmission facility that has no regional cost allocation method applied to it, which would effectively exclude that type of transmission facility from being selected in a regional transmission plan for purposes of cost allocation. In response to New York ISO and Long Island Power Authority, a transmission facility proposed to address a Public Policy Requirement must be eligible for selection in a regional transmission plan for purposes of cost allocation and must not be designated as a type of transmission facility for which the cost allocation method must be determined only on a project-specific basis. However, in contrast to what New York ISO's comment implies, the regional cost allocation method for such a transmission facility may take into account the transmission needs driven by a Public Policy Requirement, who is responsible for complying with that Public Policy Requirement, and who benefits from the transmission facility. If a regional transmission plan determines that a transmission facility serves several functions, as many commenters

point out it may, the regional cost allocation method must take the benefits of these functions of the transmission facility into account in allocating costs roughly commensurate with benefits.

691. As stated elsewhere, we decline to opine here on whether any existing processes satisfy Cost Allocation Principle 6 in the regional and interregional context. For example, if a region believes that its regional transmission planning process meets Regional Cost Allocation Principle 6 for all facilities, including transmission facilities driven by a Public Policy Requirement, it may submit evidence in support of this position in a compliance filing pursuant to this Final Rule.

692. Some commenters are concerned that designation of transmission facility type can result in substantial delay because transmission facilities may serve multiple functions and benefits and beneficiaries may vary over time. This concern should be addressed in each region's transmission planning process. However, we note that many regional transmission planning processes currently have mechanisms for distinguishing between types of transmission facilities, and there is no reason to believe that transmission facilities designation necessarily results in a substantial delay.

693. In response to Alliant Energy's comment, the Commission addressed this concern in the regional transmission planning section above.[515]

[515] *See* discussion *supra* section III.A.

8. Whether To Establish Other Cost Allocation Principles

a. Commission Proposal

694. The Proposed Rule sought comment on whether additional principles should apply to cost allocation for either regional or interregional transmission facilities, and it asked commenters to submit and explain the need for those principles.[516]

b. Comments

695. Six Cities ask the Commission to include a new principle or a corollary requirement that the transmission planning processes include provisions to encourage cost containment, a point echoed in other comments on cost allocation.[517] The New England States Committee on Electricity also argues that the Commission should establish transmission cost control and review mechanisms to ensure that construction is performed as efficiently as possible and the costs incurred are reasonable.

696. ELCON and Associated Industrial Groups urge the Commission to adopt two

---

[516] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 178.

[517] *E.g.*, California Commissions; California Municipal Utilities; City of Santa Clara; Connecticut & Rhode Island Commissions; NEPOOL; New England States Committee on Electricity; New England Transmission Owners; Northeast Utilities; Northern California Power Agency; and Transmission Agency of Northern California. While San Diego Gas & Electric agrees that it is appropriate for commenters to seek safeguards with respect to cost overruns, it takes issue as a factual matter with California Municipal Utilities' inclusion of the Sunrise-Powerlink project as one that is a clear example that cost overruns are endemic.

technical principles related to the costs of new transmission investments being allocated on a representatively-determined capacity (MW) basis, not on an volumetric (MWh) basis and periodic adjustment of cost allocation to reflect changes in power flows.[518] However, ITC Companies do not support periodic adjustments of cost allocation and describe it as disruptive and potentially risky.

697. Other commenters propose principles that look to safeguard particular participants in the transmission planning process. For example, City of Los Angeles Department of Water and Power states that there should be appropriate safeguards that allow non-public utilities to seek required approvals before they are allocated costs for new transmission projects, and that participation in the regional transmission planning process by non-public utilities remain voluntary. Similarly, Transmission Dependent Utility Systems state that if a particular customer is not allowed to participate fully in a regional planning process, there should be a presumption that the customer is not receiving benefits from the regional plan.

698. San Diego Gas & Electric proposed policy changes for transmission projects that span multiple balancing authority areas and for which a voluntarily negotiated cost allocation arrangement proves feasible. Its proposed policy changes focused on payment by loads, allocation of costs to balancing authority areas that do or do not benefit, and

[518] *See also* East Texas Cooperatives and Maine Parties.

encouragement for non-jurisdictional governmental agencies to adopt reciprocal cost allocation policies.

699. Michigan Citizens Against Rate Excess proposed three additional principles that limit transmission costs driven by public policy requirements to the state or states of origin,[519] that transmission cost recovery should not be a means to subsidize non-transmission projects, and that no state or region should shoulder the cost alone when benefits accrue to others as well, namely for reliability projects only.

700. PUC of Ohio maintains that the Commission should consider principles when considering any long-term transmission rate design that provide the utility the opportunity to recover an authorized revenue amount, is equitable, provides for customer understanding and rate continuity, minimizes customer impact and undue cost shifts, and recognizes the use and benefits of the transmission system.

701. Environmental Defense Fund, the Wilderness Society, and Western Resource Advocates recommended principles that they argue will assist in identifying the full range of benefits that must be accounted for when justifying a project.[520] They state that project costs should be allocated consistent with the range/distribution of benefits that are

[519] *See also* Electricity Consumers Resource Council and the Associated Industrial Groups and Public Power Council.

[520] *E.g.*, Environmental Defense Fund; Wilderness Society; and Western Resource Advocates. Sonoran Institute also proposes the second and third principles proposed by Environmental Defense Fund and Wilderness Society and Western Resource Advocates.

likely to accrue in both the near- and long-term, that the benefits of projects must include carbon emissions reductions and the attainment of other state and federal policy imperatives, and that beneficiaries under any beneficiaries-pay cost allocation policy be defined to include consideration of the myriad of beneficial outcomes described above, as well as other benefits likely to accrue to transmission system users over the life of the grid investment.

702. American Antitrust Institute states that the Commission should consider how cost-benefit tests for cost allocation and recovery can be designed to promote competition and encourages the Commission to carefully scrutinize cost allocation approaches based on voting rules that give incumbent utility transmission providers the ability to vote against economic transmission projects that benefit ratepayers.

703. Energy Consulting Group suggests that beneficiaries, including those receiving firm transmission service should to be obligated to pay the allocated costs of the improvements through a specified tariff rate and relieved of any obligations to pay current OATT rates for improvements.

c. Commission Determination

704. We agree with Six Cities, New England States Committee on Electricity, and others that cost containment is important. However, we decline to establish a corresponding cost allocation principle as recommended, primarily because cost containment concerns the level of costs, not how costs should be allocated among

beneficiaries. While we understand and agree that those receiving a cost allocation are appropriately concerned that the level of the cost being allocated should be controlled accordingly, we do not believe that a new principle or corollary requirement in this Final Rule is the appropriate mechanism to promote cost containment.

705. We have considered all the other additional principles proposed by commenters but decline to adopt them. We do not believe that any additional principles are necessary at this time. Moreover, we believe that many of the suggestions of commenters, if required by this Final Rule, would limit the flexibility we provide in this Final Rule for public utility transmission providers to propose the appropriate cost allocation method or methods for their transmission planning region or pair of transmission planning regions. If a commenter believes that one or more of its suggestions is consistent with the six principles we adopt herein, that commenter is free to work within a regional stakeholder process to see if its concerns could be addressed. We will permit each transmission planning region or pair of transmission planning regions to propose cost allocation methods that satisfy additional requirements that they deem necessary to meet the specific needs of that transmission planning region or transmission planning regions provided they are consistent with the cost allocation principles of this Final Rule. Any such requirements should be submitted as part of the cost allocation method or methods on compliance, along with an explanation of how they comply with the requirements of this Final Rule.

F. Application of the Cost Allocation Principles

706. The Proposed Rule addressed several potential applications of the cost allocation principles, seeking general comment on the appropriateness of these six cost allocation principles and how they should be applied to the costs of new regional and interregional transmission facilities that are eligible for cost allocation.[521]

1. Whether To Have Broad Regional Cost Allocation for Extra-High Voltage Facilities

a. Commission Proposal

707. The Commission declined in the Proposed Rule to address in the abstract and in the absence of a record whether several candidate cost allocation methods, either in use today in a region or proposed by some commenters, would satisfy the proposed regional and interregional cost allocation principles.

b. Comments on Cost Allocation for Extra-High Voltage Facilities

708. Several commenters recommend that the Commission establish a rebuttable presumption that the costs of extra-high voltage transmission facilities be allocated widely across a region.

709. NextEra argues that extra-high voltage lines, typically 345 kV and above, provide

[521] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 178.

regional benefits, and that the Commission should require that every cost allocation method include a rebuttable presumption that the costs of such lines will be allocated widely. WIRES agrees, pointing out that this is essentially the approach taken in PJM for projects above 500 kV. NextEra suggests that those seeking to rebut this presumption in the context of a particular extra-high voltage project should bear the burden of showing they receive no benefits from the project. To accomplish this, NextEra recommends that the Commission adopt a *pro forma* transmission cost allocation method, and that transmission providers and stakeholders could either follow the *pro forma* model or propose a method that is consistent with or superior to that model. Multiparty Commenters also support a rebuttable presumption for extra-high voltage lines.[522] Similarly, AEP argues that extra-high voltage facilities provide regionwide benefits and the costs of such facilities should be allocated widely across a region. AEP also suggests that extra-high voltage AC facilities that interconnect electrical regions and that are identified as needed under the applicable interregional coordination agreement benefit both regions, and AEP states that the costs of such facilities should be allocated across those regions. Clean Line supports allocating the costs for extra-high voltage lines across the largest region possible.

[522] Multiparty Commenters append an analysis performed by CRA International that purports to show the widely dispersed benefits of extra-high voltage transmission facilities (CRA Study).

710. Baltimore Gas & Electric submits that the Final Rule should apply highway/byway principles to projects that traverse RTOs and to projects within RTOs. It states that the cost allocation principles espoused in the Proposed Rule should be adopted, and that the Commission should at least allow for the Opinion No. 494 method to be continued in PJM,[523] regardless of the methods that are deemed appropriate for other RTOs.[524] However, Baltimore Gas & Electric states that other RTOs must maintain cost allocation mechanisms with respect to each other that provide for reciprocal treatment. It states that new, high voltage, RTO-approved facilities should be paid for uniformly by all rate zones because they provide significant benefits to all rate zones.

711. Several reply commenters oppose proposals to establish a rebuttable presumption for extra-high voltage facilities.[525] Large Public Power Council argues that such proposals cannot be squared with the cost allocation principle set forth in *Illinois Commerce Commission* that utilities cannot be required to pay for facilities from which

[523] *PJM Interconnection, L.L.C.*, Opinion No. 494, 119 FERC ¶ 61,063 (2007), Opinion No. 494-A, 112 FERC ¶ 61,082 (2008) (cost allocation methods for new transmission facilities that distinguished between facilities below and above 500 kV), *remanded*, *Illinois Commerce Comm'n v. FERC*, 576 F.3d 470 (7th Cir. 2009).

[524] Delaware PSC and American Forest & Paper also support PJM's cost allocation method for high voltage facilities. American Forest & Paper asserts PJM's method is preferable to the energy allocator method proposed in MISO.

[525] *E.g.*, Coalition for Fair Transmission Policy; Ad Hoc Coalition of Southeastern Utilities; Southern Companies; Large Public Power Council; East Texas Cooperatives; New England States Committee on Electricity; and APPA.

its members derive no or only trivial benefits. Ad Hoc Coalition of Southeastern Utilities replies that there is no basis to presume that an extra-high voltage transmission overlay is beneficial to all customers, and that such a position is inconsistent with *Illinois Commerce Commission*. Ad Hoc Coalition of Southeastern Utilities emphasizes that the addition of extra-high voltage facilities can overload the underlying transmission system and change power flows, requiring upgrades to lower voltage lines and operational changes. Ad Hoc Coalition of Southeastern Utilities contends that broadly socializing the costs of extra-high voltage facilities could bias the integrated resource planning process total-cost analyses toward such facilities in that at least some of their costs will be spread throughout the region and not incurred by the utility causing the need for the facilities. Similarly, Southern Companies states that its integrated resource planning has not shown that extra-high voltage lines are a cost-effective, reliable solution to meeting identified transmission needs and that constructing such lines in the Southeast and then broadly socializing their costs over the entire load in the region would result in higher costs to consumers than implementing non-extra-high voltage solutions. Southern Companies also argue that such an approach would skew the evaluations of which transmission and non-transmission alternatives are the least cost means to meet an identified need. MEAG Power provides illustrations of how such a proposal could result in unjust and unreasonable rates. Coalition for Fair Transmission Policy argues that the CRA Study filed by Multiparty Commenters is flawed because it neglects to mention that in some

cases extra-high voltage facilities impose costs on some parts of a region as well, and that such impacts can be ascertained only by examining specific projects. MEAG Power similarly asserts that the CRA study is flawed for a number of reasons, including the fact that it examines only the existing grid, omits several regions from its analysis and fails to estimate any dollar benefits accruing to any party.

712. In addition, in its reply comments, SoCal Edison disagrees with NextEra's proposal for a *pro forma* cost allocation agreement, arguing that there is not sufficient evidence to determine that such an approach is consistent with the principle that costs be allocated roughly commensurate with benefits.

c. Commission Determination

713. We are not persuaded to adopt a rebuttable presumption that the costs of extra-high voltage facilities, such as 345 kV and above, should be allocated widely across a transmission planning region. Such a presumption would be akin to a default cost allocation method which, as discussed above,[526] we do not adopt. For the same reason, we do not agree that a *pro forma* cost allocation method is appropriate.

714. The Commission recognizes and intends that several approaches to cost allocation may satisfy the principles adopted in this Final Rule. If it were otherwise, the offer of regional flexibility would be an empty offer. Therefore, we do not impose a single cost

[526] *See* discussion *supra* section IV.E.1.

allocation method for any transmission planning region. If public utility transmission providers and their stakeholders in a transmission planning region reach a consensus that the costs of extra-high voltage facilities, such as 345 kV and above, should be allocated widely and that this would result in a distribution of costs that is at least roughly commensurate with the benefits received, and support this conclusion with evidence, they may submit the method to the Commission on compliance.

2. Whether To Limit the Use of Participant Funding

a. Commission Proposal

715. Following the presentation of these six cost allocation principles in the Proposed Rule, the Commission discussed their application to participant funding as a regional or interregional cost allocation method for satisfying these principles. The Commission explained that in transmission planning regions outside of the RTO and ISO footprints, many of the cost allocation methods that the Commission accepted in the Order No. 890 compliance proceedings rely exclusively on a "participant funding" approach to cost allocation, in which the costs of a new transmission facility are allocated only to entities that volunteer to bear those costs.[527] The Commission proposed that participant funding is not a cost allocation method that would satisfy these principles. The Commission further noted that a cost allocation method that relies exclusively on a participant funding

[527] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 121-28.

approach, without respect to other beneficiaries of a transmission facility, increases the incentive of any individual beneficiary to defer investment in the hopes that other beneficiaries will value a transmission project enough to fund its development. However, the Proposed Rule did not prohibit voluntary participant funding for those that choose to use it.

b. Comments on Limiting Participant Funding

716. Many commenters generally agree that a cost allocation method based exclusively on a participant funding approach neither achieves the goal of timely development of building transmission facilities nor results in just and reasonable rates.[528] In support of this position, several commenters maintain that participant funding does not allocate the costs of new regional transmission projects to their multiple beneficiaries.[529] East Texas Cooperatives request that the Commission define the scope of acceptable benefits that may be considered, provide that cost allocation methods ensure that customers receive benefits commensurate with their share of costs, and conclude that participant funding is a failed cost allocation method.

717. Several commenters agree that the Commission should clarify what regional cost

---

[528] *E.g.*, AWEA; East Texas Cooperatives; Gaelectric; ITC Companies; Multiparty Commenters; NextEra; Transmission Access Policy Study Group; Transmission Dependent Utility Systems; and WIRES.

[529] *E.g.*, AWEA; Gaelectric; Multiparty Commenters; and Transmission Dependent Utility Systems.

allocation approaches are not acceptable.[530] AWEA states that to ensure that future cost allocation proposals do not serve as barriers to transmission expansion, and can support transmission additions that are "right sized" to meet the long-term needs of the system, the Commission should specify when participant funding, and other such cost allocation methods, should not be allowed, or what level of participant funding it might find acceptable. NextEra argues that the use of participant funding should be minimized, and that the Final Rule should specify that costs of transmission projects identified through the transmission planning process cannot be allocated to generators because any other outcome would simply continue the status quo of discouraging development of new resources.

718. In contrast, other commenters argue that the Commission should promote flexibility, and continue to allow for participant funding of projects with voluntary agreements on cost sharing.[531] Some commenters appear to believe the Proposed Rule would prohibit the use of participant funding in all circumstances, not just for new

[530] *E.g.*, AWEA; ITC Companies; Multiparty Commenters; NextEra; and WIRES.

[531] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Arizona Corporation Commission; Arizona Public Service Company; City of Los Angeles Department of Water and Power; Santa Clara; E.ON; Large Public Power Council; Nebraska Public Power District; Northern Tier Transmission Group; Salt River Project; Transmission Agency of Northern California; Tucson Electric; Washington Utilities and Transportation Commission; WestConnect; and Westar.

transmission facilities in a regional transmission plan for purposes of regional cost allocation to regional beneficiaries. As a starting point, a few commenters state that the Commission has accepted and continues to accept rates using participant funding. For example, E.ON points out that the Commission approved negotiated rates for the Chinook and Zephyr merchant transmission projects, which it believes is evidence that participant funding may be of practical use and may have more widespread application as transmission customers are required to access electricity from renewable generation. Therefore, some commenters argue that the Commission first must present factual evidence that current cost allocation methods are unjust and unreasonable, or otherwise unduly discriminatory, which it has not done. Ad Hoc Coalition of Southeastern Utilities and Arizona Corporation Commission argue that participant funding most closely follows "but for" cost causation principles, and Ad Hoc Coalition of Southeastern Utilities adds that it is most consistent with judicial precedent regarding what constitutes an appropriate cost allocation method. Similarly, many commenters contend that the participant funding approach has led to the building of transmission projects that meet the reliability and economic needs of customers, and state and local policy goals.[532] Ad Hoc Coalition of Southeastern Utilities emphasizes that a requestor pays approach has been the norm for intersystem transmission projects in both the electric and gas industries. Arizona

[532] *E.g.*, Ad Hoc Coalition of Southeastern Utilities; Arizona Corporation Commission; City of Los Angeles Department of Water and Power; and Tucson Electric.

Corporation Commission, Salt River Project, City of Los Angeles Department of Water and Power, and Tucson Electric state that, in the West and Southwest, the participant-funded method of cost allocation has not delayed construction of transmission facilities and has been effective. Northern Tier Transmission Group believes that facilitating willing parties to make rational business decisions has a higher probability of causing the construction of new transmission than does a situation where costs could be forced upon unwilling parties, as is contemplated by the Proposed Rule.

719. In its reply comments, Entergy states that it believes that participant funding is an appropriate pricing method and should not be excluded from consideration in the Final Rule. Entergy requests clarification that any adverse finding against participant funding would not apply to customer-specific requests for service under the *pro forma* OATT. It notes that the Commission provided this clarification in Order No. 890, and it suggests that the Commission had the same intent in the Proposed Rule. Entergy argues that the types of projects set forth in the Proposed Rule do not include customer-specific requests for service, and it explains that such requests are evaluated pursuant to specific OATT procedures that govern system impact and facilities studies, and are performed in consultation with the affected customer, not vetted through a regional stakeholder process. Entergy notes that upgrades necessary to meet the specific request are similarly constructed to meet the needs of the customers, and are not subjected to a cost-benefit test to identify beneficiaries. Entergy cites to its own proposal regarding customer-specific

service requests that the Commission found "will promote, not discourage, efficient investments."[533]

720. Some commenters that support participant funding as a cost allocation method raise concerns about overly broad socialization of costs absent such a mechanism.[534] Large Public Power Council adds that the potential for cost socialization will lead to the planning process becoming vastly more contentious. Southern Companies argue that the proposed reforms are not consistent with cost causation principles. Likewise, Transmission Agency of Northern California argues that broad socialization of costs among all transmission customers is inconsistent with cost causation principles. Avista and Puget Sound state that the cost allocation proposals appear to improperly shift costs to existing customers that do not participate in projects. American Forest & Paper is concerned about the potential for overly broad socialization of costs to diminish incentives for cost-effective planning.

721. Some commenters believe that existing participant funding cost allocation processes are adequate and do not see a need at this time to change those existing processes.[535] These commenters and others,[536] primarily located in the Western

[533] *Entergy Servs., Inc.*, 115 FERC ¶ 61,095, at P 168 (2006).

[535] *E.g.*, WestConnect; PUC of Nevada; Transmission Agency of Northern

(continued…)

Interconnection, believe that voluntary coordination and cost allocation of transmission facilities are more appropriate, particularly given their experiences, and that a mandatory cost allocation requirement could impede the transmission planning process and unintentionally delay or impede the development of new transmission.[537] California Commissions contend that this voluntary approach has minimized disputes and litigation. Arizona Public Service Company, Tucson Electric, and others suggest that voluntary participant funding of projects has permitted participants to successfully engage in allocating costs for transmission projects in the Southwest.

722. Commenters note other challenges to restricting participant funding. For example, California Commissions explain that assessment of benefits and beneficiaries is particularly challenging for long distance interregional transmission that would access remote renewable resources, given the uncertainties surrounding the ultimate build-out, cost (and cost competitiveness), and long-term purchasers for these resources, which are greatly complicated by the fact that energy and renewable energy credits may be purchased separately. Xcel states that MISO included a proposed solution to the "first move/free rider" issue, namely, that a generator interconnection customer who funds

---

California; and Coalition for Fair Transmission Policy.

[536] *E.g.*, Arizona Public Service Company; Bonneville Power; Tucson Electric; and California Transmission Planning Group.

[537] *E.g.*, Arizona Public Service Company; California Commissions; and Western Area Power Administration.

network upgrades pays the entire cost of those upgrades, regardless of other parties who may use them. Xcel asks that the Commission encourage such flexible and innovative solutions to such issues, particularly as public policy requirements are incorporated into transmission planning processes.

c. Commission Determination

723. The Commission finds that participant funding is permitted, but not as a regional or interregional cost allocation method. If proposed as a regional or interregional cost allocation method, participant funding will not comply with the regional or interregional cost allocation principles adopted above. The Commission is concerned that reliance on participant funding as a regional or interregional cost allocation method increases the incentive of any individual beneficiary to defer investment in the hopes that other beneficiaries will value a transmission project enough to fund its development. Because of this, it is likely that some transmission facilities identified as needed in the regional transmission planning process would not be constructed in a timely manner, adversely affecting ratepayers. On the other hand, we agree that if the costs of a transmission facility were to be allocated to non-beneficiaries of that transmission facility, then those non-beneficiaries are likely to oppose selection of the transmission facility in a regional transmission plan for purposes of cost allocation or to otherwise impose obstacles that delay or prevent the transmission facility's construction. For this reason, we adopt the cost allocation principles above that seek, among other things, to ensure that any regional

cost allocation method or methods developed in compliance with this Final Rule allocates costs roughly commensurate with benefits.

724. We therefore disagree with commenters who challenge this Final Rule's limitation on the use of participant funding on the grounds that it is inconsistent with the cost causation principle. Through the cost allocation principles adopted above, we require in all cases that regional and interregional cost allocation methods result in the allocation of costs for new transmission facilities in a manner that is roughly commensurate with the benefits received by those who will pay those costs. In proposing any cost allocation method or methods on compliance, there must be a demonstrated link between the costs imposed through a cost allocation method and the benefits received by beneficiaries that must pay those costs. However, these principles do not in any way foreclose the opportunity for a transmission developer, a group of transmission developers, or one or more individual transmission customers to voluntarily assume the costs of a new transmission facility. Indeed, the evaluation of the potential benefits and beneficiaries of a proposed transmission facility may facilitate negotiations among such entities, potentially leading to greater use of participant funding for transmission projects not selected in the regional transmission plan for purposes of cost allocation.

725. Thus, we will not permit participant funding to be the cost allocation method for regional or interregional projects that are selected in a regional transmission plan for

purposes of cost allocation. However, we are not finding that participant funding leads to improper results in all cases. For example, a transmission developer may propose a project to be selected in the regional transmission plan for purposes of regional cost allocation but fail to satisfy the transmission planning region's criteria for a transmission project selected in the regional transmission plan for purposes of cost allocation. Under such circumstances, the developer could either withdraw its transmission project or proceed to "participant fund" the transmission project on its own or jointly with others. In addition, it is possible that the developer of a facility selected in the regional transmission plan for purposes of cost allocation might decline to pursue regional cost allocation and, instead, rely on participant funding.

726. Ad Hoc Coalition of Southeastern Utilities and Arizona Corporation Commission have not shown why participant funding is uniquely the cost allocation method that most closely follows "but for" cost causation principles. In fact, established precedent argues against this claim. Cost causation principles specify that, "[t]o the extent that a utility benefits from the costs of new facilities, it may be said to have 'caused' a part of those costs to be incurred [because] without the expectation of its contributions, the facilities might not have been built, or might have been delayed."[538] This statement embodies "but for" reasoning, and since participant funding does not in all cases capture all beneficiaries

[538] *Illinois Commerce Commission*, 576 F.3d 470 at 476.

of new facilities, it cannot be said to be the cost allocation method that mostly follows "but for" cost causation principles.[539] Northern Tier Transmission Group argues that participant funding has a higher probability of causing the construction of new transmission facilities because it relies on willing parties and does not involve parties who are unwilling to bear costs and who will engage in litigation to oppose transmission project development. Yet nothing in this Final Rule precludes the use of participant funding for those transmission projects with the support of individual market participants. We find that Northern Tier Transmission Group's argument that other cost allocation methods will impair construction to be speculative and see no reason to conclude that other methods in fact will have this result.

727. In response to Transmission Agency of Northern California, Avista, and Puget Sound, we note that a limitation on participant funding is far from a mandate for broad cost socialization. There is nothing in our cost allocation reforms that requires broad socialization or supports improper cost shifting in violation of cost causation principles.

As discussed fully above, our cost allocation principles require that costs be allocated roughly commensurate with the benefits received by those that pay those costs.

[539] We discuss Ad Hoc Coalition of Southeastern Utilities' claim regarding the consistency of participant funding with judicial precedent on cost allocation methods below in section IV.F.2.

728. In any event, nothing in this Final Rule applies to existing transmission facilities with existing cost allocations or to transmission projects currently under development.[540]

729. In response to Entergy's request, we clarify that our cost allocation reforms in this Final Rule are not intended to modify existing *pro forma* OATT transmission service mechanisms for individual transmission service requests or requests for interconnection service.

3. Whether Regional and Interregional Cost Allocation Methods May Differ

a. Commission Proposal

730. In the Proposed Rule, the Commission explained that the method used for allocating interregional transmission facility costs between any two transmission planning regions may be different from the method used by the public utility transmission providers located in either of those transmission planning regions to allocate the costs of new regional facilities. Additionally, the Commission proposed that the cost allocation method used by the public utility transmission providers located in a transmission planning region to allocate the costs of new regional facilities could be different from the cost allocation method by which the public utility transmission providers in the same transmission planning region further allocate costs to be borne by that transmission planning region pursuant to an agreed-upon method for allocating the costs of

[540] *See also* discussion *supra* section III.A.3.

interregional facilities.[541]

b. Comments

731. Several commenters agree with the Commission's proposal that the method used for allocating interregional transmission facility costs may differ from the method used to allocate regional costs.[542] Georgia Transmission Corporation states that if an interregional coordination obligation would require entities to enter into agreements with neighboring regions, the Commission should specify that it would not require the transmission entity to accept the neighboring entity's cost allocation method. Indianapolis Power & Light states that the cost allocation provisions of an interregional coordination agreement should set forth how costs are divided between the regions and leave it up to the regions to determine how their shares are divided among their subregions/zones/customers. MISO Transmission Owners state that transmission providers and their stakeholders should be permitted to determine whether the cost allocation methods used for regional projects should apply to the transmission provider's share of interregional facilities.

732. ISO New England supports the preservation of a voluntary, flexible approach to interregional cost allocation that recognizes regional differences. It also states that the

[541] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 176.

[542] *E.g.*, Georgia Transmission Corporation; Indianapolis Power & Light; MISO Transmission Owners; NEPOOL; and Northeast Utilities.

Final Rule should either clarify the manner in which agreement on a cost allocation would be signified by each of the two regions or provide for flexibility in recognition of the mechanisms that may be most appropriate in light of the internal transmission planning processes of the paired regions.

c. Commission Determination

733. We find that the method or methods for interregional cost allocation used by two transmission planning regions may be different from the method or methods used by either of them for regional cost allocation. Also, the method or methods for allocating a region's share of the cost of an interregional transmission facility may differ from the method or methods for allocating the cost of a regional facility within that region.

734. Although the public utility transmission providers in a transmission planning region may choose to allocate their share of the costs of an interregional transmission facility using their regional cost allocation method or methods, we see no reason to require them to do so. Indeed, for a transmission planning region that shares the cost of regional transmission facilities broadly, it may be inappropriate to apply broad cost sharing for an interregional transmission facility that is found to benefit only part of that transmission planning region. In addition, an interregional transmission facility may be of such greater scale than most regional transmission facilities that it may result in different types of benefits and beneficiaries than for a regional transmission facility.

735. In response to Georgia Transmission Corporation, we clarify that we do not require the public utility transmission providers in a transmission planning region to accept the regional transmission planning method or methods of another transmission planning region with which it participates regarding interregional transmission coordination. Each transmission planning region would determine for itself how to allocate the costs of a new interregional transmission facility consistent with this Final Rule.

4. Recommendations for Additional Commission Guidance on the Application of the Transmission Cost Allocation Principles

736. Several comments recommend that the Commission provide additional guidance on how to apply the cost allocation principles.

a. Comments

737. A number of commenters provide additional suggestions on cost allocation methods. Duke states that without clear pricing guidelines that do more than restate general cost allocation principles, regional and interregional transmission projects will have trouble getting out of the starting gate. Pennsylvania PUC asserts that cost allocation principles and methods should be reasonably clear and explainable to all stakeholders so that development of a cost allocation paradigm can be effectively grasped by all participants. East Texas Cooperatives believe that the costs of all transmission facilities needed to maintain reliability or to deliver long-term resources to load serving entities should be rolled into the applicable zonal, regional, or interregional rate, and that

individual cost allocation methods should clearly set forth a plan for identifying beneficiaries and allocating costs to them. Washington Utilities and Transportation Commission is concerned that necessary certainty on cost allocation would not be achieved if the Final Rule lacks detail on the standards to be applied when reviewing or approving cost allocations proposals and the Commission opts to develop more precise cost allocation policies on a case-by-case basis.

738. Federal Trade Commission encourages the Commission to consider providing stronger guidance regarding transmission cost allocation principles. It expresses its concern that unnecessary variance in allocation methods will have a disruptive effect on multi-area transmission proposals, akin to the disruptive effects that unnecessary diversity in methods for calculating available transmission capacity had on transmission services spanning multiple areas. Federal Trade Commission encourages the Commission to consider whether stronger guidance would promote consensus sooner and avoid creating a patchwork of transmission cost allocation methods that may not support broad, efficient regional markets and low-cost compliance with environmental and energy security policy initiatives.

739. WIRES states that, as proposed, the principles provide only the most general outer bounds of acceptable practice and do not specify the characteristics of cost allocation methods that the Commission is likely to consider just and reasonable. WIRES states that the use of a relatively complete set of principles affords the Commission an

opportunity to help short-cut the endless debates about limited merits of participant funding in a network environment and about the extent to which the benefits of transmission can be quantified in specific instances.

740. Northwestern Corporation (Montana) asserts that new transmission lines should not be insulated from sharing a portion of the network costs and/or an allocation of the network revenue requirement because new transmission lines experience enhanced reliability by connecting to the network transmission system.

741. Illinois Commerce Commission urges the Commission to remove "postage stamp" cost allocation from the list of acceptable cost allocation methods.[543] It maintains that postage stamp cost allocation is highly unlikely to produce just, reasonable, and nondiscriminatory rates, and continuing to maintain it as a possible cost allocation method is paralyzing transmission expansion.

742. Other commenters make suggestions or requests for guidance that are similar to other commenters' recommendations for additional cost allocation principles discussed above. For example, some commenters suggest that cost allocation methods should be periodically recalculated or reevaluated. Many commenters believe that changes to transmission system topology and amendments to state policies could alter disbursement

[543] "Postage stamp" here refers to regionwide allocation of the cost of a transmission facility.

of benefits, so the Final Rule should require cost allocations to be periodically reviewed and recalculated.[544] Some of these commenters believe that permanent cost allocations may inhibit investing in transmission upgrades and that there should be periodic reassessments to address any unintended consequences.[545] For example, E.ON and East Texas Cooperatives suggest that cost allocation reevaluation should occur every five years. Pennsylvania PUC states that a cost allocation method should be designed to evolve and reflect system changes over time.

743. Ohio Consumers Counsel and West Virginia Consumer Advocate Division suggest that the Commission adopt a process that allows for expedited resolution of disputes over cost allocation that may arise during the regional planning process. ISO New England recommends Commission-sponsored mediation or other alternative dispute resolution for interregional cost allocation to assist two regions on reaching agreement if they cannot do so.

744. Commenters also submitted comments suggesting multiple ways to allocate costs

[544] *E.g.*, Sunflower and Mid-Kansas; Electricity Consumers Resource Council and Associated Industrial Groups; PUC of Ohio; East Texas Cooperatives; E.ON; and Transmission Dependent Utility Systems.

[545] *E.g.*, Transmission Dependent Utility Systems; Sunflower and Mid-Kansas; E.ON; East Texas Cooperatives; and Massachusetts Municipal and New Hampshire Electric.

of public policy driven projects.[546] FirstEnergy Service Company believes the Commission should clarify that the cost causation principle, including the requirement that costs are at least roughly commensurate with benefits, applies with full force to public policy driven projects in the regional planning process. First Wind believes the Commission should seek state input and rely upon state judgment on cost allocation for projects flowing from state policy. NEPOOL and New England States Committee on Electricity believe that each region should have considerable flexibility to develop public policy cost allocations. Transmission Dependent Utility Systems notes that not all projects proposed to implement public policy are worthy of presumptive acceptance and should be rigorously scrutinized in the stakeholder process.

b. Commission Determination

745. The Commission appreciates interested commenters' views, suggestions and requests for additional Commission guidance regarding the development of an acceptable cost allocation method or methods to comply with the identified cost allocation principles for new regional and interregional transmission facilities. We believe, however, that the principles adopted in this Final Rule provide sufficient general guidance for public utility transmission providers. The principles establish threshold criteria for a cost allocation

[546] *E.g.*, FirstEnergy Service Company; First Wind; NEPOOL; New England States Committee on Electricity; New England Transmission Owners; Public Power Council; and Transmission Dependent Utility Systems.

method or methods to facilitate the development of a just and reasonable and not unduly discriminatory or preferential cost allocation method or methods. Additionally, the principles afford public utility transmission providers in individual transmission planning regions the flexibility necessary to accommodate unique regional characteristics. The Commission is concerned that providing the additional guidance or limitations requested by commenters would unduly restrict this flexibility. As we explained above, the Commission recognizes the need for regions to retain some level of flexibility to account for specific regional characteristics, resource types, or policy mandates.

746. We emphasize, however, that any variations between regions must be consistent with the six cost allocation principles. For example, East Texas Cooperatives suggest periodic reevaluation of cost allocation methods to respond to system changes. We do not view such a proposal as inconsistent with the cost allocation principles adopted above and, as such, it could be presented and evaluated at the regional level and, if agreed upon, proposed to be implemented by that transmission planning region. However, the Commission declines to prescribe such a policy for all transmission planning regions nationwide.

747. With respect to comments regarding how to allocate costs for public policy driven transmission projects, as discussed above,[547] we are not requiring public utility

[547] *See* discussion *supra* section III.E.7.

transmission providers to use the same cost allocation method for public policy and other types of transmission facilities. Instead, as discussed for Cost Allocation Principle 6, we permit different regional and interregional cost allocation methods for different types of transmission projects. Thus, whether each region or pair of transmission planning regions has a separate cost allocation method for public policy driven transmission projects depends on the consensus within that transmission planning region or those transmission planning regions, and we will not prescribe a uniform method for such transmission projects.

748. In response to Illinois Commerce Commission, the Commission declines to find in advance that a "postage stamp" cost allocation may not be an acceptable cost allocation method. If public utility transmission providers in a region, in consultation with their stakeholders, agree to such a method, and it is demonstrated to be consistent with the cost allocation principles and is supported with an appropriate assessment of benefits, then such an allocation may be submitted to the Commission on compliance, and the Commission will determine then whether the method meets its requirements.

749. We also clarify that, by establishing the six principles for regional and interregional cost allocation, the Commission is not attempting to supersede the cost causation principle. Rather, these six principles serve as guidelines for public utility transmission providers to use to create cost allocation methods that are consistent with the cost causation principle.

750. With regard to the concerns of Ohio Consumers' Counsel, West Virginia Consumer Advocate Division, and ISO New England about dispute resolution, the Commission believes that the dispute resolution processes in place under Order No. 890, enhanced as may be necessary to comply with our transmission planning reforms, will be adequate to address in the first instance, any disagreements that may arise regarding the allocation of transmission costs. The Commission reviewed and approved all of the dispute resolution procedures currently in place during our review of the compliance filings in response to Order No. 890, requiring enhancements in a number of cases.[548] We will review any changes to those dispute resolution procedures in response to compliance filings submitted in response to this Final Rule.

G. Cost Allocation Matters Related to Other Commission Rules, Joint Ownership, and Non-Transmission Alternatives

751. Commenters also raised cost allocation issues related to generator interconnection costs in Order No. 2003,[549] pancaked transmission rates policy in Order No. 2000,[550]

---

transmission rate incentives in Order No. 679,[551] the relationship of this proceeding to the proceeding on variable energy resources, Docket No. RM10-11-000, and joint transmission ownership.

1. Whether To Reform Cost Allocation for Generator Interconnections

752. In the Proposed Rule, the Commission did not propose to alter the cost recovery provisions of its generator interconnection rules.

a. Comments

753. Several commenters address the interaction between Order No. 2003 and the cost allocation requirements of this Final Rule. For example, Duke seeks clarification that impacts on transmission owners in neighboring regions resulting from a specific generator interconnection or transmission service request will continue to be addressed under the existing generation or transmission interconnection arrangements. East Texas Cooperatives urge the Commission to require development of an integrated process for

studying network and point-to-point transmission service requests and generator interconnection requests that affect neighboring regions.

754. Other commenters address the interaction between Order No. 2003 and the transmission planning requirements. For instance, Solar Energy Industries and Large-scale Solar state that the Commission should require transmission providers to coordinate the transmission planning study process with the generator interconnection study process. PPL Companies agree stating that this would ensure that interconnection customers and native load bear their fair share of the costs of new transmission. On the other hand, NextEra believes that the costs of transmission projects identified through the transmission planning process should not be allocated to generators.

755. Some commenters urge the Commission to reevaluate the cost responsibilities in Order No. 2003 because they believe these are being used to circumvent the transmission planning process, creating a situation where load serving entities are forced to finance projects without project beneficiaries being identified.[552] If this continues, Bay Area Municipal Transmission Group asserts that greater transparency in the interconnection process is needed to facilitate the determination of the most cost-effective interconnection alternative. California Municipal Utilities argue that, if the costs of network upgrades

[552] *E.g.*, Bay Area Municipal Transmission Group; California Municipal Utilities; and City of Santa Clara.

identified through generator interconnection studies are borne by load within a region, those upgrades should be examined by the regional transmission planning process as a necessary precondition to approval by the relevant transmission provider. Six Cities note that the California ISO had represented in an Order No. 890 compliance filing that all interconnection-related network upgrades would be submitted through the request window open in each planning cycle and evaluated in the transmission planning process. Northern California Power Agency asserts that the generator interconnection process includes a loophole whereby transmission providers can circumvent the transmission planning process by proposing individual projects that are constructed by transmission providers, and recommends that the Commission limit

the use of interconnection-related upgrades by ensuring they are a cost-effective means of grid expansion.

756. Several commenters discuss cost allocation for generation interconnection in the context of public policy projects. For example, Imperial Irrigation District asks the Commission to clarify that generation interconnection customers and their off-takers can be allocated the costs of public policy projects under the principles developed by transmission providers in each region when those generation project developers and their off-takers cause the need for or benefit from the public policy projects. In its reply comments, City of Santa Clara agrees with Imperial Irrigation District. Old Dominion

agrees with PJM that greater clarity is needed regarding the extent to which the Commission is proposing that cost allocation for public policy driven projects depart from the existing Order No. 2003 framework. Old Dominion recommends that the Commission require all transmission providers to describe in their respective transmission planning and cost allocation tariff filings specific rules governing cost allocation for such projects.

757. East Texas Cooperatives state that they support a cost allocation policy under which the costs of network upgrades required to serve the native load of a transmission provider's network customers are rolled into the transmission provider's rates. They recommend that if a network upgrade is needed to accommodate an interconnection request for a generating facility that has not been designated as a network resource or is not otherwise contractually committed to serve customers within the transmission provider's footprint on a long-term basis, the interconnecting customer should be required to pay for the cost of network upgrades that would not have been required but for the interconnection request. They state that applying this policy would provide a level of assurance that the cost of such facilities will be allocated roughly commensurate to the estimated benefits.

758. Northern Tier Transmission Group asserts that, if a transmission provider does not execute an interconnection agreement with a generator, then the transmission provider has no mechanism to assess costs upon the generator. Northern Tier Transmission Group

states that, to the extent the Commission chooses to address this practical issue, it should be done in the context of the generator interconnection procedures and agreements and not in the context of transmission planning.

759. In response, California ISO argues that such suggestions are beyond the scope of this proceeding and, if the Commission wishes to overhaul Order No. 2003, it should do so in a separate rulemaking so that parties have adequate notice that the Commission is proposing to modify its *pro forma* large generator interconnection procedures. Replying to Six Cities, California ISO argues that their assertion is based on a misconception that interconnection-related network upgrades need to be approved through the transmission planning process. California ISO states that Order No. 890 did not apply to such network upgrades.

b. Commission Determination

760. The Commission agrees with the California ISO and other commenters that issues related to the generator interconnection process and to interconnection cost recovery are outside the scope of this rulemaking. Order No. 2003 sets forth the procedures for the interconnection of a large generating transmission facility to the bulk power system. This Final Rule does not set forth any new requirements with respect to such procedures for interconnecting large, small, or wind or other generation facilities. Therefore, this Final Rule is not the proper proceeding for commenters to raise issues about the

interconnection agreements and procedures under Order Nos. 2003,[553] 2006[554] or 661.[555] However, in not addressing these issues here, we are not minimizing the importance of evaluating the impact of generation interconnection requests during transmission planning, nor limiting the ability of public utility transmission providers to use requests for generator interconnections in developing assumptions to be used in the transmission planning process.

2. Pancaked Rates

a. Comments

761. A few commenters ask the Commission to address the pancaking of rates within transmission planning regions. Transmission Dependent Utility Systems assert that the Proposed Rule should eliminate regional rate pancaking as it remains a significant financial dilemma for many transmission customers and is destructive to regional

[553] Order No. 2003, 68 FR 49846, FERC Stats. & Regs. ¶ 31,146, *order on reh'g*, Order No. 2003-A, 69 FR 15932, FERC Stats. & Regs. ¶ 31,160, *order on reh'g*, Order No. 2003-B, 70 FR 265, FERC Stats. & Regs. ¶ 31,171, *order on reh'g*, Order No. 2003-C, 70 FR 37661, FERC Stats. & Regs. ¶ 31,190 , *aff'd sub nom. Nat'l Ass'n of Regulatory Util. Comm'rs v. FERC*, 475 F.3d 1277 (D.C. Cir. 2007), *cert. denied*, 552 U.S. 1230 (2008).

[554] Order No. 2006, 70 FR 34189, FERC Stats. & Regs. ¶ 31,180, *order on reh'g*, Order No. 2006-A, 70 FR 71760, FERC Stats. & Regs. ¶ 31,196, *order granting clarification*, Order No. 2006-B, 71 FR 42587, FERC Stats. & Regs. ¶ 31,221.

[555] Order No. 661, 70 FR 34993 (Jun. 16, 2005), FERC Stats. & Regs. ¶ 31,186, *order on reh'g*, Order No. 661-A, FERC Stats. & Regs. ¶ 31,198.

planning. Transmission Dependent Utility Systems submit that if the Commission is going to implement a requirement for regional cost allocation, it should, at a minimum, eliminate pancaked rates unless there is an existing regional cost allocation method in place.

762. Sunflower and Mid-Kansas, on the other hand, contend that the Commission should modify its "no pancaking" policies for an RTO or ISO because the policy is not appropriate for large interregional projects and will potentially create extremely high rate increases for customers.

763. Gaelectric North America explains that merchant transmission developers are creating new pancaked rates. It asserts that, as public utilities construct radial merchant lines and allocate their costs through participant funding, they are creating additional pancaked rates for new generation owners who may wish to utilize these new facilities. Gaelectric North America argues that such pancaked rates inhibit the development and use of renewable resources. Further, it states that stringing radial transmission over network facilities is inefficient and pursued only to avoid appropriate cost allocation.

b. Commission Determination

764. We decline to make new findings with respect to pancaked rates in this Final Rule as it is beyond the scope of this proceeding. In particular, we do not make any modifications to the Commission's pancaked rate provisions for an RTO under Order No. 2000. If rate pancaking is an issue in a particular transmission planning region,

stakeholders may raise their concerns in the consultations leading to the compliance proceedings for this Final Rule or make a separate filing with the Commission under section 205 or 206 of the FPA, as appropriate.

3. Transmission Rate Incentives

765. In the Proposed Rule, the Commission did not propose to alter its transmission rate incentive policies of Order No. 679.

a. Comments

766. Some commenters suggest that the Commission revisit its policy on transmission rate incentives, as set forth in Order No. 679. For example, they relate the Commission's proposals regarding nonincumbent transmission developers to transmission rate incentives.[556] Transmission Access Policy Study Group suggests that the Commission could require an incumbent transmission provider that exercises a federal right of first refusal to own and build a transmission facility to forgo any incentives on that facility. It argues that an incumbent transmission owner that exercises a federal right of first refusal should not then be given an incentive as necessary to encourage it to construct needed transmission. Minnesota Public Utilities Commission and Minnesota Office of Energy Security believe that one reason a federal right of first refusal may be justified is because there are instances where an incumbent transmission provider's rate of return is

[556] *E.g.*, New England States Committee on Electricity; Transmission Access Policy Study Group; and Southern California Edison.

significantly lower than the incentive rate of return the Commission has approved for nonincumbent transmission developers. ITC Companies replies that such instances only demonstrate that different transmission incentives have been awarded in different cases by different regulatory bodies, noting that there are a variety of approved utility ROEs across the industry.

767. Other commenters tie the Commission's cost allocation proposals to transmission rate incentives. For example, APPA states that there is a clear causal connection between thorny cost allocation concerns and the Commission's incentive policy. APPA argues that when excessive transmission rate incentives are awarded to project sponsors, no one benefits from the associated costs except for the sponsors. Transmission Access Policy Study Group also suggests that the Commission use this opportunity to reevaluate application of Order No. 679 so that it does not add burdens on the economy or make siting and cost allocation issues more difficult than they already are. Transmission Dependent Utility Systems also state that transmission providers should be able to recover only the costs associated with a major transmission project through formula rates if that project was a product of an Order No. 890-compliant planning process that also meets the requirements of the Final Rule.

768. Joint Commenters recite cases in which project developers have been granted rate incentives that they believe substantially exceed the incentives that would result in just and reasonable rates. Joint Commenters also assert that the Commission has failed to

recognize that the financial ground has shifted, citing the recent recession, historically low interest rates, and high unemployment. According to Joint Commenters, the rate of return needed to attract investment in a long-lived asset used to provide monopoly service is less than it was a few years ago. Finally, Joint Commenters recommend that the Commission revisit two features of its 1992 incentive rate policy statement,[557] concerning the requirement that incentive rate mechanisms be symmetrical and the requirement that applicants quantify the benefits to ratepayers as the incentive payment is awarded, arguing that these principles are equally important today. In its reply comments, Illinois Commerce Commission generally agrees with Joint Commenters, as does Organization of MISO States.

769. Pacific Gas & Electric recommends that the Commission clearly signal in the Final Rule that rate incentives are available for utilities that dedicate resources to the successful development of needed regional projects. In particular, Pacific Gas & Electric suggests that incentives for partnership in the development of major backbone projects crossing multiple jurisdictions are appropriate. Pacific Gas & Electric suggests that incentives should be offered for partnerships to both independent transmission companies and incumbent utilities, and that the incentives should be conditioned upon establishment of development arrangements that ensure consistent design standards are used that are

[557] *Incentive Ratemaking for Interstate Natural Gas Pipelines, Oil Pipelines, and Electric Utilities*, 61 FERC ¶ 61,168 (1992).

compatible with the incumbent system, ongoing coordination of maintenance arrangements by responsible entities, and proper bilateral interconnection or coordinated operation agreements that will ensure the continuity and sustained reliability of the system.

770. However, a number of commenters oppose calls to reopen Order No. 679 in this proceeding.[558] Several commenters argue that such comments are beyond the scope of this rulemaking. They note that Order No. 679 was implemented in response to the direction of Congress, codified in section 219 of the FPA, to incent transmission investment. Some commenters note that Order No. 679 does not undermine transmission planning and cost allocation processes because the grant of incentives is conditioned on approval of the project under the relevant regional transmission planning processes. APPA states that it opposes blanket statements supporting the applicability of incentives under Order No. 679, and notes that Pacific Gas & Electric's request is illuminating because it shows how accustomed investor-owned utilities have become to obtaining such incentives and how they assume the Commission will simply rubber stamp in advance their requests for more incentives.

b. Commission Determination

771. We acknowledge commenters concerns regarding the Commission's policy on

[558] *E.g.*, AEP; Edison Electric Institute; EIF Management; ITC Companies; National Grid; Pacific Gas & Electric; and PSEG Companies.

transmission rate incentives under Order No. 679. However, we decline to revisit or modify our policy under Order No. 679 in this Final Rule, as it is beyond the scope of this proceeding.[559]

4. Relationship of This Proceeding to the Proceeding on Variable Energy Resources

a. Comments

772. APPA argues that, contrary to the Commission's decision not to address transmission planning and cost allocation issues in its proceeding on the integration of variable energy resources (VER), Docket No. RM10-11-000, it believes that the two issues are not easy to compartmentalize. According to APPA, effective integration of VERs into regional transmission systems depends in large part on the availability of transmission facilities to support such integration, which in turn raises the issue of who will pay for the additional transmission facilities needed to undertake this integration effort. Thus, APPA urges the Commission to consider the tariff modification issues raised by VERs integration together with the need to develop cost allocation methods to pay for the additional transmission facilities that such integration requires.[560]

773. In its reply comments, Exelon argues that the Commission should address in this

[559] The Commission issued a Notice of Inquiry on May 19, 2011 regarding its policy on transmission incentives under Order No. 679. *See Promoting Transmission Investment Through Pricing Reform*, Notice of Inquiry, 135 FERC ¶ 61,146 (2011).

[560] APPA also incorporates by reference the comments it submitted in Docket No. RM10-11-000.

proceeding the operational issues entailed in integrating large amounts of VERs onto the grid in tandem with its rules for transmission planning and cost allocation. It states that whether or not the Commission issues a single rule in these dockets, it should rely on the record developed in the VERs rulemaking proceeding in deciding the Final Rule here, arguing that the record in the VERs proceeding fully supports the Commission requiring full accounting for the costs of integrating wind and other variable resources.

b. Commission Determination

774. This Final Rule establishes minimum requirements to guide the affected entities in developing their own transmission planning processes and cost allocation methods, which then will be submitted for filing with the Commission. The requirements established by this Final Rule apply to transmission planning and cost allocation for all resources. The VERs proceeding, however, addresses operational issues. To the extent that entities consider it necessary or appropriate to consider such operational issues in this Final Rule, they may do so by making a separate section 205 filing rather than raise issues on compliance in this proceeding.

5. Joint Ownership

a. Comments

775. A number of commenters urge the Commission to consider joint transmission ownership as a financing and cost allocation tool within the Proposed Rule. APPA and Six Cities ask the Commission to promulgate a rule favoring joint transmission

ownership and to require that eligibility for rate incentives depend on an applicant's showing that it has offered reasonable opportunities for joint transmission ownership. APPA asserts that joint ownership diversifies financial risks and reduces the overall costs of the project as well as the need for transmission incentives. Transmission Access Policy Study Group and Transmission Agency of Northern California state that joint ownership leads to a more collaborative process in planning and development for both pooled systems and load serving entities. Transmission Access Policy Study Group states that joint ownership results in more diverse generation scenarios, shorter permitting processes during siting, and simpler resolutions of cost allocation issues, and points out that joint ownership spreads the risk of projects and provides a variety of sources of capital for projects.

b. Commission Determination

776. Specific financing techniques such as joint ownership are beyond the scope of this proceeding. Transmission developers are, of course, free to consider joint ownership when proposing and developing a transmission project. Just as we are not requiring any specific cost allocation method, we do not specifically address joint ownership as a cost allocation tool in this proceeding. However, we reiterate here our statement in Order No. 890 that we believe there are benefits to joint ownership of transmission facilities, particularly large backbone facilities, both in terms of increasing opportunities for investment in the transmission grid, as well as ensuring nondiscriminatory access to the

transmission grid by transmission customers.[561]

6. Cost Recovery for Non-Transmission Alternatives

a. Comment Summary

777. GridSolar suggests that the Commission require utilities and RTOs/ISOs to evaluate alternatives to traditional transmission solutions on the same basis, using the same standards as those used for traditional transmission solutions, and that this could be done through a competitive solicitation. GridSolar notes that distributed energy resources connect at voltages below 69 kV and therefore do not qualify for cost allocation treatment under the transmission planning process although they provide the same services as other transmission resources. Similarly, 26 Public Interest Organizations argue that transmission and non-transmission solutions should be treated comparably for cost recovery purposes.

778. FirstEnergy Service Company argues that while the Proposed Rule does not address cost recovery for non-transmission projects, only the costs of facilities that perform a transmission function (including energy storage projects) should be included in transmission rates. FirstEnergy Service Company argues that regional transmission planning processes should not be a vehicle for owners of generation or demand side

[561] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 593.

management projects that are eligible to earn revenue from sales of energy, capacity, and ancillary services to earn subsidies from transmission customers.

b. Commission Determination

779. As we make clear above in the section on Regional Transmission Planning, we are maintaining the approach taken in Order No. 890 and will require that generation, demand resources, and transmission be treated comparably in the regional transmission planning process.[562] However, while the consideration of non-transmission alternatives to transmission facilities may affect whether certain transmission facilities are in a regional transmission plan, we conclude that the issue of cost recovery for non-transmission alternatives is beyond the scope of the transmission cost allocation reforms we are adopting here, which are limited to allocating the costs of new transmission facilities.[563]

[562] *See* discussion *supra* Section III.A.

[563] As we stated in the Proposed Rule, the Commission has recognized that, in appropriate circumstances, alternative technologies may be eligible for treatment as transmission for ratemaking purposes. *See* Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at n.58 (citing *Western Grid Development, LLC*, 130 FERC ¶ 61,056 (2010)).

V. Compliance and Reciprocity Requirements

A. Compliance

1. Commission Proposal

780. With the exception of the proposed interregional transmission coordination and interregional cost allocation requirements, the Proposed Rule would require each public utility transmission provider to submit a compliance filing within six months of the effective date of the Final Rule in this proceeding. With regard to the proposed interregional transmission coordination and interregional cost allocation requirements, the Proposed Rule would require each public utility transmission provider to submit a compliance filing within one year of the effective date of the Final Rule in this proceeding.[564] The Commission proposed that it would assess whether each compliance filing satisfies the proposed requirements and principles stated above and issue additional orders as necessary to ensure that each public utility transmission provider meets the requirements of the Proposed Rule.

2. Comments

781. Exelon urges the Commission to adhere to its original time schedule for compliance filings of six months for intraregional transmission planning and one year for interregional agreements. In its reply comments, LS Power argues that the six-month and

[564] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 179.

twelve-month compliance deadlines are far more generous than the 60-day deadline that the Commission provided for compliance with Order No. 888 and the filing of revised power pooling and multilateral coordination agreements, respectively.

782. Some commenters suggest that the Commission extend the compliance deadlines for up to three years.[565] Indianapolis Power & Light and SPP state that the proposed six-month and one-year deadlines do not allow sufficient time for the stakeholder process. Indianapolis Power & Light states that this is particularly true if the right of first refusal is removed and recommends that the Commission extend the deadlines by a minimum of one year. SPP recommends that the Commission extend the proposed deadline for regional transmission planning by at least six months and for interregional transmission planning and cost allocation to three years. MISO Transmission Owners state that the Commission should extend all compliance deadlines by a minimum of six months. Arizona Corporation Commission states that the Commission should recognize that most public utility transmission providers in the West are not members of an RTO and will need more time, perhaps 24-36 months, to draft regional and interregional transmission plans. Arizona Public Service Company agrees in is reply comments that the compliance deadlines are too aggressive, arguing that the Commission is proposing a vast array of

[565] *E.g.*, Indianapolis Power & Light; SPP; MISO Transmission Owners; Arizona Corporation Commission; and Arizona Public Service Company.

changes that will require utilities to develop positions, collaborate with neighboring utilities, and reach consensus with regional groups.

783. Western Area Power Administration recommends that, in lieu of compliance filings, the Commission require transmission providers to file periodic status reports regarding intraregional and interregional efforts. As an alternative approach, it recommends that the Commission extend the compliance filing deadline to one year for intraregional transmission planning and cost allocation issues and two years for interregional issues. Ad Hoc Coalition of Southeastern Utilities and Large Public Power Council recommend that in lieu of the proposed one-year compliance filing requirement, that the Commission call for status updates on these matters in one year's time, potentially to be followed by further orders on a regional basis establishing reasonable timeline targets.

784. Focusing on the six month regional planning compliance deadline, some commenters express the view that six months is a reasonable compliance period.[566] LS Power notes that many of the commenters expressing opposition to the six-month compliance deadline are the same entities that are opposed to removal of the federal right of first refusal, suggesting that any extension of compliance periods not apply to the federal right of first refusal from jurisdictional OATTs and agreements.

[566] *E.g.*, Northwest & Intermountain Power Procedures Coalition and LS Power.

785. Other commenters express concern about the ability of transmission providers to meet the six-month compliance filing requirement for regional transmission planning requirements.[567] New England States Committee on Electricity states that a Final Rule addressing the rights and obligations of nonincumbent transmission providers within the regional planning process should provide the planning regions adequate time to sort through a means of complying. Xcel urges the Commission to allow entities in the Western Interconnection sufficient time and latitude to develop mechanisms that effectively meet the needs of the region; it states that, given the needs of the western region, six months or even one year is an unreasonably short period of time to build a structure to comply with the Commission's regional transmission planning requirements. Washington Utilities and Transportation Commission states that the Commission need not proceed with urgency but should allow existing regional processes to mature, which may lead to a more expeditious and effective transmission planning process.

786. Focusing on the one year interregional compliance deadline, East Texas Cooperatives state that, given the urgent need for interregional transmission planning reform, the Commission should require filing of interregional transmission planning agreements within six months of the effective date of the Final Rule. In its reply comments, East Texas Cooperatives add that shortening this deadline would motivate

[567] *E.g.*, New England States Committee on Electricity and Xcel.

transmission providers to improve coordination with their adjacent regions. Exelon states that for sets of regions that currently have Commission-approved joint operating agreements, the Commission should require a six-month compliance filing.

787. Other commenters contend that the one-year time period for compliance filings relating to interregional transmission planning agreements is unworkable. Southern Companies doubt that an interregional cost allocation agreement could be developed in the Southeast within the proposed one-year deadline. ISO/RTO Council states that this proposal is unworkable due to the complexity, limited resources, the need to involve stakeholders, and potentially the number of agreements to be reached. NV Energy agrees, stating that significant additional time is needed to address interregional transmission agreements and cost allocation issues given the number of parties involved. Xcel agrees that the proposed one-year deadline is unattainable and the Commission should allow more time for interregional planning and cost allocation initiatives to develop voluntarily.

788. Duke and Georgia Transmission Corporation state that the Commission should provide two years to submit interregional transmission planning agreements, given the number of parties that may be involved and the difficulties of developing cost allocation methods. Edison Electric Institute requests that the Commission be flexible regarding compliance deadlines for interregional agreements and cost allocation and consider allowing up to two years for compliance. Pennsylvania PUC states that interregional

agreements will require many actions internal to RTOs and ISOs and planning organizations, therefore the Commission should consider expanding the compliance period from one year to 18 or 24 months.

789. With regard to compliance filings by RTOs and ISOs, New York ISO argues that the Commission should narrow the scope of the compliance filings required under the Final Rule so that RTOs and ISOs are not effectively compelled to demonstrate compliance with requirements that they have already satisfied in their individual Order No. 890 planning proceedings. Several commenters also urge the Commission to consider existing RTO or ISO cost allocation methods as compliant with the proposed cost allocation principles and to avoid reopening debates about regional cost allocation methods already approved by the Commission.[568] Some of these commenters argue that existing processes, such as those used in California ISO and ISO New England, are reasonable[569] while others disagree.[570]

---

[568] *E.g.*, California ISO; SoCal Edison; San Diego Gas & Electric; Eastern Mass. Consumer Owned System; Northeast Utilities; MISO; New York ISO; NEPOOL; New England States Committee on Electricity; Kansas Corporation Commission; and Xcel.

[569] *E.g.*, California PUC; Pacific Gas & Electric; NEPOOL; and Connecticut & Rhode Island Commissions.

[570] Several commenters, such as the Integrated Transmission Benefits Model Proponents and Maine Parties argue that ISO New England's current transmission planning and cost allocation methods do not comply with this Final Rule. These concerns should be raised during the stakeholder process used to develop compliance with this Final Rule. To the extent that a commenter believes that its concerns have not

(continued…)

790. Several commenters state that the Commission should not lightly change existing regional cost allocation methods.[571] For example, Duke states that parties challenging the appropriateness of an existing Commission-approved method should bear a heavy burden of showing why that method is inconsistent with the Final Rule. Transmission Dependent Utility Systems state that the Commission should not automatically disrupt current regional cost allocation methods but instead require compliance filings that demonstrate that the regional cost allocation method was indeed the product of an open and inclusive stakeholder process and that the regional cost allocation method either meets the Commission's proposed cost allocation principles, or that the existing regional cost allocation method is consistent with or superior to the requirement of those principles.

791. Additionally, MISO Transmission Owners, Indianapolis Power & Light, and SPP recommend that the Commission clarify that transmission owners in an RTO or ISO are permitted to participate in the compliance filing of the RTO or ISO without making a separate compliance filing of their own. Omaha Public Power District suggests that providers that are not members of an RTO be allowed to participate in the relevant RTO

---

been resolved in the relevant compliance filing, it can raise those concerns at that time in a protest to the compliance filing.

[571] *E.g.*, Duke; New Jersey Board; Northeast Utilities; and Transmission Dependent Utility Systems.

planning process to achieve the interregional planning mandate because this would reduce the cost of coordination and improve its efficiency and effectiveness.

3. Commission Determination

792. Given the various comments requesting a longer compliance period, we extend the compliance filing requirements set forth in the Proposed Rule. Accordingly, we find that, with the exception of the requirements with respect to interregional transmission coordination procedures and an interregional cost allocation method or methods, each public utility transmission provider must submit a compliance filing within twelve months of the effective date of this Final Rule revising its OATT or other document(s) subject to the Commission's jurisdiction as necessary to demonstrate that it meets the requirements set forth in this Final Rule.[572] The Commission also requires each public utility transmission provider to submit a compliance filing within eighteen months of the effective date of this Final Rule revising its OATT or other document(s) subject to the Commission's jurisdiction as necessary to demonstrate that it meets the requirements set forth herein with respect to interregional transmission coordination procedures and an interregional cost allocation method or methods. As explained below, we expect that the twelve month and eighteen month deadlines provide sufficient time for each public utility transmission provider to meet the requirements of this Final Rule.

[572] *See* Appendix C for the *pro forma* Attachment K consistent with this Final Rule.

793. For those suggesting that current transmission planning and cost allocation initiatives should be allowed more time to develop, we find that the need to provide rates, terms and conditions of jurisdictional service that are just and reasonable and not unduly discriminatory or preferential, and the need to build new transmission facilities that more efficiently or cost-effectively support the reliable development and operation of wholesale electricity markets, requires that the reforms adopted in this Final Rule are implemented in a timely fashion.[573] The Commission concludes that the time periods provided for adoption of these reforms—twelve months for regional transmission planning and cost allocation reforms and eighteen months for interregional reforms—are reasonable and achievable. These extended time periods provide additional time for public utility transmission providers to work with their stakeholders to develop transmission planning and cost allocation processes that conform with the requirements adopted herein.

794. We find that the compliance time periods established in this Final Rule strike an appropriate balance between implementing needed reforms to transmission planning and cost allocation processes in a timely fashion and providing time for those involved in these processes to work with stakeholders to develop transmission planning and cost allocation processes that conform with the requirements adopted herein. Moreover, we

[573] This finding is supported by our discussion above in section II.

believe these compliance filing deadlines are compatible with the interests of those that intend to develop transmission planning processes that take into account the lessons learned through the ARRA-funded transmission planning initiatives, discussed above in section I.C and III.C.I, under which the participants of each interconnection are currently collaborating on transmission planning to produce an initial long-term plan in mid-2012 and a final plan in 2013. For this same reason, we are not persuaded by those commenters that recommend that the Commission require periodic status reports in lieu of compliance filings.

795. In response to commenters' requests, we clarify that an RTO or ISO and its public utility transmission provider members may make a compliance filing that demonstrates that some or all of its existing RTO and ISO transmission planning processes are already in compliance with this Final Rule, and we will consider this demonstration and any contrary views on compliance. We require every public utility transmission provider, including an RTO or ISO transmission provider, to file its existing or proposed OATT provisions with an explanation of how these provisions meet the requirements of this Final Rule. While many of the existing transmission planning and cost allocation processes and methods may be similar to what this Final Rule requires, others may differ because this Final Rule's requirements expand on the Order No. 890 requirements. Whether an existing process was approved previously by the Commission is not dispositive of whether that process complies with this Final Rule.

796. We recognize that it is possible that some existing RTO and ISO transmission planning and cost allocation processes may already satisfy the Commission's proposal in whole or in part. However, we decline to rule generically, in the absence of a record based on a comparison of existing practices with the provisions of this Final Rule, on the degree to which a particular RTO or ISO may already be in compliance.

797. Furthermore, public utility transmission owners that are part of Commission-jurisdictional RTOs and ISOs may demonstrate compliance through that RTO's or ISO's compliance filing and are not required to make a separate compliance filing. This includes, in response to SPP, compliance with the interregional transmission coordination requirements to the extent an RTO or ISO has negotiated the necessary arrangements on behalf of its members. In response to Omaha Public Power District, we encourage both RTO and ISO members and those not in an RTO or ISO to work together regarding regional transmission planning. We neither prohibit non-RTO/ISO members that are geographically adjacent to and/or contiguous with an RTO/ISO from participating in the RTO/ISO's regional transmission planning process nor do we require an RTO/ISO to admit nonmembers to its regional transmission planning process. The decision on whether to combine their transmission planning efforts in this way to comply with the regional transmission planning and regional cost allocation requirements and the interregional transmission coordination requirements and interregional cost allocation requirements of this Final Rule is a decision that is best left to the individual entities as

well as to the two regions in question. In addition, the OATT for the RTO or the ISO of which a public utility transmission provider is a part should include commonly agreed-to language describing that RTO/ISO's interregional transmission coordination with each neighboring transmission planning region.

798. In addition, in non-RTO/ISO regions, if public utility transmission providers in those regions decide to make combined compliance filings, they are free to do so. However, each public utility transmission providers' OATT must include the reforms required in this Final Rule.

B. Reciprocity

1. Commission Proposal

799. The Commission proposed that transmission providers that are not public utilities (i.e., non-public utility transmission providers) would have to adopt the requirements of the Proposed Rule as a condition of maintaining the status of their safe harbor tariff or otherwise satisfying the reciprocity requirement of Order No. 888.[574] The Commission

[574] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 181 (citing Order No. 888, FERC Stats. & Regs. ¶ 31,036 at 31,760-63). Under the *pro forma* OATT, a non-public utility transmission provider may satisfy the reciprocity condition in one of three ways. First, it may provide service under a tariff that has been approved by the Commission under the voluntary "safe harbor" provision of the *pro forma* OATT. A non-public utility transmission provider using this alternative submits a reciprocity tariff to the Commission seeking a declaratory order that the proposed reciprocity tariff substantially conforms to, or is superior to, the *pro forma* OATT. The non-public utility transmission provider then must offer service under its reciprocity tariff to any public utility transmission provider

(continued…)

also stated that if it finds on the appropriate record that a non-public utility transmission provider is not participating in the proposed regional transmission planning and cost allocation processes set forth in this Final Rule, the Commission may exercise its authority under FPA section 211A[575] on a case-by-case basis.[576]

2. Comments

800. Some commenters question whether non-jurisdictional entities can legally be required to participate in regional and interregional transmission planning and cost allocation processes. Several non-jurisdictional entities suggest that they cannot. For example, Bonneville Power asserts that the proposed mandatory cost allocation reforms could conflict with its statutory obligations. Bonneville Power states that it is required by statute to have Congressional approval before it can build facilities outside the Pacific

---

whose transmission service the non-public utility transmission provider seeks to use. Second, the non-public utility transmission provider may provide service to a public utility transmission provider under a bilateral agreement that satisfies its reciprocity obligation. Finally, the non-public utility transmission provider may seek a waiver of the reciprocity condition from the public utility transmission provider. *See* Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 163.

[575] FPA section 211A(b) provides, in pertinent part, that "the Commission may, by rule or order, require an unregulated transmitting utility to provide transmission services – (1) at rates that are comparable to those that the unregulated transmitting utility charges itself; and (2) on terms and conditions (not relating to rates) that are comparable to those under which the unregulated transmitting utility provides transmission services to itself and that are not unduly discriminatory or preferential." The non-public utility transmission providers referred to in this Final Rule include unregulated transmitting utilities that are subject to FPA section 211A.

[576] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 43.

Northwest or build major transmission facilities within the Pacific Northwest. Bonneville Power states that it is obligated to determine the appropriateness of its transmission expenditures, and those expenditures are subject to specific directives or limitations that Congress may include in its appropriation acts. As a result of these statutory obligations, Bonneville Power contends that it must retain the right to review each proposal and agree to any proposed allocation of costs from another party.

801. Western Area Power Administration states that it is a federal power marketing administration and must comply with statutory requirements that apply to such entities, such as the Anti-Deficiency Act, the Reclamation Project Act of 1939, and the Flood Control Act of 1944. Western Area Power Administration argues that these statutory requirements preclude involuntary cost allocation of third-party transmission facilities to it. Western Area Power Administration also argues that requiring it to incorporate a mandatory cost allocation share into its rates is inconsistent with the jurisdiction over, and power to review, Western Area Power Administration's rates that the Department of Energy delegated to the Commission.

802. Bonneville Power requests that the Commission explain the effect of reciprocity in the context of transmission planning and cost allocation. Bonneville Power states that if the Commission conditions reciprocity on adherence to the Proposed Rule, it requests that the Commission state in the Final Rule that it will accommodate deviations in compliance filings that are necessary to allow non-public utilities to participate.

Bonneville Power contends that if the Commission does not accept regional deviations, coordinated regional planning and cost allocation will likely be unworkable for both public and non-public utilities in the Pacific Northwest.

803. Public Power Council asserts that the Commission's proposed cost allocation method will drive non-public utilities out of the voluntary planning process. Public Power Council states that governmentally-owned utilities are subject to state statutes that may limit their ability to enter into contracts involving unknown future costs and that bind future district commissions or city councils. Public Power Council thus argues that the Commission should either abandon its proposal to require binding cost allocation agreements for non-RTO areas or withdraw its proposal that voluntary participant funding cannot be the sole method of cost allocation when the transmission provider is not a participant in an RTO. Omaha Public Power District states that it is committed to voluntary participation in the transmission planning process. However, it also states that as a state political subdivision it is not subject to the Commission's general jurisdiction under the FPA and that the Commission has no authority to set rates for it without its consent.

804. Four G&T Cooperatives argues that the Commission does not have jurisdiction under the FPA to require non-public utilities to participate in regional transmission planning processes or to agree to regional cost allocation methods. It also argues that the reciprocity provisions under Order Nos. 888 and 890 and the *pro forma* OATT do not

provide a basis for requiring non-public utilities to participate in regional transmission planning and cost allocation. National Rural Electric Coops state that the Commission has consistently refused to expand the reach of the reciprocity provision to include transmission customers other than those from which the non-public utility is taking service and those who are transmission-owning members of an RTO or ISO. G&T Cooperatives and National Rural Electric Coops request clarification that the Commission is not modifying the scope of the reciprocity requirement as established in Order Nos. 888, 890, and 890-A.

805. Western Grid Group, on the other hand, recommends that to engage non-jurisdictional utilities in regional planning groups, the Commission should make it clear that such participation is a requirement for Commission recognition of reciprocity tariffs and that all entities that share the grid have an obligation in the public interest to help plan its expansion and modernization.

806. SPP states that, consistent with the approach set forth in Order No. 890, the Commission should continue to encourage participation by non-jurisdictional entities in regional transmission planning processes. SPP also states that the Commission should consider requiring non-jurisdictional entities that have reciprocity tariffs on file with the Commission to modify those tariffs specifically to address the obligation to participate in the regional transmission planning process and cost allocation mechanism development. Similarly, San Diego Gas & Electric suggests that Order No. 888's reciprocity

requirements be enforced, as necessary. Anbaric and PowerBridge also believe that the Final Rule should apply to all transmission providers, including to those subject to the Commission's reciprocity requirements.

807. A number of commenters also address the Commission's authority under FPA section 211A. National Rural Electric Coops argue that the Commission's jurisdiction under FPA section 211A is limited to requiring a subset of unregulated transmitting utilities to provide transmission services to others on terms and conditions (not relating to rates) that are comparable to those under which the unregulated transmitting utility provides transmission services to itself and that are not unduly discriminatory or preferential. National Rural Electric Coops asserts that it is concerned that the Commission may be interpreting FPA section 211A to mean that it could invoke the provision in circumstances other than those in which it makes a finding that an unregulated transmitting utility is not treating its transmission customers in a way that is comparable to the way it treats itself. National Rural Electric Coops request that the Commission clarify that it will address questions of non-comparable treatment on a case-by-case basis as necessary. National Rural Electric Coops state that such a clarification could help avoid unnecessary litigation.

808. Imperial Irrigation District questions the Commission's legal authority to allocate costs to non-public utilities via either the reciprocity principle or FPA section 211A. It states that cost allocation is a rate issue, and Congress has not authorized the Commission

to set rates for non-public utilities. It argues that under the Commission's reciprocity principle, the Commission does not set rates of non-public utilities.

809. Large Public Power Council and Nebraska Public Power District state that the proposed reciprocity requirement would dramatically expand the commitment that non-public utilities were asked to make under Order No. 888 and ensuing orders and would greatly exceed the Commission's authority. They state that FPA section 211A does not permit the Commission to compel a non-public utility to contribute funding for regional or interregional transmission projects, nor would it enable the Commission to exercise any authority over the transmission planning or construction plans of a non-public utility. Sacramento Municipal Utility District urges the Commission to reconsider its proposal to invoke FPA section 211A authority on a case-by-case basis. It states that this is unnecessary, beyond the limited reciprocity requirements of Order Nos. 888 and 890, and it is beyond the Commission's authority. Western Area Power Administration states that FPA section 211A does not authorize the Commission to require unregulated transmitting utilities to engage in regional transmission planning and cost allocation.

810. Western Area Power Administration and National Rural Electric Coops request clarification that the Commission did not intend its statements in the Proposed Rule regarding FPA section 211A and the reciprocity provisions of Order Nos. 888 and 890 to expand its authority over non-public utilities. Georgia Transmission Cooperative argues that the Commission has not provided evidence to support application of FPA section

211A and that applying it would be inconsistent with prior Commission statements that non-public utilities are not subject to the same cost allocation rules as public utilities.

811. Transmission Access Policy Study Group and Colorado Independent Energy Association support the Commission's proposal to invoke reciprocity for non-jurisdictional transmission providers as needed to achieve its goals, and they agree with the Commission's decision not to invoke its authority under FPA section 211A. Colorado Independent Energy Association also recommends that to avoid the use of FPA section 211A, the Commission should provide a *pro forma* OATT and a date certain for non-jurisdictional entities to report their progress to the Commission regarding incorporation of the principles set forth in the Proposed Rule into their OATTs and practices. Transmission Agency of Northern California believes that the demonstrated willingness of non-public utility transmission providers to comply voluntarily with Commission directives shows that an explicit requirement that they comply with the Proposed Rule is unnecessary.

812. Other commenters, including MidAmerican and NextEra, suggest that the Commission should apply reciprocity or exercise its authority under FPA section 211A to require non-public utilities to participate in regional and interregional transmission planning and cost allocation processes. MidAmerican states that the Commission has the authority to require all non-jurisdictional utilities to comply with, and remain subject to, the proposed transmission planning and cost allocation requirements and that the

Commission should use this authority if it intends to achieve its stated objectives on a non-discriminatory basis. MidAmerican believes that failure to include all transmission providers will result in an inequitable burden for jurisdictional utilities and their customers, and it will create additional investment uncertainty for projects included in the regional plan. NextEra supports the use of FPA section 211A to extend the requirements of the Final Rule to unregulated transmitting utilities. It believes that invoking FPA section 211A on a case-by-case basis is risky and may not ensure maximum participation by unregulated utilities. AWEA states that the Commission should make clear its intention to invoke FPA section 211A as necessary to ensure needed participation in regional transmission efforts and cost allocation requirements.

813. Bonneville Power asserts in its response that neither the Proposed Rule, nor any of the initial comments, provide evidence that supports invoking FPA section 211A, either on a case-by-case basis or generically. Bonneville Power disagrees with MidAmerican that public utility transmission providers would be subject to undue discrimination if non-public utilities do not participate in transmission planning and cost allocation. It argues that any differences in treatment would result from adopting the Proposed Rule, not from discrimination by non-public utilities. Large Public Power Council disagrees that the Commission has authority under FPA section 211A to compel non-public utilities to participate fully in whatever planning and cost allocation rules are adopted in this

proceeding. It also states that the Commission cannot accomplish indirectly through its reciprocity provisions what it cannot accomplish directly under the statute.

814. MidAmerican also suggests that the Commission use its conditioning authority to require non-jurisdictional utilities to participate in the regional transmission planning and cost allocation processes, stating that the Commission has already taken this approach under FPA section 215. However, in reply, Large Public Power Council disagrees, noting that section 215 explicitly extends Commission jurisdiction for reliability purposes over a wide range of entities, thereby confirming that express direction from Congress is required before the Commission can exercise jurisdiction over otherwise non-jurisdictional entities.

3. Commission Determination

815. To maintain a safe harbor tariff, a non-public utility transmission provider must ensure that the provisions of that tariff substantially conform, or are superior, to the *pro forma* OATT as it has been revised by this Final Rule. As noted in the Proposed Rule, we are encouraged, based on the efforts that followed Order No. 890, that both public utility and non-public utility transmission providers collaborate in a number of regional transmission planning processes. We therefore do not believe it is necessary at this time to invoke our authority under FPA section 211A, which gives us authority to require non-public utility transmission providers to provide transmission services on a comparable and not unduly discriminatory or preferential basis. However, if the Commission finds

on the appropriate record that non-public utility transmission providers are not participating in the transmission planning and transmission cost allocation process required by this Final Rule, the Commission may exercise its authority under FPA section 211A on a case-by-case basis.

816. Given our decision above, we decline to adopt SPP's suggestion that the Commission require non-public utility transmission providers that have safe harbor tariffs on file to modify those tariffs specifically to address the transmission planning and cost allocation processes required by this Final Rule. Rather, it remains up to each non-public utility transmission provider whether it wants to maintain its safe harbor status by meeting the transmission planning and cost allocation requirements of this Final Rule.[577] We also note in response to National Rural Electric Coops and others that the Commission is not proposing any changes to the reciprocity provision of the *pro forma* OATT or any other document. The Commission is not modifying the scope of the reciprocity provision.

[577] For this same reason, we find that it is not necessary to address Anbaric and PowerBridge's suggestion that this Final Rule should apply to all transmission providers, including those subject to the Commission's reciprocity provisions and enforced as necessary. However, we reiterate our determination in section IV.E.2. that an entity participating in the regional transmission planning process can be identified as the beneficiary of a regional transmission facility and allocated associated costs, irrespective of its status as a public utility under the FPA.

817. We disagree with Colorado Independent Energy Association that the Commission should impose any requirements on non-public utility transmission providers for the purpose of avoiding recourse to section 211A, as we do not see any necessity, at this time, to invoke our authority under that section. In addition, we disagree with MidAmerican, NextEra, and SPP that we should establish requirements regarding participation by non-public utility transmission providers in regional and interregional transmission planning and cost allocation processes beyond those required by reciprocity. We likewise disagree with Western Grid Group that we need to clarify for non-public utility transmission providers the importance of their participation in the processes established by this Final Rule.

818. The Commission recognizes that many of the existing regional transmission planning processes are comprised of both public and non-public utility transmission providers. In the Proposed Rule, the Commission described the significance of its proposal for non-public utility transmission providers in terms of the principle of reciprocity.[578] None of the commenters has provided a persuasive reason for departing from the position taken in the Proposed Rule. Thus, as noted above, and consistent with the approach taken in Order No. 890, the Commission expects all public utility and non-public utility transmission providers to participate in the transmission planning and cost

[578] Proposed Rule, FERC Stats. & Regs. ¶ 32,660 at P 43.

allocation processes set forth in this Final Rule. The success of the reforms implemented here will be enhanced if all transmission owners participate. Further, we believe that non-public utility transmission providers will benefit greatly from the improved transmission planning and cost allocation processes required for public utility transmission providers because a well-planned grid is more reliable and provides more available, less congested paths for the transmission of electric power in interstate commerce. Those that take advantage of open access, including improved transmission planning and cost allocation, should be expected to follow the same requirements as public utility transmission providers.

819. In response to G&T Cooperatives and others, we note that the Commission is not acting here under the FPA to require non-public utility transmission providers to participate in regional transmission planning processes or to agree to a method or methods for allocating the costs of their transmission facilities. Under the reciprocity provision, if a public utility transmission provider seeks transmission service from a non-public utility transmission provider to which it provides open access transmission service, the non-public utility transmission provider that owns, controls or operates transmission facilities must provide comparable transmission service that it is capable of providing on its own system.[579] A non-public utility transmission provider that elects to receive such

[579] Order No. 890, FERC Stats. & Regs. ¶ 31,241 at P 163.

service, therefore, must do so on terms that satisfy the reciprocity condition. We disagree that we are using the principle of reciprocity to expand our jurisdiction over non-public utility transmission providers. Non-public utility transmission providers are free to decide whether they will seek transmission service that is subject to the Commission's jurisdiction, and we do not exercise jurisdiction over them when we determine the terms under which public utility transmission providers must provide that transmission service.

820. While a number of commenters argue that this Final Rule's reforms could conflict with their statutory obligations, no specific conflict has been presented for us to act on in this Final Rule. Concerns about possible conflicts should be raised in transmission cost allocation discussions and any subsequent Commission proceedings on proposed transmission cost allocation methods.

821. We disagree with National Rural Electric Coops that our discussion of FPA section 211A in the Proposed Rule is unclear or ambiguous. However, in response to National Rural Electric Coops we note that our intent is to invoke section 211A only on a case-by-case basis. We see no reason to reconsider our position on section 211A as Sacramento Municipal Utility District requests, nor a need to address additional arguments concerning the scope of our authority under section 211A given that we are not acting under section 211A in issuing this Final Rule. Likewise, in response to Georgia Transmission Cooperative, we do not need to provide evidence in this

proceeding to support the application of FPA section 211A because we are not applying it here.

822. With regard to Transmission Agency of Northern California's suggestion that an explicit requirement that non-public utility transmission providers comply with the Proposed Rule is unnecessary because they are already complying, we note that this Final Rule does not include any such explicit requirement and instead only notes an expectation that non-public utility transmission providers will participate voluntarily.

VI. Information Collection Statement

823. The Office of Management and Budget (OMB) requires that OMB approve certain information collection and data retention requirements imposed by agency rules.[580] Upon approval of a collection(s) of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of a rule will not be penalized for failing to respond to these collections of information unless the collections of information display a valid OMB control number.

824. The Commission is submitting the proposed modifications to its information collections to OMB for review and approval in accordance with section 3507(d) of the Paperwork Reduction Act of 1995.[581] In the Proposed Rule, the Commission solicited

[580] 5 C.F.R. 1320.11(b).

[581] 44 U.S.C. 3507(d).

comments on the need for this information, whether the information will have practical utility, the accuracy of provided burden estimates, ways to enhance the quality, utility, and clarity of the information to be collected or retained, and any suggested methods for minimizing the respondent's burden, including the use of automated information techniques. The Commission also included a chart that listed the estimated public reporting burdens for the proposed reporting requirements, as well as a projection of the costs of compliance for the reporting requirements. The Commission received one comment from Arizona Public Service Company specifically addressing the Commission burden estimate in the Proposed Rule.

825. Arizona Public Service Company states that while it supports the need for a robust regional transmission planning process, it contends that the burden estimate in the Proposed Rule understated the number of hours and the average rates of the employees working on these processes. As an example, Arizona Public Service Company states that it participates in WestConnect, which in the past twelve months has involved over two dozen regional or subregional transmission planning meetings. According to Arizona Public Service Company, many of these meetings last an entire day, and require a significant amount of preparation work prior to the meeting. It further contends that the Commission should have included calculation of travel expenses of participants in the regional transmission planning processes, including transportation, lodging, and meal expenses.

826. In the Proposed Rule, the Commission estimated the number of hours required for the average public utility transmission provider to comply with the minimum requirements included in the Proposed Rule. The burden estimates in this Final Rule represent the incremental burden changes related only to the requirements set forth in this Final Rule.[582] It should also be noted that the burden estimates are averages for all of the filers. Furthermore, we acknowledge that some regional transmission planning processes have been developed to date that may require more time to participate than the estimate that the Commission provided in the Proposed Rule. However, the fact that such processes have been developed reflects the choice of the participants in those regional transmission planning processes on how to comply with the Commission's rules, it does not mean that the Commission's rules necessarily required such processes. For example, we note that public utility transmission providers may decide, in a particular region or between regions, to develop a regional transmission planning process that includes more objectives and procedures than the minimum set forth in this Final Rule, which may increase the number of hours necessary to participate. In any event, Arizona Public Service Company did not provide any estimates of the number of hours that it has taken to participate in its regional transmission planning processes, nor suggested alternative

[582] 5 C.F.R. 1320.3(b)(1)-(2).

estimates. Thus, for the most part, the Commission adopts the burden estimates that it set out in the Proposed Rule.

827. As for the hourly rates of the employees, the Commission relies on average national salaries to develop hourly rates of the employees necessary to comply with the requirements adopted in this Final Rule. Again, we note that this is an average rate, and that rates may be higher or lower depending on the area of the country where the public utility transmission provider is located. Therefore, we find that the averages in the Proposed Rule are reasonable estimates of the average national rates for the employees described below.

828. Finally, the Commission has included, in its burden estimate, the number of hours that a public utility transmission provider may need to travel to participate in a regional transmission planning process and interregional transmission coordination procedures.

Burden Estimate and Information Collection Costs: The estimated Public Reporting burden and cost for the requirements contained in this Final Rule follow.

FERC-917 - Proposed Reporting Requirements in RM10-23	**Annual Number of Respondents (Filers)**	**Annual Number of Responses**	**Hours per Response**	**Total Annual Hours in Year 1**	**Total Annual Hours in Subsequent Years**
Participation in a transparent and open regional transmission planning process that meets regional transmission planning principles, includes consideration of transmission needs driven by Public	132	132	110 hrs in Year 1; 52 hrs in subsequent years	14520	6864

Policy Requirements, identifies and evaluates transmission facilities to meet needs, develops cost allocation method(s), and produces a regional transmission plan that describes and incorporates a cost allocation method(s) that meets the Commission's principles.					
Development of interregional transmission coordination procedures that meet the Commission's requirements, including the ongoing requirement to provide or post certain transmission planning information and provide annual data exchange, as well as the development of a cost allocation method for interregional transmission facilities that meets the Commission's principles.	132	132	133 hrs in Year 1; 43 hrs in subsequent years	17556	5676
Conforming tariff changes for local transmission planning, including those related to consideration of transmission needs driven by Public Policy Requirements; and conforming tariff changes for regional transmission planning and interregional transmission coordination.	132	132	57 hrs in Year 1; 25 hrs in subsequent years	7524	3300
Total Estimated Additional Burden Hours, Proposed for FERC-917 in NOPR in RM10-23				39600	15840

Cost to Comply:

Year 1: $4,514,400 or [39,600 hours X $114 per hour[583]]

Subsequent Years: $1,805,760 or [15,840 hours X $114 per hour]

Title: FERC-917

Action: Proposed Collections.

OMB Control No: 1902-0233.

Respondents: Public Utility Transmission Providers. An RTO or ISO also may file some materials on behalf of its members.

Frequency of Responses: Initial filing and subsequent filings.

Necessity of the Information:

829. Building on the reforms in Order No. 890, the Federal Energy Regulatory Commission adopts these amendments to the *pro forma* OATT to correct certain deficiencies in the transmission planning and cost allocation requirements for public utility transmission providers. The purpose of this Final Rule is to strengthen the *pro forma* OATT, so that the transmission grid can better support wholesale power markets and ensure that Commission-jurisdictional services are provided at rates, terms, and conditions that are just and reasonable and not unduly discriminatory or preferential. We expect to achieve this goal through this Final Rule by reforming electric transmission

[583] The estimated cost of $114 an hour is the average of the hourly costs of: attorney ($200), consultant ($150), technical ($80), and administrative support ($25).

planning requirements and establishing a closer link between cost allocation and regional transmission planning processes.

830. Interested persons may obtain information on reporting requirements by contacting the following: Federal Energy Regulatory Commission, 888 First Street NE, Washington, DC 20426 [Attention: Ellen Brown, Office of the Executive Director, e-mail: DataClearance@ferc.gov, Phone: (202) 502-8663, fax: (202) 273-0873. Comments concerning the collection of information and the associated burden estimate(s), may also be sent to the Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW, Washington, DC 20503 [Attention: Desk Officer for the Federal Energy Regulatory Commission, phone: (202) 395-4638, fax (202) 395-7285]. Due to security concerns, comments should be sent electronically to the following e-mail address: oira_submission@omb.eop.gov. Comments submitted to OMB should include OMB Control No. 1902-0233 and Docket No. RM10-23-000.

VII. Environmental Analysis

831. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[584] The Commission concludes that neither an Environmental Assessment nor an Environmental Impact Statement is required for this Proposed Rule

[584] *Regulations Implementing the National Environmental Policy Act*, Order No. 486, 52 FR 47897 (Dec. 17, 1987), FERC Stats. & Regs. ¶ 30,783 (1987).

because section 380.4(a)(15) of the Commission's regulations provides a categorical exemption for approval of actions under sections 205 and 206 of the FPA relating to rates and charges for the transmission or sale of electric energy subject to the Commission's jurisdiction, plus the classification, practices, contracts and regulations that affect rates, charges, classifications, and services.[585] The reforms herein do not require transmission or other facilities to be built, but rather establish transmission planning mechanisms that will result in a more appropriate allocation of costs and thus better ensure just and reasonable and not unduly discriminatory or preferential rates.

VIII. Regulatory Flexibility Act Analysis

832. The Regulatory Flexibility Act of 1980 (RFA)[586] generally requires a description and analysis of final rules that will have significant economic impact on a substantial number of small entities. This Final Rule applies to public utilities that own, control or operate interstate transmission facilities other than those that have received waiver of the obligation to comply with Order Nos. 888, 889, and 890. The total number of public utility transmission providers that, absent waiver, must modify their current OATTs by filing the revised *pro forma* OATT is 132. Of these public utility transmission providers,

[585] 18 C.F.R. 380.4(a)(15).

[586] 5 U.S.C. 601-612.

only 9 filers, or 6.8 percent, have output of four million MWh or less per year.[587] The Commission does not consider this a substantial number and, in any event, each of these entities retains its rights to request waiver of these requirements. The criteria for waiver that would be applied under this rulemaking for small entities is unchanged from that used to evaluate requests for waiver under Order Nos. 888, 889, and 890. Accordingly, the Commission certifies that this Final Rule will not have a significant economic impact on a substantial number of small entities.

IX. Document Availability

833. In addition to publishing the full text of this document in the Federal Register, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov) and in the Commission's Public Reference Room during normal business hours (8:30 a.m. to 5:00 p.m. Eastern time) at 888 First Street, NE, Room 2A, Washington, DC 20426.

834. From the Commission's Home Page on the Internet, this information is available on eLibrary. The full text of this document is available on eLibrary in PDF and

[587] A firm is "small" if, including its affiliates, it is primarily engaged in the generation, transmission, and/or distribution of electric energy for sale and its total electric output for the preceding fiscal year did not exceed 4 million megawatt-hours. Based on the filers of the annual FERC Form 1 and Form 1-F, as well as the number of companies that have obtained waivers, we estimate that 6.8 percent of the filers are "small."

Microsoft Word format for viewing, printing, and/or downloading. To access this document in eLibrary, type the docket number excluding the last three digits of this document in the docket number field.

835. User assistance is available for eLibrary and the Commission's web site during normal business hours from FERC Online Support at (202)502-6652 (toll free at 1-866-208-3676) or email at ferconlinesupport@ferc.gov, or the Public Reference Room at (202) 502-8371, TTY (202) 502-8659. E-mail the Public Reference Room at public.referenceroom@ferc.gov.

X. Effective Date and Congressional Notification

836. These regulations are effective [insert date 60 days after publication in the **FEDERAL REGISTER**]. The Commission has determined, with the concurrence of the Administrator of the Office of Information and Regulatory Affairs of OMB, that this rule is not a "major rule" as defined in section 351 of the Small Business Regulatory Enforcement Fairness Act of 1996. The Commission will submit this Final Rule to both houses of Congress and the Government Accountability Office.

By the Commission. Commissioner Moeller is dissenting, in part, with a separate statement attached.

(S E A L)

Nathaniel J. Davis, Sr.,
Deputy Secretary.

Regulatory Text

In consideration of the foregoing, the Commission amends part 35, Chapter I, Title 18, Code of Federal Regulations, as follows:

PART 35—FILING OF RATE SCHEDULES AND TARIFFS

1. The authority citation for part 35 continues to read as follows:

Authority: 16 U.S.C. 791a-825r, 2601-2645; 31 U.S.C. 9701; 42 U.S.C. 71-7352.

2. Amend § 35.28 as follows:

a. Paragraph (c)(1) through (c)(1)(iii) are revised.

b. Paragraph (c)(1)(vi) is revised.

c. Paragraphs (c)(3), (c)(3)(i), and (c)(3)(ii) are revised.

d. Paragraphs (c)(4) through (c)(4)(ii) are revised.

e. Paragraph (d) (1) is revised.

f. Paragraph (e)(1) is revised.

§ 35.28 Non-discriminatory open access transmission tariff.

* * * * *

(c) Non-discriminatory open access transmission tariffs.

(1) Every public utility that owns, controls, or operates facilities used for the transmission of electric energy in interstate commerce must have on file with the Commission a tariff of general applicability for transmission services, including ancillary services, over such facilities. Such tariff must be the open access pro forma tariff contained in Order No. 888, FERC Stats. & Regs. ¶ 31,036 (Final Rule on Open Access

and Stranded Costs), as revised by the open access pro forma tariff contained in Order No. 890, FERC Stats. & Regs. ¶ 31,241 (Final Rule on Open Access Reforms) and further revised in Order No. 1000, FERC Stats. & Regs. ¶ _____ (Final Rule on Transmission Planning and Cost Allocation by Transmission Owning and Operating Public Utilities), or such other open access tariff as may be approved by the Commission consistent with Order No. 888, FERC Stats. & Regs ¶ 31,306, Order No. 890, FERC Stats. & Regs. ¶ 32,241, and Order No. 1000, FERC Stats. & Regs. ¶ _____.

(i) Subject to the exceptions in paragraphs (c)(1)(ii), (c)(1)(iii), (c)(1)(iv) and (c)(1)(v) of this section, the pro forma tariff contained in Order No. 888, FERC Stats. & Regs. ¶ 31,036, as revised by the open access pro forma tariff contained in Order No. 890, FERC Stats. & Regs. ¶ 31,241 and further revised in Order No. 1000, FERC Stats. & Regs. ¶ _____, and accompanying rates, must be filed no later than 60 days prior to the date on which a public utility would engage in a sale of electric energy at wholesale in interstate commerce or in the transmission of electric energy in interstate commerce.

(ii) If a public utility owns, controls, or operates facilities used for the transmission of electric energy in interstate commerce as of [insert date that is 60 days after date of publication of the Final Rule in the **FEDERAL REGISTER**], it must file the revisions to the pro forma tariff contained in Order No. 890, FERC Stats. & Regs. ¶ 31,241, as amended by Order No. 1000, FERC Stats. & Regs. ¶ ____, pursuant to section 206 of the FPA and accompanying rates pursuant to section 205 of the FPA in

accordance with the procedures set forth in Order No. 890, FERC Stats. & Regs. ¶ 31,241 and Order No. 1000, FERC Stats. & Regs ¶ ____.

(iii) If a public utility owns, controls, or operates transmission facilities used for the transmission of electric energy in interstate commerce as of [insert date that is 60 days after date of publication of the Final Rule in the **FEDERAL REGISTER**], such facilities are jointly owned with a non-public utility, and the joint ownership contract prohibits transmission service over the facilities to third parties, the public utility with respect to access over the public utility's share of the jointly owned facilities must file the revisions to the pro forma tariff contained in Order No. 890, FERC Stats. & Regs. ¶ 31,241 as amended by Order No. 1000, FERC Stats. & Regs. ¶ ____, pursuant to section 206 of the FPA and accompanying rates pursuant to section 205 of the FPA.

* * * * *

(vi) Any public utility that seeks a deviation from the pro forma tariff contained in Order No. 888, FERC Stats. & Regs. ¶ 31,036, as revised in Order No. 890, FERC Stats. & Regs. ¶ 31,241 and Order No. 1000, FERC Stats. & Regs. ¶ _____, must demonstrate that the deviation is consistent with the principles of Order No. 888, FERC Stats. & Regs ¶ 31,036, Order No. 890, FERC Stats. & Regs. ¶ 31,241, and Order No. 1000, FERC Stats. & Regs. ¶ _____.

* * * * *

(3) Every public utility that owns, controls, or operates facilities used for the

transmission of electric energy in interstate commerce, and that is a member of a power pool, public utility holding company, or other multi-lateral trading arrangement or agreement that contains transmission rates, terms or conditions, must have on file a joint pool-wide or system-wide open access transmission tariff, which tariff must be the pro forma tariff contained in Order No. 888, FERC Stats. & Regs. ¶ 31,036, as revised by the pro forma tariff contained in Order No. 890, FERC Stats. & Regs. ¶ 31,241 and further revised in Order No. 1000, FERC Stats. & Regs. ¶ _____, or such other open access tariff as may be approved by the Commission consistent with Order No. 888, FERC Stats. & Regs. ¶ 31,036, Order No. 890, FERC Stats. & Regs. ¶ 31,241, and Order No. 1000, FERC Stats. & Regs. ¶ _____.

(i) For any power pool, public utility holding company or other multi-lateral arrangement or agreement that contains transmission rates, terms or conditions and that is executed after [insert date that is 60 days after date of publication of the Final Rule in the **FEDERAL REGISTER**], this requirement is effective on the date that transactions begin under the arrangement or agreement.

(ii) For any power pool, public utility holding company or other multi-lateral arrangement or agreement that contains transmission rates, terms or conditions and that is executed on or before [insert date that is 60 days after date of publication of the Final Rule in the **FEDERAL REGISTER**], a public utility member of such power pool, public utility holding company or other multi-lateral arrangement or agreement that owns,

controls, or operates facilities used for the transmission of electric energy in interstate commerce must file the revisions to its joint pool-wide or system-wide open access transmission tariff consistent with Order No. 890, FERC Stats. & Regs. ¶ 31,241 as amended by Order No. 1000, FERC Stats. & Regs. ¶ ____, pursuant to section 206 of the FPA and accompanying rates pursuant to section 205 of the FPA in accordance with the procedures set forth in Order No. 890, FERC Stats. & Regs. ¶ 31,241 and Order No. 1000, FERC Stats. & Regs ¶ ____.

* * * * *

(4) Consistent with paragraph (c)(1) of this section, every Commission-approved ISO or RTO must have on file with the Commission a tariff of general applicability for transmission services, including ancillary services, over such facilities. Such tariff must be the pro forma tariff contained in Order No. 888, FERC Stats. & Regs. ¶ 31,036, as revised by the pro forma tariff contained in Order No. 890, FERC Stats. & Regs. ¶ 31,241 and further revised in Order No. 1000, FERC Stats. & Regs. ¶ _____, or such other open access tariff as may be approved by the Commission consistent with Order No. 888, FERC Stats. & Reg. ¶ 31,036, Order No. 890, FERC Stats. & Regs. ¶ 31,241, and Order No. 1000, FERC Stats. & Regs. ¶ _____ .

(i) Subject to paragraph (c)(4)(ii) of this section, a Commission-approved ISO or RTO must file the revisions to the pro forma tariff contained in Order No. 890, FERC Stats. & Regs. ¶ 31,241 as amended by Order No. 1000, FERC Stats. & Regs. ¶ ____,

pursuant to section 206 of the FPA and accompanying rates pursuant to section 205 of the FPA in accordance with the procedures set forth in Order No. 890, FERC Stats. & Regs. ¶ 31,241 and Order No. 1000, FERC Stats. & Regs ¶ ____.

(ii) If a Commission-approved ISO or RTO can demonstrate that its existing open access tariff is consistent with or superior to the revisions to the pro forma tariff contained in Order No. 888, FERC Stats. & Regs. ¶ 31,036, as revised by the pro forma tariff in Order No. 890, FERC Stats. & Regs. ¶ 31,241 and further revised in Order No. 1000, FERC Stats. & Regs. ¶ _____, or any portions thereof, the Commission-approved ISO or RTO may instead set forth such demonstration in its filing pursuant to section 206 in accordance with the procedures set forth in Order No. 1000, FERC Stats. & Regs ¶ ____.

(d) Waivers. * * *

(1) No later than [insert date that is 60 days after date of publication of the Final Rule in the **FEDERAL REGISTER**], or

* * * * *

(e) Non-public utility procedures for tariff reciprocity compliance.

(1) A non-public utility may submit a transmission tariff and a request for declaratory order that its voluntary transmission tariff meets the requirements of Order No. 888, FERC Stats. & Regs. ¶ 31,036, Order No. 890, FERC Stats. & Regs. ¶ 31,241, and Order No. 1000, FERC Stats. & Regs. ¶ _____ .

* * * * *

Note: The following appendices will not be published in the Code of Federal Regulations.

Appendix A: Summary of Compliance Filing Requirements

Deadline (months after the effective date of the Final Rule)	Compliance Action	Section of the Final Rule
12 months	Submit revised Attachment K of the *pro forma* OATT and any other Commission jurisdictional documents to include local and regional transmission planning processes that are consistent with the requirements of this Final Rule.	Section III.A.
12 months	Submit revised Attachment K of the *pro forma* OATT and other Commission jurisdictional documents to include a cost allocation method or methods for regional cost allocation consistent with principles of this Final Rule.	Section III.C.
18 months	Submit revised Attachment K of the *pro forma* OATT and any other Commission jurisdictional documents to include an interregional transmission coordination procedure or procedures consistent with the requirements of this Final Rule.	Section IV.C.
18 months	Submit revised Attachment K of the *pro*	Section IV.D.

forma OATT and any other Commission jurisdictional documents to include a cost allocation method or methods for interregional cost allocation consistent with the principles of this Final Rule.

Appendix B: Abbreviated Names of Commenters

The following two tables contain the abbreviated names of initial and reply commenters that are used in this Final Rule.

Initial Commenters

Abbreviation	Initial Commenter(s)
26 Public Interest Organizations	Alliance for Clean Energy New York; Citizens Utility Board of Wisconsin; Climate and Energy Project; Conservation Law Foundation; Earthjustice; Environment Northeast; Environmental Defense Fund; Environmental Law & Policy Center; Fresh Energy; Great Plains Institute; Institute for Market Transformation; Iowa Environmental Council; Land Trust Alliance; National Audubon Society; Natural Resources Defense Council; Pennsylvania Land Trust Alliance; Nevada Wilderness Project; NW Energy Coalition; Pace Energy and Climate Center; Piedmont Environmental Council; Project for Sustainable FERC Energy Policy; Sierra Club; Southern Alliance for Clean Energy; The Wilderness Society; Union of Concerned Scientists; and Western Grid Group
Ad Hoc Coalition of Southeastern Utilities	Central Electric Power Cooperative, Inc.; Dalton Utilities; Georgia Transmission Corporation; JEA; MEAG Power; Orlando Utilities Commission; Progress Energy Service Company, LLC (on behalf of Progress Energy Carolinas, Inc. and Progress Energy Florida, Inc.); South Carolina Electric & Gas Company; South Carolina Public Service Authority (Santee Cooper); and Southern Company Services, Inc. (on behalf of Alabama Power Company, Georgia Power Company, Gulf Power Company, Mississippi Power Company, and Southern Power Company)
AEP	American Electric Power Service Corporation

Abbreviation	Initial Commenter(s)
Alabama PSC	Alabama Public Service Commission
Allegheny Energy Companies	Monongahela Power Company; The Potomac Edison Company; West Penn Power Company; Trans-Allegheny Interstate Line Company; and Allegheny Energy Supply Company, LLC
ALLETE	ALLETE, Inc.
Alliant Energy	Alliant Energy Corporate Services, Inc.
American Antitrust Institute	American Antitrust Institute
American Forest & Paper	American Forest & Paper Association
American Transmission	American Transmission Company LLC
Anbaric and PowerBridge	Anbaric Holding, LLC; PowerBridge, LLC
APPA	American Public Power Assocation
Arizona Corporation Commission	Arizona Corporation Commission
Arizona Public Service Company	Arizona Public Service Company
Atlantic Grid	Atlantic Grid Development, LLC on behalf of Atlantic Wind Connection
Avista and Puget Sound	Avista Corporation and Puget Sound Energy, Inc.
AWEA	American Wind Energy Association; Wind on the Wires; Renewable Northwest Project; Mid-Atlantic Renewable Energy Coalition; Alliance for Clean Energy, Inc.; Interwest Energy Alliance; RENEW; the Wind Coalition; and Center for Energy Efficiency and Renewable Technologies
Baltimore Gas & Electric	Baltimore Gas & Electric Company

Abbreviation	Initial Commenter(s)
Bay Area Municipal Transmission Group	City of Santa Clara, California; the City of Palo Alto, California; and the City of Alameda, California
Bonneville Power	Bonneville Power Administration
Boundless Energy and Sea Breeze	Boundless Energy, LLC and Sea Breeze Pacific Regional Transmission System
Brattle Group (The)	Peter Fox-Penner; Johannes Pfeifenberger; and Delphine Hou
California Commissions	California Public Utilities Commission and the Energy Resources Conservation and Development Commission of the State of California
California ISO	California Independent System Operator Corporation
California Municipal Utilities	California Municipal Utilities Association (Cities of Alameda; Anaheim; Azusa; Banning; Burbank; Cerritos; Colton; Corona; Glendale; Gridley; Healdsburg; Hercules; Lodi; Lompoc; Moreno Valley; Needles; Palo Alto; Pasadena; Pittsburg; Rancho Cucamonga; Redding; Riverside; Roseville; Santa Clara; Shasta Lake; Ukiah; and Vernon; the Imperial; Merced; Modesto; Turlock Irrigation Districts; the Northern California Power Agency; Southern California Public Power Authority; Transmission Agency of Northern California; Lassen Municipal Utility District; Power and Water Resources Pooling Authority; Sacramento Municipal Utility District; the Trinity and Truckee Donner Public Utility Districts; the Metropolitan Water District of Southern California; and the City and County of San Francisco, and Hetch-Hetchy)
California Transmission	Sacramento Municipal Utility District; the Imperial

Abbreviation	Initial Commenter(s)
Planning Group	Irrigation District; the Los Angeles Department of Water and Power; the Southern California Public Power Authority; the Transmission Agency of Northern California; the Turlock Irrigation District; the Southern California Edison Company; the Pacific Gas & Electric Company and the San Diego Gas & Electric Company
California State Water Project	California Department of Water Resources State Water Project
CapX2020 Utilities	Central Minnesota Municipal Power Agency; Dairyland Power Cooperative; Great River Energy; Minnesota Power; Minnkota Power Cooperative; Missouri River Energy Services; Otter Tail Power Company; Rochester Public Utilities; Southern Minnesota Municipal Power Agency; WPPI Energy; and Xcel Energy Inc.
Champlain Hudson	Champlain Hudson Power Express, Inc.
City and County of San Francisco	City and County of San Francisco
City of Los Angeles Department of Water and Power	City of Los Angeles Department of Water and Power
City of Santa Clara	City of Santa Clara, California
Clean Energy Group	Clean Energy Group
Clean Line	Clean Line Energy Partners LLC
Coalition for Fair Transmission Policy	CMS Energy Corporation; Consolidated Edison; DTE Energy Company; Northeast Utilities; PPL Corporation; Progress Energy, Inc.; Public Service Enterprise Group; SCANA Corporation; Southern Company; United Illuminating Company

Abbreviation	Initial Commenter(s)
Colorado Independent Energy Association	Colorado Independent Energy Association
ColumbiaGrid	ColumbiaGrid (Avista Corporation; Bonneville Power Administration; Public Utility District No. 1 of Chelan County, Washington; Public Utility District No. 1 of Snohomish County, Washington; Public Utility District No. 2 of Grant County, Washington; Puget Sound Energy, Inc.; City of Tacoma, Department of Public Utilities, Light Division; and the City of Seattle, by and through its City Light Department)
Connecticut & Rhode Island Commissions	Connecticut Department of Public Utility Control and the Rhode Island Public Utilities Commission
Conservation Law Foundation	Conservation Law Foundation
Consolidated Edison and Orange & Rockland	Consolidated Edison Company of New York, Inc. and Orange and Rockland Utilities, Inc.
Consumers Energy Company	Consumers Energy Company
Dayton Power and Light	Dayton Power and Light Company (The)
DC Energy	DC Energy, LLC
Delaware PSC	Delaware Public Service Commission
Direct Energy	Direct Energy Services, LLC; Direct Energy Business, LLC; and Energy America, LLC
Dominion	Dominion Resources Services, Inc.
Duke	Duke Energy Corporation
Duquesne Light Company	Duquesne Light Company

ATTACHMENT K

Transmission Planning Process

Local Transmission Planning

The Transmission Provider shall establish a coordinated, open and transparent planning

process with its Network and Firm Point-to-Point Transmission Customers and other interested parties to ensure that the Transmission System is planned to meet the needs of both the Transmission Provider and its Network and Firm Point-to-Point Transmission Customers on a comparable and not unduly discriminatory basis. The Transmission Provider's coordinated, open and transparent planning process shall be provided as an attachment to the Transmission Provider's Tariff.

The Transmission Provider's planning process shall satisfy the following nine principles, as defined in Order No. 890: coordination, openness, transparency, information exchange, comparability, dispute resolution, regional participation, economic planning studies, and cost allocation for new projects. The planning process also shall include the procedures and mechanisms for considering transmission needs driven by Public Policy Requirements consistent with Order No. 1000. The planning process also shall provide a mechanism for the recovery and allocation of planning costs consistent with Order No. 890.

The description of the Transmission Provider's planning process must include sufficient detail to enable Transmission Customers to understand:

(i) The process for consulting with customers;

(ii) The notice procedures and anticipated frequency of meetings;

(iii) The methodology, criteria, and processes used to develop a transmission plan;

(iv) The method of disclosure of criteria, assumptions and data underlying a transmission plan;

(v) The obligations of and methods for Transmission Customers to submit data to the Transmission Provider;

(vi) The dispute resolution process;

(vii) The Transmission Provider's study procedures for economic upgrades to address congestion or the integration of new resources;

(viii) The Transmission Provider's procedures and mechanisms for considering transmission needs driven by Public Policy Requirements, consistent with Order No. 1000; and

(ix) The relevant cost allocation method or methods.

Regional Transmission Planning

The Transmission Provider shall participate in a regional transmission planning process through which transmission facilities and non-transmission alternatives may be proposed and evaluated. The regional transmission planning process also shall develop a regional transmission plan that identifies the transmission facilities necessary to meet the needs of

transmission providers and transmission customers in the transmission planning region. The regional transmission planning process must be consistent with the provision of Commission-jurisdictional services at rates, terms and conditions that are just and reasonable and not unduly discriminatory or preferential, as described in Order No. 1000. The regional transmission planning process shall be described in an attachment to the Transmission Provider's Tariff.

The Transmission Provider's regional transmission planning process shall satisfy the following seven principles, as set out and explained in Order Nos. 890 and 1000: coordination, openness, transparency, information exchange, comparability, dispute resolution, and economic planning studies. The regional transmission planning process also shall include the procedures and mechanisms for considering transmission needs driven by Public Policy Requirements, consistent with Order No. 1000. The regional transmission planning process shall provide a mechanism for the recovery and allocation of planning costs consistent with Order No. 890.

Nothing in the regional transmission planning process shall include an unduly discriminatory or preferential process for transmission project submission and selection.

The description of the regional transmission planning process must include sufficient

detail to enable Transmission Customers to understand:

(i) The process for consulting with customers;

(ii) The notice procedures and anticipated frequency of meetings;

(iii) The methodology, criteria, and processes used to develop a transmission plan;

(iv) The method of disclosure of criteria, assumptions and data underlying transmission plan;

(v) The obligations of and methods for transmission customers to submit data;

(vi) Process for submission of data by nonincumbent developers of transmission projects that wish to participate in the transmission planning process and seek regional cost allocation;

(vii) Process for submission of data by merchant transmission developers that wish to participate in the transmission planning process;

(viii) The dispute resolution process;

(ix) The study procedures for economic upgrades to address congestion or the integration of new resources;

(x) The procedures and mechanisms for considering transmission needs driven by Public Policy Requirements, consistent with Order No. 1000; and

(xi) The relevant cost allocation method or methods.

The regional transmission planning process must include a cost allocation method or

methods that satisfy the six regional cost allocation principles set forth in Order No. 1000.

Interregional Transmission Coordination

The Transmission Provider, through its regional transmission planning process, must coordinate with the public utility transmission providers in each neighboring transmission planning region within its interconnection to address transmission planning coordination issues related to interregional transmission facilities. The interregional transmission coordination procedures must include a detailed description of the process for coordination between public utility transmission providers in neighboring transmission planning regions (i) with respect to each interregional transmission facility that is proposed to be located in both transmission planning regions and (ii) to identify possible interregional transmission facilities that could address transmission needs more efficiently or cost-effectively than separate regional transmission facilities. The interregional transmission coordination procedures shall be described in an attachment to the Transmission Provider's Tariff

The Transmission Provider must ensure that the following requirements are included in any applicable interregional transmission coordination procedures:

(1) A commitment to coordinate and share the results of each transmission planning region's regional transmission plans to identify possible interregional transmission facilities that could address transmission needs more efficiently or cost-effectively than separate regional transmission facilities, as well as a procedure for doing so;
(2) A formal procedure to identify and jointly evaluate transmission facilities that are proposed to be located in both transmission planning regions;
(3) An agreement to exchange, at least annually, planning data and information;
and (4) A commitment to maintain a website or e-mail list for the communication of information related to the coordinated planning process.

The Transmission Provider must work with transmission providers located in neighboring transmission planning regions to develop a mutually agreeable method or methods for allocating between the two transmission planning regions the costs of a new interregional transmission facility that is located within both transmission planning regions. Such cost allocation method or methods must satisfy the six interregional cost allocation principles set forth in Order No. 1000.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Transmission Planning and Cost Allocation by Transmission Owning and Operating Public Utilities — Docket No. RM10-23-000

(Issued July 21, 2011)

MOELLER, Commissioner, *dissenting in part*:

While I offer substantial praise for this final rule, the Commission should have taken a different approach to several important issues. But before addressing these issues, we must recognize that all of the nation's difficulties in building needed transmission will not be resolved by this rule. Rather, this rule largely addresses planning for long-distance transmission lines, which is only a subset of the critical issues that are inhibiting needed investment.

This rule cannot address issues like the delays caused by other federal agencies in the siting of important projects, as this Commission lacks the legal authority to require other federal agencies to act.[1] And this rule also cannot address issues of state law, regardless of the reliability needs that are served by a new transmission line. Moreover, and as described further below, this rule did not address whether a transmission provider can thwart competitive options by refusing to upgrade its transmission system. For these reasons, this rule will not resolve all of the difficult issues that discourage this nation from constructing needed transmission lines.

Regarding the issues that the final rule does address, I believe that the owner of a transmission network should have been provided with greater flexibility to ensure the reliability of its own network. Moreover, the rule should have clarified that a right of first refusal is not a right of "forever" refusal. That is, a right to "forever" block a needed transmission project could prevent the lowest-cost power from reaching consumers.

[1] See the comments of PJM at 17, which state that, "[t]he PJM Board approved the Susquehanna-Roseland 500 kV line in 2007. The Susquehanna-Roseland line was approved by the state regulatory commissions in Pennsylvania and New Jersey for 2012. The line is currently delayed by the National Parks Service [sic] and is not expected to be in service until 2014 at the earliest."

To encourage needed transmission investment, the final rule permits incumbent transmission owners to maintain their existing rights of first refusal for: (1) local projects where the incumbent does not seek to share the costs of those projects; (2) upgrades to existing assets; and (3) projects on existing right of way.[2] However, notably absent from these categories of projects is the right of a utility to build a project within its franchised service territory in order to maintain the reliability of its existing network – regardless of whether the cost of that project is allocated on a regional basis.

In my view, transmission providers should have been entitled under the final rule to maintain their rights of first refusal to build a new transmission facility that is: (1) located entirely within the provider's franchised service territory; and (2) identified by the provider as needed to satisfy NERC reliability standards – even if that facility is selected in a regional transmission plan for purposes of cost allocation. And because a transmission provider would have retained its authority to address reliability issues in its franchised service territory, the final rule would not have needed its blanket waiver of penalties in the event that a competitor fails to fix a reliability issue.[3]

Had we allowed all reliability projects within a franchised service territory to retain a right of first refusal, this Commission would have emphasized its commitment to reliability. An incumbent transmission provider should be responsible for reliability needs in its franchised territory without regard to cost allocation. And by granting a blanket waiver of penalties, the final rule could be placing the Commission in a difficult position if a blackout results in widespread loss of power, and we are unable to assess a penalty.

My approach also would have encouraged transmission owners to seek regional cost allocation for their own local projects as a way of balancing regional costs. Such a balancing of projects could help ensure that all the parts of a region receive benefits that are at least roughly equivalent. Yet under the final rule, local projects that have their costs assigned regionally generally cannot maintain a right of first refusal, thus

---

[2] Section III.B.3.d of the final rule, at PP 318-319.

[3] For a description of the blanket waiver, see section III.B.4.b of the final rule, at P 344 ("Provided the public utility transmission provider follows the NERC approved mitigation plan, the Commission will not subject that public utility transmission provider to enforcement action for the specific NERC reliability standard violation(s) caused by a nonincumbent transmission developer's decision to abandon a transmission facility.")

discouraging transmission owners from seeking regional cost allocation for their local projects. For this reason, instead of encouraging more regional cooperation, the rule could ultimately discourage such cooperation by encouraging more local transmission projects.

In addition to my concerns regarding reliability, this Commission should have clarified that it was willing to protect the energy markets against misuse of the right of first refusal. That is, the Commission should have emphasized that a right of first refusal in a Commission-jurisdictional tariff is not license to effectively block, or endlessly delay building, a project that would efficiently and cost effectively provide significant benefits to a transmission network. While an incumbent utility with a right of first refusal is entitled to have the ability to exercise its initial right to develop a project, if it decides not to construct, the opportunity to construct the project and thus improve the power grid should be available to a non-incumbent developer.

A review of the transmission projects that have been adopted in various regional plans indicates that most projects will be allowed to retain the right of first refusal under the final rule, as most projects involve upgrades to existing assets, or they are built on an existing right of way, or their costs are not allocated to other transmission providers.[4] Thus, given the extensive number of projects that will be allowed to retain a right of first refusal, the Commission should have emphasized that a transmission provider cannot use a Commission-jurisdictional[5] tariff to prevent the lowest-cost power from reaching consumers.

Recognizing that no party to this proceeding asserted that a right of first refusal grants its holder a right to refuse building a project forever, I believe that a federal right of first refusal must be exercised within a reasonable time frame. The record in this case suggests that 90 days is a reasonable time frame for management to make a decision on

---

[4] For a list of transmission projects that have been approved in PJM, see the various plans for PJM, and a comprehensive list available at: http://www.pjm.com/planning/rtep-upgrades-status/construct-status.aspx. And see Chapter 8 of CAISO's transmission plan for 2010-2011 dated May 18, 2011, available at: http://www.caiso.com/Documents/Board-approvedISO2010-2011TransmissionPlan.pdf.

[5] Consistent with the remainder of the rule, any time limitation on a right of first refusal under my approach would be subject to relevant state and other law concerning property rights, contracts, utility franchises, zoning, siting, permitting, easements, or rights of way. *See* section III.B.2.c of the final rule, at P 287.

whether to exercise its right to build a project.[6] While adoption of a 90-day time frame for transmission providers need not have been mandated, the Commission should have encouraged every region to adopt a time frame that best reflects the needs and circumstances of that region.[7]

In conclusion, new transmission lines can sometimes be the lowest-cost way to improve the delivery of electricity. By building needed transmission, our nation's transmission network can be maintained at reliability levels that are the envy of the world, while simultaneously improving consumer access to lower-cost power generation. Plus, a well-designed transmission network can allow efficient and cost-effective renewable resources to compete on an equal basis with traditional sources of power. While this rule moves us forward to achieve those goals, a different approach would have been better on the issues described above.

_____

Philip D. Moeller
Commissioner

[6] Comments of Southwest Power Pool at 14-27; AEP Comments at 3, 19; Comments of Edison Electric Institute at 46-47, Comments of Iberdrola Renewables at 23-24; Comments of Indianapolis Power & Light at 32; MidAmerican Comments at 24; Comments of MISO Transmission Owners at 73; Comments of Oklahoma Gas and Electric Co., at 1, 12, 25; SCE Comments at 41-43; PSEG Reply Comments at 12; Westar Comments at 6; Comments of ITC Companies at 4, 22; Comments of CapX2020 Utilities at 11, where the CapX2020 Utilities consist of Central Minnesota Municipal Power Agency, Dairyland Power Cooperative, Great River Energy, Minnesota Power, Minnkota Power Cooperative, Missouri River Energy Services, Otter Tail Power Co., Rochester Public Utilities, Southern Minnesota Municipal Power Agency, WPPI Energy, and Xcel Energy Inc. In contrast to these comments on a 90-day time limit, LS Power and NextEra object to any right of first refusal and state that a 90-day limitation does not resolve their objections. UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

18 CFR Part 35

[Docket No. RM21-17-000; Order No. 1920]

Building for the Future Through Electric Regional Transmission Planning and Cost Allocation

(Issued May 13, 2024)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Final rule.

SUMMARY: The Federal Energy Regulatory Commission (Commission) revises the *pro forma* Open Access Transmission Tariff (OATT) to remedy deficiencies in the Commission's existing regional and local transmission planning and cost allocation requirements. In this final rule, the Commission requires transmission providers to conduct Long-Term Regional Transmission Planning that will ensure the identification, evaluation, and selection, as well as the allocation of the costs, of more efficient or cost-effective regional transmission solutions to address Long-Term Transmission Needs. The Commission also directs other reforms to improve coordination of regional transmission planning and generator interconnection processes, require consideration of certain alternative transmission technologies in regional transmission planning processes, and improve transparency of local transmission planning processes and coordination between regional and local transmission planning processes. These reforms are intended to ensure that existing regional and local transmission planning and cost allocation

requirements are just, reasonable, and not unduly discriminatory or preferential.

EFFECTIVE DATE: This final rule will become effective **[INSERT DATE 60 DAYS AFTER DATE OF PUBLICATION IN THE FEDERAL REGISTER]**

Appendix A: Abbreviated Names of Commenters
Appendix B: Pro Forma Open Access Transmission Tariff Attachment K

I. Introduction and Background

1. In this final rule, the Commission acts under section 206 of the Federal Power Act (FPA) to adopt reforms to its electric transmission planning and cost allocation requirements.[1] The reforms herein will remedy deficiencies in the Commission's existing regional and local transmission planning and cost allocation requirements to ensure that the rates, terms, and conditions for transmission service provided by public utility transmission providers (transmission providers)[2] remain just and reasonable and not

[1] 16 U.S.C. 824e.

[2] Section 201(e) of the FPA, 16 U.S.C. 824(e), defines "public utility" to mean "any person who owns or operates facilities subject to the jurisdiction of the Commission under this subchapter." As stated in the Order No. 888 *pro forma* Open Access Transmission Tariff (OATT), "transmission provider" is a "public utility (or its Designated Agent) that owns, controls, or operates facilities used for the transmission of electric energy in interstate commerce and provides transmission service under the Tariff." *Promoting Wholesale Competition Through Open Access Non-Discriminatory Transmission Servs. by Pub. Utils.; Recovery of Stranded Costs by Pub. Utils. & Transmitting Utils.*, Order No. 888, 61 FR 21540 (May 10, 1996), FERC Stats. & Regs. ¶ 31,036 (1996) (cross-referenced at 75 FERC ¶ 61,080), *order on reh'g*, Order No. 888-A, 62 FR 12274 (Mar. 14, 1997), FERC Stats. & Regs. ¶ 31,048 (cross-referenced at 78 FERC ¶ 61,220), *order on reh'g*, Order No. 888-B, 81 FERC ¶ 61,248 (1997), *order on reh'g*, Order No. 888-C, 82 FERC ¶ 61,046 (1998), *aff'd in relevant part sub nom. Transmission Access Pol'y Study Grp. v. FERC*, 225 F.3d 667 (D.C. Cir. 2000), *aff'd sub nom. N.Y. v. FERC*, 535 U.S. 1 (2002); *Pro forma* OATT section I.1 (Definitions). The

unduly discriminatory or preferential. This final rule builds upon Order No. 888, Order No. 890,[3] and Order No. 1000,[4] in which the Commission incrementally developed the requirements that govern regional transmission planning and cost allocation processes to ensure that Commission-jurisdictional rates remain just and reasonable and not unduly discriminatory or preferential. Specifically, in this final rule, we find that there is substantial evidence to support the conclusion that the existing regional transmission planning and cost allocation processes are unjust, unreasonable, and unduly discriminatory or preferential because the Commission's existing transmission planning and cost allocation requirements do not require transmission providers to: (1) perform a sufficiently long-term assessment of transmission needs that identifies Long-Term Transmission Needs;[5] (2) adequately account on a forward-looking basis for known

term "transmission provider" includes a public utility transmission owner when the transmission owner is separate from the transmission provider, as is the case in regional transmission organizations (RTO) and independent system operators (ISO).

[3] *Preventing Undue Discrimination & Preference in Transmission Serv.*, Order No. 890, 72 FR 12266 (Mar. 15, 2007), FERC Stats. & Regs. ¶ 31,241, 118 FERC ¶ 61,119 (2007), *order on reh'g,* Order No. 890-A, 73 FR 2984 (Jan. 16, 2008), FERC Stats. & Regs. ¶ 31,261 (2007) (cross-referenced at 118 FERC ¶ 61,119), *order on reh'g and clarification,* Order No. 890-B, 73 FR 39092 (July 8, 2008), 123 FERC ¶ 61,299 (2008), *order on reh'g,* Order No. 890-C, 74 FR 12540 (Mar. 25, 2009), 126 FERC ¶ 61,228 (2009), *order on clarification*, Order No. 890-D, 74 FR 61511 (Nov. 25, 2009), 129 FERC ¶ 61,126 (2009).

[4] *Transmission Plan. & Cost Allocation by Transmission Owning & Operating Pub. Utils.*, Order No. 1000, 76 FR 49842 (Aug. 11, 2011), 136 FERC ¶ 61,051 (2011), Order No. 1000-A, 77 FR 32184 (May 31, 2012), 139 FERC ¶ 61,132 (2012), *order on reh'g & clarification*, Order No. 1000-B, 141 FERC ¶ 61,044 (2012), *aff'd sub nom. S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d 41 (D.C. Cir. 2014).

[5] All capitalized terms are defined below. *Infra* Use of Terms section.

determinants of Long-Term Transmission Needs; and (3) consider the broader set of benefits of regional transmission facilities planned to meet those Long-Term Transmission Needs. Accordingly, we believe that it is necessary to revisit existing transmission planning and cost allocation requirements. We conclude that adopting the reforms of this final rule, as previously contemplated in the Notice of Proposed Rulemaking,[6] will remedy the identified deficiencies in existing regional and local transmission planning and cost allocation requirements, as discussed below, and will ensure the identification, evaluation, and selection, as well as the allocation of the costs, of more efficient or cost-effective regional transmission solutions to address Long-Term Transmission Needs.

2. Specifically, the reforms adopted in this final rule require transmission providers in each transmission planning region to participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning.[7] This final rule adopts specific requirements regarding how transmission providers must conduct Long-Term Regional Transmission Planning, including, among other things, the use of

[6] *Bldg. for the Future Through Elec. Reg'l Transmission Planning & Cost Allocation & Generator Interconnection*, 87 FR 26504 (May 4, 2022), 179 FERC ¶ 61,028 (2022) (NOPR); *see also Bldg. for the Future Through Elec. Reg'l Transmission Planning & Cost Allocation & Generator Interconnection*, 86 FR 40266 (July 27, 2021), 176 FERC ¶ 61,024 (2021) (ANOPR).

[7] For purposes of this final rule, and consistent with Order No. 1000, a transmission planning region is one in which transmission providers, in consultation with stakeholders and affected states, have agreed to participate for purposes of regional transmission planning and development of a single regional transmission plan. *See* Order No. 1000, 136 FERC ¶ 61,051 at P 160.

scenarios to identify Long-Term Transmission Needs and Long-Term Regional Transmission Facilities to meet those needs.

3. This final rule also requires transmission providers to measure and use at least the seven specified benefits to evaluate Long-Term Regional Transmission Facilities as part of Long-Term Regional Transmission Planning. In addition, this final rule requires transmission providers to calculate the benefits of Long-Term Regional Transmission Facilities over a time horizon that covers, at a minimum, 20 years starting from the estimated in-service date of the transmission facilities and requires that this minimum 20-year benefit horizon be used both for the evaluation and selection of Long-Term Regional Transmission Facilities in the regional transmission plan for purposes of cost allocation.[8]

4. This final rule requires transmission providers to include in their OATTs an evaluation process, including selection criteria, that they will use to identify and evaluate Long-Term Regional Transmission Facilities for potential selection to address Long-Term Transmission Needs.

5. Further, this final rule requires transmission providers to file one or more *ex ante* Long-Term Regional Transmission Cost Allocation Methods to allocate the costs of

[8] We recognize that some transmission planning regions may include Long-Term Regional Transmission Facilities, or a portfolio of such Facilities, in a regional transmission plan, but may not necessarily include these Facilities for purposes of cost allocation. *See* Order No. 1000, 136 FERC ¶ 61,051 at P 63. For purposes of this final rule, unless otherwise noted, when referencing Long-Term Regional Transmission Facilities (or a portfolio of such Facilities) that are selected, we intend "selected" to mean that those Facilities are selected in the regional transmission plan for purposes of cost allocation.

Long-Term Regional Transmission Facilities (or a portfolio of such Facilities) that are selected. This final rule further permits, but does not require, transmission providers to adopt a State Agreement Process, wherein Relevant State Entities agree to such a State Agreement Process that would provide up to six months after selection for its participants to determine, and transmission providers to file, a cost allocation method for specific Long-Term Regional Transmission Facilities. This final rule establishes a six-month time period (Engagement Period), during which transmission providers must: (1) provide notice of the starting and end dates for the six-month time period; (2) post contact information that Relevant State Entities may use to communicate with transmission providers about any agreement among Relevant State Entities on a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process, as well as a deadline for communicating such agreement; and (3) provide a forum for negotiation of a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process that enables robust participation by Relevant State Entities.

6. This final rule also requires transmission providers to include in their OATTs a process to provide Relevant State Entities and interconnection customers the opportunity to voluntarily fund the cost of, or a portion of the cost of, a Long-Term Regional Transmission Facility that otherwise would not meet the transmission providers' selection criteria. This final rule requires transmission providers to include in their OATTs provisions that require transmission providers—in certain circumstances—to reevaluate Long-Term Regional Transmission Facilities that previously were selected.

7. In addition, this final rule requires that transmission providers evaluate for potential selection in their existing Order No. 1000 regional transmission planning processes regional transmission facilities that will address certain identified interconnection-related transmission needs associated with certain interconnection-related network upgrades[9] originally identified through the generator interconnection process.

8. This final rule requires transmission providers in each transmission planning region to consider more fully the alternative transmission technologies of dynamic line ratings, advanced power flow control devices, advanced conductors, and transmission switching in Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning and cost allocation processes.

9. This final rule does not finalize the NOPR proposal to not permit transmission providers to take advantage of the recovery of 100% of construction work in progress for Long-Term Regional Transmission Facilities, and the Commission will instead continue to consider transmission incentives issues in other proceedings. This final rule similarly

[9] The Commission's *pro forma* Large Generator Interconnection Procedures (LGIP) and *pro forma* Large Generator Interconnection Agreement (LGIA) provide that, "Network Upgrades shall mean the additions, modifications, and upgrades to the Transmission Provider's Transmission System required at or beyond the point at which the Interconnection Facilities connect to the Transmission Provider's Transmission System to accommodate the interconnection of the Large Generating Facility to the Transmission Provider's Transmission System." *See Improvements to Generator Interconnection Procedures & Agreements*, Order No. 2023, 88 FR 61014 (Sept. 6, 2023), 184 FERC ¶ 61,054, at P 13 n.23, *order on reh'g*, 185 FERC ¶ 61,063 (2023), *order on reh'g*, Order No. 2023-A, 89 FR 27006 (Apr. 16, 2024), 186 FERC ¶ 61,199 (2024). In this final rule, we refer to network upgrades developed through the generator interconnection process as interconnection-related network upgrades.

does not finalize the NOPR proposal with respect to permitting the exercise of federal rights of first refusal for selected transmission facilities, conditioned on the incumbent transmission provider with the federal right of first refusal establishing joint ownership of the transmission facilities, and the Commission will instead continue considering the NOPR proposal and potential federal right of first refusal issues in other proceedings.

10. This final rule adopts the NOPR proposal to require transmission providers to adopt enhanced transparency requirements for local transmission planning processes and improve coordination between regional and local transmission planning with the aim of identifying potential opportunities to "right-size" replacement transmission facilities.

11. This final rule requires transmission providers to revise their interregional transmission coordination processes to reflect the Long-Term Regional Transmission Planning reforms adopted in this final rule. This final rule also requires that transmission providers meet additional information sharing and transparency requirements with respect to their interregional transmission coordination processes.

12. This final rule requires that each transmission provider submit a compliance filing within ten months of the effective date of this final rule revising its OATT and other document(s) subject to the Commission's jurisdiction to demonstrate that it meets the requirements of this final rule, with the exception of those requirements adopted in the Interregional Transmission Coordination section in this final rule. This final rule requires that each transmission provider submit a compliance filing within 12 months of the effective date of this final rule revising its OATT and other document(s) subject to the

Commission's jurisdiction as necessary to demonstrate that it meets the interregional transmission coordination requirements adopted in this final rule.

13. We recognize that transmission providers have ongoing efforts to address transmission planning and cost allocation. This final rule is not intended to interfere with the potential progress represented by those efforts, and we encourage transmission providers to continue to innovate to improve their transmission planning and cost allocation processes.

A. Historical Framework: Order Nos. 888, 890, and 1000

14. Over the last several decades, the Commission has taken multiple significant actions on transmission planning and cost allocation, including issuing Order Nos. 888, 890, and 1000. In 1996, the Commission issued Order No. 888, which implemented open access to transmission facilities owned, operated, or controlled by a public utility and included certain minimum requirements for transmission planning. In 2007, the Commission issued Order No. 890 to address identified deficiencies in the *pro forma* OATT after more than 10 years of experience since Order No. 888. Among other OATT reforms, the Commission required all public utility transmission providers' local transmission planning processes to satisfy nine transmission planning principles: (1) coordination; (2) openness; (3) transparency; (4) information exchange; (5) comparability; (6) dispute resolution; (7) regional participation; (8) economic planning studies; and (9) cost allocation for new projects.[10]

[10] Order No. 890, 118 FERC ¶ 61,119 at PP 418-601.

15. In 2011, the Commission recognized the need for further transmission planning reforms with its issuance of Order No. 1000. The Commission based the reforms it adopted in Order No. 1000 on changes in the energy industry, its experience implementing Order No. 890, and a robust record developed through technical conferences and comments from a diverse range of stakeholders.[11] The Commission stated in Order No. 1000 that "the electric industry is currently facing the possibility of substantial investment in future transmission facilities to meet the challenge of maintaining reliable service at a reasonable cost."[12] In establishing the requirements of Order No. 1000, the Commission found that the existing requirements of Order No. 890 were not adequate, noting that Order No. 1000 "expands upon the reforms begun in Order No. 890 by addressing new concerns that have become apparent in the Commission's ongoing monitoring of these matters."[13] The Commission then enumerated multiple concerns that it had regarding existing transmission planning practices, including concerns about: (1) the lack of an affirmative obligation to develop a transmission plan evaluating if a regional transmission facility "may be more efficient or cost-effective than solutions identified in local transmission planning processes"; (2) the lack of a

[11] For purposes of this final rule, and consistent with Order No. 1000, a stakeholder includes any party interested in the transmission planning processes. *See* Order No. 1000, 136 FERC ¶ 61,051 at P 151 n.143.

[12] *Id.* P 2.

[13] *Id.* P 21.

requirement to address Public Policy Requirements;[14] (3) the federal right of first refusal for incumbent transmission developers to build upgrades to their existing transmission facilities; (4) the lack of procedures to identify and evaluate the benefits of interregional transmission facilities; and (5) cost allocation for regional and interregional transmission facilities.[15]

16. Order No. 1000 included reforms intended to ensure that the transmission planning and cost allocation requirements embodied in the *pro forma* OATT could support the development of more efficient or cost-effective transmission facilities.[16] The reforms in Order No. 1000 included: (1) regional transmission planning; (2) transmission needs driven by Public Policy Requirements; (3) nonincumbent transmission developer reforms; (4) regional and interregional cost allocation, including a set of principles for each category of cost allocation; and (5) interregional transmission coordination. The reforms focused on the process by which transmission providers engage in regional

[14] Public Policy Requirements are requirements established by local, state, or federal laws or regulations (i.e., enacted statutes passed by the legislature and signed by the executive and regulations promulgated by a relevant jurisdiction, whether within a state or at the federal level). *Id.* P 2. Order No. 1000-A clarified that Public Policy Requirements include local laws or regulations passed by a local governmental entity, such as a municipal or county government. Order No. 1000-A, 139 FERC ¶ 61,132 at P 319.

[15] Order No. 1000, 136 FERC ¶ 61,051 at P 3.

[16] *Id.* PP 11-12, 42-44; Order No. 1000-A, 139 FERC ¶ 61,132 at PP 3, 4-6.

transmission planning and the associated cost allocation rather than on the outcomes of the process.[17]

17. Among other regional transmission planning reforms in Order No. 1000, the Commission required that the following Order No. 890 transmission planning principles apply to regional transmission planning processes: (1) coordination; (2) openness; (3) transparency; (4) information exchange; (5) comparability; (6) dispute resolution; and (7) economic planning studies.[18]

18. In addition, with respect to the Order No. 1000 reforms, the Commission made a distinction between a transmission facility "included" in a regional transmission plan and a transmission facility "selected." A transmission facility selected in a regional transmission plan for purposes of cost allocation is a transmission facility that has been selected pursuant to a transmission planning region's Commission-approved regional transmission planning process for inclusion in a regional transmission plan for purposes of cost allocation because it is a more efficient or cost-effective transmission facility needed to meet regional transmission needs. Both regional transmission facilities and interregional transmission facilities are eligible for potential "selection" in a regional transmission plan for purposes of cost allocation.[19]

---

[17] Order No. 1000, 136 FERC ¶ 61,051 at P 12.

[18] The Commission did not include the regional participation or cost allocation transmission planning principles with respect to regional transmission planning processes because those issues were addressed by other reforms in Order No. 1000. *Id.* P 151.

[19] *Id.* P 63. A regional transmission facility and an interregional transmission

19. Selected transmission facilities often will not comprise all of the transmission facilities that are included in a regional transmission plan.[20] Some transmission facilities are merely "rolled up" and listed in a regional transmission plan without going through an analysis at the regional level, and/or are merely considered for reliability implications upon a transmission system, and therefore, are not eligible for selection and regional cost allocation.[21] For example, a local transmission facility is a transmission facility located solely within a transmission provider's retail distribution service territory or footprint that is not selected.[22] Thus, a local transmission facility may be rolled up and "included" in a regional transmission plan for informational purposes, but it is not "selected."

B. ANOPR and Technical Conference

20. In July 2021, the Commission issued the ANOPR[23] presenting potential reforms to improve the regional transmission planning and cost allocation and generator interconnection processes. In issuing the ANOPR, the Commission noted that, in part

facility are defined below. *Infra* Use of Terms section.

[20] Order No. 1000, 136 FERC ¶ 61,051 at P 63.

[21] *Id.* PP 7, 226, 318.

[22] *Id.* P 63. The Commission clarified in Order No. 1000-A that a local transmission facility is one that is located within the geographical boundaries of a public utility transmission provider's retail distribution service territory, if it has one; otherwise, the area is defined by the public utility transmission provider's footprint. In the case of an RTO/ISO whose footprint covers the entire region, a local transmission facility is defined by reference to the retail distribution service territories or footprints of its underlying transmission owing members. Order No. 1000-A, 139 FERC ¶ 61,132 at P 429.

[23] ANOPR, 176 FERC ¶ 61,024.

because more than a decade had passed since Order No. 1000, it was now an appropriate time to review its regulations governing regional transmission planning and cost allocation to determine whether reforms are needed to ensure Commission-jurisdictional rates remain just and reasonable and not unduly discriminatory or preferential.[24] The Commission noted that the electricity sector is transforming as the generation fleet shifts from resources located close to population centers toward resources that may often be located far from load centers. The Commission also highlighted the growth of new resources seeking to interconnect to the transmission system and that the differing characteristics of those resources are creating new demands on the transmission system. The Commission explained that ensuring just and reasonable Commission-jurisdictional rates during these changes, while maintaining grid reliability, remains the Commission's priority in adopting requirements for the regional transmission planning and cost allocation and generator interconnection processes. As a result, the Commission issued the ANOPR to consider whether there should be changes in the regional transmission planning and cost allocation and generator interconnection processes and, if so, which changes are necessary to ensure that Commission-jurisdictional rates remain just and reasonable and not unduly discriminatory or preferential and that reliability is maintained.

21. On November 15, 2021, the Commission convened a staff-led technical conference (November 2021 Technical Conference or Technical Conference) to examine in detail issues and potential reforms related to regional transmission planning as

[24] *Id.* P 3.

described in the ANOPR. Specifically, the Technical Conference included three panels covering issues to consider in long-term scenarios, consideration of long-term scenarios in regional transmission planning processes, and identifying geographic zones with high renewable resource potential for use in regional transmission planning processes.[25] Following the Technical Conference, the Commission invited all interested persons to file comments to address issues raised during the Technical Conference.

C. Joint Federal-State Task Force on Electric Transmission

22. On June 17, 2021, the Commission established a Joint Federal-State Task Force on Electric Transmission (Task Force) to formally explore broad categories of transmission-related topics.[26] The Commission explained that the development of new transmission infrastructure implicates a host of different issues, including how to plan and pay for these facilities. Given that federal and state regulators each have authority over transmission-related issues and given the impact of transmission infrastructure development on numerous different priorities of federal and state regulators, the Commission determined that the topic was ripe for greater federal-state coordination and cooperation.[27] The Task Force was composed of all sitting FERC Commissioners as well

[25] *Bldg. for the Future Through Elec. Reg'l Transmission Planning & Cost Allocation & Generator Interconnection*, Further Supplemental Notice of Technical Conference, Docket No. RM21-17-000 (issued Nov. 12, 2021) (attaching agenda).

[26] *Joint Fed.-State Task Force on Elec. Transmission*, 175 FERC ¶ 61,224, at PP 1, 6 (2021).

[27] *Id.* P 2.

as representatives from 10 state commissions nominated by the National Association of Regulatory Utility Commissioners (NARUC), with two originating from each NARUC region.[28]

23. The Task Force has convened multiple formal meetings with eight meetings held thus far to discuss regional transmission planning and cost allocation issues, convening on November 10, 2021, February 16, 2022, May 6, 2022, July 20, 2022, November 15, 2022, February 15, 2023, July 16, 2023, and February 28, 2024.

24. The discussion at the November 2021 meeting was focused on incorporating state perspectives into regional transmission planning.[29] The February 2022 meeting included discussion of specific categories and types of transmission benefits that transmission providers should consider for the purposes of transmission planning and cost allocation.[30] The May 2022 meeting focused on barriers to the efficient, expeditious, and reliable interconnection of new resources.[31] The July 2022 meeting focused on interregional

[28] An up-to-date list of Task Force members, as well as additional information on the Task Force, is available on the Commission's website at: https://www.ferc.gov/TFSOET. Public materials related to the Task Force, including transcripts from public meetings, are available in the Commission's eLibrary in Docket No. AD21-15-000.

transmission planning and transmission project development and the NOPR.[32] The November 2022 meeting focused on regulatory gaps and challenges in oversight of transmission development.[33] The February 2023 meeting focused on the physical security of the nation's transmission system, and featured guest speakers from the North American Electric Reliability Corporation and US DOE.[34] The July 2023 meeting focused on grid enhancing technologies, featuring a guest speaker from the Electric Power Research Institute.[35] The February 2024 meeting focused on transmission siting, featuring guest speakers from US DOE.[36]

25. In light of the Task Force expiring three years from its first public meeting, i.e., on November 10, 2024,[37] on March 21, 2024, the Commission established the Federal and State Current Issues Collaborative (Collaborative).[38] The Collaborative will be comprised of all Commissioners, as well as representative from 10 state commissions.

The Collaborative will provide a venue for federal and state regulators to share perspectives, increase understanding, and where appropriate, identify potential solutions regarding challenges and coordination on matters that impact specific state and federal regulatory jurisdiction.[39]

D. Notice of Proposed Rulemaking

26. On April 21, 2022, the Commission issued the NOPR, proposing reforms focused on long-term regional transmission planning and cost allocation processes. In particular, the Commission proposed in the NOPR that transmission providers in each transmission planning region participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning.[40] The Commission also proposed to require that transmission providers develop Long-Term Scenarios as part of Long-Term Regional Transmission Planning.[41]

27. The Commission proposed that transmission providers consider, as part of their Long-Term Regional Transmission Planning, regional transmission facilities that address certain interconnection-related transmission needs that the transmission provider has identified multiple times in the generator interconnection process but that have never been constructed due to the withdrawal of the relevant interconnection request(s).[42]

---

[39] *Id.* PP 5-6.

[40] NOPR, 179 FERC ¶ 61,028 at PP 64, 68.

[41] *Id.* P 84.

[42] *Id.* P 166.

28. The Commission proposed 12 benefits that transmission providers may consider in Long-Term Regional Transmission Planning and cost allocation processes.[43] The Commission stated that the list of potential benefits was neither mandatory nor exhaustive, and that pursuant to the proposal, transmission providers would have flexibility to propose which benefits to use as part of their Long-Term Regional Transmission Planning.[44]

29. The Commission proposed, with regard to the selection of Long-Term Regional Transmission Facilities in the regional transmission plan for purposes of cost allocation, to require that transmission providers, as part of their Long-Term Regional Transmission Planning, include in their OATTs: (1) transparent and not unduly discriminatory criteria, which seek to maximize benefits to consumers over time without over-building transmission facilities, to identify and evaluate transmission facilities for potential selection that address transmission needs driven by changes in the resource mix and demand; and (2) a process to coordinate with the Relevant State Entities in developing such criteria.[45]

30. The Commission proposed to require transmission providers to more fully consider the incorporation into transmission facilities of dynamic line ratings and

[43] *Id.* P 185.

[44] *Id.* P 184.

[45] *Id.* P 241.

advanced power flow control devices in regional transmission planning and cost allocation processes.[46]

31. The Commission proposed to require, with regard to allocating the costs of Long-Term Regional Transmission Facilities, transmission providers to revise their OATTs to include: (1) a Long-Term Regional Transmission Cost Allocation Method to allocate the costs of Long-Term Regional Transmission Facilities; (2) a State Agreement Process by which one or more Relevant State Entities may voluntarily agree to a cost allocation method; or (3) a combination thereof.[47] The Commission proposed to require transmission providers to seek the agreement of Relevant State Entities within the transmission planning region regarding the Long-Term Regional Transmission Cost Allocation Method, State Agreement Process, or combination thereof.[48] The Commission proposed to require transmission providers to identify on compliance the benefits they will use in *ex ante* Long-Term Regional Transmission Cost Allocation Methods associated with Long-Term Regional Transmission Planning, how they will calculate those benefits, and how the benefits will reasonably reflect the benefits of regional transmission facilities to meet identified transmission needs driven by changes in the resource mix and demand.[49]

---

[46] *Id.* P 272.

[47] *Id.* P 302.

[48] *Id.* P 303.

[49] *Id.* P 326.

32. The Commission further proposed to not permit transmission providers to take advantage of the allowance for inclusion of 100% of construction work in progress costs in rate base in certain circumstances for Long-Term Regional Transmission Facilities.[50]

33. Finally, the Commission proposed to permit the exercise of federal rights of first refusal for selected transmission facilities, conditioned on the incumbent transmission provider with the federal right of first refusal for such regional transmission facilities establishing joint ownership of the transmission facilities consistent with certain proposed requirements described in the NOPR.[51]

34. The Commission also proposed to require transmission providers to revise the regional transmission planning process in their OATTs with additional provisions to enhance transparency of: (1) the criteria, models, and assumptions that they use in their local transmission planning process; (2) the local transmission needs that they identify through that process; and (3) the potential local or regional transmission facilities that they will evaluate to address those local transmission needs.[52] The Commission proposed to require transmission providers to evaluate whether transmission facilities operating at or above 230 kV that an individual transmission provider that owns the transmission facility anticipates replacing in-kind with a new transmission facility during the next 10

[50] *Id.* P 333.

[51] *Id.* P 351.

[52] *Id.* P 400.

years can be "right-sized" to more efficiently or cost-effectively address regional transmission needs identified in Long-Term Regional Transmission Planning.[53]

35. The Commission further proposed to require transmission providers in neighboring transmission planning regions to revise their existing interregional transmission coordination procedures (and regional transmission planning processes as needed) to provide for: (1) the sharing of information regarding their respective transmission needs identified in Long-Term Regional Transmission Planning, as well as potential transmission facilities to meet those needs; and (2) the identification and joint evaluation of interregional transmission facilities that may be more efficient or cost-effective transmission facilities to address transmission needs identified through Long-Term Regional Transmission Planning.[54] Finally, the Commission proposed to require transmission providers in neighboring transmission planning regions to revise their interregional transmission coordination procedures (and regional transmission planning processes as needed) to allow an entity to propose an interregional transmission facility in the regional transmission planning process as a potential solution to transmission needs identified through Long-Term Regional Transmission Planning.[55]

[53] *Id.* P 403.

[54] *Id.* P 427.

[55] *Id.* P 428.

E. High-Level Overview of NOPR Comments

36. The Commission received a great many comments from a diverse set of parties in response to the NOPR.[56] One hundred and ninety-six parties, including federal agencies, state regulatory commissions, state policy makers and other state representatives, ratepayer advocates, municipalities, RTOs/ISOs, RTO/ISO market monitors, transmission providers, transmission-dependent utilities, electric cooperatives, municipal power providers, independent power producers, transmission developers, generation trade associations, transmission trade associations, industry interest groups, consumer interest groups, energy policy and law interest groups, individual businesses, landowners, and individuals, filed initial comments that totaled over 15,000 pages with attachments. A similarly diverse set of 92 parties filed reply comments that totaled nearly 1,900 pages.

F. Use of Terms

37. Before turning to the detailed requirements of this final rule, we note several of the key terms used herein. We further address the definitions of these terms, including any modifications to definitions proposed in the NOPR, in the relevant later sections of this final rule.

38. For purposes of this final rule, Long-Term Regional Transmission Planning means regional transmission planning on a sufficiently long-term, forward-looking, and comprehensive basis to identify Long-Term Transmission Needs, identify transmission

[56] *See* Appendix A for a list of commenters and the abbreviated names of commenters that are used in this final rule.

facilities that meet such needs, measure the benefits of those transmission facilities, and evaluate those transmission facilities for potential selection in the regional transmission plan for purposes of cost allocation as the more efficient or cost-effective regional transmission facilities to meet Long-Term Transmission Needs.

39. For purposes of this final rule, Long-Term Transmission Needs are transmission needs identified through Long-Term Regional Transmission Planning by, among other things and as discussed in this final rule, running scenarios and considering the enumerated categories of factors.[57]

40. For purposes of this final rule, Long-Term Scenarios are scenarios that incorporate various assumptions using best available data inputs about the future electric power system over a sufficiently long-term, forward-looking transmission planning horizon to identify Long-Term Transmission Needs and enable the identification and evaluation of transmission facilities to meet such transmission needs.

41. For purposes of this final rule, a Long-Term Regional Transmission Facility is a regional transmission facility[58] that is identified as part of Long-Term Regional Transmission Planning to address Long-Term Transmission Needs.

---

[57] Further discussion on Long-Term Transmission Needs can be found below. *Infra* Development of Long-Term Scenarios subsection under the Long-Term Regional Transmission Planning section.

[58] For purposes of this final rule, and consistent with Order No. 1000, a regional transmission facility is a transmission facility located entirely in one transmission planning region. An interregional transmission facility is a transmission facility that is located in two or more transmission planning regions. A local transmission facility is a transmission facility located solely within a transmission provider's retail distribution service territory or footprint that is not selected in the regional transmission plan for

42. For purposes of this final rule, best available data inputs are data inputs that are timely, developed using best practices and diverse and expert perspectives, and adopted via a process that satisfies the transmission planning principles of Order Nos. 890 and 1000, and reflect the list of factors that transmission providers account for in their Long-Term Scenarios.

43. For purposes of this final rule, a Long-Term Regional Transmission Cost Allocation Method is an *ex ante* regional cost allocation method for one or more selected Long-Term Regional Transmission Facilities (or a portfolio of such Facilities) that are selected in the regional transmission plan for purposes of cost allocation.

44. For purposes of this final rule, a Relevant State Entity is any state entity responsible for electric utility regulation or siting electric transmission facilities within the state or portion of a state located in the transmission planning region, including any state entity as may be designated for that purpose by the law of such state.

45. For purposes of this final rule, a State Agreement Process is a process by which one or more Relevant State Entities may voluntarily agree to a cost allocation method for Long-Term Regional Transmission Facilities (or a portfolio of such Facilities) before or no later than six months after they are selected.

---

purposes of cost allocation. Order No. 1000, 136 FERC ¶ 61,051 at PP 63, 482 n.374.

46. For purposes of this final rule, federally-recognized Tribes are those Tribes listed in the most recent notice provided by the Bureau of Indian Affairs and published in the *Federal Register*.[59]

II. The Overall Need for Reform

A. NOPR Proposal

47. The Commission issued the NOPR on April 21, 2022, proposing to reform the *pro forma* OATT and the *pro forma* LGIA to remedy deficiencies in the Commission's existing regional transmission planning and cost allocation requirements. The Commission stated that, over the last 25 years, it has undertaken a series of significant reforms to ensure that transmission planning and cost allocation processes result in Commission-jurisdictional rates that are just and reasonable and not unduly discriminatory or preferential.[60] The Commission noted that it has now been more than a decade since Order No. 1000—its last significant regional transmission planning and cost allocation rule—and that there is mounting evidence that its regional transmission planning and cost allocation requirements may be inadequate to ensure that Commission-jurisdictional rates remain just and reasonable and not unduly discriminatory or preferential.[61]

---

[59] *See, e.g.*, *Indian Entities Recognized by and Eligible to Receive Servs. from the U.S. Bureau of Indian Affairs*, *Federal Register*, 89 FR 944 (Jan. 8, 2024).

[60] NOPR, 179 FERC ¶ 61,028 at P 24.

[61] *Id.*

48. The Commission found that, in particular, although transmission providers are required to participate in regional transmission planning and cost allocation processes under Order No. 1000, it was concerned that those processes may not be planning transmission on a sufficiently long-term, forward-looking basis to meet transmission needs driven by changes in the resource mix and demand. The Commission stated that, as a result, the regional transmission planning and cost allocation processes that transmission providers adopted to comply with Order No. 1000 may not be identifying the more efficient or cost-effective transmission facilities.[62] The Commission stated that it was concerned that the absence of sufficiently long-term, forward-looking, comprehensive transmission planning processes appears to be resulting in piecemeal transmission expansion to address relatively near-term transmission needs, and that continuing with the status quo approach may cause transmission providers to undertake relatively inefficient investments in transmission infrastructure, the costs of which are ultimately recovered through Commission-jurisdictional rates. The Commission stated that this dynamic may result in transmission customers paying more than necessary to meet their transmission needs, customers forgoing benefits that outweigh their costs, or some combination thereof—either or both of which could potentially render Commission-jurisdictional rates unjust and unreasonable or unduly discriminatory or preferential. Based on the evidence, the Commission preliminarily concluded that revisions to its existing transmission planning and cost allocation requirements

[62] *Id.* PP 24-25.

established in Order Nos. 890 and 1000 are necessary to ensure that Commission-jurisdictional services are provided at rates, terms, and conditions that are just and reasonable and not unduly discriminatory and preferential.[63]

B. Comments

49. A significant majority of commenters, including transmission providers, transmission developers, transmission customers, members of Congress, states, state commissions, consumer advocates, trade associations, and public interest organizations, among others, agree that existing regional transmission planning and cost allocation processes need to be reformed.[64] Advanced Energy Buyers note that the electric system

[67] Clean Energy Buyers Initial Comments at 7.

50. Many commenters argue that current regional transmission planning and cost allocation processes across the country are not ensuring efficient and cost-effective transmission development, are not satisfying the purposes of Order Nos. 890 and 1000, and are not meeting transmission needs at a reasonable cost. For example, several commenters assert that Order Nos. 890 and 1000 have not solved longstanding problems with regional transmission planning and cost allocation.[68] Northwest and Intermountain claim that Order No. 1000 has been inadequate to meet transmission needs, particularly in the non-RTO/ISO West.[69] Michigan State Entities assert that the current lack of long-term transmission planning has led to significantly higher costs for residential ratepayers, costs that will increase without reforms.[70] SREA argues that reform is needed to correct the unintended consequences of Order No. 1000 in the Southeast, where transmission planning "has grown into an enormously elaborate and extremely expensive black box," without any meaningful review by state regulatory bodies.[71]

[68] *See, e.g.*, Acadia Center and CLF Initial Comments at 1; ACEG Initial Comments at 17-18, 20 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 3; NOPR, 179 FERC ¶ 61,028 at PP 24-25); AEE Initial Comments at 1-2; CARE Coalition Initial Comments at 3; NERC Initial Comments at 5; Massachusetts Attorney General Initial Comments at 5-6; Northwest and Intermountain Initial Comments at 6-7; Pine Gate Initial Comments at 8-10; PIOs Initial Comments at 2-3; Southeast PIOs Initial Comments at 7-9, 11, 16-17, 43-44; SPP Market Monitor Initial Comments at 3-4; SREA Reply Comments at 4; US DOE Initial Comments at 3-4, 7-8.

[70] Michigan State Entities Initial Comments at 1-2.

[71] SREA Reply Comments at 4.

51. PIOs assert that transmission owners can evade Order No. 1000 requirements through investments in local transmission projects, which has led to billions of dollars in excessive costs.[72] PIOs explain that financial incentives drive utilities to upgrade their own systems at the expense of building a more integrated and robust transmission system to meet the needs and demands of the future.[73] PIOs observe that, between 2013 and 2017, about one-half of the approximately $70 billion in aggregate transmission investments by Commission-jurisdictional transmission owners in RTO/ISO regions were approved outside of regional transmission planning processes or with limited stakeholder engagement.[74] Ohio Consumers add that since 2017, less than 25% of new transmission investments in Ohio have been associated with large regional transmission projects needed for reliability or economic efficiency.[75] Competition Coalition argues that incumbent transmission owners have used reliability designations to justify projects with higher costs.[76]

[72] PIOs Initial Comments at 8 (citing Johannes P. Pfeifenberger et al., The Brattle Group, *Cost Savings Offered by Competition in Electric Transmission: Experience to Date and the Potential for Additional Customer Value*, at 19-20, and Section I (Apr. 2019) (Brattle Apr. 2019 Competition Report), https://www.brattle.com/wp-content/uploads/2021/05/16726_cost_savings_offered_by_competition_in_electric_transmission.pdf).

[75] Ohio Consumers Initial Comments at 5.

[76] Competition Coalition Initial Comments at 15-16.

52. Citing to a report from Lawrence Berkeley National Laboratory, US DOE concludes that many existing regional transmission planning approaches are likely understating the economic value of new transmission. US DOE suggests that the need for increased transmission capacity to address persistent and worsening transmission congestion demonstrates that these processes may not fully anticipate present and future transmission needs.[77] In addition, US DOE notes the unfair burden on interconnection customers that must bear increasing costs, especially for interconnection-related network upgrades that provide system-wide benefits.[78] US DOJ and FTC agree that reforms are necessary to encourage needed regional and interregional transmission investment and that a larger, more integrated transmission system would improve resilience, promote competition, and lower costs for consumers.[79]

53. Many commenters contend that inadequate regional transmission planning and cost allocation processes have resulted in, or are threatening to cause, unjust, unreasonable, and unduly discriminatory or preferential rates.[80] Michigan State Entities

[85] Massachusetts Attorney General Initial Comments at 5; Ørsted Initial Comments at 3-5.

54. Several commenters agree with the Commission's concerns that the expansion of the high-voltage transmission system is increasingly occurring outside of the regional transmission planning process through other mechanisms such as the generator interconnection process, which results in piecemeal transmission development.[86] AEE agrees that limited development of regional transmission facilities, increased spending on local transmission projects, and backlogged interconnection queues all show that the existing regional transmission planning requirements are not sufficient to meet customers' transmission needs.[87] Likewise, Exelon argues that relying on interconnection studies as the primary transmission planning method results in piecemeal and inefficient transmission investment.[88] PIOs add that many generation developers have to bear the full costs of transmission upgrades, which leads to interconnection request withdrawals, inefficiencies, and higher system-wide costs.[89] In addition, Clean Energy States note that interconnection queues are extremely large and that the current

[86] *See, e.g.*, Acadia Center and CLF Initial Comments at 3-4; Anbaric Initial Comments at 5; Clean Energy Associations Initial Comments at 4-7; Exelon Initial Comments at 1-2, 5; Joint Consumer Advocates Initial Comments at 5; Non-RTO NASUCA Initial Comments at 4; Ørsted Initial Comments at 4-5; Pine Gate Initial Comments at 8-10; SEIA Initial Comments at 2; *see also* AEP Initial Comments at 8.

[88] Exelon Initial Comments at 5.

[89] PIOs Initial Comments at 9-10.

one-plant-at-a-time approach to transmission upgrades drives up costs and misses opportunities for improvements to the system as a whole.[90]

55. Non-RTO NASUCA agrees with the Commission that Long-Term Regional Transmission Planning is necessary to help alleviate generation interconnection issues.[91] According to Harvard ELI, current transmission planning processes have failed to address backlogged interconnection queues and operational challenges that are best addressed at the regional level, as well as to include inexpensive technologies that can increase transmission capacity.[92]

56. ACEG argues that there is no evidence that any regional reliability or economic transmission planning performed in non-RTO/ISO regions, like the Southeastern Regional Transmission Planning region (SERTP), is equal to or superior to the techniques or outcomes in the NOPR.[93] ACEG further contends that, instead, most new transmission facilities built since Order No. 1000 have been built for local transmission needs, thereby resulting in less efficient and cost-effective transmission development that does not address the larger needs of the transmission system for reliability and

[90] Clean Energy States Initial Comments at 2.

[91] Non-RTO NASUCA Initial Comments at 4.

resilience.[94] Relatedly, SREA states that no state fully participates in SERTP, and that instead, each state in the Southeast uses its own state planning process, with no platform for states to collaborate. As a result, SREA argues that "transmission planning in the Southeast has many holes and is threadbare."[95] SREA catalogs deficiencies in many Southeastern states' planning processes, including a lack of transparency.[96]

57. Western PIOs argue that, outside of CAISO, transmission planning in the West is ineffective.[97] Specifically, Western PIOs assert that Western transmission planning groups have not developed new transmission projects using their Order No. 1000 transmission planning processes, but have instead built transmission projects that their utility members have already proposed.[98] Relatedly, SEIA argues that "non-RTO areas do not engage in sufficient or transparent transmission planning," and that transmission planning in non-RTO/ISO regions is exclusionary, based on inconsistent and inaccurate data, and disjointed.[99] More broadly, NRECA contends that incumbent investor-owned utilities control transmission planning, and that some incumbent investor-owned utilities

develop transmission without transparency, leading to disparities in transmission rates in different RTO/ISO local zones.[100]

58. Several commenters specify other reasons that transmission planning reforms are needed.[101] Americans for Fair Energy Prices agree with PIOs that there is a need for regional transmission planning instead of the balkanized process that currently exists.[102] DC and MD Offices of People's Counsel assert that the NOPR provides a once-in-a-generation opportunity to meet the energy transition in a just, equitable, efficient, reliable, and resilient fashion by recognizing the benefits of long-term transmission planning and developing rules that incorporate those broad benefits. DC and MD Offices of People's Counsel state that current transmission planning processes do not fully consider all of the benefits of transmission development, including enhanced reliability and resilience that will serve as a necessary bulwark against disruptions caused by extreme weather.[103] ACEG argues that current transmission planning processes have not led to investment in interregional transmission capacity, and that more interregional transmission capacity could have avoided some of the $25 billion to $70 billion in yearly costs caused by severe

weather events.[104] EEI states that robust transmission development will provide a host of benefits for customers, including greater resilience, enhanced system reliability, and cost-savings from greater access to low-cost resources.[105] Some commenters emphasize the importance of the Commission taking prudent action to remedy deficiencies in the Commission's existing regional transmission planning and cost allocation requirements,[106] and to strengthen electric reliability and resilience, while controlling costs.[107]

59. Several commenters argue that the need to reform transmission planning includes addressing environmental justice and equity issues.[108] Center for Biological Diversity states that energy justice and environmental justice considerations are appropriately

[104] ACEG Initial Comments at 21-22 (citing Grid Strategies, LLC, *Transmission Makes the Power System Resilient to Extreme Weather*, at 1-3, 12 (July 2021) (Grid Strategies July 2021 Extreme Weather Report)).

weather events, which is both a reliability and environmental justice issue because communities of color and low-income communities are more susceptible to power outages during extreme weather.[114]

60. Advanced Energy Buyers state that failure to prepare the grid for the energy transition would be problematic for three primary reasons: (1) insufficient transmission investment will leave customer cost savings on the table; (2) lack of available transmission capacity will constrain its members' ability to meet decarbonization and clean energy goals; and (3) failure to plan and build adequate transmission will hamper the transition to a cleaner and more reliable electric grid.[115] New Jersey Commission contends that the lack of holistic multi-driver transmission planning is inflating consumers' electricity costs by billions of dollars every year.[116] Northwest and Intermountain explain that due to insufficient transmission capacity from renewable rich zones, utilities must attempt to meet their renewable energy policy targets with new resources that are close to load but more expensive, less reliable, and less efficient than more distant alternatives, even considering the potential costs of transmission expansion.[117] Clean Energy Associations add that the lack of transmission capacity imposes real and demonstrable costs today, as evidenced by geographic differences in

[117] Northwest and Intermountain Initial Comments at 6.

real-time power prices, and that the lack of robust and proactive transmission planning rules renders current rates unjust, unreasonable, and unduly discriminatory or preferential.[118]

61. Southeast PIOs contend that the "snowballing" inefficiencies created by numerous small-scale transmission "band-aids" result in unjust, unreasonable, and unduly discriminatory or preferential rates, and that reforms are particularly needed in the Southeast, where there is minimal utility coordination and a balkanized transmission system.[119] According to ACEG, short-term, piecemeal transmission planning is unlikely to identify the more efficient or cost-effective solutions to transmission needs and thus will result in unjust, unreasonable, and unduly discriminatory or preferential rates.[120]

62. Many commenters argue that reforms are necessary to meet state policy goals[121] and that greater state involvement or consideration of state policies is needed to avoid

customers across the states in question and that not planning for that reality imposes costs on unwilling customers.[126]

63. PacifiCorp and NV Energy similarly assert that the need for reform in the West is driven by the diverse policy priorities in its six-state transmission system, and they note that decisions are subject to state oversight and the participation of disparately situated transmission providers without inclination or authority to accept any cost allocation.[127] National Grid asserts that ISO New England's (ISO-NE) 2050 Transmission Study demonstrates a direct connection between state laws and requirements to meet clean energy goals and the need for new and expanded transmission facilities.[128] Indicated PJM TOs add that maintaining a reliable and resilient transmission system requires forward-looking assessments informed by evolving public policy, changing generation mix and demand patterns, and stakeholder input.[129]

64. Maryland Energy Administration contends that Maryland has experienced unfair and costly consequences of inadequate consultation with state authorities in regional transmission planning processes.[130] AEE argues that if current transmission planning

processes fail to incorporate factors such as state laws, corporate targets, and retail demand, then transmission needs will be unmet, risking unjust, unreasonable, and unduly discriminatory or preferential rates.[131]

65. Many commenters argue that, based on the record, the Commission has an obligation under the FPA to take action to ensure that transmission planning and cost allocation results in rates that are just and reasonable and not unduly discriminatory.[132] ACEG states that the Commission's broad authority to remedy unduly discriminatory behavior pursuant to FPA section 206 applies to transmission planning and cost allocation, as the U.S. Court of Appeals for the District of Columbia Circuit held in *South Carolina Public Service Authority v. FERC*.[133] PIOs contend that the Commission is required by the FPA to use its authority to address market abuses and undue discrimination that have led to unjust, unreasonable, and unduly discriminatory or preferential rates for consumers, who bear the costs of inefficiencies in the current transmission planning process.[134]

[134] PIOs Initial Comments at 8.

66. Southeast PIOs assert that the NOPR adequately demonstrated that existing regional transmission planning processes have intrinsic flaws, making the integrated resource planning and request for proposal processes ill-equipped to efficiently address changes in the resource mix and demand.[135] Specifically, Southeast PIOs cite the following preliminary findings from the NOPR: (1) existing transmission planning processes utilize a limited planning horizon; (2) many transmission planning processes provide an inaccurate portrayal of the comparative benefits of different transmission facilities; and (3) rapid changes to the generation fleet and demand are creating increasingly urgent transmission needs.[136]

67. Southeast PIOs cite the finding in *South Carolina Public Service Authority v. FERC* that the threshold of substantial evidence could be met without "empirical evidence" as long as the Commission provides evidence based on "reasonable economic propositions."[137] Southeast PIOs also note that *South Carolina Public Service Authority v. FERC* upheld the Commission's findings in Order No. 1000, which were based on (1) a threat to just and reasonable rates from existing regional transmission planning and cost allocation practices, (2) significant changes in the industry driven by increases in

renewable energy resources, and (3) recent increases in transmission investment.[138] Moreover, Southeast PIOs note that findings need not be region-specific, as the "Commission may rely on generic or general findings of a systemic problem to support imposition of an industry-wide solution."[139]

68. ACEG similarly asserts that the Commission has shown the need for transmission planning reform based on findings that existing transmission planning requirements do not adequately identify transmission needs driven by changes in the resource mix and demand, and that failure to identify such needs causes customers to pay for less efficient or cost-effective transmission investments.[140] Relatedly, ACEG argues that pursuing region-specific solutions will lead to siloed and disjunctive transmission planning policies that will not solve the problems facing the nation's electric transmission system.[141]

69. Colorado Consumer Advocate and Joint Consumer Advocates aver that the Commission has a statutory duty under the FPA to reform current regional transmission planning processes because they lack transparency, coordination, and openness, and because they create opportunities for monopoly transmission developers to exert

[138] *Id.* at 6-7 (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 65-66).

[139] *Id.* at 7 (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 67).

[141] *Id.* at 17.

dominant influence and promote their own economic self-interest at customers' and other stakeholders' expense.[142] According to New Jersey Commission, current transmission planning processes are inefficient and unnecessarily burden ratepayers with excessive costs without providing additional benefits. New Jersey Commission contends that those processes are therefore per se unjust and unreasonable, and that the Commission thus has FPA section 206 authority to require that transmission providers employ practices like long-term, holistic, multi-driver transmission planning.[143]

70. Similarly, Harvard ELI states that deficient transmission planning threatens the justness and reasonableness of transmission rates, and therefore the Commission has legal authority and jurisdiction to order changes to transmission planning to remedy that deficiency.[144] Harvard ELI further asserts that the Commission must remedy undue discrimination due to incumbent transmission owners' unduly discriminatory influence in regional transmission planning.[145] Massachusetts Attorney General also argues that the Commission's proposed reforms are necessary to fulfill the Commission's statutory obligation to ensure that transmission rates are just and reasonable.[146]

[145] *Id.* at 3.

[146] Massachusetts Attorney General Initial Comments at 3-6.

71. Some commenters argue that there is insufficient evidence for the Commission to find that existing jurisdictional rates are unjust, unreasonable, and unduly discriminatory or preferential.[147] For example, while Idaho Commission recognizes that there are deficiencies in existing transmission planning and cost allocation processes, Idaho Commission disagrees with the NOPR's claim that their failure to identify and plan for transmission needs driven by changes in the resource mix and demand is resulting in unjust, unreasonable, and unduly discriminatory or preferential Commission-jurisdictional rates.[148] Mississippi Commission also disagrees that the lack of long-term regional transmission planning will result in unjust, unreasonable, and unduly discriminatory or preferential rates.[149] ELCON questions a finding of unjust, unreasonable, and unduly discriminatory or preferential rates, and it states that the NOPR's focus on Long-Term Regional Transmission Planning solely to address changes in resource mix and demand, if adopted, could fail to produce better outcomes for customers and may exceed the Commission's authority under the FPA.[150]

[147] *See, e.g.*, ELCON Initial Comments at 7; Idaho Commission Initial Comments at 2; Mississippi Commission Initial Comments at 2, 9; NRECA Initial Comments at 14-16; Undersigned States Reply Comments at 6-7.

[148] Idaho Commission Initial Comments at 2 (citing NOPR, 179 FERC ¶ 61,028 at P 34).

[149] Mississippi Commission Initial Comments at 2.

[150] ELCON Initial Comments at 7.

72. Louisiana Commission states that the Commission's finding that, absent reforms, transmission rates universally are not just and reasonable and are discriminatory is not based on individual analysis of each RTO or region, is not supported, and should be retracted.[151] Mississippi Commission also states that the Commission should, instead, initiate region-specific investigations pursuant to FPA section 206.[152] Southern argues that the Commission has failed to satisfy the first prong of its FPA section 206 burden of proof, noting that the NOPR's preliminary conclusion, that existing regional transmission planning processes are not sufficient to address changes in the resource mix and demand, cannot reasonably be made of Southern or SERTP.[153]

73. Similarly, Industrial Customers argue that the Commission has not satisfied the first prong of FPA section 206, which requires the Commission to find, and provide substantial evidence supporting its finding, that existing rates are unjust, unreasonable, and unduly discriminatory or preferential.[154] Industrial Customers claim that demand growth should be the primary factor in identifying transmission needs, and that demand is growing more slowly than in previous periods. Industrial Customers add that, in contrast, investment in transmission is rising relative to demand, which is the opposite of the

[151] Louisiana Commission Reply Comments at 5-6.

[153] Southern Initial Comments at 40; Southern Reply Comments at 1-3.

[154] Industrial Customers Initial Comments at 6-7.

circumstances that prevailed in 2007 when the Commission issued Order No. 890.[155] According to Industrial Customers, changes in demand are not significant enough in historical terms to warrant major changes in transmission planning. Moreover, Industrial Customers state that changes in demand are unpredictable because technological changes are inherently difficult to forecast and the risks to consumers of making mistakes are too high. Industrial Customers argue that, if anything, the rapid growth of renewables indicates that current processes are already facilitating changes in the resource mix.[156] Similarly, NRG argues that long-term forecasts of important factors are often wrong, which has real-world impacts on customers.[157]

74. Further, Industrial Customers contend that the NOPR does not clearly define the term "changes in the resource mix and demand," despite using such changes as the justification for the proposals. Industrial Customers argue that transmission should only be planned in order to maintain reliability and should not be based on the demand for certain fuel sources or the fuel type of the generation fleet.[158] Industrial Customers argue that current transmission planning is based on known and measurable factors, and that

[155] *Id.* at 8-10.

[156] *Id.* at 10-11.

[157] NRG Initial Comments at 10-12 (noting, for example, that "[p]redictions for the future price of natural gas and thus the economics of gas generation in long-term forecasts have been notoriously inaccurate." (citing Lawrence Berkeley National Laboratory, *Comparison of AEO 2008 Natural Gas Price Forecast to NYMEX Futures Prices* (Jan. 2008)).

[158] Industrial Customers Initial Comments at 7-8.

any attempt to plan for potential future changes in the resource mix without determining precisely what these changes will be would result in the overbuilding of the system for generation that may not be built. Industrial Customers argue that this outcome would be unjust and unreasonable and would force transmission customers to pay for generation that is non-existent.[159]

75. Other commenters agree that the Commission lacks a specific record to support the need for reform.[160] For example, former Kansas Commission Chair Keen avers that there is no analytical or evidentiary basis in the NOPR for a complete and thorough overhaul or revision of transmission planning processes.[161]

76. Duke asserts that the NOPR does not provide robust and specific support as to how and why current regional transmission planning processes are failing to plan for transmission needs driven by changes in the resource mix and demand, leading to inefficient investment.[162] Duke asserts that the NOPR does not support the presumption that the absence of significant regional transmission investment is evidence of inefficient

[159] *Id.* at 15.

[160] *See, e.g.*, Alabama Commission Initial Comments at 4-5; Duke Initial Comments 6-9; Idaho Commission Initial Comments at 2; Industrial Customers Initial Comments at 1, 6-11, 15; Kansas Commission Chair Keen Initial Comments at 1-2; Nebraska Commission Initial Comments at 1-2; NRECA Initial Comments at 14-16; NRG Initial Comments at 3; Ohio Commission Federal Advocate Initial Comments at 5-6; Potomac Economics Initial Comments at 3-4; Southern Initial Comments at 40.

[161] Kansas Commission Chair Keen Initial Comments at 2.

[162] Duke Initial Comments at 6-7.

transmission planning.[163] Duke also asserts that, to ensure legal durability, the Commission should identify evidence that justifies a nationwide finding that current transmission planning processes are failing to plan for transmission needs driven by changes in the resource mix and demand, leading to inefficient investment and unjust, unreasonable, and unduly discriminatory or preferential rates.[164]

77. Undersigned States argue that the Commission does not have evidence in the record that current rates are unjust, unreasonable, or unduly discriminatory or preferential, which FPA section 206 requires.[165] Undersigned States argue that, contrary to the preliminary findings in the NOPR, the Southeast has developed significant and sufficient transmission infrastructure and renewable energy from 2015-2020. Undersigned States further argue that the Commission is supposed to enhance reliability, and that, because renewables are intermittent and inherently less reliable, forcing ratepayers to subsidize their use through financing the construction of additional transmission infrastructure is not consistent with the Commission's mission.

[165] Undersigned States Reply Comments at 6-7. The Undersigned States that submitted reply comments include the States of Texas, Utah, Alabama, Alaska, Arkansas, Florida, Georgia, Kansas, Kentucky, Louisiana, Mississippi, Montana, Nebraska, Ohio, Oklahoma, South Carolina, and West Virginia. *Id.* at 1. The Undersigned States that submitted initial comments include the States of Utah, Alaska, Georgia, Idaho, Indiana, Kansas, Kentucky, Louisiana, Mississippi, Montana, Nebraska, North Dakota, Ohio, Oklahoma, South Carolina, Texas, West Virginia, and Wyoming. Undersigned States Initial Comments at 5-6.

Undersigned States also argue that the Commission has not justified replacing existing transmission planning processes with a new approach, so the NOPR is arbitrary and capricious.[166] Further, Undersigned States argue that the Commission has not offered a detailed justification for countering prior precedent in Order No. 1000 that "the regional transmission planning process is not the vehicle by which integrated resource planning is conducted."[167]

78. Some commenters assert that the intention of the NOPR is to improperly favor certain energy resources.[168] Consumer Organizations argue that solutions that allow for an equitable transition and make space for advancing technology and smaller energy systems are preferrable to a rushed plan that favors certain resources, such as wind, solar, and battery storage, that have already proven to be inadequate.[169] ELCON adds that Congress did not give the Commission express authority to balance the FPA's just and reasonable rates requirement with the policy goal of connecting renewable resources to the transmission system.[170] SERTP Sponsors argue that Congress has not clearly provided the Commission with jurisdiction to presuppose generation decisions and

[166] Undersigned States Reply Comments at 6-8.

thereby effect particular, substantive transmission outcomes; rather, SERTP Sponsors continue, Congress has expressly and unequivocally reserved generation authority to the states.[171] Louisiana Commission argues that the FPA does not confer on the Commission authority to engage in wide-scale public policymaking by enacting sweeping energy policy changes with far-reaching, nationwide effects.[172]

79. Ohio Commission Federal Advocate states that the NOPR may be intended "to establish policies designed to encourage the massive transmission build-out that will doubtless be required to transition to an aspirational renewable future" and "to achieve narrow environmental policy objectives, not to address legitimate requirements under the Federal Power Act like ensuring just and reasonable rates or reliability."[173] Former Kansas Commission Chair Keen claims that the NOPR encourages an extensive and expensive transmission build-out without considering the impact on state-jurisdictional generation mixes. He also claims that some of the NOPR proposals impose an accelerated pace for the transition from dispatchable to renewable resources, which could hasten the premature retirement of dispatchable generation and compromise regional and state power reliability. He also expresses concern that the NOPR proposals would force

[171] SERTP Sponsors Initial Comments at 18.

ratepayers in some states to pay for neighboring states' transmission projects to advance public policy goals that they do not share.[174]

80. Some commenters challenge aspects of the need for reform. For example, Nebraska Commission believes that the established structures in RTO/ISO regions are generally working and that many aspects of the NOPR are thus unnecessary there.[175] Potomac Economics disagrees with some of the Commission's arguments for requiring Long-Term Regional Transmission Planning, contending that the Commission's proposals are based on anticipated future generation and other speculative factors and seem to be incorrectly premised on a presumption that congestion should not exist or may limit investment in economic generation. Potomac Economics states that investment should occur only to the extent that the savings of reducing congestion are larger than the investment costs. According to Potomac Economics, congestion that is caused by generators' siting decisions should be borne by the generation developers, as it will incent them to propose the lowest-cost projects taking transmission costs into account. Potomac Economics argues that, if transmission is expanded preemptively to facilitate generation investment in a particular location, such costs are equivalent to subsidies for the developer.[176]

[174] Kansas Commission Chair Keen Initial Comments at 3.

[175] Nebraska Commission Initial Comments at 1-2.

[176] Potomac Economics Initial Comments at 3-4.

81. Mississippi Commission disagrees that too much expansion of high-voltage transmission has occurred through the generator interconnection process instead of through regional transmission planning.[177] Similarly, North Carolina Commission and Staff disagree with the Commission's conclusion that the growth in interconnection-related network upgrades demonstrates a failure of regional transmission planning as it relates to North Carolina.[178] Southern adds that, contrary to statements in the NOPR, it is not significantly expanding its transmission system through the generator interconnection process.[179]

82. Alabama Commission asserts that Alabama has a resource planning process that accounts for needed transmission buildout to maintain reliable service, and thus, Alabama Power plans its transmission system proactively both to maintain deliveries from existing resources and to accommodate Alabama Commission-certified generation additions. Alabama Commission claims that the SERTP process builds on the integrated resource planning efforts of its sponsor states, ensuring that there are no regional transmission solutions that are more efficient or cost-effective than solutions identified through the underlying state-jurisdictional processes.[180]

[179] Southern Initial Comments at 38-40.

[180] Alabama Commission Initial Comments at 4.

83. Duke argues that, for certain transmission providers, the local transmission planning process may more effectively meet transmission needs, especially when combined with state-regulated integrated resource planning and a bottom-up regional transmission planning process. Duke contends that a regional transmission facility may not fully address local transmission needs such that a local transmission facility would still be needed, and thus, the regional transmission facility is not necessarily more efficient or cost-effective than the local transmission facility.[181]

84. NRECA states that certain of its members in RTOs/ISOs believe that regional transmission planning is working well to meet long-term needs (e.g., those in MISO) and that the NOPR proposals would burden transmission providers' limited resources. NRECA states that other NRECA members in RTOs/ISOs believe that existing RTO/ISO transmission planning processes contain discrete deficiencies that the NOPR proposals will not remedy. According to NRECA, these electric cooperatives believe that some incumbent investor-owned transmission owners develop local transmission projects without transparency concerning need or costs, leading to disparities in transmission rates across RTO/ISO transmission zones, and that incumbent transmission owners control the transmission planning process such that no regional transmission planning occurs. NRECA states that, in these cooperatives' view, the criteria to determine the eligibility of

[181] Duke Initial Comments at 7-9.

a regional transmission project is the barrier, and that requiring Long-Term Regional Transmission Planning, by itself, will not solve the problem.[182]

C. Commission Determination

85. Based on the record, we find that there is substantial evidence to support the conclusion that the Commission's existing regional transmission planning and cost allocation requirements are unjust, unreasonable, and unduly discriminatory or preferential. We therefore adopt the preliminary findings in the NOPR concerning the need for reform. Specifically, we find that the absence of sufficiently long-term, forward-looking, and comprehensive transmission planning requirements is causing transmission providers to fail to adequately anticipate and plan for future system conditions. It causes transmission providers to fail to appropriately evaluate the benefits of transmission infrastructure, and results in piecemeal transmission expansion to address relatively near-term transmission needs. We find that this status quo causes transmission providers to undertake relatively inefficient investments in transmission infrastructure, the costs of which are ultimately recovered through Commission-jurisdictional rates. This dynamic results in, among other things, transmission customers paying more than necessary or appropriate to meet their transmission needs and forgoing benefits that outweigh their costs, which results in less efficient or cost-effective transmission investments. As explained below, we find that these deficiencies render Commission-

[182] NRECA Initial Comments at 14-16.

jurisdictional regional transmission planning and cost allocation processes unjust, unreasonable, and unduly discriminatory or preferential.

86. The Commission has authority under FPA section 206 to issue this final rule. Specifically, FPA section 206 "instructs the Commission to remedy 'any . . . practice' that 'affect[s]' a rate for interstate electricity service 'demanded' or 'charged' by 'any public utility' if such practice is 'unjust, unreasonable, unduly discriminatory or preferential.'"[183] As the D.C. Circuit has recognized, regional transmission planning and cost allocation processes are practices affecting rates subject to the Commission's exclusive jurisdiction.[184] As the Court explained in *South Carolina Public Service Authority v. FERC*, transmission providers use those processes to "determine which transmission facilities will more efficiently or cost-effectively meet" transmission needs, the development of which directly impacts the rates, terms, and conditions of Commission-jurisdictional service.[185] In particular, because these processes identify, evaluate, and select the regional transmission facilities whose costs will be recovered through transmission rates, we find that they directly affect those rates.[186] In addition, as

[183] *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 55 (quoting 16 U.S.C. 824e(a)).

[184] *Id.* at 55-59, 84 (affirming the Commission's authority to regulate transmission planning and cost allocation as practices affecting rates); *see also* Order No. 1000-A, 139 FERC ¶ 61,132 at P 577 (holding that "requirements regarding transmission planning and cost allocation . . . are practices affecting rates.").

[185] *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 56 (citing Order No. 1000, 136 FERC ¶ 61,051 at PP 112, 116); *see also Emera Me. v. FERC*, 854 F.3d at 674.

[186] That is true even if regional transmission planning and cost allocation processes do not result in the development, siting, and construction of every regional transmission

discussed below, such transmission facilities contribute to the development of a more robust transmission system, supporting continuity of service in the face of growing reliability challenges and providing wholesale electric customers greater access to lower-cost generation supplied by a wider range of resources. Accordingly, regional transmission planning and cost allocation processes, as well as "the rules and practices that determine how those [processes] operate,"[187] have a direct effect on the rates that customers pay for *both* the transmission and sale of electric energy in interstate commerce.[188] The Commission may act pursuant to FPA section 206 if the Commission first establishes, through substantial evidence,[189] that the existing practices are unjust, unreasonable, or unduly discriminatory or preferential and, second, establishes that the replacement practices are just and reasonable.[190]

---

facility that transmission providers select to more efficiently or cost-effectively meet transmission needs. *See, e.g.*, *Conn. Dep't of Pub. Util. Control v. FERC*, 569 F.3d 477, 485 (D.C. Cir. 2009) (holding that "even if all [that] the I[nstalled] C[apacity] R[equirement] did was help to find the right [capacity] price," rather than result in the construction or procurement of any new capacity, "it would still amount to a 'practice . . . affecting' rates." (citing 16 U.S.C. 824e(a) (omission in original))).

[187] *FERC v. Elec. Power Supply Ass'n*, 577 U.S. 260, 279 (2016) (*EPSA*).

[188] 16 U.S.C. 824e(a).

[189] *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 54 ("The Commission's factual findings are conclusive if supported by substantial evidence."). Courts have held that substantial evidence in this context does not necessarily require the Commission to provide *empirical* evidence for every proposition. Rather, FPA section 206 empowers the Commission to address a mere *threat* of unjust and unreasonable rates. *See S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 64-65, 85.

[190] 16 U.S.C. 824e(a); *see also EPSA*, 577 U.S. at 277 (affirming the Commission "has the authority—and indeed, the duty—to ensure that rules or practices 'affecting'

87. With regard to the first showing under FPA section 206, we find that, while Order No. 890 requires transmission providers to satisfy certain principles in their local transmission planning processes and Order No. 1000 requires transmission providers to participate in regional transmission planning and cost allocation processes that satisfy the requirements set forth therein, these existing transmission planning and cost allocation requirements do not result in regional transmission planning that is conducted on a sufficiently long-term, forward-looking, and comprehensive basis to plan for Long-Term Transmission Needs. As a result, we find that transmission providers are often not identifying, evaluating, or selecting more efficient or cost-effective regional transmission solutions to meet Long-Term Transmission Needs. This gap in existing regional transmission planning processes results in piecemeal, inefficient, and less cost-effective transmission planning that imposes real costs on customers, who pay Commission-jurisdictional transmission rates for less efficient or cost-effective transmission facilities and do not realize the benefits that would result from long-term, forward-looking, and more comprehensive regional transmission planning and cost allocation processes that identify, evaluate, and select more efficient or cost-effective transmission solutions to Long-Term Transmission Needs.

88. We find that these deficiencies in the Commission's existing transmission planning and cost allocation requirements render those requirements unjust, unreasonable, and unduly discriminatory or preferential in violation of FPA section 206.

---

wholesale rates are just and reasonable").

89. We also find that the Commission's existing transmission planning and cost allocation requirements are insufficient to ensure just and reasonable and not unduly discriminatory or preferential rates. Given these findings, we are now requiring, pursuant to FPA section 206, that transmission providers engage in and conduct sufficiently long-term, forward-looking, and comprehensive transmission planning and cost allocation processes to identify and plan for Long-Term Transmission Needs. We find that these reforms will facilitate a process by which transmission providers can better identify, evaluate, and select more efficient or cost-effective transmission solutions to meet Long-Term Transmission Needs, which will ensure that Commission-jurisdictional rates are just and reasonable and not unduly discriminatory or preferential.

1. The Transmission Investment Landscape Today

90. As the Commission explained in the NOPR, a robust, well-planned transmission system is foundational to ensuring an affordable, reliable supply of electricity.[191] Due to continuing changes in the industry, ongoing investment in transmission facilities is necessary to ensure the transmission system continues to serve load in a reliable,[192]

[191] NOPR, 179 FERC ¶ 61,028 at P 28 (citing 16 U.S.C. 824, 824d, 824e); *see also* US DOE ANOPR Initial Comments at 2 (stating that "strengthening and expanding existing transmission infrastructure, particularly the development of regional and inter-regional transmission projects, is key to continued access to reliable, resilient, lower-cost, and clean electricity for all").

[192] *See, e.g.*, MISO ANOPR Initial Comments at 40; Testimony of James B. Robb Before the U.S. Senate Energy and Natural Resources Committee, *Reliability, Resiliency, and Affordability of Electric Service in the United States Amid the Changing Energy Mix and Extreme Weather Events*, at 8-9 (Mar. 11, 2021), https://www.energy.senate.gov/services/files/D47C2B83-A0A7-4E0B-ABF2-9574D9990C11 (testifying that more transmission infrastructure is required to ensure the reliability and resilience of the bulk

affordable, and economically efficient fashion. Such investments support enhanced reliability, as larger, more integrated transmission systems result in a diversity of supply and demand conditions and a certain degree of redundancy that allows the system to better withstand failures during extreme events.[193] Proactive, forward-looking transmission planning that considers both evolving reliability needs and other drivers of transmission needs more comprehensively can enable transmission providers to identify potential reliability problems and economic constraints, as well as to evaluate potential transmission solutions, well in advance of these issues affecting the transmission system,[194] which can facilitate the selection of more efficient or cost-effective transmission facilities to meet Long-Term Transmission Needs.

91. In addition, transmission infrastructure can unlock the forces of competition, changing who can sell to whom, eliminating barriers to entry, and mitigating market

power system in light of changing conditions).

[193] ACORE ANOPR Initial Comments Ex. 4, Grid Strategies July 2021 Extreme Weather Report; Mark Chupka & Pearl Donohoo-Vallett, *Recognizing the Role of Transmission in Electric System Resilience* (May 2018), https://wiresgroup.com/wp-content/uploads/2020/06/2018-05-09-Brattle-Group-Recognizing-the-Role-of-Transmission-in-Electric-System-Resilience-.pdf; NERC ANOPR Initial Comments at 17-18; US DOE ANOPR Initial Comments at 18.

[194] MISO's Multi-Value Project (MVP) regional transmission planning process, for example, eliminated the need for approximately $300 million in reliability transmission facilities, resolving reliability violations and mitigating system instability conditions, through a forward-looking approach. Midcontinent Independent System Operator, *MTEP17 MVP Triennial Review: A 2017 review of the public policy, economic, and qualitative benefits of the Multi-Value Project Portfolio*, at 11, 33 (Sept. 2017) (MTEP2017 Review).

power.[195] Increased competition, in turn, can provide a host of benefits for customers, including cost-savings from greater access to low-cost power and a wider range of resources.[196] Transmission infrastructure can also serve as a form of insurance against future uncertainties because a more robust, integrated transmission system has the potential to provide consumers with the benefits of competition and enhanced reliability even if supply and demand fundamentals change over time.[197]

---

[195] Policy Integrity ANOPR Initial Comments at 13 n.40 ("A new transmission project can enhance competition by both increasing the total supply that can be delivered to consumers and the number of suppliers that are available to serve load." (citing Mohamed Awad et al., *The California ISO Transmission Economic Assessment Methodology (TEAM): Principles and Applications to Path 26*, at 3 (2006)); PIOs ANOPR Initial Comments Ex. [197] US DOE, *National Electric Transmission Congestion Study*, at 11 (Sept. 2015),

92. With that overview, we again begin with the key facts on the ground.[198] Since the issuance of Order No. 1000, transmission spending has continued to increase nationwide. A study by US DOE found that "annual investment [in transmission] first exceeded $5 billion per year in 2006 . . . and has increased consistently since that time. Annual investment [] doubled to more than $10 billion per year by 2010 and then [] doubled again by 2016. Annual investment has been between $18 billion and $22 billion annually since 2014."[199] A separate study, noted by the Commission in the NOPR, estimated that transmission developers in the United States invested $20 to $25 billion annually in transmission facilities from 2013 to 2020.[200] Unsurprisingly, in regions that saw a significant increase in transmission expenditures, transmission costs have also become an

https://www.energy.gov/sites/prod/files/2015/09/f26/2015%20National%20Electric%20Transmission%20Congestion%20Study_0.pdf (stating transmission expansion can strengthen and increase the flexibility of the overall network and "create real options to use the transmission system in ways that were not originally envisioned"); Vikram S. Budhraja et al., *Improving Electricity Resource Planning Processes by Considering the Strategic Benefits of Transmission*, 22 ELEC. J. 54 (Mar. 2009) (high voltage transmission affords "mitigation of risks as a form of insurance against extreme events").

[198] NOPR, 179 FERC ¶ 61,028 at P 36.

[199] California Commission Reply Comments at 9 n.27 (quoting US DOE, *National Electric Transmission Congestion Study*, at 9-10 (Sept. 2020), https://www.energy.gov/sites/default/files/2020/10/f79/2020%20Congestion%20Study%20FINAL%2022Sept2020.pdf).

increasing share of customers' overall electricity bills, underscoring the importance of ensuring that transmission investments are efficient and cost-effective.[201]

93. Furthermore, the record demonstrates that transmission investment is likely to substantially increase in coming years. A number of studies project significant and sustained transmission spending through at least 2050. For example, one projection cited by the US DOJ and FTC states that "high voltage transmission capacity must expand by 60 percent by 2030 at a capital cost of $330 billion, and must triple by 2050 at a capital cost of $2.2 trillion."[202] TAPS cites a separate study projecting $750 billion of new transmission investment between 2023 and 2050.[203] SoCal Edison "estimates that grid

[201] Resale Iowa Initial Comments at 3 ("[T]ransmission costs have comprised an increasing percentage of [] total wholesale electric costs [for Resale Iowa's members]. Currently, transmission and ancillary services constitute approximately 43% of such costs, as compared to 18.1% in 2009."); Industrial Customers Initial Comments at 5 (showing that transmission costs made up just 7% of the total PJM electricity bill in 2011 but 27% by 2020); Rob Gramlich and Jay Caspary, Americans for a Clean Energy Grid, *Planning for the Future: FERC's Opportunity to Spur More Cost-Effective Transmission Infrastructure*, at 26-28 (Jan. 2021), https://cleanenergygrid.org/wp-content/uploads/2021/01/ACEG_Planning-for-the-Future1.pdf (ACEG Jan. 2021 Planning Report) (stating that the current approach to transmission planning "results in higher total energy bills for customers than would result from more forward-looking, holistic transmission planning"); *see also* California Municipal Utilities Initial Comments at 10 (projecting that between 2022 and 2040, total high and low-voltage transmission access charges will nearly double and noting that "[g]one are the days when transmission was a *de minimis* portion of the overall bill and increases had little impact on the end consumer"); Public Systems Initial Comments at 5 (noting that "New England's Regional Network Service transmission rate has grown *nine-fold*, from $15.60 per kW-year (in 2003) to $140.98 per kW-year (in 2021)").

[202] US DOJ and FTC Initial Comments at 3 (citing Eric Larson et al., *Net-Zero America: Potential Pathways, Infrastructure, and Impacts*, Princeton Univ., 108 (Oct. 2021), https://netzeroamerica.princeton.edu/the-report).

[203] TAPS Initial Comments at 46 & n.133 (citing Jürgen Weiss et al., The Brattle

investments of up to $75 billion, including transmission upgrades, will be required from 2030 to 2045 *in California alone* to integrate bulk renewable generation and storage and serve load growth associated with electrification."[204] And ISO-NE's recently-completed 2050 Transmission Study estimates that transmission investment in New England will range from $16 billion to $26 billion between 2024 and 2050, depending on the amount of load growth realized in the region.[205]

94. The growing need for new transmission infrastructure, particularly over a longer time horizon, is being driven by a number of factors. First, longer-term reliability needs are changing. The NOPR explained that transmission system operators are increasing their reliance on regional transmission facilities to ensure operational stability, particularly because of the growing frequency of extreme weather events and increasing share of variable resources entering the resource mix.[206] The comments submitted in response to the NOPR support that preliminary finding. The record shows that changing

Group, *The Coming Electrification of the North American Economy*, at iii (2019), https://wiresgroup.com/wp-content/uploads/2020/05/2019-03-06-Brattle-Group-The-Coming-Electrification-of-the-NA-Economy.pdf)).

[206] NOPR, 179 FERC ¶ 61,028 at P 45.

reliability needs are driving a significant shift in demands placed on the transmission system,[207] and that because extreme weather events are occurring with greater frequency, transmission is increasingly critical to ensuring system reliability.[208] For example, Winter Storm Uri demonstrated that transmission infrastructure can make critical contributions to system reliability during extreme weather events,[209] as well as how

[207] ACEG Initial Comments at 5 (noting that weather-related power outages cost Americans $25-70 billion annually (citing Grid Strategies July 2021 Extreme Weather Report at 1)); *id.* at 52 (explaining that "[c]hanges to the transmission planning processes that would allow for certain transmission upgrades identified in the interconnection process to be addressed and ultimately constructed through the transmission planning process will only serve to increase the resiliency and reliability of the transmission system."); ACEG Reply Comments at 5-6 ("[R]eliability requires long term transmission planning that incorporates known and knowable information about the future resource mix."); NERC Initial Comments at 6 ("Transmission will be the key to support the resource transformation enabling delivery of energy from areas that have surplus energy to areas which are deficient. The frequency of such occurrences are increasing as extreme weather conditions resulting from climate change impact the fuel sources for variable energy resources. Regional transmission planning can ensure that sufficient amounts of transmission capacity will be needed to address these more frequent extreme weather conditions.").

[208] *See* DC and Maryland Offices of People's Counsel Reply Comments at 2 (noting that new transmission development has benefits including enhanced reliability and resilience that will serve as a necessary bulwark against disruptions caused by extreme weather); Indicated PJM TOs Initial Comments at 1 (explaining that maintaining a "reliable and resilient" transmission system requires holistic planning); NESCOE Initial Comments at 32-33 ("ISO-NE explains that energy-security risks in New England are well documented, highlighting the importance of conducting comprehensive energy security assessments covering a wide range of operating conditions, including low-probability, high-impact reliability risks (tail risks) related to extreme weather" (internal quotations omitted)); NYISO Initial Comments at 16 (expressing a desire to engage in actionable scenario planning to plan for future reliability challenges that may arise due to extreme weather, including the loss of all generation connected to a pipeline or other fuel sources, loss of an entire transmission line, and impacts from weather events like hurricanes or wildfires).

[209] ACEG Initial Comments at 22 n.63 (During Winter Storm Uri, "[a]n additional

transmission constraints can prevent operational generation resources from being able to serve load during tight supply conditions.[210] Consistent with experience from Winter Storm Uri, US DOE's Lawrence Berkeley National Laboratory provides further evidence of the significant value of transmission during unanticipated events, with research suggesting that 50% of the value created by alleviating transmission system congestion occurs during only 5% of the hours during which the transmission system is used.[211] Thus, transmission investment is likely to be more critical, and produce more reliability benefits, for customers as extreme weather and other system contingencies become more

---

1 gigawatt (GW) of transmission ties between ERCOT and the Southeastern U.S. could have saved nearly $1 billion and kept power flowing to hundreds of thousands of Texans." (citing Grid Strategies July 2021 Extreme Weather Report at 1-3, 12)); Grid Strategies July 2021 Extreme Weather Report at 7-8 ("The value of transmission for resilience can be seen in the drastically different outcomes of MISO and SPP relative to ERCOT during [Winter Storm Uri]. . . . In contrast to the 13,000 MW MISO was importing during the peak of [the] event, ERCOT was only able to import about 800 MW of power throughout the event."); NARUC Initial Comments at 67 n.192 (During Winter Storm Uri, SPP's "'relationships and interconnections with neighboring systems were critical. Usually a net exporter of energy, SPP relied significantly on imported energy to serve load during the winter event, with net amounts exceeding 6,000 megawatts (MW) at times. This emphasizes the value these relationships and robust transmission interconnections provide during emergency events and the opportunity to further strengthen them.'" (quoting Southwest Power Pool, *A Comprehensive Review of Southwest Power Pool's Response to the February 2021 Winter Storm: Analysis and Recommendations*, at 9 (July 2021), https://spp.org/documents/65037/comprehensive%20review%20of%20spp%27s%20response%20to%20the%20feb.%202021%20winter%20storm%202021%2007%2019.pdf (brackets omitted))).

[211] ACORE Initial Comments at 10-11 (citing LBNL Aug. 2022 Transmission Value Study at 33); US DOE Initial Comments at 5-6 & n.13.

frequent.[212] For some communities who can be more susceptible to the impacts of extreme weather, like communities of color and low-income communities, transmission investment has the potential to be even more critical.[213] Conversely, failure to adequately plan the transmission system to meet such changing reliability needs will forgo many of those potential benefits, jeopardize system reliability, and force customers to pay for transmission facilities that may not efficiently or cost-effectively address urgent reliability needs.

95. Second, demand is changing. After many years of flat or minimal load growth in regions across the country, demand, on both a national and a regional basis, is projected to significantly increase in the coming decades, and it will require an increasingly robust transmission system to reliably serve this load growth. As stated in the NOPR, changes in electric demand and associated load profiles are occurring as load-serving entities work to meet increasing needs due to electrification trends, as well as new large loads associated with evolving industrial and commercial needs, such as growth in data centers.[214] The comments submitted in this record demonstrate that, in regions across the

The nationwide forecast of electricity demand shot up from 2.6% to 4.7% growth over the next five years, as reflected in 2023 FERC [Form 714] filings. Grid planners forecast peak demand growth of 38 gigawatts (GW) through 2028."); N. Amer. Elec. Reliability Corp., *2023 Long-Term Reliability Assessment*, at 33 (Dec. 2023), https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_LTRA_2023.pdf ("Electricity peak demand and energy growth forecasts over the 10-year assessment period are higher than at any point in the past decade. The aggregated assessment area summer peak demand forecast is expected to rise by 79 GW, and aggregated winter peak demand forecasts are increasing by nearly 91 GW. Furthermore, the growth rates of forecasted peak demand and energy have risen sharply since the *2022* [*Long-Term Reliability Assessment*], reversing a decades-long trend of falling or flat growth rates.").

and heating operations, are well underway or soon to begin.[219] Importantly, the record shows that these increases in aggregate demand for electricity will have significant consequences for the transmission system. To serve more load, the capacity of the already-oversubscribed transmission system will need to increase.[220] Moreover, load growth driven primarily by electrification can create a load profile that has a higher load factor and that is thus more challenging to serve.[221]

---

[219] Renewable Northwest Initial Comments at 20 ("A recent study done by Deloitte showed that 70 percent of executives in industrial manufacturing industries have plans for the electrification of industrial processes, and 50 percent of the executives who responded have goals to electrify vehicle fleets and space and water heating within their companies by 2030." (citing Stanley Porter et al., Deloitte, *Electrification in Industrials* (Aug. 2020), https://www2.deloitte.com/us/en/insights/industry/power-and-utilities/electrification-in-industrials.html)).

[220] *See, e.g.*, National Grid Initial Comments at 6 (discussing preliminary findings of the ISO-NE 2050 Transmission Study, which show "significant new transmission will be needed to reliably serve" increased future loads assumed in the study (citing ISO-NE, *2050 Transmission Study* (2023), https://www.iso-ne.com/static-assets/documents/2023/08/2050_study_ma_cetwg_2023_aug_final.pdf)); Northwest and Intermountain Initial Comments at 5 n.12 ("For example, Bonneville Power Administration ('BPA') owns about 75 percent of the transmission lines in the Pacific Northwest. In BPA's 2022 Transmission Service Expansion Plan cluster study, customers submitted 153 separate transmission service requests totaling 11,831 MW of transmission capacity. BPA was able to offer service (without requiring detailed studies and transmission upgrades) to only 275 MWs of those service requests." (citing BPA, *TSR Study and Expansion Process*, at 12 (Dec. 2021), https://www.bpa.gov/-/media/Aep/transmission/atc-methodology/2021-22tsep-overview.pdf.)).

[221] MISO Initial Comments at 54 ("In addition, a return to load growth driven primarily by the electrification of transportation, space heating and water heating is creating a load profile that has a higher load factor and is more challenging to serve."). Load factor refers to "[t]he ratio of the average load to peak load during a specified time interval." U.S. Energy Info. Admin. (EIA), *Glossary* (last visited Mar. 2024), https://www.eia.gov/tools/glossary/index.php?id=L.

96. Third, supply is changing. As the NOPR explained, federal, state, and local policies are incentivizing various forms of generation resources and other technologies,[222] resulting in changes to the nation's resource mix. The comments in this record show that these policies are widespread and now span many regions of the country. States and cities in the Northeast,[223] Mid-Atlantic,[224] Midwest,[225] West,[226] and Southeast[227] have

[222] NOPR, 179 FERC ¶ 61,028 at P 45.

[223] National Grid Initial Comments at 6-7 (explaining how all six states in New England have renewable energy standards and how ISO-NE's 2050 Transmission Study demonstrates the demands that meeting those standards will place on New England's transmission system); *id.* at 7 (explaining how the Climate Leadership and Community Protection Act enacted in New York State requires 70% renewable generation by 2030, zero-emissions by 2040, and 85% economy-wide emissions reductions by 2050, and that transmission infrastructure will be critical in meeting those goals); NESCOE Initial Comments at 15 ("Achieving a decarbonized system is required by laws and mandates in Connecticut, Maine, Massachusetts, Rhode Island, and Vermont.").

[224] DC and MD Offices of People's Counsel Initial Comments at 18 (noting that "both Maryland and the District have adopted ambitious jurisdiction-wide decarbonization policies applicable to the [electric distribution companies] regulated by their respective public service commissions.").

[225] Illinois Commission Initial Comments at 5 (explaining that "[i]n Illinois, the Climate and Equitable Jobs Act of 2021 . . . will affect the future resource mix and demand and lead to decarbonization and electrification. For example, [it] requires Illinois to completely transition to clean energy by 2050 and facilitates electrification through the promotion of electric vehicles.").

[226] Renewable Northwest Initial Comments at 6 (explaining that, "[c]urrently, 80 percent of NorthernGrid's load is subject to state clean energy laws, and by 2040 NorthernGrid will have 65 percent carbon-free energy."); *id.* at 21 (explaining that Washington state's "SB 5974 sets a goal of all vehicles sold in 2030 and beyond to be [electric vehicles], with that goal becoming a mandate in 2035[.]").

[227] SREA Initial Comments at 25 (noting that North Carolina has adopted Renewable Energy and Energy Efficiency Portfolio Standards and enacted the North Carolina Carbon Plan).

adopted binding state laws requiring emissions reductions. Moreover, with the passage of the Inflation Reduction Act in 2022, Congress has enacted legislation that will further spur investment nationwide in renewable and non-emitting resources.[228]

97. Customers are also driving changes in the resource mix. In addition to increasing their aggregate demand for electricity, the NOPR explained that customers, including major corporations, in many regions are increasingly demanding that load be served by renewable or non-emitting resources.[229] Substantial evidence in the record supports the existence of this trend. Since 2014, for example, "commercial and industrial customers have contracted for more than 52 GW of clean energy[.]"[230] Furthermore, this trend is

[228] ACORE Initial Comments at 1-2 & n.2 (projecting that "annual additions increasing from 15 GW of wind and 10 GW of utility-scale solar PV in 2020 to an average of 39 GW/year of wind additions in 2025-2026 (~2x the 2020 pace) and 49 GW/year of solar (~5x the 2020 pace), with solar growth rates increasing thereafter." (citing REPEAT Project, *Preliminary Report: The Climate and Energy Impacts of the Inflation Reduction Act of 2022*, at 15 (2022), https://repeatproject.org/docs/REPEAT_IRA_Prelminary_Report_2022-08-12.pdf)); CARE Coalition Initial Comments at 17 ("Analysis suggests that the [Inflation Reduction Act] could more than triple clean energy production in the U.S. and lead to $600 billion in capital investment in clean energy infrastructure." (citing American Clean Power Ass'n, *It's a Big Deal for Job Growth and for a Clean Energy Future* (2022), https://cleanpower.org/blog/its-a-big-deal-for-job-growth-and-for-a-clean-energy-future)); Evergreen Action Initial Comments at 3-4 (discussing model showing that clean energy could comprise up to 81% of all U.S. generation as a result of increased incentives in the Inflation Reduction Act (citing John Larsen et al., Rhodium Group, *A Turning Point for US Climate Progress: Assessing the Climate and Clean Energy Provisions in the Inflation Reduction Act* (2022), https://rhg.com/research/climate-clean-energy-inflation-reduction-act)); NextEra Reply Comments at 5 ("The signing of the Inflation Reduction Act of 2022 . . . will only increase the demand for renewables in the coming years and accelerate corresponding demands on the transmission system.").

[229] NOPR, 179 FERC ¶ 61,028 at P 45.

[230] Advanced Energy Buyers Initial Comments at 5 (citing Clean Energy Buyers

accelerating. In 2021 alone, energy customers voluntarily contracted for "11.06 GW of clean energy."[231] The record demonstrates that, going forward, this shift is projected to continue, as forecasts show that Fortune 1000 companies will have up to 85 GW of new demand for renewable energy to meet their public sustainability commitments for 2030.[232] As also noted in the NOPR, utilities in many regions have made commitments to procure most or all of their electricity from renewable or non-emitting resources. For example, Exelon,[233] Dominion,[234] AEP,[235] and Southern[236] have all committed to achieve

Alliance, *State of the Market 2022*, https://cebuyers.org/state-of-the-market/).

[231] Clean Energy Buyers Initial Comments at 7.

[232] Clean Energy Buyers Initial Comments at 7 n.13 (citing Clean Energy Buyers ANOPR Initial Comments at 21-22).

[233] Exelon Initial Comments at 2 ("Exelon has established ambitious targets and aims to be a leader in clean energy by continuing to reduce its own greenhouse gas emissions, including reducing operations-driven emissions 50 percent by 2030, relative to a 2015 baseline, and achieving net-zero operations by 2050." (citing Calvin Butler, Exelon Corporation, *We're on the Path to Clean* (Apr. 2021), https://www.exeloncorp.com/grid/were-on-the-path-to-clean)).

[234] Dominion Initial Comments at 3-4 ("Dominion Energy has committed to achieve net zero greenhouse gas emissions by 2050 and is investing in clean energy resources such as solar and wind.").

[235] AEP Initial Comments at 4 n.12 ("AEP's goal is to reduce carbon emissions from directly owned generation by 80% by 2030 compared to 2000 levels and to achieve net-zero emissions by 2050." (citing AEP, *2022 Corporate Sustainability Report*, at 48 (2022), https://www.aep.com/news/releases/read/8520/AEP-Releases-2022-Corporate-Sustainability-Report)).

[236] Southern Initial Comments at 14 ("By 2019, Southern Companies had already achieved a 44% reduction in greenhouse gas emissions in pursuit of its goals of a 50% reduction by 2030 and net zero by 2050.").

net-zero emissions by 2050, and each has set an interim goal to significantly reduce emissions by 2030. And, although utility commitments vary by utility and by region, the record shows that many utilities have announced some future emissions target.[237]

98. Furthermore, as noted in the NOPR,[238] the resource mix is also being affected by the changing economics of the resources that comprise the resource mix.[239]

[237] *See, e.g.*, SREA Initial Comments at 41-42 ("Major utilities in the South, including Entergy, Dominion Energy, Duke Energy, NextEra, Tennessee Valley Authority, and Southern Company have all announced some version of a net zero carbon emission plan or commitment.").

[238] NOPR, 179 FERC ¶ 61,028 at P 45 & n.72 (noting the average levelized cost of wind energy for commercial wind generation has decreased from $90 per MWh in 2009, to $35 per MWh in 2019 (citing Lawrence Berkeley National Laboratory, *Wind Energy Technology Date Update: 2020 Edition*, at 66 (Nov. 2020))); *id.* (noting that the average levelized power purchase agreement price for utility-scale solar generation has decreased from approximately $160 per MWh in 2009, to approximately $40 MWh in 2020 (citing Lawrence Berkeley National Laboratory, *Utility-Scale Solar Data Update: 2020 Edition*, at 32 (Nov. 2020))).

[239] *See* ACORE ANOPR Initial Comments at app. 1, p. 22 (ACEG Jan. 2021 Planning Report) ("Wind and solar energy costs have fallen 70 and 89 percent, respectively, in the last ten years, from 2009 through 2019."); Dominion Initial Comments at 19 (noting how, during the 2010s, the fracking revolution and advanced technology for natural gas combined cycle generation lead to a shift away from coal and nuclear as "baseload" fuels and how, today, renewable energy resources are likewise undergoing a similar expansion); Evergreen Action Initial Comments at 3 ("Rapid innovation has made wind and solar power the lowest-cost resource in many areas of the country[.]" (citing Univ. of Tex. at Austin Energy Inst., *Levelized Cost of Electricity in the United States by County* (2022), http://calculators.energy.utexas.edu/lcoe_map/#/county/tech); *see also* ACORE Reply Comments at 2 ("In all scenarios, building transmission that enables low-cost wind and other energy resources is often cheaper than the alternatives, such as use of higher-cost but local resources (and potentially additional storage)." (citing Paul Denholm, et al., National Renewable Energy Laboratory, *Examining Supply-Side Options to Achieve 100% Clean Electricity by 2035*, at 47-78 (Sept. 2022))).

99. Together, trends in economics, growing demand, and federal, federally-recognized Tribal, state, and local policies are already resulting in significant changes in the resource mix. The record shows that as of 2021, nearly 70% of capacity additions across the country were from new, utility-scale wind and solar resources.[240] Meanwhile, most of the capacity retirements are, and are projected to continue to be, coal resources.[241] Based on the record, those trends are projected to continue, with over 1,300 GW of wind, solar, and storage resources in interconnection queues across the country as of 2021.[242] With the

[240] SREA Initial Comments at 1-2 (citing US Energy Info. Admin., *Today in Energy* (2021), https://www.eia.gov/todayinenergy/detail.php?id=46416#); *see also* AEE Initial Comments at 13 (noting that between 2011 and 2021, "renewable generation nearly doubled, from 12.5% to more than 20%.").

[241] AEE Initial Comments at 12-13 ("From 2011 to 2021, the proportion of U.S. electricity generated by coal plants dropped by almost half, from 42% to under 22%" (citing U.S. Energy Info. Admin., *U.S. Electricity Generation by Major Energy Source, 1950-2021* (2022), https://www.eia.gov/energyexplained//electricity/charts/generation-major-source.csv)); California Commission Initial Comments at 65 (citing FERC, *State of the Markets 2020* (Mar. 2021); Renewable Northwest Initial Comments at 36 (using IRP data to show that utilities in NorthernGrid plan to retire 6,573 MW of coal, 1,476 MW of natural gas, 10 MW of wind, and 18 MW of solar, by 2040). FERC's State of the Markets 2020 report stated that 9.6 GW of coal capacity retired in 2020, which had a noticeable effect on coal's operating capacity share in most RTOs/ISOs. FERC, *State of the Markets 2020*, at 10, 12 (Mar. 2021). FERC's State of the Markets 2023 indicates that this trend is continuing, with coal generation declining 18.8% in 2023. FERC, *State of the Markets 2023*, at 4 (Mar. 2024). *See also* US DOE Initial Comments at App. B, pp. 8-9 (Rand et al., Lawrence Berkeley National Laboratory, *Queued Up: Characteristics of Power Plants Seeking Transmission Interconnection as of the End of 2021* (Apr. 2021)).

[242] *See* US DOE Initial Comments app. B, at p. 26 (Lawrence Berkeley National Laboratory, *Queued Up: Characteristics of Power Plants Seeking Transmission Interconnection As of the End of 2021* (Apr. 2022)) (noting that 676 GW of solar, 246 GW of wind, 213 GW of standalone battery capacity, and ~208 GW of hybrid battery capacity wait in interconnection queues across the U.S.). On the other hand, the number of coal and, relatedly, natural gas resources waiting to interconnect is limited. *See id.*;

passage of the Inflation Reduction Act in 2022, many analysts are predicting that the shift toward renewable resources will accelerate.[243]

100. In light of these changing demands on the transmission system, the record also affirms what the Commission has long recognized: regional transmission planning that identifies more efficient or cost-effective transmission solutions to needs helps to ensure cost-effective transmission development for customers and can yield better returns for every dollar spent than localized or piecemeal transmission solutions.[244] Conversely,

---

Colorado Consumer Advocates Initial Comments attach. 7, at p. 21 ("No new coal plants have been built for domestic utility electricity production since 2014[.]"); NESCOE Initial Comments at 15-16 (noting that new natural gas generation represented nearly 48% of the queue in 2017, but just 3% by March of 2022). Moreover, the updated version of the report to which US DOE cites indicates that the capacity of wind, solar, and storage in interconnection queues is still increasing. Lawrence Berkeley National Laboratory, *Queued Up: Characteristics of Power Plants Seeking Transmission Interconnection As of the End of 2022* (Apr. 2023) (noting that 947 GW of solar, 300 GW of wind, 325 GW of standalone battery capacity, and ~358 GW of hybrid storage capacity, totaling over 1900 GW, wait in interconnection queues across the country).

[243] ACORE Initial Comments at 1-2 & n.2 ("[P]rojecting annual additions increasing from 15 GW of wind and 10 GW of utility-scale solar PV in 2020 to an average of 39 GW/year of wind additions in 2025- 2026 (~2x the 2020 pace) and 49 GW/year of solar (~5x the 2020 pace), with solar growth rates increasing thereafter." (quoting REPEAT Project, *Preliminary Report: The Climate and Energy Impacts of the Inflation Reduction Act of 2022*, at 15 (2022), https://repeatproject.org/docs/REPEAT_IRA_Prelminary_Report_2022-08-12.pdf)).

[244] Order No. 1000, 136 FERC ¶ 61,051 at P 55 ("[T]he narrow focus of current planning requirements and shortcomings of current cost allocation practices create an environment that fails to promote the more efficient and cost-effective development of new transmission facilities."); *id.* P 68 (concluding that reforms that require transmission providers to engage in regional transmission planning and evaluate proposed alternatives that "may resolve the region's needs more efficiently or cost-effectively than solutions identified in the local transmission plans . . . will provide assurance that rates for transmission services on these systems will reflect more efficient or cost-effective solutions for the region."); Order No. 890, 118 FERC ¶ 61,119 at P 524 ("[C]oordination

inadequate or poorly designed transmission planning processes can lead to relatively inefficient or less cost-effective transmission investment, with customers footing the bill for piecemeal, inefficient, and less cost-effective transmission solutions designed to meet short-term or small-scale transmission needs. Given the magnitude of transmission investment needed to meet customers' changing needs, it is essential that regional transmission planning be of sufficient scope and duration to help to ensure customers' money is well-spent on transmission infrastructure that can efficiently and cost-effectively meet those needs. Unfortunately, we conclude that this is not the case today and that existing regional transmission planning processes are inadequate to address the emerging Long-Term Transmission Needs that are expected to increasingly drive transmission investment in the coming decades.

101. Experience with the implementation of Order No. 1000 over the last decade has highlighted a critical gap in the Commission's existing transmission planning and cost

---

of planning on a regional basis will also increase efficiency through the coordination of transmission upgrades that have region-wide benefits, as opposed to pursuing transmission expansion on a piecemeal basis."); *see also* ACORE Initial Comments at 6 (demonstrating that effective regional transmission planning could significantly reduce total electric system costs compared to electric system costs that result from intrastate planning (citing Brattle-Grid Strategies Oct. 2021 Report at 12)); R Street Initial Comments at 8 ("[H]olistic transmission planning could improve economic efficiencies and save billions of dollars . . . . For example, MISO's 2022 long-range transmission plan results include $10 billion in transmission projects that support interconnection of 53,000 megawatts of new renewable generation and reduces other costs by $37-$68 billion. PJM similarly identified $3 billion in transmission upgrades that would save billions compared to the current practice of incremental upgrades through the interconnection process." (citing Johannes Pfeifenberger, Brattle Group, *Planning for Generation Interconnection*, at 5 (May 31, 2022), https://www.esig.energy/event/special-topic-webinar-interconnection-study-criteria (citation omitted))).

allocation requirements. Notwithstanding the broad recognition that additional transmission infrastructure is needed to address the drivers noted above, regional transmission planning processes across the country have yielded only limited investments in regional transmission projects. As the Commission observed in the NOPR, investment in regional transmission facilities in some regions has declined compared to prior to Order No. 1000.[245] Moreover, across all the non-RTO/ISO regions, there has not yet been a single transmission facility selected since implementation of Order No. 1000.[246] The record also demonstrates that within some RTO/ISO regional transmission planning processes, even where investments through the regional transmission planning process do occur, much of that investment has been in transmission projects that only address immediate reliability needs.[247] We find that this evidence supports our conclusion that

[245] NOPR, 179 FERC ¶ 61,028 at P 39 (citing ACEG Jan. 2021 Planning Report at 25 & fig. 8); *see also* ACORE ANOPR Initial Comments at 4 ("Despite the potential benefits, regional transmission investment has not increased and in some regions even has declined over the past decade.") (citing ACEG Jan. 2021 Planning Report at 25)); State Agencies Initial Comments at 23 ("Regionally planned projects have [] declined in RTOs/ISOs . . . ." (citing John C. Gravan and Rob Gramlich, NRRI Insights, *A New State-Federal Cooperation Agenda for Regional and Interregional Transmission*, at 2 (Sept. 2021), https://pubs.naruc.org/pub/FF5D0E68-1866-DAAC-99FB-A31B360DC685)).

[247] Southwestern Power Group Initial Comments at 15; PIOs ANOPR Initial Comments at 93 & n.276; *see also* Ari Peskoe, *Is the Utility Syndicate Forever?*, 42 Energy L.J. 1, 56-57 (2021) (explaining, for example, that in ISO-NE, all but one of the

existing regional transmission planning processes are not of sufficient scope and duration to adequately or consistently identify transmission needs and associated opportunities to more comprehensively evaluate and select more efficient or cost-effective transmission solutions to those needs.

102. Indeed, in the limited instances in which transmission providers have followed processes that share many of the elements of the long-term, forward-looking, and more comprehensive regional transmission planning this rule requires, customers have seen clear and quantifiable benefits. For example, as the Commission observed in the NOPR,[248] MISO's Multi-Value Project (MVP) transmission planning process proactively planned over a 20-year period for two key drivers of transmission needs: the impacts of changing state laws on the resource mix, and a large increase in the number of generator interconnection requests. To mitigate the uncertainties associated with such long-term projections of transmission needs, MISO relied on scenarios to consider a range of potential future conditions[249] and disclosed the assumptions and inputs underlying each scenario.[250] The MVP process then identified a portfolio of transmission projects that were projected to provide multiple kinds of reliability and economic benefits under all the

transmission projects approved through the regional transmission planning process were immediate-need reliability projects).

alternate future scenarios studied.[251] This process resulted in MISO identifying, evaluating, and selecting transmission facilities that are estimated to generate $2.20 to $3.40 of benefit per dollar invested.[252]

103. The benefits to transmission customers of long-term, forward-looking, and more comprehensive regional transmission planning, which we discuss further below, are thus well-documented but realized all too infrequently under existing regional transmission planning processes. Relatedly, the record demonstrates that a substantial amount of new transmission investment is occurring outside of regional transmission planning processes. Because these other processes—specifically, generator interconnection processes and local transmission planning processes—are generally designed to address discrete, shorter-term needs, and do not comprehensively assess either broader transmission needs or solutions to those needs, overreliance on those processes can result in relatively inefficient or less cost-effective transmission development for customers,[253] which contributes to rates for transmission that are unjust and unreasonable.

[251] *Id.* (citing MTEP2017 Review at 13).

[252] *Id.* P 30 (citing MTEP2017 Review at 4).

[253] ACORE Initial Comments at 4-5 (citing Brattle-Grid Strategies Oct. 2021 Report at 3); Clean Energy Associations Initial Comments at 5 (explaining that proactive, forward-looking transmission planning processes can reduces costs by nearly half as compared to incremental and reactive transmission planning processes); Ørsted Initial Comments at 5 (explaining that failure to proactively plan for offshore wind results in suboptimal transmission development, which can increase costs to ratepayers); Southeast PIOs Reply Comments at 2 (explaining that in the Southeast, "snowballing inefficiencies created by numerous small-scale transmission band-aids, unfit to address broader generation trends, translate into excessive, unjust, and unreasonable rates borne by an

104. The record demonstrates that significant expansion of the transmission system is occurring through one-off, piecemeal, interconnection-related network upgrades constructed in response to individual generator interconnection requests.[254] As the Commission observed in the NOPR, the evidence shows a sharp growth in both the total cost of interconnection-related network upgrades and in the cost of such upgrades relative to generation project costs.[255] The record indicates that the average cost of interconnection-related network upgrades is increasing over time as the transmission system is fully subscribed and demand for interconnection service outpaces transmission investment. As highlighted in the NOPR,[256] in 2020, MISO identified the need for nearly $2.5 billion in interconnection-related network upgrades to interconnect just 9.2 GW of generation in MISO South, and MISO expects to need over $3 billion in interconnection-related network upgrades for interconnection in MISO West.[257] Similarly, SPP identified the need for $4.6 billion in interconnection-related network upgrades to interconnect just 10.4 GW of new generation.[258]

---

already overburdened populace.").

105. Record evidence also shows that increases in interconnection costs are being driven, in many cases, by an expansion in the scope and complexity of interconnection-related network upgrades.[259] The Commission noted in the NOPR, for example, that interconnection-related network upgrade costs in MISO West went from approximately $300/kW in 2016 to nearly $1,000/kW in 2017.[260] The trend is evident in other parts of

[259] *See, e.g.*, US DOE Initial Comments at 8 & n.20 (citing Jay Caspary et al., ACEG, *Disconnected: The Need for a New Generator Interconnection Policy*, at 13-16 (2021), https://cleanenergygrid.org/wp-content/uploads/2021/01/Disconnected-The-Need-for-a-New-Generator-Interconnection-Policy-1.pdf) (ACEG 2021 Interconnection Report); Will Gorman et al., *Improving estimates of transmission capital costs for utility-scale wind and solar projects to inform renewable energy policy*, 135 Energy Policy 110994 (2019), https://www.sciencedirect.com/science/article/pii/S0301421519305816)); ACEG 2021 Interconnection Report at 13 ("[T]he costs for integrating new resources in MISO are rising substantially relative to previous years, indicating that the large-scale network has reached its capacity and needs to expand to connect more generation. In other words, much more than 'driveway' type facilities are need; larger roads and highways are required to alleviate the traffic. . . . [H]istorically, interconnecting wind projects have incurred interconnection costs of $0.85 per megawatt hour (MWh) or $66 per kilowatt (kW). However, newly proposed wind projects now face interconnection costs that are nearly five times higher, at $4.05/MWh or $317/kW."); *id.* at 14 ("New solar projects in MISO South have much higher upgrade costs. The most recent 2019 system impact study for solar projects in MISO South estimated upgrade costs to total $307/kW, with upgrade costs for individual interconnection requests as high as $677/kW."); *id.* ("The same trend of rising network upgrade cost assignments is occurring in PJM. Historically, the levelized costs for constructed wind and solar projects were $0.25/MWh and $1.72/MWh, respectively, or $19.07 kW and $61.83/kW, respectively . . . costs for newly proposed wind and solar projects, however, have now risen to $0.69/MWh and $3.66/MWh, respectively or $0.54/kW and $131.90/kW, respectively—more than a 100 percent increase.").

[260] NOPR, 179 FERC ¶ 61,028 at P 38 (citing ACEG Jan. 2021 Interconnection Report at 14; NextEra ANOPR Initial Comments at 16 (citing Midcontinent Indep. Sys. Operator, *MISO 2020 Queue Outlook*, at 9 (2020), https://cdn.misoenergy.org/MISO2020InterconnectionQueueOutlook445829.pdf)).

the country as well.[261] The costs of interconnection-related network upgrades are, in many cases, an ever-growing percentage of the total capital costs of new generation projects. According to one report, interconnection costs for new renewable resources were less than 10% of total generation project costs until a few years ago, but recently these costs have risen to as much as 50%-100% of the total generation project costs.[262] At the same time, interconnection-related network upgrades have frequently transitioned from primarily small transmission facilities that serve the needs of a limited number of interconnection customers to the size and scope of what have traditionally been considered high voltage transmission facilities. For example, interconnection-related

[261] NOPR, 179 FERC ¶ 61,028 at P 38 (showing that, as of 2019, interconnection costs in PJM for constructed wind and solar projects were $19.07/kW and 61.83/kW, respectively, as compared to a greater than 100% increase to $54/kW and $131.90/kW, respectively, for projects newly proposed today) (citing *e.g.*, ACEG Jan. 2021 Interconnection Report at 14 & tbl.2)); NextEra ANOPR Initial Comments at 16-17 (stating that interconnection-related network upgrade cost estimates have nearly tripled for newly proposed wind projects, and more than doubled for solar projects in PJM); *see also* ACEG Jan. 2021 Interconnection Report at 16 (illustrating an increase in average interconnection-related network upgrade costs in NYISO from $67/kW in 2013 to $124/kW in 2019). *Compare* ACEG Jan. 2021 Interconnection Report at 15 (identifying interconnection-related network upgrade costs in 2013 in SPP as $89/kW), *with* ICF Sept. 2021 Interconnection Report at 2 (citing interconnection-related network upgrade costs of $448/kW for interconnection customers studied in SPP's system impact study published in April 2021)).

network upgrades have recently included demolishing and rebuilding multiple 500 kV transmission lines[263] and constructing long, double-circuit, 765 kV transmission lines,[264] all at significant cost to the interconnection customer initially—and ultimately to consumers.

106. Unlike regional transmission planning processes, however, the generator interconnection process is not designed to consider how to address transmission needs more efficiently or cost-effectively beyond the discrete interconnection request (or requests) being studied. Therefore, the generator interconnection process does not look at time horizons beyond the specific interconnection request(s) being studied, comprehensively assess any transmission needs beyond those created by the specific interconnection request(s), or achieve the economies of scale in transmission investment that long-term, forward-looking, and more comprehensive regional transmission planning processes can provide.[265]

---

107. We acknowledge that the Commission recently issued Order No. 2023, which requires transmission providers to reform their generator interconnection processes. But while Order No. 2023 aims to improve the efficient processing of interconnection queues, it does not attempt to remedy the discrete deficiency addressed in this final rule: that existing regional transmission planning and cost allocation requirements do not require transmission providers to plan on a sufficiently long-term, forward-looking, and comprehensive basis. Instead, Order No. 2023 seeks to ameliorate the fact that existing generator interconnection procedures and agreements were "insufficient to ensure that interconnection customers are able to interconnect to the transmission system in a reliable, efficient, transparent, and timely manner[.]"[266] The interconnection queue backlogs and delays that were the Commission's focus in Order No. 2023 have arisen, in part, due to deficiencies in the existing transmission planning requirements. But the Commission found issues regarding the coordination between transmission planning and

[interconnection-related] network upgrades" using the generator interconnection processes will likely not result in efficient or cost-effective outcomes given the ongoing changes in the resource mix and demand); Pine Gate Initial Comments at 9 (explaining how piecemeal approaches to transmission planning, like the generator interconnection process, result in inefficiently small upgrades (citing ACEG Jan. 2021 Interconnection Report at 7)); PIOs Initial Comments at 10; SEIA Initial Comments at 2; Southeast PIOs Initial Comments at 37 ("The lack of any regular, formal proceeding to consider Alabama Power's comprehensive facility investment plan is troubling and ensures that both generation and transmission are considered on a project-by-project basis. This piecemeal approach to addressing transmission needs for individual generation resource decisions will cause sticker-shock every time and an institutional aversion to broader transmission investment, especially when transmission benefits are expressly ignored.").

[266] Order No. 2023, 184 FERC ¶ 61,054 at P 36.

generator interconnection processes were beyond the scope of Order No. 2023 and, therefore, the Commission addressed only interconnection queue processes rather than also addressing transmission planning requirements.[267] Consequently, this final rule addresses a root cause of interconnection backlogs and delays that Order No. 2023 did not—the failure of transmission providers to plan on a sufficiently long-term, forward-looking, and comprehensive basis. Accordingly, the need to reform this deficiency persists despite the Commission's reforms required by Order No. 2023.

108. While some commenters argue that transmission providers do not rely too heavily on the generator interconnection process to build transmission facilities,[268] we find that the record indicates otherwise. Specifically, as discussed above, the increase in both the total and average cost of interconnection demonstrates how much transmission investment is occurring on a one-off, incremental basis through generator interconnection processes.[269] The Commission has consistently and repeatedly found that

[267] Order No. 2023, 184 FERC ¶ 61,054 at PP 1741, 1743 (finding that, although "several commenters argue in favor of greater coordination between generator interconnection and transmission planning or identify interconnection as a matter requiring interregional planning," those comments were beyond the scope of that rulemaking proceeding and noting that "the Commission proposed reforms related to coordination between regional transmission planning and cost allocation and generator interconnection in" the docket for this final rule).

[268] Mississippi Commission Initial Comments at 9; North Carolina Commission and Staff Initial Comments at 5; Southern Initial Comments at 38-40.

[269] New Jersey Commission Initial Comments at 6-7 (noting that interconnecting 87.1 GW of capacity, which is needed to meet the PJM states' offshore wind and renewable portfolio standards goals, through the interconnection queue process alone is projected to cost $36 billion); US DOE Initial Comments at 8 (citing ACEG 2021

interconnection-related network upgrades provide systemwide benefits,[270] a finding which courts have upheld.[271] In turn, we find that increasingly relying on interconnection customers' interconnection-related network upgrades to expand the capacity of the transmission system is inefficient and leads to less cost-effective transmission development than would result from long-term, forward-looking, and more comprehensive regional transmission planning, to the detriment of customers.

109. Separately, the record here also substantiates the NOPR's preliminary finding that the majority of investment in transmission facilities since the issuance of Order No. 1000

Interconnection Report at 13-16 (2021)).

has been in local transmission facilities.[272] Commenters explain that, in RTO/ISO regions, one half of the nearly $70 billion in aggregate transmission investments by Commission-jurisdictional transmission providers between 2013 and 2017 was approved outside of regional transmission planning processes.[273] This investment trend is continuing and accelerating. For example, in 2019, PJM approved 383 transmission-owner planned supplemental projects at a total cost of $3.75 billion, compared to only 80 regionally planned baseline projects at a total cost of $1.27 billion. Then, in 2020, PJM approved 236 supplemental projects at a total cost of $4.7 billion, compared to only 43 regionally planned baseline projects at a total cost of $413 million.[274] In MISO, baseline reliability projects and other local transmission projects have grown dramatically since 2010 and constituted 100% of approved transmission between 2018 and 2020 and 80% since 2010.[275] From 2019 to 2021, 63% of transmission investment by the three largest transmission owners in CAISO was in local transmission projects, and Pacific Gas and Electric forecasts that of the $13 billion it will spend on capital additions between 2022

[272] NOPR, 179 FERC ¶ 61,028 at PP 39-40.

[273] PIOs Initial Comments at 9.

[274] PIOs ANOPR Initial Comments at 31-44; *see also* Ohio Consumers Initial Comments at 5 ("Since 2017, in Ohio, less than 25% of the new investment in transmission has been associated with large regional transmission projects needed for reliability or economic efficiency.").

[275] *See* PIOs Initial Comments at 10 n.31 (citing PIOs ANOPR Initial Comments at 49 (citing Brattle-Grid Strategies Oct. 2021 Report at iii, 2)).

and 2027, approximately 84% will be on local transmission projects.[276] In ISO-NE, spending on in-kind transmission replacements, which are not part of the regional transmission planning process, has been significant. Between 2016 and 2022, over $2.5 billion has been spent on in-kind replacement projects that have entered service and, as of 2022, an additional $3.122 billion of in-kind replacement projects had been proposed, planned, or were under construction.[277]

110. As with the growing reliance on the generator interconnection process to identify needed transmission system improvements, local transmission planning, with its focus on the needs of individual utility footprints, does not necessarily provide sufficient, comprehensive analysis of broader regional transmission needs. Similarly, local transmission planning processes and in-kind replacement processes do not generally assess transmission needs based on a forward-looking multi-scenario assessment that more comprehensively accounts for the benefits of transmission infrastructure.[278] Therefore, transmission expansion in this incremental manner also misses the potential for transmission providers to identify, evaluate, and select more efficient or cost-effective transmission facilities to solve transmission needs, as well as to afford system-wide benefits that may not be achieved through piecemeal, one-off local transmission facilities.

[276] *See* California Commission Initial Comments at 109-110.

[277] NESCOE Reply Comments at 6.

[278] PIOs ANOPR Initial Comments at 33-34 (citing ACEG Jan. 2021 Planning Report); ACEG Jan. 2021 Planning Report at 98-99.

As stated above, the result is relatively inefficient or less cost-effective transmission development for customers, which contributes to rates for transmission that are unjust and unreasonable.

111. To be clear, our findings here are not intended to call into question the justness and reasonableness of either generator interconnection processes or local transmission planning processes, which each serve important roles in ensuring reliability and integrating new resources onto the transmission system.[279] Rather, the trends regarding use of these processes, as well as in-kind replacement processes, provide additional evidence to support our finding that existing regional transmission planning and cost allocation requirements are inadequate without reform. As discussed further in the next section, we conclude that the record regarding the current and projected transmission landscape—including the investment trends and changing drivers of that investment detailed above—highlights critical deficiencies in the Commission's current regional transmission planning and cost allocation requirements. In this final rule, we address those deficiencies to help to ensure that customers receive the benefits of long-term, forward-looking, and more comprehensive regional transmission planning.

[279] As discussed below, we separately find that specific existing requirements governing transparency in local transmission planning processes and coordination between local and regional transmission planning processes are unjust, unreasonable, and unduly discriminatory or preferential. *See infra* Local Transmission Planning Inputs in the Regional Transmission Planning Process section.

2. Unjust, Unreasonable, and Unduly Discriminatory or Preferential Commission-Jurisdictional Transmission Planning and Cost Allocation Processes

112. Based on the record, including comments submitted in response to the NOPR, as discussed below, we find that there is substantial evidence to support the determination that sufficiently long-term, forward-looking, and comprehensive regional transmission planning and cost allocation to meet Long-Term Transmission Needs is not occurring on a consistent and sufficient basis. We find that the absence of sufficiently long-term, forward-looking, and comprehensive regional transmission planning processes is resulting in piecemeal transmission expansion to address relatively near-term transmission needs. We find that the status quo approach results in transmission providers undertaking investments in relatively inefficient or less cost-effective transmission infrastructure, the costs of which are ultimately recovered through Commission-jurisdictional rates. This dynamic results in, among other things, transmission customers paying more than is necessary or appropriate to meet their transmission needs, customers forgoing benefits that outweigh their costs, or some combination thereof, which results in less efficient or cost-effective transmission investments and, in turn, renders Commission-jurisdictional regional transmission planning and cost allocation processes unjust and unreasonable.

113. We therefore adopt, as modified by the discussion herein, the preliminary findings of the NOPR concerning the need for reform[280] and, pursuant to FPA section 206,

[280] NOPR, 179 FERC ¶ 61,028 at PP 28-55.

conclude that revisions to the Commission's regional transmission planning and cost allocation requirements are necessary to ensure that Commission-jurisdictional rates, terms, and conditions are just, reasonable, and not unduly discriminatory or preferential. We find that, as stated in the NOPR,[281] absent the reforms instituted by this final rule, regional transmission planning processes will continue to fail to identify, evaluate, and select regional transmission facilities that can more efficiently or cost-effectively meet Long-Term Transmission Needs, requiring customers to pay for relatively inefficient or less cost-effective transmission development.

114. Based on the record, including the comments submitted in response to the NOPR, we find that there is substantial evidence to support the conclusion that deficiencies in the Commission's existing regional transmission planning and cost allocation requirements are resulting in Commission-jurisdictional rates that are unjust, unreasonable, and unduly discriminatory or preferential. Specifically, we find that the Commission's regional transmission planning and cost allocation requirements fail to require transmission providers to: (1) perform a sufficiently long-term assessment of transmission needs that identifies Long-Term Transmission Needs; (2) adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs; and (3) consider the broader set of benefits of regional transmission facilities planned to meet those Long-Term Transmission Needs. We find that these deficiencies render Commission-jurisdictional regional transmission planning and cost allocation processes unjust and

[281] NOPR, 179 FERC ¶ 61,028 at P 33.

unreasonable because they result in transmission providers failing to identify Long-Term Transmission Needs, to evaluate and select more efficient or cost-effective transmission solutions to meet those transmission needs, and to allocate the costs of transmission facilities selected to meet those transmission needs in a manner that is at least roughly commensurate with benefits. Below, we address each deficiency in turn.

115. The first deficiency is that the Commission's regional transmission planning and cost allocation requirements fail to require transmission providers to perform a sufficiently long-term assessment of transmission needs. This deficiency is present in multiple aspects of existing regional transmission planning processes, from the degree to which planning studies that identify transmission needs are sufficiently forward looking, to whether forward-looking assessments actually inform the evaluation, selection, and eventual cost allocation of regional transmission facilities. The record demonstrates that, under existing regional transmission planning and cost allocation processes, transmission providers typically identify and plan for transmission needs using a relatively near-term transmission planning horizon. Specifically, commenters have noted that most transmission planning regions do not plan beyond a 10-year transmission planning horizon. For example, commenters point out that ISO-NE, SERTP, and NorthernGrid plan using a 10-year transmission planning horizon,[282] while PJM notes that it plans using

[282] Massachusetts Attorney General Initial Comments at 25 ("For example, the Commission's proposal to increase the required long-term transmission planning horizon to at least 20 years with 3-year reassessments would double the current long-term planning horizon for ISO-NE."); Renewable Northwest Initial Comments at 12 (citing Brattle-Grid Strategies Oct. 2021 Report at 15); Southeast PIOs Initial Comments at 12 ("The 'independent reliability planning studies . . . start with the combined local

two different transmission planning horizons: a 5-year transmission planning horizon for what it refers to as its short-term transmission planning process and a 6-to-15-year transmission planning horizon for what it refers to as its intermediate-term transmission planning process.[283] While it is reasonable and necessary for regional transmission planning and cost allocation processes to include a near-term study of the transmission system, the absence of any consistent and sufficient longer-term assessment of transmission needs prevents transmission providers from identifying Long-Term Transmission Needs and considering regional transmission facilities that may be more efficient or cost-effective solutions to address those needs.[284]

116. This lack of a longer-term assessment of transmission needs is particularly problematic for a few reasons. First, shorter-term transmission planning fails to take

---

transmission plans of participating utilities,' and the results comprise the ten-year regional transmission plan." (citation omitted)); Western PIOs Initial Comments at 8-9 ("NorthernGrid conducts transmission reliability plans on a two-year cycle, with each plan covering a 10-year time horizon."); *see also* ITC Initial Comments at 9 (referring to the "broad use of a 10-year planning horizon in the existing transmission planning processes of many major planning regions[.]").

[283] PJM Initial Comments at 2 n.4.

[284] *See, e.g.*, MISO ANOPR Reply Comments at 5 ("[G]iven long-term needs of an evolving system, additional transmission is necessary to reliably serve customers now and into the future. These challenges require immediate action and further delay only increases the risk that system enhancements may not be in place in the timeframe needed."); PIOs Initial Comments at 13 ("[A] short-term outlook under-forecasts longer-term transmission needs, preventing the development of more cost-effective transmission facilities, and fails to consider how the needs of the transmission system are shifting[.]"); US DOE ANOPR Initial Comments at 10 (stating that failure to plan transmission far enough ahead results in "adverse implications for system reliability, resilience, consumers' electricity rates, and the achievement of clean energy goals.").

advantage of the potential for efficiencies or economies of scale that regional transmission facilities can provide by allowing fewer or better designed transmission facilities to meet multiple transmission needs. For example, shorter-term transmission planning fails to provide the opportunity for transmission providers to identify, evaluate, and select regional transmission facilities that could address multiple transmission needs over various time horizons.[285] Moreover, shorter-term transmission planning fails to create opportunities to "right size" the replacement of aging transmission facilities to address multiple transmission needs over the longer term.[286] Second, constructing large (e.g., high voltage or long distance) transmission facilities comes with long lead times:

[285] ACORE Initial Comments at 4 ("The narrowly focused current approaches [to transmission planning] do not identify opportunities to take advantage of the large economies of scale in transmission that come from 'up-sizing' reliability projects to capture additional benefits, such as congestion relief, reduced transmission losses, and facilitating the more cost-effective interconnection of the renewable and storage resources needed to meet public policy goals." (quoting Brattle-Grid Strategies Oct. 2021 Report at 3)); PIOs ANOPR Initial Comments at 10-11; SEIA ANOPR Initial Comments at 14.

[286] ACORE Initial Comments at 4 ("[I]n-kind replacement of aging existing facilities misses opportunities to better utilize scarce rights-of-way for upsized projects that can meet multiple other needs and provide additional benefits, thus driving up costs and inefficiencies." (quoting Brattle-Grid Strategies Oct. 2021 Report at 3)). PJM's long-term assessment of the transmission system ostensibly uses a 15-year transmission planning horizon, for example, but does not account for changes to the generation mix beyond a 5-year period. *See* Concerned Scientists ANOPR Initial Comments at 10 & n.11 ("Generation additions are unchanged in the 15-year study period, as the input assumption has no additional information that would expand the set of generators included in the forecast."); PSEG ANOPR Initial Comments at 11 (stating that "in practice only new resources that are near the end of the interconnection queue process and have signed an Interconnection Service Agreement are considered in the RTEP base case.").

planning, permitting, and building regional transmission facilities can often take more than ten years.[287] As an example, the MVP initiative in the MISO region took a decade to move from approval by the MISO Board of Directors in 2011 to completion of most of the projects by 2021, and this period of 10 years does not even account for the significant transmission facility development efforts that occurred prior to the MISO Board of Directors' approval.[288] Finally, the useful life of transmission assets generally far exceeds even 20 years, so a 10-year transmission planning horizon is much too short to capture all of the benefits that regional transmission facilities can provide.[289]

117. Thus, relying solely on shorter-term transmission planning and studies fails to identify Long-Term Transmission Needs and, consequently, undervalues or entirely ignores the benefits of transmission investments to meet those needs. Moreover, the likelihood that near-term assessments will fail to identify Long-Term Transmission Needs and more efficient or cost-effective regional transmission facilities to meet those needs is higher during periods of rapid change, as the electric sector is now experiencing,

[287] AEP Initial Comments at 11; Nevada Commission Initial Comments at 7 n.24 (noting that it took over seven years between the request to include a transmission line in an Integrated Resource Plan (IRP) and the in-service date, which did not include the lead time for developing the underlying application) PIOs Initial Comments at 14 ("[A] 20-year planning horizon was necessary given the time needed to site, permit, and construct transmission facilities or because states have longer-term public policy goals."); Renewable Northwest Initial Comments at 5; SEIA Initial Comments at 6.

[288] AESL Consulting, *A Transmission Success Story: The MISO MVP Transmission Portfolio*, at 39 (2021).

[289] SEIA Initial Comments at 6; US DOE Initial Comments at 33 (noting that transmission assets can have a useful life of at least 40 years).

during which the need for transmission infrastructure is expected to grow considerably.[290] We find that continuing with the status quo approach is resulting in transmission providers undertaking investments in relatively inefficient or less cost-effective transmission infrastructure, the costs of which are ultimately recovered through Commission-jurisdictional rates.[291] As a result, among other things, customers are paying more than necessary or appropriate to meet their transmission needs, forgoing benefits that outweigh their costs, or some combination thereof, which results in less efficient or cost-effective transmission investments and, in turn, renders Commission-jurisdictional regional transmission planning and cost allocation processes unjust and unreasonable.

118. The second deficiency is that the Commission's existing regional transmission planning and cost allocation requirements fail to require transmission providers to account adequately on a forward-looking basis for known determinants of Long-Term

[290] US DOE ANOPR Initial Comments at 10 ("Relying on successive small transmission expansion projects to meet foreseeable long-term needs may lead to the need for expensive retrofits (at customers' expense) at a later date. Economies of scale and network economies suggest that an initial larger-scale buildout will often represent a lower-cost solution."); Midcontinent Independent System Operator, *MTEP21 Report Addendum: Long Range Transmission Planning Tranche 1 Portfolio Report*, at 6 (July 28, 2022), https://cdn.misoenergy.org/MTEP21%20Addendum-LRTP%20Tranche%201%20Report%20with%20Executive%20Summary625790.pdf ("While the Tranche 1 Portfolio is the result of MISO's long-range planning process being executed for only the second time, the rapid change within the industry will require that it become a more routine aspect of the MISO planning process going forward.").

[291] *See, e.g.*, *S.C. Pub. Serv. Auth.*, 762 F.3d at 56-59 (explaining that transmission planning processes are practices affecting rates pursuant to Section 206 of the FPA).

Transmission Needs. This deficiency is related to the first deficiency in the sense that both relate to the failure of the existing transmission planning requirements to require transmission providers to adequately plan for the foreseeable future. We find that, even following Order Nos. 890 and 1000, transmission providers have adopted widely divergent approaches to determining the factors that are relevant to identifying transmission needs within regional transmission planning.[292] Specifically, as commenters note, some existing regional transmission planning processes ignore trends in future generation and the impact of extreme weather.[293] Other commenters note that certain regional transmission planning processes ignore state laws or utility goals.[294] In addition

[292] ELCON Initial Comments at 3 ("While regional differences are important to consider, too much flexibility was provided to transmission providers in Order No. 1000 that . . . created a patchwork of planning processes further complicating planning and fostering additional balkanization of the grid[.]"); NOPR, 179 FERC ¶ 61,028 at P 50.

[293] GridLab Initial Comments at 4-5 (noting that SPP does not consider extreme weather events in its transmission plan); Grid Strategies July 2021 Extreme Weather Report at 5 ("[T]ransmission's value for making the grid more resilient against severe weather and other unexpected threats is not typically accounted for in transmission planning and cost allocation analyses. Grid operator transmission planning processes typically assume normal electricity supply and demand patterns, and in most cases do not account for the value of transmission for increasing resilience."); Renewable Northwest Initial Comments at 4, 8 (explaining that regional transmission planning in the Pacific Northwest does not model extreme weather events and generally does not reflect publicly available data such as utility IRPs or carbon reduction goals); *see also* Brattle-Grid Strategies Oct. 2021 Report at 36 (stating that production cost simulations that are typically used to estimate the economic benefit of regional transmission facilities assume no extreme weather events); SPP Market Monitor ANOPR Initial Comments at 3 & n.5 (describing that even SPP's more forward-looking scenario analysis of an emerging technology case in its Integrated Transmission Plan presently underestimates the actual growth of renewables so much that "[w]ind capacity in service today (29.8 GW) already exceeds wind levels projected in both 2019 ITP futures that go out to 2029").

[294] Acadia Center and CLF Initial Comments at 1 ("Order No. 1000 has failed to

to failing to adequately account for factors that shape the resource mix, commenters also assert that current regional transmission planning processes fail to account for factors that will shape future load, particularly new loads associated with electrification trends like, for example, electric vehicles[295] and data centers.[296] Although transmission providers in

require public utility transmission providers to align their transmission planning and funding processes with state policies and objectives." (citing Regulatory Assistance Project, *FERC Transmission: The Highest-Yield Reforms*, at 4 (July 2022), https://www.raponline.org/wp-content/uploads/2023/09/rap-littell-prause-weston-FERC-transmission-highest-yield-reforms-2022-july.pdf)); Renewable Northwest Initial Comments at 12 (citing Brattle-Grid Strategies Oct. 2021 Report at 15, which states that WestConnect, for example, does not include planning inputs that extend beyond generic, baseline projects nor "knowable information about enacted public policy mandates, publicly stated utility plans, and/or consumer procurement targets[.]"); SREA Initial Comments at 25 (stating that "SERTP relies entirely on member utilities to self-nominate transmission study requests regarding public policy, meaning if utilities do not provide recommendations or requests, no SERTP study is completed. For instance, in 2021, SERTP stated, '[t]he SERTP did not receive *any input or proposals* for possible transmission needs driven by Public Policy Requirements for the 2021 planning cycle. Therefore, no possible transmission needs driven by Public Policy Requirements have been identified for further evaluation of potential transmission solutions in the 2021 SERTP planning cycle.'" (emphasis in original)).

[295] *See, e.g.*, Clean Energy Buyers Initial Comments at 7-8; National Grid Initial Comments at 8; *see also* AEE ANOPR Initial Comments at 18 (stating that MISO projects electrification effects on load in its long-term regional transmission planning, but how other transmission providers account for electrification trends is not consistent or transparent).

[296] *See supra* note 6; Rocky Mountain Institute Supplemental Comments at 1 ("Technology companies have begun requesting large interconnections for data centers that require increased electricity supply to power generative artificial intelligence."); WIRES Supplemental Comments at attach. 1, p. 36 (Rob Gramlich, et al., *Fostering Collaboration Would Help Build Needed Transmission* (Feb. 2024)) ("Load growth is rising in much of the country, and it is happening in a way that is hard for any single entity to assess on their own. It varies by local area due to factors such as manufacturing plant and data center additions, plus expectations for end-use electrification and penetration of electric vehicles.").

some transmission planning regions account for a wider range of the factors that drive Long-Term Transmission Needs when performing regional transmission planning studies than do others,[297] we find that transmission providers are not consistently or sufficiently accounting on a forward-looking basis for the known determinants of Long-Term Transmission Needs or accounting for such known determinants in a manner that ensures the identification and evaluation of more efficient or cost-effective regional transmission facilities to meet Long-Term Transmission Needs.

119. We recognize there is inherent uncertainty in forecasting,[298] and we agree with Industrial Customers that current transmission planning is based on known and

[297] *See, e.g.*, Renewable Northwest Initial Comments at 11, 14-15 (discussing how the MISO transmission planning process accounts for the future resource mix); Western PIOs Initial Comments at 23-24, 26-27 (explaining forward-looking aspects of the CAISO transmission planning process).

[298] We acknowledge NRG's comment that forecasting is inherently uncertain. NRG Initial Comments at 10-12. Sufficiently long-term, forward-looking, and comprehensive regional transmission planning and cost allocation, however, is better than a lack of planning. The Commission may, by applying its expertise and experience to the record, determine what type and amount of transmission planning results in a just and reasonable rate. *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 55 ("[I]n rate-related matters, the court's review of the Commission's determination is particularly deferential because such matters are either fairly technical or 'involve policy judgements that lie at the core of the regulatory mission.'" (citing *Alcoa Inc. v. FERC*, 564 F.3d 1342, 1347 (D.C. Cir. 2009))). "The court owes the Commission 'great deference' in this realm because '[t]he statutory requirement that rates be 'just and reasonable' is obviously incapable of precise judicial definition' and 'the Commission must have considerable latitude in developing a methodology responsive to its regulatory challenge[.]'" *Id.* (citing *Morgan Stanley Cap. Grp. v. Pub. Util. Dist. No. 1*, 554 U.S. 527, 532 (2008); *Am. Pub. Gas Ass'n v. FPC*, 567 F.2d 1016, 1037 (D.C. Cir. 1977)).

measurable factors.[299] However, we find, based on this record, that the universe of known and measurable factors that drive regional transmission needs extends beyond those that transmission providers currently consider as part of their regional transmission planning processes. Specifically, the record demonstrates that a multitude of factors like reliability needs driven by the impact of extreme weather, trends in future generation additions and retirements, load growth, federal, federally-recognized Tribal, state, and local laws, and utility goals increasingly shape Long-Term Transmission Needs, are known and identifiable, and have reasonably predictable effects, especially in the aggregate.

120. As noted above, the record shows that the increasing frequency, duration, and intensity of extreme weather events are driving changes in Long-Term Transmission Needs to maintain system reliability.[300] Additionally, demand growth is a major driver of

[299] Industrial Customers Initial Comments at 11.

[300] ACEG Initial Comments at 63 ("[T]he need to improve regional and interregional planning arises from the transformative changes occurring with respect to resource diversity, energy market efficiencies, technological changes, operational innovations and resiliency to withstand severe weather events. If transmission facilities are not constructed, these are all benefits that would otherwise be forfeited."); NERC Initial Comments at 6; Evergreen Action Initial Comments at 2 ("[A]dditional transmission built under improved planning procedures would [] create large reliability benefits. With increasing extreme weather events due to climate change—including wildfires, winter storms, hurricanes, and more—additional transmission infrastructure and grid improvements are increasingly necessary for resilience purposes."); WE ACT Initial Comments at 2 ("Requiring public utility transmission providers to consider extreme weather events in Long-Term Regional Transmission Planning is a positive step towards addressing grid reliability in the face of more frequent and intensifying weather events.").

Long-Term Transmission Needs, and contrary to commenter assertions,[301] the record shows that evolving trends in load growth due to data centers, electrification, and industrial growth are driving Long-Term Transmission Needs.[302] Similarly, state laws, utility integrated resource plans and resource procurements, and other regulatory actions necessarily affect Long-Term Transmission Needs for Commission-jurisdictional transmission services.[303] Several commenters also support the broader consideration of anticipated generation retirements and interconnection requests in regional transmission

[301] *See, e.g.*, Industrial Customers Initial Comments at 8-10 (arguing that demand is growing more slowly than in previous periods).

[302] *See, e.g.*, Northwest and Intermountain Initial Comments at 5 n.12 ("For example, Bonneville Power Administration ('BPA') owns about 75 percent of the transmission lines in the Pacific Northwest. In BPA's 2022 Transmission Service Expansion Plan cluster study, customers submitted 153 separate transmission service requests totaling 11,831 MW of transmission capacity. BPA was able to offer service (without requiring detailed studies and transmission upgrades) to only 275 MWs of those service requests." (citing BPA, *TSR Study and Expansion Process*, at 12 (Dec. 7, 2021), https://www.bpa.gov/-/media/Aep/transmission/atc-methodology/2021-22tsep-overview.pdf.)); John Wilson and Zach Zimmerman, *The Era of Flat Demand is Over*, Grid Strategies, at 3, 6 (Dec. 2023), https://gridstrategiesllc.com/wp-content/uploads/2023/12/National-Load-Growth-Report-2023.pdf (noting the 5-year load growth forecast has nearly doubled from 2.6% to 4.7% and "transmission investments need to increase just to keep up with demand").

[303] *See, e.g.*, Acadia Center and CLF Initial Comments at 8 ("State laws are . . . essential considerations in planning transmission . . . as state laws drive substantial procurements of energy resources along with the concomitant need for additional transmission, as well as repurposed transmission and non-transmission grid solutions."); AEE Initial Comments at 10 (noting that "[a]s of September 2020, 38 states and the District of Columbia had adopted renewable portfolio standards, and 21 states (plus the District of Columbia and Puerto Rico) – representing more than half of the U.S. population – include a target of 100% renewable energy by 2050 or sooner. Many of these requirements have been enacted in statute and are binding on utilities and retail energy providers.").

planning processes because those factors shape the future resource mix and, therefore, Long-Term Transmission Needs.[304] Relatedly, many commenters highlight the impact of utility goals on the resource mix because such goals will impact transmission needs.[305] Yet, as described above, existing regional transmission planning processes frequently undervalue or entirely omit consideration of some or all of these factors. And while some existing regional transmission planning processes do a better job than others of incorporating different components of long-term, forward-looking, and more comprehensive regional transmission planning, the Commission's existing regional transmission planning requirements do not ensure that factors influencing future transmission will be sufficiently accounted for in that planning.

121. The failure to adequately consider such factors delays planning for the transmission system's changing operational needs until shortly before those transmission needs manifest. As a result, existing transmission planning processes are piecemeal and fail to take advantage of economies of scale in transmission investment or opportunities to address multiple transmission needs over multiple time horizons.[306] We find that

[304] *See, e.g.*, Pattern Energy Initial Comments at 26 ("[T]he generation interconnection queues are indicative of the market and should also be a major source for generation assumptions in scenario planning (both near-term and long-term)."); SEIA Initial Comments at 9.

[305] *See, e.g.*, Renewable Northwest Initial Comments at 6; SREA Initial Comments at 41-46 ("The major utility announcements of achieving net zero or some approximation affects the marketplace, especially in the [S]outheast.").

[306] PIOs Initial Comments at 10-11; Renewable Northwest Initial Comments at 8 (citing Brattle-Grid Strategies Oct. 2021 Report at iii, iv).

engaging in regional transmission planning without adequate consideration of such factors leads to transmission investment that is not more efficient or cost-effective and renders Commission-jurisdictional regional transmission planning and cost allocation processes unjust and unreasonable.[307]

122. Third, the record demonstrates that the Commission's regional transmission planning and cost allocation requirements fail to require transmission providers to adequately consider the broader set of benefits of regional transmission facilities planned to meet Long-Term Transmission Needs.[308] For example, commenters note that many regional transmission planning processes focus too narrowly only on some benefits.[309]

[307] *See, e.g.*, AEE Initial Comments at 10 ("Failing to take any of [the Commission-proposed factors] into consideration in developing long-term scenarios would risk under investment in needed regional transmission projects to meet transmission needs and potential[ly] result in unjust and unreasonable rates for transmission service."); New Jersey Commission Initial Comments at 3-9 (arguing that "[e]nsuring just and reasonable rates requires mandating long-term, multi-value, and portfolio based transmission planning.").

[308] *See* Order No. 1000, 136 FERC ¶ 61,051 at P 624 (declining to prescribe "a particular definition of 'benefits'").

[309] Massachusetts Attorney General ANOPR Initial Comments at 22 ("New England's siloed approach to transmission planning inhibits identification of multi-value solutions." As part of ISO-NE's Boston 2028 Request for Proposals, "[i]n focusing on cost-effectively solving reliability needs alone, ISO-NE rejected all but one of thirty-six proposals. While ISO-NE rejected some of these proposals for technical reasons, it eliminated several due to cost considerations alone."); PIOs Initial Comments at 10 ("[T]he vast majority of current transmission projects are focused solely either on network reliability or connecting the next generator in the interconnection queue and ignore any other potential benefits, possible economies of scale or other efficiencies that might occur by considering multiple future needs . . . . [M]ultiple quantifiable benefits to transmission . . . are being ignored in the transmission planning process.").

For instance, the Brattle-Grid Strategies Report concludes that "most of [the nation's recent transmission] investment addresses individual local asset replacement needs, near-term reliability compliance, and generation-interconnection-related reliability needs without considering a comprehensive set of multiple regional needs and system-wide benefits."[310] As PIOs argue, the Commission's existing regional transmission planning and cost allocation requirements do not require that transmission providers assess "opportunities to benefit from economies of scale that come from 'right-sizing' and strategic, comprehensive planning of transmission portfolios and projects to capture additional benefits. . . ."[311] Other regional transmission planning processes fail entirely to consider cost savings associated with certain transmission facilities.[312]

123. Based on the record, we find that, as with the universe of known and measurable factors driving transmission needs, the benefits that regional transmission facilities provide extend beyond those benefits that transmission providers currently consider as

[310] Brattle-Grid Strategies Oct. 2021 Report at 2.

[311] PIOs Initial Comments at 10-11. The benefits cited by PIOs "include congestion relief, reduced transmission losses, resiliency to extreme weather events, increased flexibility to respond to changing market or system conditions, and facilitating larger regional or interregional solutions for cost effective interconnection of the renewable and storage resources needed to meet public policy goals." *Id.* at 11.

[312] SREA Initial Comments at 24 ("SERTP participants explained that SERTP is unable to conduct adjusted production cost savings, because none of the utilities involved in SERTP have the software capable of doing so. In effect, the 'Economic Planning Studies' only evaluate the costs of potential upgrades to the system, but none of the benefits.").

part of their regional transmission planning and cost allocation processes.[313] Failing to adequately identify and consider the benefits of such transmission facilities may lead to relatively inefficient or less cost-effective transmission development. In particular, the cost-benefit analyses that transmission providers often use as part of the evaluation process may fail to identify more efficient or cost-effective regional transmission facilities for selection because they provide an inaccurate portrayal of the comparative benefits of different transmission facilities. Thus, the failure to adequately consider the benefits of regional transmission facilities results in, among other things, transmission customers forgoing benefits that may significantly outweigh their costs, which results in less efficient or cost-effective transmission investments and, in turn, contributes to Commission-jurisdictional rates that are unjust and unreasonable.

124. Given our findings above concerning the deficiencies in existing transmission planning requirements, and our conclusion that long-term, forward-looking, and more comprehensive regional transmission planning is needed, we also conclude that existing cost allocation requirements are deficient and must be modified to properly account for Long-Term Regional Transmission Planning. The Commission has long recognized the

[313] We disagree with Potomac Economics' arguments that the sole benefit of transmission is alleviating congestion and that congestion is primarily an economic issue, so investment in alleviating congestion should not exceed the benefit of doing so. *See* Potomac Economics Initial Comments at 3-4. As discussed *infra* in the Evaluation of the Benefits of Regional Transmission Facilities section alleviating congestion is just one of many potential benefits that transmission infrastructure provides, and transmission benefits beyond solving congestion are considered by transmission providers in regional transmission planning processes today.

"close relationship between transmission planning, which identifies needed transmission facilities, and the allocation of costs of the transmission facilities in the plan,"[314] and that cost allocation issues will often determine whether transmission providers and customers support the construction of new facilities.[315] Furthermore, experience with Order No. 1000 has reinforced the critical role that states play in the development of new transmission infrastructure, particularly at the regional level, where transmission projects may physically span, and their costs may be allocated across, multiple states. As the Commission discussed in the NOPR and we continue to find in this final rule, facilitating state regulatory involvement in the cost allocation process could minimize delays and additional costs associated with state and local siting proceedings.[316]

125. Given the link between cost allocation and transmission planning, it is essential that cost allocation requirements for Long-Term Regional Transmission Facilities are appropriately tailored to the new Long-Term Regional Transmission Planning requirements of this rule, particularly given the anticipated long-lead time for any regional transmission facilities developed and regionally cost allocated through this final rule. Without proper alignment of the regional transmission planning and cost allocation requirements, it is less likely that transmission facilities selected in Long-Term Regional

[314] Order No. 1000, 136 FERC ¶ 61,051 at P 496.

[315] Order No. 890, 118 FERC ¶ 61,119 at P 557; *see also* Order No. 1000, 136 FERC ¶ 61,051 at P 496.

[316] NOPR, 179 FERC ¶ 61,028 at P 301; *infra* Regional Transmission Cost Allocation section.

Transmission Planning will be developed, which would undermine the essential purpose of the regional transmission planning process, namely, the development of more efficient or cost-effective regional transmission facilities.

126. We find that the Commission's current cost allocation requirements, which were designed and established in the context of existing Order No. 1000 regional transmission planning processes, are insufficient to appropriately allocate costs associated with regional transmission facilities that are selected in accordance with the new Long-Term Regional Transmission Planning requirements that we establish in this final rule. The Commission's existing Order No. 1000 cost allocation requirements contemplate the application of differing cost allocation methods to different types of transmission facilities. But we find that Long-Term Regional Transmission Planning, which accounts for multiple drivers of Long-Term Transmission Needs and results in Long-Term Regional Transmission Facilities that produce a broader set of benefits, warrants a different approach to cost allocation for such transmission facilities. Likewise, existing Order No. 1000 regional transmission planning processes do not mandate the consideration of specific benefits that we believe are appropriately considered as part of Long-Term Regional Transmission Planning. New information concerning these benefits uncovered through the transmission planning process may be relevant when allocating the costs of Long-Term Regional Transmission Facilities in a manner that is at least roughly commensurate with their benefits.[317] Importantly, existing cost allocation

[317] *Ill. Commerce Comm'n v. FERC*, 576 F.3d 470, 477 (7th Cir. 2009) (*ICC v. FERC I*); Order No. 1000, 136 FERC ¶ 61,051 at PP 622, 639 (requiring costs of regional

requirements do not provide a dedicated process through which states have an opportunity to participate in the development of regional cost allocation methods. We conclude such a role is particularly relevant to Long-Term Regional Transmission Planning, given: (1) the lengthy planning horizon over which transmission projects might be identified, selected, and ultimately constructed; (2) the resultant increased uncertainty for Long-Term Regional Transmission Facilities; and (3) accordingly, the increased importance for state engagement regarding cost allocation to increase the likelihood such facilities obtain needed siting approvals from the states and are thus timely and cost-effectively developed. We therefore believe that it is both necessary and appropriate to establish specific cost allocation requirements that are tailored to the Long-Term Regional Transmission Planning reforms in this final rule.

127. Based on the record, including comments submitted in response to the NOPR, we find that there is substantial evidence demonstrating that Long-Term Regional Transmission Planning and cost allocation to identify and plan for Long-Term Transmission Needs does not occur on a consistent and sufficient basis.[318] We find, in

transmission facilities to be allocated in a manner that is at least roughly commensurate with estimated benefits).

[318] *See* New Jersey Commission Initial Comments at 8 (explaining that, outside of limited circumstances, PJM, Florida, ISO-NE, Southeastern Regional, South Carolina Regional, WestConnect, NorthernGrid, NYISO, SPP, and CAISO do not conduct multi-driver or portfolio transmission planning, which has required ratepayers to pay for tens of billions of dollars in unnecessary transmission projects); NextEra ANOPR Initial Comments at 71 ("While there are examples of longer-term planning currently being utilized by some regions, such as MISO's annual 15-year Futures assessment or SPP's 20-year Integrated Transmission Plan run every five years, there is no standard as to what time horizon long-term planning must study, nor how often this planning should be done.

large part, that this is because of the deficiencies that we have identified above in the Commission's existing regional transmission planning and cost allocation requirements. In addition, we find that, in the absence of sufficiently long-term, forward-looking, and comprehensive regional transmission planning and cost allocation processes, transmission providers are meeting many transmission needs by identifying transmission solutions and developing transmission facilities through other processes, i.e., outside of the regional transmission planning and cost allocation processes,[319] or, as discussed above, in response to near-term reliability needs,[320] which may not identify the more-efficient or cost-effective solution.

128. To reiterate, the fact that transmission facilities are being identified and built outside of regional transmission planning processes and in response to near-term reliability needs is not inherently problematic. In many instances, as some commenters

---

Further, no standards or guidelines exist as to what should be included in such long-term planning to ensure that customers are charged just and reasonable rates for the most efficient and cost-effective investments given the most comprehensive and up-to-date information available."); Western PIOs Initial Comments at 4-28 (arguing that in the Western United States transmission planning outside of CAISO is not developed and is ineffective); Brattle-Grid Strategies Oct. 2021 Report at 13-15 & tbl. 2 (documenting inconsistent "use of proactive, scenario-based, multi-value processes" across various planning authorities, including NYISO, CAISO, MISO, PJM, ISO-NE, Florida, Southeast Regional, and South Carolina").

[319] *See, e.g.*, LS Power Initial Comments at 46-50; PIOs Initial Comments at 9-10 (explaining that about half of the approximately $70 billion in aggregate transmission investment by Commission-jurisdictional transmission owners in RTO/ISO regions was approved outside of regional transmission planning processes).

[320] *Supra* note 309.

point out,[321] those processes may be well equipped to identify necessary and appropriate transmission solutions. Rather, the problem is that incremental and piecemeal expansion of the transmission system outside of regional transmission planning process misses the potential for transmission providers to identify, evaluate, and select more efficient or cost-effective transmission solutions to solve Long-Term Transmission Needs, as well as to afford system-wide benefits that may not be achieved through one-off transmission system upgrades.[322] To the extent that transmission providers may not be identifying and evaluating the more efficient or cost-effective transmission solutions needed to meet underlying transmission needs, including Long-Term Transmission Needs, over time, consumers will bear the costs of relatively inefficient or less cost-effective piecemeal transmission investment and expansion.[323]

---

[321] *E.g.*, Duke Initial Comments at 7.

[322] *See, e.g.*, ACORE Initial Comments at 8 ((“For example, two solutions to address a particular reliability need may offer vastly different total system-wide benefits. Thus, the higher-cost transmission solutions can actually result in significantly lower net cost from a system-wide perspective.”) (quoting Brattle-Grid Strategies Oct. 2021 Report at 30)); Clean Energy States Initial Comments at 2 (“[T]he one-plant-at-a-time approach to transmission upgrades results in a patchwork approach that drives up costs and misses opportunities for improvements to the system as a whole.”); Exelon Initial Comments at 5.

[323] Michigan State Entities Initial Comments at 1-2 (explaining concerns that the lack of long-term transmission planning has led to significantly higher residential rates and how the problem will worsen if transmission investment does not reflect changes in the resource mix and demand); New Jersey Commission Initial Comments at 6-7 (noting PJM analysis showing transmission upgrades to interconnect 87.1 GW of a variety of resources, including offshore wind, would cost $3.2 billion if done through holistic transmission planning whereas connecting only 15.4 GW of offshore wind would cost $6.4 billion if done through the interconnection queue process, and estimating that the interconnection of 87.1 GW through the interconnection queue would increase the cost to

129. We find that the concerns arising from the absence of sufficiently long-term, forward-looking, and comprehensive regional transmission planning and cost allocation processes and the corresponding failure by transmission providers to identify and evaluate more efficient or cost-effective transmission solutions to Long-Term Transmission Needs are exacerbated by the fact that transmission needs in most transmission planning regions are drastically changing. Contrary to the claims of some commenters, we are not promulgating this rule in an attempt to steer the resource mix and demand[324] based on a preference for certain resources over others.[325] Instead, the

consumers by over $30 billion compared to holistic transmission planning); PIOs Initial Comments at 8 (noting how deficiencies in the Commission's regional transmission planning processes have "led to billions of dollars in excessive costs for consumers." (citing Brattle-Grid Strategies Oct. 2021 Report at 1-13 (Section 1)).

[324] Consumer Organizations Initial Comments at 1-2; ELCON Initial Comments at 9; SERTP Sponsors Initial Comments at 16-20. *But see* SEIA Reply Comments at 2-3 ("The NOPR does make 'repeated references' to the changing resource mix. But that is not because the NOPR will 'promote a transition to a more renewables-heavy electric system.' The NOPR makes these references because the resource mix is, in fact, changing. The question before the Commission is not whether to promote or impede that change, but how to address the needs of the grid as a result of that inevitable change." (internal quotations omitted)); New Jersey Commission Reply Comments at 2 ("The Commission is . . . trying to ensure the electricity system can reliably and efficiently achieve the generation mix that state policymakers and voluntary consumers—not the Commission—have chosen. Ensuring that these customers are served at the lowest possible cost while maintaining reliability is entirely consistent with and indeed required in order to meet the dictates of the FPA. In other words, the Commission is acting to ensure transmission planning processes account for current realities and meet evolving consumer needs at a total cost that is just and reasonable." (internal citations omitted)).

[325] *See, e.g.*, Ohio Commission Federal Advocate Initial Comments at 4-6 (arguing that the Commission's purpose in issuing the NOPR was to promote an aspirational renewable future and achieve narrow environmental objectives); Undersigned States Reply Comments at 7 (arguing that the Commission is forcing ratepayers to subsidize

Commission is reacting to well-documented factors, which the record demonstrates are driven by exogenous forces beyond the Commission's jurisdiction or control, including, but not limited to, the increasing frequency of extreme weather events, customer preferences, demand growth, economic and technological trends, and federal, federally-recognized Tribal, state, and local policies.[326]

130. In response to commenters, we acknowledge that integrated resource planning processes, where they exist, shape the resource mix and can often include forms of proactive transmission planning. As stated in Order No. 1000, we reiterate that "the regional transmission planning process is not the vehicle by which integrated resource planning is conducted."[327] Indeed, this final rule does not aim to affect—either facilitate or hinder—any changes or decisions that occur outside of the Commission's jurisdiction. Instead, because practices directly affecting Commission-jurisdictional rates, terms, and conditions of service for interstate transmission and wholesale electricity are the exclusive jurisdiction of the Commission, we must ensure that Commission-jurisdictional processes associated with regional transmission planning and cost allocation result in rates that are just and reasonable and not unduly discriminatory or preferential. To this

forms of energy by socializing the cost of a transmission build out).

[326] *See* New Jersey Commission Initial Comments at 3 ("The Commission is not proposing to unduly favor, mandate, or subsidize forms of generation but is rather seeking to ensure that the bulk electricity system maintains reliability and satisfies evolving consumer demand . . .").

[327] Order No. 1000, 136 FERC ¶ 61,051 at P 154.

end, this final rule is focused on ensuring that regional transmission planning processes are adequately *accounting for* the changes occurring outside of the Commission's jurisdiction, including the resource decisions that are the exclusive jurisdiction of states.[328] Additionally, to the extent that integrated resource planning processes include forms of transmission planning, such planning can be complementary to Commission-jurisdictional regional transmission planning processes but cannot take the place of such processes. This is not to diminish the importance of integrated resource planning processes, which serve a critical role in shaping the generation mix and transmission infrastructure. In recognition of this role, this final rule requires transmission providers to consider integrated resource planning as a factor when conducting Long-Term Regional Transmission Planning. But, as discussed below, we conclude that integrated resource planning is appropriately considered as *one of several* categories of factors used to develop Long-Term Scenarios and identify Long-Term Transmission Needs.

131. In response to commenters that argue regional transmission facilities may not address local transmission needs such that a local transmission facility would still be needed,[329] we acknowledge that regional transmission facilities are not necessarily always

[328] *See PJM Power Providers Grp. v. FERC*, 88 F.4th 250, 275 (3d Cir. 2023) (holding that the Commission is "unambiguously authorize[d] . . . to take state policies into account to the extent that such policies affect [the Commission's] statutorily prescribed area of focus . . . ."); *see also Elec. Power Supply Ass'n v. Star*, 904 F.3d 518, 524 (7th Cir. 2018) (approving of the Commission's decision to take state zero-emissions credit systems like that in Illinois "as givens and set out to make the best of the situation [these systems] produce").

[329] *See, e.g.*, Duke Initial Comments at 9 (arguing that there are instances in which

a more efficient or cost-effective solution to address local transmission needs, and nothing in this final rule requires transmission providers to rely on regional transmission facilities to address exclusively local transmission needs. Instead, this final rule identifies deficiencies in existing Commission-jurisdictional regional transmission planning processes that lead transmission providers to fail to identify Long-Term Transmission Needs and fail to identify, evaluate, or select more efficient or cost-effective transmission solutions to meet those transmission needs. As a result of these deficiencies, transmission providers may undertake relatively inefficient investments in transmission infrastructure by missing opportunities to identify regional transmission facilities that bring economies of scale or address multiple transmission needs over different time horizons, including local transmission needs.

132. We disagree with arguments that the Commission cannot promulgate this final rule because we rely on general findings, rather than individualized analyses of each, specific transmission planning region.[330] Relevant precedent, including regarding the Commission's comparable action in Order No. 1000, is clear that the Commission has discretion as to the procedural means through which it will apply its substantive expertise, and we need not make findings that are region specific in every case; rather, we are empowered to "rely on 'generic' or 'general' findings of a systemic problem to

larger regional transmission projects may not resolve localized transmission needs).

[330] *See, e.g.*, Louisiana Commission Reply Comments at 5-6; NRECA Initial Comments at 14-16.

support imposition of an industry-wide solution,"[331] and we do so here. The fact that individual transmission planning regions may have different forms of transmission planning processes, and may experience varying levels of transmission investment, would be "as unastonishing as it is irrelevant."[332] Moreover, although transmission planning practices vary considerably between transmission planning regions and some regions may engage in transmission planning that shares many of the elements of the more long-term, forward-looking, comprehensive regional transmission planning required in this rule, the record demonstrates that this final rule identifies deficiencies that reach well beyond "isolated pockets[.]"[333] Rather, the record demonstrates that these deficiencies pervade large swaths of the country, which include RTO/ISO and non-RTO/ISO transmission planning regions.[334] Accordingly, this final rule's remedy does not present an "extreme 'disproportion of remedy to ailment[.]'"[335] The Commission may reasonably rely on a rulemaking procedure to address the industry-wide changes to the transmission landscape, notwithstanding regional variation among regional transmission planning processes. As the Commission stated in Order No. 1000, "[i]t is well established that the

[331] *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 67 (quoting *Interstate Nat. Gas v. FERC*, 285 F.3d 18, 37 (D.C. Cir. 2002)).

[332] *Id.* (quoting *Wis. Gas v. FERC*, 770 F.2d 1144, 1157 (D.C. Cir. 1985)).

[333] *Id.*

[334] *See, e.g.*, *supra* notes 283 and 284 (explaining that ISO-NE, SERTP, Northern Grid, and PJM undergo transmission planning using time horizons shorter than 20 years).

[335] *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 67.

choice between rulemaking and case-by-case adjudication 'lies primarily in the informed discretion of the administrative agency.'"[336] The Commission also stated that "[i]t is within our discretion to conclude that a generic rulemaking, not case-by-case adjudications, is the most efficient approach to take to resolve the industry wide problems facing us."[337] Moreover, we agree with ACEG that pursuing region-specific solutions will lead to "siloed and disjunctive transmission planning policies [that] will not solve the problems facing the nation's electric grid."[338]

133. Furthermore, although not every transmission planning region is experiencing these changes in equal measure, the record shows that significant changes are well underway nationwide, and that failing to adequately account for Long-Term Transmission Needs poses a risk to just and reasonable rates throughout the country.[339] In fact, the record raises a wide range of concerns, and the Commission need not, and should not, wait for systemic problems to undermine regional transmission planning in every region before it acts.[340] The record in this proceeding confirms that significant investments in new transmission facilities are expected to occur, with substantial impacts

[336] Order No. 1000, 136 FERC ¶ 61,051 at P 60.

[337] *Id.*

[338] ACEG Reply Comments at 17.

[339] AEE Reply Comments at 3-4.

[340] *See* Order No. 1000, 136 FERC ¶ 61,051 at P 50.

on the Commission-jurisdictional rates that customers pay.[341] It is therefore critical, and it is the Commission's responsibility, to act now to address deficiencies in its regional transmission planning and cost allocation requirements to ensure that more efficient or cost-effective transmission investments are made as the industry addresses the changing landscape.[342]

3. Benefits of Long-Term Regional Transmission Planning and Cost Allocation to Identify and Plan for Long-Term Transmission Needs

134. Upon consideration of the record, we find that the requirements set forth in this final rule will address deficiencies in the existing regional transmission planning and cost allocation requirements and will promote enhanced reliability and more efficient or cost-effective transmission solutions, which will help to ensure just and reasonable Commission-jurisdictional rates.

135. The record demonstrates that long-term, forward-looking, and more comprehensive regional transmission planning that identifies Long-Term Transmission Needs will help transmission providers to identify, evaluate, and select more efficient or cost-effective transmission solutions to those needs. For example, like the Commission in the NOPR,[343] commenters cite to the success of MISO's Long-Range Transmission Plan in delivering more efficient or cost-effective transmission solutions. By addressing

[341] *See supra* P 93.

[342] *See* Order No. 1000, 136 FERC ¶ 61,051 at P 46.

public policy, economic, and reliability transmission planning needs simultaneously through its MVP category, MISO "'eliminate[d] the need for $300 million in future baseline reliability upgrades,' and provided production cost savings that *exceeded the entire cost of the portfolio by $10 billion*."[344] Brattle Group and Grid Strategies also found that "building out piecemeal network upgrades through the interconnection queue process to integrate the same amount of generation would have cost over 80% more than the cost of the MVP portfolio."[345] Similarly, the New Jersey Commission asserts that, by planning transmission facilities to address a specific set of known and identified transmission needs through a holistic portfolio, rather than piecemeal through the generator interconnection process, PJM could save customers more than $30 billion.[346]

136. We note that the cost-saving results that MISO experienced were the direct product of more comprehensive, longer-term regional transmission planning. By

[344] New Jersey Commission Initial Comments at 4 (citing MTEP2017 Review at 6, 8) (emphasis in original).

[345] *Id.* at 4-5 (citing Brattle-Grid Strategies Oct. 2021 Report at 7 & nn.13-14); *see id.* at 5 n.9 (noting that the cost of the MVP portfolio divided by the amount of wind capacity it interconnected came to $412 per kilowatt, while interconnection-related network upgrades for new generation in MISO planned through the interconnection queue cost $756 per kilowatt).

[346] *Id.* at 6-7 (citing Brattle-Grid Strategies Oct. 2021 Report at 7); *id.* (explaining that the onshore network upgrades required to interconnect 87.1 GW of resources meeting all of PJM states' current offshore wind goals and total renewable portfolio standards through "piecemeal interconnection queue projects would cost nearly $36 billion in total—*more than eleven times* the $3.2 billion cost of the integrated portfolio approach," or "[p]ut another way, proactive, portfolio-based planning in PJM could ultimately save ratepayers over $30 billion compared to the status quo.").

expanding the transmission planning horizon and considering factors affecting Long-Term Transmission Needs, as well as considering a broader list of benefits, transmission providers will be able to identify, evaluate, and select more efficient or cost-effective transmission solutions to address Long-Term Transmission Needs.[347] Such Long-Term Regional Transmission Planning will: (1) reduce reliance on transmission solutions that are relatively inefficient or less cost-effective because they address only short-term transmission needs; (2) unlock the benefits of economies of scale in transmission investment;[348] (3) enable opportunities to "right size" replacement transmission facilities;[349] (4) facilitate the selection of regional transmission facilities that could address multiple transmission needs over different time horizons; and (5) provide states, utilities, customers, and other stakeholders with greater insight and transparency into the costs and benefits of particular transmission solutions to address Long-Term Transmission Needs. We conclude that these regional transmission planning and cost allocation reforms will benefit customers by leading to more efficient or cost-effective transmission investment, thereby helping to ensure just and reasonable rates.[350]

---

[347] PIOs Initial Comments at 35.

[348] *Id.* at 10 ("[T]he vast majority of current transmission projects are focused solely either on network reliability or connecting the next generator in the interconnection queue and ignore any other potential benefits, possible economies of scale or other efficiencies that might occur by considering multiple future needs.").

137. In addition to potentially enhancing the efficiency and cost-effectiveness of transmission investment, we find that sufficiently long-term, forward-looking, and comprehensive regional transmission planning and cost allocation processes will enhance reliability. In the NOPR, the Commission found that a robust, well-planned transmission system is foundational to ensuring an affordable, reliable supply of electricity. The record supports this conclusion. Many commenters agree that, especially in light of continuing changes in both supply and demand, ongoing investment in regional transmission facilities is necessary to ensure that the transmission system continues to serve load in a reliable manner at reasonable cost.[351] Commenters also agree that regional transmission investments support enhanced reliability because larger, more

interconnection requests does not take into account broader, longer-term planning needs and furthermore raises questions about whether it will lead to efficient and cost-effective outcomes as the resource mix rapidly evolves."); PIOs Initial Comments at 8 ("[O]verwhelming evidence indicates that transmission owners are largely able to evade the requirements of Order No. 1000 and . . . have primarily invested in local projects. This has led to . . . billions of dollars in excessive costs for consumers." (citing Brattle-Grid Strategies Oct. 2021 Report at Section 1)); Southeast PIOs Reply Comments at 2 ("All the while, snowballing inefficiencies created by numerous small-scale transmission band-aids, unfit to address broader generation trends, translate into excessive, unjust, and unreasonable rates borne by an already overburdened populace.").

[351] ACORE ANOPR Initial Comments at 21-22 (explaining how additional transmission investments can alleviate billions of dollars in costs caused by extreme weather); EEI Initial Comments at 4 ("Transmission plays and will continue to play a vital role in enabling the energy transition and in ensuring a reliable and resilient energy grid. A robust transmission system will not only enable electric utilities to integrate more renewable energy resources and deliver more clean energy to customers but will also enhance the reliability and resiliency of the grid and enable the deployment of new technologies." (citing EEI, *Planning and Developing Electric Transmission Projects: The Path to the Grid of the Future* (2022)); NERC Initial Comments at 6 (explaining that transmission will be key to managing a reliable transformation in the resource mix).

integrated transmission systems are better equipped to accommodate a diversity of supply and demand conditions and provide redundancy that allow the system to better withstand unpredictable and extreme weather events, which are occurring with increased frequency and severity.[352]

138. Moreover, commenters provide examples of how long-term, forward-looking, and more comprehensive regional transmission planning can better identify reliability needs and resolve these needs with more efficient or cost-effective transmission solutions.[353] For example, as noted above, MISO's MVP Portfolio 4 eliminated the need for $300 million in future baseline reliability upgrades.[354] By comparison, the Reliability Must-Run Agreement for Indian River Unit 4, a 410 MW coal-fired generation unit, highlights the costs of inadequate regional transmission planning. As NARUC explains, the Indian River Unit 4 was scheduled to retire, but PJM found that retirement would cause

[352] NERC Initial Comments at 6 (explaining that regional transmission planning is necessary to ensure sufficient transmission capacity to move energy from areas with a surplus to areas that are deficient).

[353] ITC Initial Comments at 44 ("While local transmission planning continues to serve a critically necessary, valuable function in maintaining the reliability and efficiency of transmission systems, it is nonetheless clear that holistic, long range transmission planning is far more capable of identifying optimal transmission solutions that serve the most needs and deliver the most benefits."); MISO Initial Comments at 88 (explaining that in its Tranche 1 Long Range Transmission Plan, MISO recognizes Avoided Transmission Investment benefits provided by Long Range Transmission Plan facilities in addressing both avoided reliability projects and avoided age and condition replacement projects with the results being avoided costs in local transmission that would have otherwise been incurred to replace existing facilities).

[354] New Jersey Commission Initial Comments at 4.

reliability issues and would necessitate upgrades to transmission facilities that, due to their age, were already due to be upgraded, and that the Reliability Must-Run Agreement was needed because those upgrades would take five years to complete.[355] A long-term, forward-looking, and more comprehensive regional transmission planning process may have obviated the need for the Reliability Must-Run Agreement, the individual transmission facility upgrades, or both.

4. Conclusion

139. In consideration of the record provided in this proceeding, as well as the related conclusions stated above, we find that the Commission's existing regional transmission planning and cost allocation requirements are unjust, unreasonable, and unduly discriminatory or preferential because they fail to require transmission providers to adequately plan on a sufficiently long-term, forward-looking, and comprehensive basis. Specifically, as discussed, we find that the Commission's regional transmission planning and cost allocation requirements fail to require transmission providers to: (1) perform a sufficiently long-term assessment of transmission needs that identifies Long-Term Transmission Needs; (2) adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs; and (3) consider the broader set of benefits of regional transmission facilities planned to meet those Long-Term Transmission Needs. We find that reforms to those requirements are thus necessary to ensure that Commission-jurisdictional rates are just, reasonable, and not unduly

[355] NARUC Initial Comments at 14-15.

discriminatory or preferential. The failure to plan on a sufficiently long-term, forward-looking, and comprehensive basis results in the potential for relatively inefficient or less cost-effective transmission development for which customers must pay. The requirements set forth in this final rule will help to ensure that transmission providers plan to address Long-Term Transmission Needs, in turn helping to ensure more efficient or cost-effective transmission development and thus just and reasonable Commission-jurisdictional rates.

III. Long-Term Regional Transmission Planning

A. Requirement to Participate in Long-Term Regional Transmission Planning

1. NOPR Proposal

140. In the NOPR, the Commission proposed to require each transmission provider to participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning,[356] meaning regional transmission planning on a sufficiently long-term, forward-looking, and comprehensive basis to identify transmission needs driven by changes in the resource mix and demand and to identify and evaluate transmission

[356] The two features of Long-Term Regional Transmission Planning that the Commission included in the proposed reforms were the development of scenarios with a 20-year transmission planning horizon to be reassessed and revised every three years, with each such re-assessment providing the basis for identification and evaluation of transmission facilities for potential selection. NOPR, 179 FERC ¶ 61,028 at P 68 n.128.

facilities for potential selection as the more efficient or cost-effective transmission facilities to meet such needs.[357]

141. The Commission proposed that transmission providers may continue to rely on their existing regional transmission planning and cost allocation processes to comply with Order No. 1000's requirements related to transmission needs driven by reliability concerns or economic considerations.[358]

142. The Commission proposed that transmission providers that comply with the Long-Term Regional Transmission Planning requirements will comply with the requirement in Order No. 1000 that they participate in a regional transmission planning process that considers, and has associated cost allocation provisions related to, transmission needs driven by Public Policy Requirements.[359] The Commission further proposed to allow transmission providers to propose to continue using some or all aspects of the existing regional transmission planning and cost allocation processes they use to consider transmission needs driven by Public Policy Requirements.[360] The Commission stated, however, that such continued use of existing regional transmission planning and cost allocation processes would not supplant transmission providers' obligations to comply with the Long-Term Regional Transmission Planning requirements established in any

[357] *See id.* PP 54, 64, 68.

[358] *Id.* P 72.

[359] *Id.* P 73.

[360] *Id.* P 74.

final rule in this proceeding. Moreover, the Commission proposed that transmission providers seeking to retain existing regional transmission planning and cost allocation processes to consider transmission needs driven by Public Policy Requirements would have to demonstrate that continued use of any such processes does not interfere or otherwise undermine the Long-Term Regional Transmission Planning proposed in the NOPR by demonstrating that continued use of such processes is consistent with or superior to any final rule issued in this proceeding.[361]

143. The Commission preliminarily found that transmission providers could propose a regional transmission planning process that plans for reliability needs, economic needs, transmission needs driven by Public Policy Requirements, and transmission needs driven by changes in the resource mix and demand simultaneously through a combined approach. The Commission stated that transmission providers proposing to address all such transmission needs in a single regional transmission planning process would bear the burden of demonstrating continued compliance with Order No. 1000 in addition to compliance with the requirements of any final rule in this proceeding.[362]

144. Finally, the Commission proposed to require that Long-Term Regional Transmission Planning comply with the following existing Order Nos. 890 and 1000

[361] *Id.*

[362] *Id.* P 75.

transmission planning principles: (1) coordination; (2) openness; (3) transparency; (4) information exchange; (5) comparability; and (6) dispute resolution.[363]

2. Comments

a. General Comments

145. The majority of commenters support the Commission's proposal,[364] with multiple commenters claiming that Long-Term Regional Transmission Planning is crucial to

[363] *Id.* P 76.

ensure that regional transmission planning appropriately identifies transmission needs to meet the changing resource mix and demand.[365]

146. AEP and Ørsted argue that the Commission's proposal will address deficiencies in the current transmission planning process.[366] National Grid claims that existing long-term transmission planning processes are sufficient for addressing reliability and economic transmission needs in the near-term but are inadequate for addressing the changing resource mix and demand, as well as for addressing resilience challenges driven by climate change.[367] ACEG claims that Long-Term Regional Transmission Planning will allow right-sizing of transmission facilities.[368]

147. Some commenters observe that this proposal may result in cost-savings for consumers. For example, DC and MD Offices of People's Counsel claim that this

[367] National Grid Initial Comments at 10.

[368] ACEG Initial Comments at 6.

proposal could result in significant cost savings to consumers by helping address severe weather events and reduce the relative cost of decarbonizing the country's resource fleet.[369] AEP argues that the NOPR proposal will benefit consumers by establishing a process that will identify more efficient or cost-effective transmission facilities, capturing currently missed opportunities and achieving economies of scale.[370] North Carolina Commission and Staff argue that Long-Term Regional Transmission Planning can provide state utility commissions and consumer advocates with useful information to promote a cost-effective and reliable transmission grid.[371]

148. NextEra states that Long-Term Regional Transmission Planning can minimize overall costs to consumers by enabling the lowest-cost generation.[372] Relatedly, Tabors Caramanis Rudkevich states that the NOPR proposal would establish a transmission planning process that coordinates across franchises, states, and regions, which will reduce the production cost of delivery of energy to consumers.[373]

---

[369] DC and MD Offices of People's Counsel Initial Comments at 8-10 (citing Patrick Brown & Audun Botterud, *The Value of Inter-Regional Coordination and Transmission in Decarbonizing the US Electricity System*, 5 JOULE 115, 115-134 (2020), https://www.sciencedirect.com/science/article/pii/S2542435120305572?dgcid=author%20_blank); *see also* EEI Supplemental Comments at 1 (arguing that robust transmission development will provide cost savings from greater access to low-cost resources).

[371] North Carolina Commission and Staff Initial Comments at 4.

[372] NextEra Initial Comments at 62.

[373] Tabors Caramanis Rudkevich Initial Comments at 4-5.

149. PPL notes that Long-Term Regional Transmission Planning may improve some of the limitations of criteria-based transmission planning, which is currently employed in RTOs/ISOs.[374] Ørsted supports the proposed requirements regarding Long-Term Regional Transmission Planning and argues that existing regional transmission plans fail to anticipate the size and scale of future offshore wind generation development, leading to inaccurate plans and insufficient investment in infrastructure needed to integrate known future offshore wind generation.[375]

150. State Agencies assert that the Commission's various proposed reforms in the NOPR collectively would enhance transparency, prevent unnecessary investment in local transmission projects, and improve the competitive landscape.[376] US DOJ and FTC support reforms that address obstacles to transmission development and that are implemented consistent with principles for competition.[377]

b. Requests for Flexibility in Transmission Planning

151. A number of commenters support the Commission's proposal to require Long-Term Regional Transmission Planning, but also express reservations or objections regarding what they perceive as an overly prescriptive approach that may disrupt existing

[374] PPL Initial Comments at 4. PPL claims that, while PJM may perform long-term transmission planning on a 15-year time frame on paper, its long-term transmission planning is effectively undertaken over only 7 to 10 years. *Id.*

[375] Ørsted Initial Comments at 4-5.

[376] State Agencies Reply Comments at 6.

[377] US DOJ and FTC Initial Comments at 19.

processes that are already working.[378] For example, multiple commenters express concerns that the NOPR's allegedly prescriptive requirements for Long-Term Regional Transmission Planning will significantly limit needed discretion to conduct such planning, and that, without discretion to adjust the scenario modeling and assumptions to regional circumstances, the final rule could lead to more delay and conflict.[379] MISO TOs contend that the NOPR proposals vary sufficiently from MISO's current approach that MISO and its stakeholders will need to engage in complex and time-intensive revisions in order to comply.[380] Similarly, City of New Orleans Council asks that the final rule not hinder existing MISO processes.[381]

152. Multiple commenters recommend that the Commission's final rule establish principles and objectives for long-term transmission planning that address the Commission's concerns and provide transmission providers with the flexibility to develop tailored long-term transmission planning approaches and implementation details

[378] *See, e.g.*, Avangrid Initial Comments at 6, 9; CAISO Initial Comments at 1-2, 7-10, 13; California Commission Initial Comments at 6; Duke Initial Comments at 1-2; Indiana Commission Initial Comments at 1, 3; ISO-NE Initial Comments at 20; ISO/RTO Council Initial Comments at 4-5 (citing NOPR, 179 FERC ¶ 61,028 at PP 66, 104); Massachusetts Attorney General Initial Comments at 10-12; Michigan Commission Initial Comments at 4-5; MISO Initial Comments at 23; NEPOOL Initial Comments at 7; NYISO Initial Comments at 11; PG&E Initial Comments at 2; PJM Initial Comments at 54-55; US Chamber of Commerce at 4-5.

[381] City of New Orleans Initial Comments at 5-6.

accordingly.[382] MISO recommends that each transmission provider should give the Commission a report outlining the actions and processes that support the Commission's principles and guidance, and then the Commission could direct specific changes within each transmission planning region as it deems necessary.[383]

153. Multiple commenters argue for flexibility to accommodate local and regional differences, including differences in public policy goals that affect transmission planning.[384] NYISO asks that the final rule give each transmission planning region discretion to determine, in coordination with state entities and stakeholders, how best to incorporate the Long-Term Regional Transmission Planning requirements within its transmission planning framework.[385] California Municipal Utilities add that a significant amount of demand in the West is served by publicly-owned utilities and electric

[385] NYISO Initial Comments at 13.

cooperatives, which fall outside of state commission regulation, highlighting the need for flexibility in planning.[386]

154. Dominion asserts that any reforms adopted in this proceeding should align with the purpose of the transmission system, which is to provide reliable, affordable electric service to customers rather than to benefit generators.[387]

155. APPA agrees with concerns expressed by Commissioner Christie and former Commissioner Danly that overly prescriptive transmission planning requirements have the potential to interfere with existing regional transmission planning processes, and hence argues that adequate flexibility is needed.[388] Mississippi Commission states that where an RTO/ISO or non-RTO/ISO transmission provider is already engaged in long-term regional transmission planning, the Commission should accept flexibility and regional variations on compliance to address region-specific issues, including the delineation of regional and local transmission facilities through, for example, a voltage threshold (e.g., 100 kV).[389]

[386] California Municipal Utilities Reply Comments at 2.

[387] Dominion Initial Comments at 5.

[388] APPA Initial Comments at 23.

[389] Mississippi Commission Reply Comments at 7-8 (citing Entergy Initial Comments at 2-4; Louisiana Commission Initial Comments at 35-36; Michigan State Entities Initial Comments at 2; MISO Initial Comments at 2-3, 19; MISO TOs Initial Comments at 2, 4, 13-15).

156. CAISO maintains that the Commission should allow it to continue evaluating transmission needs driven by Public Policy Requirements in its transmission planning process, in addition to any Long-Term Regional Transmission Planning process, and give CAISO the flexibility to continue using resource portfolios and geographic zones identified by state agencies and local regulatory authorities.[390] Although ACORE urges the Commission not to grant requests for less stringent transmission planning requirements in the final rule, ACORE agrees that there may be cases where an individual RTO's/ISO's existing processes may be superior to the proposed reforms, such as in the case of CAISO's treatment of public policy projects within its annual transmission planning process.[391] California Municipal Utilities note that CAISO has already begun to implement some of the key reforms that the Commission proposed in the NOPR, specifically by adopting a 20-year outlook for transmission planning.[392]

157. MISO requests that a final rule support, rather than detract from, its demonstrated success in long-term transmission planning.[393] MISO TOs request that the Commission revise the NOPR's required parameters for Long-Term Regional Transmission Planning to accommodate the robust long-term regional transmission planning that some

[393] MISO Reply Comments at 2-3.

transmission planning regions, like MISO, have already developed.[394] Similarly, Ameren contends that the Commission should find that MISO's approved Long Range Transmission Planning process substantially complies with the proposed reforms.[395]

158. New York TOs support allowing transmission planning regions with already successful transmission planning processes to retain those processes while making incremental enhancements and to demonstrate on compliance that they meet the NOPR's objectives.[396] New York Transco asserts that the current NYISO public policy transmission planning processes already address, at least in part, the proposed reforms and believes that the Commission should permit regional flexibility.[397]

159. SPP states that its current transmission planning processes are sufficient to meet the intent of the Commission's proposed Long-Term Regional Transmission Planning reforms.[398] Omaha Public Power states that SPP and other RTOs/ISOs have already developed long-term planning scenarios and suggests that transmission providers that already have long-term planning scenarios should be provided with the flexibility to continue using their previously established processes.[399]

160. In contrast, some commenters argue that the final rule should not provide too much flexibility to transmission providers because that flexibility will undermine Long-Term Regional Transmission Planning.[400] Many commenters opposing greater flexibility argue that the Commission should establish minimum requirements for Long-Term Regional Transmission Planning.[401]

161. AEP argues that the Commission must resist requests for excessive regional flexibility that could threaten the development of long-term regional transmission and only permit it in limited instances that exceed minimum requirements.[402] Onward Energy states that, while flexibility is reasonable, the Commission must clearly identify who will drive regional transmission planning processes and how transmission planners will coordinate, study, and implement Long-Term Scenarios that represent realistic future resource portfolios.[403] Clean Energy Associations state that without robust and proactive transmission planning rules, the Commission cannot determine that rates remain just and

[403] Onward Energy Initial Comments at 4.

reasonable.[404] DC and MD Offices of People's Counsel state that, while regional flexibility is critical, long-term transmission planning rules that provide carve-outs and opt-outs will result in balkanized transmission development.[405]

162. Hannon Armstrong states that by diluting the proposed requirements or granting flexibility as some commenters request, the Commission would allow existing deficiencies to persist, enabling the continued reliance on either the generator interconnection process or operational planning to resolve or mitigate constraints.[406] Invenergy rebuts commenters' claims that the NOPR is too prescriptive or that some of the NOPR requirements should be optional, stating that optional processes and deference to regional flexibility will not ensure needed transmission is built and that a flexible approach has already been tried and has failed to produce sufficient results.[407]

c. Comments Regarding More Comprehensive Transmission Planning

163. Several commenters contend that Long-Term Regional Transmission Planning should not interfere with and should not supplant existing shorter-term transmission

[404] Clean Energy Associations Reply Comments at 4-5 (citing CAISO Initial Comments at 3; California Commission Initial Comments at 11; ISO-New England Initial Comments at 4; ISO/RTO Council Initial Comments at 8; NYISO Initial Comments at 3; PG&E Initial Comments at 4; PJM States Initial Comments at 4).

planning processes.[408] PJM asks the Commission to confirm that it did not mean for the NOPR proposals on Long-Term Regional Transmission Planning to modify the existing reliability and market efficiency transmission planning processes.[409] Transmission Dependent Utilities encourage the Commission to ensure that transmission providers do not focus on long-term objectives to satisfy state renewable energy portfolio requirements to the detriment of near-term reliability needs, such as end-of-life transmission planning.[410] Large Public Power and NEPOOL state that any final rule should clearly state that the current near-term transmission planning rules and processes, especially cost allocation, are not changed by the final rule's reforms, except where expressly indicated.[411] Ameren argues that the Commission was clear that changes to existing reliability and economic transmission planning requirements are beyond the scope of the

[411] Large Public Power Initial Comments at 16-18; NEPOOL Initial Comments at 7-8.

NOPR and that the comments filed supporting holistic planning have provided no compelling basis for the Commission to address them.[412]

164. Several commenters contend that Long-Term Regional Transmission Planning should not interfere with and must not supplant existing shorter-term transmission planning processes for transmission needs driven by Public Policy Requirements.[413] CAISO states that the NOPR provides no guidance or criteria regarding how a transmission provider can demonstrate that its existing process for addressing transmission needs driven by Public Policy Requirements does not interfere with or undermine Long-Term Regional Transmission Planning. CAISO contends that it should not have to re-justify its existing process or demonstrate that its existing process is consistent with or superior to Long-Term Regional Transmission Planning.[414]

165. AEP asserts that transmission providers should look at nearer-term reliability and economic transmission planning processes to determine whether there are needs that can be incorporated into Long-Term Regional Transmission Planning and addressed by a Long-Term Regional Transmission Facility.[415] SEIA recommends that the Commission require transmission providers to engage in portfolio-based transmission planning that

[412] Ameren Reply Comments at 17.

[414] CAISO Initial Comments at 19.

[415] AEP Initial Comments at 10.

integrates all relevant factors, including near-term needs, into Long-Term Regional Transmission Planning.[416] Policy Integrity argues that inclusion of specific requirements for transmission modeling are needed to fulfill the mandate of ensuring wholesale electric rates are just and reasonable.[417] Xcel recommends that the Commission require that known or expected generation be included in short-term regional transmission planning assumptions.[418]

166. PIOs state that, if the two processes continue to exist, the Commission should mandate that the base cases used in Order No. 1000 regional transmission planning processes and Long-Term Scenarios in Long-Term Regional Transmission Planning be defined in the same process. Otherwise, PIOs contend, inconsistent assumptions between the two processes could lead to redundant transmission projects and failure to identify more efficient solutions. In particular, PIOs argue, if an Order No. 1000 transmission planning process base case identifies transmission needs that are not anticipated in the Long-Term Scenarios, the opportunities for more efficient planning created by the long-term process will be lost. In addition, PIOs suggest that there may be opportunities for stakeholders to undermine Long-Term Regional Transmission Planning if they believe Order No. 1000 transmission planning would produce more favorable results for them. PIOs further argue that because uncertainty grows the further one looks into the future,

[416] SEIA Initial Comments at 20-21.

[417] Policy Integrity Supplemental Comments at 3.

[418] Xcel Initial Comments at 16.

there should not be significant differences in the short-term results of Long-Term Regional Transmission Planning and Order No. 1000 regional transmission planning processes.[419]

167. Several commenters support forward-looking, Long-Term Regional Transmission Planning but argue for holistic planning using multiple drivers of transmission needs.[420] They argue that a holistic approach is more efficient, better accounts for long-term benefits of new transmission, addresses the needs of more stakeholders, and is more likely to support development of regional transmission facilities, among other benefits. Competition Advocates support a final rule that reflects the benefits of holistic modeling,[421] while New Jersey Commission contends that holistic transmission planning using a competitive process provides significant benefits, including reducing costs.[422]

168. To ensure that reforms are not undermined by existing processes, Clean Energy Buyers recommend that the Commission extend to all existing regional transmission planning processes—not just transmission planning processes to address transmission needs driven by Public Policy Requirements, as proposed in the NOPR—the requirement that, on compliance with any final rule, transmission providers who seek to retain existing regional transmission planning and cost allocation processes must demonstrate that continued use of those processes does not interfere with or undermine Long-Term Regional Transmission Planning.[423]

169. However, other commenters support the Commission's proposal in the NOPR to *not* apply the proposed reforms to existing Order No. 1000 reliability and near-term economic regional transmission planning processes.[424] Ohio Consumers support the NOPR's proposal to mostly retain the regional transmission planning processes outlined in Order No. 1000, explaining that PJM stakeholders have reached an effective settlement

under that framework in which costs are allocated in a manner that is roughly commensurate with the benefits received.[425]

170. Some commenters argue that the Commission should require that local transmission projects be evaluated and approved as part of a holistic planning approach.[426] AEE asserts that, to ensure that transmission providers consider the full range of needs in developing long-term regional transmission plans, the final rule should require them to consider local transmission plans and to determine whether a regional solution would be more efficient or cost-effective.[427] OMS suggests that the Commission require that all local transmission projects be evaluated and approved as part of regional transmission planning processes with the opportunity for meaningful input from retail regulators, which it argues will enable participation by state regulators while respecting transmission owners' abilities to maintain their systems.[428]

171. By contrast, WIRES argues that the Commission should maintain the distinction between regional transmission planning and local transmission planning. WIRES argues that, while the regional transmission planning process is directed toward addressing certain reliability concerns, economic criteria, and public policy initiatives, it is not

[425] Ohio Consumers Initial Comments at 7 (citing NOPR, 179 FERC ¶ 61,028 at P 72).

[428] OMS Initial Comments at 16-17.

geared toward addressing additional system needs related to resilience, asset management, customer needs, customer impact, and aging infrastructure replacement that is typically the focus of local transmission planning.[429] Similarly, AEP states that if an RTO/ISO were to make all decisions regarding local transmission projects, they would also need to assume the accompanying responsibility—and the liability—for such decisions, which would entail physical inspection and condition assessment of assets, as well as a determination of when transmission facilities have reached their end of useful life.[430] AEP points out that both CAISO and PJM have expressly stated that they do not wish to undertake these types of activities and assume such obligations.[431]

d. Concerns Regarding Favoring Renewable Resources

172. ELCON argues that the Commission's proposal could require customers to pay higher costs to connect distant renewables when a lower-cost transmission project would provide the same reliability or economic benefits.[432] Utah Division of Public Utilities states that Long-Term Scenario requirements favoring renewable generation burden transmission providers while providing little to no benefit and that developers and generation utilities should determine which renewable generation should be developed at

[429] WIRES Initial Comments at 9.

[430] AEP Reply Comments at 7.

[431] *Id.* (citing *S. Cal. Edison Co.*, 164 FERC ¶ 61,160, at P 18 (2018); PJM Interconnection, L.L.C., Comments of PJM, Docket No. ER20-2308-000, at attach. A (July 2, 2020) (citation omitted)).

[432] ELCON Initial Comments at 9-10.

their respective zones or sites.[433] Utah Commission further contends that nationwide mandates for transmission planning add costs, produce confusion, and create conflicts that could lead to higher utility prices for consumers.[434] Kansas Ratepayer Advocates contend that Long-Term Regional Transmission Planning would presume material additions of renewable energy to serve consumers within a state, coupled with material additions of transmission to interconnect those renewables to the electric transmission grid, which do not reflect the unique circumstances of Kansas.[435]

173. Vistra asserts that the proposed reforms could devolve into the subsidization of resources chosen to achieve state policy goals, masking the true costs of those remotely located resources that require extensive transmission development to interconnect to the grid and leading to market distortions that undermine the objectives of these reforms.[436]

174. Louisiana Commission states that the NOPR would result in subsidization of the costs of transmitting remote renewable energy, spreading the costs out broadly based on an expanded "nebulous concept of 'benefits' and perceived 'public policy,'" thus ensuring that those transmission projects will pass any economic test.[437] According to

[433] Utah Division of Public Utilities Initial Comments at 7-8.

[435] Kansas Ratepayers Advocates Reply Comments at 2.

[436] Vistra Initial Comments at 11.

[437] Louisiana Commission Reply Comments at 12 (citing NOPR, 179 FERC ¶ 61,028 (Christie, Comm'r, concurring at P 2)).

Louisiana Commission, this subsidization would interfere with price signals, thereby distorting the efficient functioning of the wholesale market.[438] Louisiana Commission states that any Commission policy should be resource and technology neutral and should not impose costs on states that do not benefit from distant renewable power.[439]

175. Finally, Louisiana Commission contends that the NOPR's long-term transmission planning requirements could threaten the reliability of the transmission grid because the intermittent renewable resources that the NOPR favors do not provide stable output and are not dispatchable.[440] Similarly, former Kansas Commission Chair Keen argues that the NOPR fails to acknowledge the reliability concerns associated with a generation mix that is too heavily weighted to intermittent renewable generation resources.[441]

e. Concerns Regarding Uncertainty, Over-building, and Costs

176. A few commenters argue that long-term transmission planning introduces uncertainty or incentivizes speculative transmission development.[442] While EPSA acknowledges that long-term forecasts can provide valuable information about the

[438] Louisiana Commission Initial Comments at 19-21.

[439] *Id.* at 21-24.

[440] *Id.* at 21-23. *But see* Cypress Creek Reply Comments at 2-4 (disagreeing with Louisiana Commission and claiming that regionally coordinated transmission planning should provide demonstrable system reliability benefits).

potential scale of construction necessary to achieve decarbonization, it argues that using such forecasts to justify investment shifts the risks to consumers from developers and facility owners.[443] California Municipal Utilities state that, as transmission planning horizons are extended, the changes in resource mix, technology types, the location of resources, and demand will likely change congestion patterns and therefore the need for transmission upgrades needed to address them.[444]

177. Louisiana Commission states that it opposes the NOPR proposal because it would lead to an inefficient and expensive build-out of the transmission system and could be used to justify shifting the costs of this build-out to load.[445] ELCON states that it is concerned that the Commission's proposal to prioritize Long-Term Regional Transmission Planning to connect renewable generation over Long-Term Regional Transmission Planning for economically necessary transmission may exceed the Commission's authority if it increases transmission rates for the benefit of a few stakeholders.[446] Southern states that transmission expansion predicated on hypothetical resources that might not materialize would not satisfy the fundamental legal requirements of being used and useful, prudent, and/or otherwise needed for the public use, could harm

[443] EPSA Initial Comments at 7.

[444] California Municipal Utilities Initial Comments at 7.

[445] Louisiana Commission Initial Comments at 4-5.

[446] ELCON Initial Comments at 9 (citing NOPR, 179 FERC ¶ 61,028 (Danly, Comm'r, dissenting, at P 2 n.3); NOPR, 179 FERC ¶ 61,028 at P 47).

reliability, and would violate the Commission's duty under the FPA to facilitate transmission planning to meet load-serving entities' obligations.[447]

178. Industrial Customers argue that the NOPR does not provide evidence that extending the transmission planning horizon would exclude modeling of speculative projects, which would likely result in the over-building of transmission and unnecessary increases in rates.[448] Industrial Customers cite the D.C. Circuit's finding in *Old Dominion Electric Cooperative v. FERC* that "[w]e are sensitive to the concern . . . that individual utilities should not have free rein to impose unjustified costs on an entire region by unilaterally adopting overly ambitious planning criteria," and argue that the current NOPR proposal would result in the same issues.[449]

179. NRG urges caution on over-reliance on any 20-year planning study for making transmission investments due to the inherent uncertainty of a study with such a long planning horizon.[450] NRG argues that the NOPR will increase delivery costs by reducing the value of private investments and replacing such investments with a centrally planned, cost-socialized approach that is founded on at least some incorrect assumptions.[451] NRG

[447] Southern Initial Comments at 32, 34.

[448] Industrial Customers Initial Comments at 6, 15-16, 19-21.

[449] *Id.* at 16 (citing *Old Dominion Elec. Coop. v. FERC*, 898 F.3d 1254, 1263 (D.C. Cir. 2018)).

[450] NRG Initial Comments at 8.

[451] *Id.* at 3.

provides several examples of how forecast errors have caused adverse consequences, including forecasts of natural gas prices, load forecasts, and canceled planned transmission facilities.[452]

180. Likewise, Ohio Consumers urge the Commission to avoid adopting proposals based on long-term projections that justify massive charges to consumers based on hypothetical scenarios.[453] Ohio Consumers state that Ohio customers have recently been saddled with rate increases in part due to transmission investments and that long-term transmission planning requirements would increase ratepayer burden, which is especially troublesome if projections turn out to be inaccurate.[454]

181. As an alternative to Long-Term Regional Transmission Planning, Potomac Economics states that the Commission could require the transmission planning process to incorporate a broader array of near-term emerging trends that are less uncertain than the proposed longer-term factors.[455] Louisiana Commission states that it shares Potomac Economics' concerns. Louisiana Commission urges the Commission to heed testimony submitted by Potomac Economics arguing that: (1) there is significant uncertainty about future technology and a significant risk of investing in transmission projects that will not ultimately provide value; (2) large transmission projects are often not the most economic,

[452] *Id.* at 10-11.

[453] Ohio Consumers Initial Comments at 5.

[454] *Id.*

[455] Potomac Economics Initial Comments at 4.

whereas smaller, targeted projects are more beneficial; and (3) there can and likely would be stranded transmission if transmission planning processes attempt to identify and meet transmission needs 20 to 30 years in the future.[456]

182. US Chamber of Commerce argues that the Commission should ensure that any Long-Term Regional Transmission Planning reforms do not perpetuate an irrational transmission buildout that undermines competitive advantages of domestic electricity rates. US Chamber of Commerce asserts that the loss of competitive advantage would lead to lost jobs, lost economic growth, decreased electricity use, and fixed system costs assessed to fewer customers.[457]

183. Vistra states that the proposed reforms lean toward accounting for regulatory and public policy initiatives that may shape changes in the generation mix without sufficiently incorporating the commercial and markets-related aspects of generation development.[458] Vistra states that, without a process to assess commercial interest and financial commitment from generation developers, long-term regional transmission plans may under- or over-build transmission facilities or build them in the wrong locations.[459] Relatedly, NRECA states that planning a regional transmission network for generation resources or changes in demand not identified by load-serving entities' forecasts, and

[456] Louisiana Commission Reply Comments at 13-14.

[457] US Chamber of Commerce Initial Comments at 8.

[458] Vistra Initial Comments at 7.

[459] *Id.*

instead through unsupported top-down assumptions, may produce uneconomic results from over-building and increase reliability risks.[460]

184. NRG states that, in light of the uncertainty of variables such as the amount of electrification and resulting load requirements, technology costs for new resources, and viability and repurposing of existing resources, it is not clear whether a "no regrets" option genuinely exists. NRG also asserts that the centralized planning envisioned in the NOPR sacrifices the ability of market participants to use available information to assess whether their investments will be viable in the future, which is a critical feature of competition. NRG asserts that the Commission has not contemplated that trade-off or quantified its costs, noting that past long-term transmission planning studies have done a questionable job at forecasting future needs.[461]

185. Other commenters, however, note that the NOPR proposal includes measures that mitigate the uncertainty inherent in longer-term regional transmission planning.[462] For example, New Jersey Commission states that the proposed requirements to develop multiple scenarios and perform reassessments mitigates the uncertainty inherently present in a 20-year transmission planning horizon.[463] Additionally, several commenters rebut

[460] NRECA Initial Comments at 18-19.

[461] NRG Initial Comments at 8.

[462] New Jersey Commission Initial Comments at 10-11; PIOs Initial Comments at 15-16.

[463] New Jersey Commission Initial Comments at 10-11.

opposition to Long-Term Regional Transmission Planning based on concerns that it presents unreasonable levels of uncertainty.[464] For example, SREA and Clean Energy Buyers assert that periodic updates of forecasts and scenarios will help to mitigate uncertainty.[465]

186. Policy Integrity further explains that future uncertainty is exactly why long-term scenario planning is necessary to ensure just and reasonable rates. Policy Integrity states that the current transmission planning process uses deterministic modeling that does not account for the changing world, which will not lead to the development of efficient or cost-effective transmission solutions. Policy Integrity asserts that, in contrast, long-term scenario planning will allow transmission planners to be prepared for changes.[466] Policy Integrity argues that any forward-looking decision will have a degree of uncertainty, but that the risk posed by uncertainty can be mitigated and managed by using a portfolio evaluation of costs and benefits.[467] Policy Integrity further argues that ignoring the uncertainty surrounding the energy transition runs its own risk of failing to build transmission that can be useful to meet needs in the short, medium, and long term.[468]

f. Concerns Regarding Incentives for Resource Development

187. Vistra asserts that it is critical for Commission policy to maintain interconnection cost signals to drive cost-effective generation siting choices.[469] Vistra also argues that a policy that assigns all interconnection-related network upgrade costs, or even a disproportionately high share, to load undermines the incentive that generation developers currently have to site new projects in locations that minimize the related transmission upgrade costs.[470]

188. In contrast, New Jersey Commission argues that requiring individual interconnecting generators to pay for piecemeal interconnection-related network upgrades does not necessarily encourage developers to make siting decisions that minimize the overall cost of integrating large amounts of new generation.[471] Likewise, Clean Energy Associations state that robust, proactive regional transmission planning will better incent efficient siting decisions, because generators will evaluate the likely costs of interconnection facilities that ensure deliverability to the grid, rather than more broadly beneficial transmission facilities.[472]

[469] Vistra Initial Comments at 7.

[470] *Id.* at 7-8.

[471] New Jersey Commission Reply Comments at 7.

[472] Clean Energy Associations Reply Comments at 9 (citing ACEG 2021 Interconnection Report at 15).

g. Comments Regarding Definition of Long-Term Regional Transmission Facility

189. PJM states that the Commission should clarify certain details of the NOPR proposal, including the meaning of the word "identified" in the proposed definition of Long-Term Regional Transmission Facility.[473] In addition, PJM requests that the Commission clarify that if a transmission project shows up in several Long-Term Scenarios but is not selected until it reaches one of the shorter-term reliability and market efficiency transmission planning processes, that project would not be considered a Long-Term Regional Transmission Facility for selection and cost allocation purposes.[474] Otherwise, PJM contends, the rules for selection and cost allocation for transmission projects selected in the shorter-term and intermediate-term reliability and market efficiency transmission planning processes will be unclear, leading to re-litigation.[475]

h. Challenges to Commission Jurisdiction or Authority

i. FPA section 201

190. Some commenters argue that the NOPR proposals exceed the Commission's jurisdiction or that the Commission otherwise lacks the authority to adopt a final rule in this proceeding. Of these commenters, most contend that the NOPR proposal interferes with authority reserved to the states under FPA section 201.[476]

---

[473] PJM Initial Comments at 8, 98.

[474] *Id.* at 99.

[476] Alabama Commission Initial Comments at 3-4, 7-8; Kansas Ratepayer Advocates Reply Comments at 2-3; Louisiana Commission Initial Comments at 5, 8-9,

191. Some commenters argue that the NOPR proposal intrudes on the authority reserved to the states under FPA section 201 over integrated resource planning processes or resource mix decision making.[477] For example, Alabama Commission states that the NOPR proposal for Long-Term Regional Transmission Planning would intrude on state integrated resource planning to the extent that it dictates the construction of facilities through a top-down regional process or seeks to influence or mandate a substantive change to the generation resource mix.[478] Similarly, Nevada Commission argues that the NOPR may impact states' authority to determine their own mix of generating resources. Nevada Commission contends that the NOPR may cross the line from regulating interstate transmission to regulating intrastate processes—particularly because the Commission has not asserted jurisdiction over bundled retail transmission.[479] Louisiana

Commission argues that the Commission should not override state jurisdiction on resource planning, fuel type, and siting decisions, along with the regulation of retail rates.[480]

192. Mississippi Commission requests that the Commission acknowledge that it cannot force regional planning entities to indirectly act as a national integrated resource planner.[481] SERTP Sponsors and Southern argue that the NOPR essentially constitutes a Commission-regulated integrated resource plan/request for proposal process and that, to be workable, Long-Term Regional Transmission Planning instead must be based on state commission-regulated integrated resource planning/request for proposal decisions.[482] SERTP Sponsors and Southern contend that the NOPR proposed to require transmission providers to make independent resource and load decisions because: (1) state integrated resource plans are just one of many factors to be considered in developing Long-Term Scenarios; and (2) state integrated resource planning or request for proposal processes generally use a 10-year planning horizon such that there are no state-approved resources for the second half of the NOPR's proposed 20-year transmission planning horizon.[483]

[483] SERTP Sponsors Initial Comments at 16; Southern Initial Comments at 12-13.

SERTP Sponsors and Southern further argue that, in upholding Order No. 1000, the D.C. Circuit emphasized that the Commission was regulating the transmission planning process and not mandating any particular outcome, and that, if the Commission prescribes a process that supplants state decision making, it will have crossed the line into prescribing substantive outcomes and thus exceeded its jurisdiction.[484]

193. Ohio Commission Federal Advocate contends that the NOPR appears designed to target the achievement of narrow environmental policy objectives or the socialization of transmission costs, not to ensure reliability or foster just and reasonable rates.[485] Southern and Utah Commission state that the Commission has consistently recognized that the FPA does not allow the Commission to pick winners and losers when it comes to generation and argue that the Commission has no authority to favor one generation mix over another.[486] Similarly, Louisiana Commission, Kansas Ratepayer Advocates, and Undersigned States contend that the Commission lacks the statutory authority to dictate states' generation resource decisions. They argue instead that each state possesses such authority and is uniquely qualified to choose the generation resources that are needed to economically meet ratepayers' electric service needs within their states.[487]

194. SERTP Sponsors and Southern argue that, even if assumptions about the resource mix included in Long-Term Scenarios do not bind states, requiring transmission providers to develop Long-Term Scenarios that are predicated on particular resource assumptions effectively makes a substantive resource decision because it favors the assumed resource mix over others.[488] SERTP Sponsors and Southern contend that this is akin to the Commission attempting to accomplish indirectly what it could not directly.[489] SERTP Sponsors argue that the Commission should support the exercise of traditional state resource and infrastructure planning authority rather than supplant it.[490] North Carolina Commission and Staff argue that the use of the production cost savings benefit in Long-Term Regional Transmission Planning "could conflict with state-jurisdictional resource decisions."[491]

195. Other commenters disagree with these contentions and argue that the NOPR proposal would not intrude on states' reserved authority over resource mix decision

making or integrated resource plan processes.[492] Kentucky Commission Chair Chandler and SEIA argue that the NOPR's stated aim of reforming regional and interregional transmission planning processes does not foreclose states' decision making on generation.[493] ACEG contends that the NOPR does not propose or purport to regulate the electric supply mix and that the Commission is acting squarely within its authority under the FPA's cooperative federalism structure.[494] AEE notes that the Commission included integrated resource planning and utility load-serving planning as a factor driving transmission needs and argues that none of the requirements proposed by the Commission directly conflict with integrated resource planning processes, require that integrated resource planning be conducted on a different timeline, or override resource planning efforts.[495] Likewise, Kentucky Commission Chair Chandler reiterates that Kentucky's integrated resource plans are not driving transmission planning processes in the state. He explains that integrated resource plans/requests for proposals are not the basis for generation investment decisions, but the state's requests for proposals seek generation proposals after the integrated resource planning process is complete and a

need for generation is identified.[496] In response to Alabama Commission's arguments that the NOPR's proposed rules have the potential to encroach on state-jurisdictional integrated resource planning and resource procurement processes overseen by Alabama Commission, SREA contends that Alabama Commission in fact does not have a formal integrated resource planning process upon which the Commission could encroach.[497]

196. New Jersey Commission disagrees with commenters who argue that the Commission intends to impose a preferred resource mix on the nation by overriding state choices and contends that such arguments are "profoundly misconstruing" the nature of the NOPR proposal and what the Commission aims to achieve.[498] Instead, New Jersey Commission argues that Long-Term Regional Transmission Planning would address transmission needs that are being driven by state policies, market decisions, and technological changes, all of which reflect consumer-driven demand for cleaner electricity.[499] New Jersey Commission contends that the NOPR proposal would ensure that transmission needs are reliably met at a total cost that is just and reasonable, which New Jersey Commission argues is required—not precluded—by the FPA.[500]

[498] New Jersey Commission Reply Comments at 1-2.

[499] *Id.* at 2.

[500] *Id.*

197. Some commenters argue that the NOPR proposal would intrude on authority over siting and construction of transmission facilities that is reserved to the states under FPA section 201.[501] For example, Southern argues that the FPA reserves transmission siting authority to the states and that the final rule should not directly or indirectly interfere with this authority.[502] Alabama Commission argues that Long-Term Regional Transmission Planning would interfere with state authority to the extent it dictates the construction of facilities through a top-down regional process.[503] Kansas Ratepayer Advocates state that the Commission would exceed its authority and violate states' constitutional rights by ordering states to construct interregional transmission facilities with construction costs paid by retail ratepayers in Kansas.[504]

198. Nevada Commission explains that Nevada law governs the issuance of permits to construct transmission facilities, and that such facilities—even where their costs are not intended to be recovered through retail rates—must go through and may not bypass that process in favor of regional transmission planning processes.[505] NARUC contends that state participation in cost allocation for a portfolio of Long-Term Regional Transmission

[501] Alabama Commission Initial Comments at 7; Kansas Ratepayer Advocates Reply Comments at 3; NARUC Initial Comments at 29; Nevada Commission Initial Comments at 2-3; Southern Initial Comments at 21-22.

[502] Southern Initial Comments at 21-22.

[504] Kansas Ratepayer Advocates Reply Comments at 3.

[505] Nevada Commission Initial Comments at 2-3.

Facilities does not require a state, in its role as a transmission siting authority, to approve any projects within the portfolio.[506]

199. A few commenters argue that the NOPR proposal would intrude on the authority over certain transmission planning allegedly reserved to the states under FPA section 201. For example, Mississippi Commission states that the final rule must respect state jurisdictional authority over planning and approval of transmission facilities used to serve state load.[507] Nevada Commission states that Nevada will continue to plan for transmission through its integrated resource planning process and that the Commission should allow "bottom up" transmission planning, particularly in non-RTO/ISO transmission planning regions.[508]

200. In contrast, other commenters express support for the Commission's role in transmission planning. Ohio Consumers argue that the Commission has authority over transmission planning, even in states like Ohio that allow for retail consumer choice.[509] SREA explains that states and other jurisdictional regulators will continue to have ultimate control over generation resource planning and transmission planning, regardless

[506] NARUC Initial Comments at 29.

[507] Mississippi Commission Initial Comments at 5 (citing Mississippi Commission ANOPR Comments at 2, 17; NOPR, 179 FERC ¶ 61,028 (Christie, Comm'r, concurring at PP 2, 11-14)).

[509] Ohio Consumers Initial Comments at 26 (citing *New York v. FERC*, 535 U.S.at 23-24, 26-28).

of what a regional transmission body proposes. SREA states that, even within RTO/ISO regions, "transmission or generation resource plans are subject to review, update or even cancellation, and those decisions are always determined by the relevant regulatory bodies."[510] Vistra states that any final rule should recognize the legal and practical boundaries on the Commission's role in transmission development and in shaping the generation sector. According to Vistra, the Commission has successfully relied on its general authority under FPA sections 205 and 206 to oversee rates, terms, and conditions of jurisdictional service as the basis for its policies on transmission planning.[511]

201. Finally, Mississippi Commission argues that the NOPR proposal may infringe upon states' reserved authority under FPA section 201 to make resource adequacy decisions. Mississippi Commission explains that, when an RTO/ISO approves construction to deliver generation output to remote utilities that have failed to agree to purchase the energy, that RTO/ISO infringes on the state's resource adequacy jurisdiction.[512] Mississippi Commission contends that requiring State A to pay for transmission upgrades to rely on energy generated in State B, despite State A having constructed its own generation facilities, would usurp State A's resource adequacy jurisdiction.[513]

[513] *Id.* at 13.

ii. "Major Questions Doctrine"

202. Some commenters argue that the NOPR proposal would not withstand judicial review under the major questions doctrine.[514]

203. Louisiana Commission claims that the NOPR proposal violates principles of "agency law" and the separation of powers doctrine because Congress has not clearly delegated to the Commission the authority to enact far-reaching, nationwide policy changes favoring one form of generation over another.[515] Louisiana Commission contends that the NOPR proposals exceed the limits of the FPA, which does not provide clear delegated authority for the Commission to decide types of generating resources. Louisiana Commission argues that the Commission therefore lacks the authority to determine whether the country should undergo a clean energy transition. Drawing parallels between the NOPR proposal and the U.S. Supreme Court's decision in *West Virginia v. EPA*, Louisiana Commission avers that the determination of what type of generating resources should be transmitted from where in the United States qualifies as a "major question" of public policy that Congress should order.[516]

---

[514] Louisiana Commission Initial Comments at 6, 12-13; Ohio Consumers Reply Comments at 14; SERTP Sponsors Initial Comments at 17-18; Southern Initial Comments at 20-21; Utah Commission Initial Comments at 8-9; Undersigned States Reply Comments at 3-4.

[515] Louisiana Commission Initial Comments at 6.

[516] *Id.* at 12 (citing 597 U.S. 697, 729-30, 735).

204. SERTP Sponsors argue that *West Virginia v. EPA* reinforces the need for the Commission to exercise restraint in expanding its jurisdiction without a clear Congressional delegation of authority.[517] According to SERTP Sponsors, *West Virginia v. EPA* makes clear that the nation's energy policy and generation mix is a "major question" for which the Commission must have direct authorization from Congress to assert jurisdiction.[518] SERTP Sponsors contend that Congress has not clearly provided the Commission with jurisdiction to presuppose generation decisions and thereby effect particular substantive transmission outcomes.[519] Rather, SERTP Sponsors argue that Congress instead expressly and unequivocally reserved generation authority to the states.[520]

205. Southern similarly argues that *West Virginia v. EPA* makes clear that the nation's energy policy and generation mix is a "major question" that requires more than a "merely plausible textual basis" for a federal agency to assert jurisdiction.[521] Southern contends that, as applied to the NOPR proposal's "contemplated foray into [integrated resource

[517] SERTP Sponsors Initial Comments at 17 (citing *West Virginia v. EPA*, 597 U.S. at 723); *see also* EEI Initial Comments at 8 (urging the Commission to consider the overlap of the Commission's and state commissions' respective jurisdictions).

[518] SERTP Sponsors Initial Comments at 17-18.

[519] *Id.* at 18.

[520] *Id.*

[521] Southern Initial Comments at 20-21 (citing *West Virginia v. EPA*, 597 U.S. at 723).

planning] and generation/resource matters," the Commission does not rely upon a specific and clear grant of congressional authorization but instead relies upon its "general, gap-filling authorization in FPA Section 206 to regulate a 'practice' affecting a rate or charge for transmission."[522] Southern contends that rather than provide clear congressional authorization, Congress instead reserved authority over integrated resource plans and generation to the states.[523]

206. Utah Commission argues that the Commission has no authority to enact any rule for the purpose of influencing the resource generation mix or expanding development of any type of generation. Utah Commission states that the increased development and integration of renewable generation is a "highly charged political question and a matter of significant political interest about which state legislatures have made very different policy choices." As such, Utah Commission argues that, although courts have given the Commission "some latitude under FPA Section 206," the U.S. Supreme Court will not uphold a final rule premised upon the Commission's "claimed authority to prescribe a single, onerous national regime for transmission planning specifically intended to pressure transmission providers to select costly expansions into remote areas for the purpose of realizing [the Commission's] preferred generation mix, a matter specifically reserved to the states."[524] Utah Commission explains that the Supreme Court's reasoning

[522] *Id.*

[523] *Id.* at 21.

[524] Utah Commission Initial Comments at 8.

in *West Virginia v. EPA* is applicable to the Commission. Utah Commission argues that "imposing a single set of federally mandated, highly prescriptive transmission planning and cost allocation requirements for the purpose of privileging the selection of costly transmission projects to serve remote and speculative renewable generation is not a lawful exercise of [the Commission's] authority under FPA Section 206."[525]

207. Undersigned States argue that "[n]ational-scale energy grid regulation" is a "major question" because of the "massive economic consequences" involved and the implication of a "unique and complex jurisdictional divide between [s]tate and federal regulatory authority."[526] According to Undersigned States, the Commission "has no statutory authority at all—much less 'clear congressional authorization'—to revamp the energy grid's mix of generation resources writ large."[527]

208. Harvard ELI and Policy Integrity disagree with Undersigned States. They argue that Undersigned States "mischaracterize the NOPR" because the NOPR would not revamp the energy grid's mix of generation resources. Rather, according to Harvard ELI and Policy Integrity, the NOPR would require utilities to amend their existing regional

[525] *Id.* at 8-9 (citing *West Virginia v. EPA*, 597 U.S. at 729-30).

[526] Undersigned States Reply Comments at 3 (citing *West Virginia v. EPA*, 597 U.S. 697; *Ala. Ass'n of Realtors v. HHS*, 594 U.S. 758, 764 (2021)).

[527] *Id.* at 4 (quoting *West Virginia v. EPA*, 597 U.S. at 723).

transmission planning processes in response to changes in the resource mix and demand that are occurring because of factors unrelated to the NOPR.[528]

209. Harvard ELI and Policy Integrity also contend that Undersigned States overlook the major questions doctrine's key requirements. They assert that application of the major questions doctrine does *not* turn on whether a regulation will have significant economic effects or intrudes on areas traditionally regulated by states. Instead, Harvard ELI and Policy Integrity assert that the major questions doctrine is triggered only when an agency's action is both unheralded and transformative.[529]

210. Harvard ELI and Policy Integrity argue that the NOPR is not unheralded. They explain that Order No. 1000 similarly regulated transmission planning and cost allocation in response to concerns about the generation mix, and that the D.C. Circuit upheld Order No. 1000 while rejecting arguments similar to those that Undersigned States make here.[530] Moreover, Harvard ELI and Policy Integrity identify provisions in existing tariffs that are similar to those that the NOPR proposes and point to other antecedents for Commission regulation of regional transmission planning.[531]

---

[529] *Id.* at 2-3.

[530] *Id.* at 4 (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 48-49; Order No. 1000, 136 FERC ¶ 61,051 at PP 45, 47).

[531] *Id.* at 4-5; *id.* app. A.

211. Likewise, Harvard ELI and Policy Integrity argue that the NOPR does not represent a transformative expansion in the Commission's authority nor a "fundamental change to the statutory scheme."[532] Instead, they assert that the NOPR merely builds on existing regional transmission planning processes to ensure that Commission-jurisdictional rates remain just and reasonable, as the FPA requires.[533]

iii. "Equal Sovereignty Doctrine"/Cross-Subsidization

212. Some commenters argue that the NOPR's cost allocation proposal impermissibly requires states to subsidize other states' public policies.[534] Undersigned States argue that the NOPR would exceed the Commission's jurisdiction because it violates the Constitution's equal sovereignty doctrine, which provides constitutional equality among the states.[535] According to Undersigned States, the NOPR "sets up a scheme where one [s]tate can effectively require other [s]tates to subsidize their own vision of what resources should be used in electricity generation—a core, sovereign [s]tate function," which risks "undue discrimination" among states.[536] Mississippi Commission argues that

unanimous agreement, rather than majority agreement, would be required for any *ex ante* default cost allocation method, as each state has sole jurisdiction within its boundaries.[537]

213. Louisiana Commission asserts that "*group* state oversight" is not equivalent to "state oversight," and that the Commission should not adopt a rule that subjects one state's will to majority override. Louisiana Commission further argues that the Commission should not enact rules that would "impose costs for projects selected under the proposed long-term planning criteria on unwilling states that do not benefit from those projects, even if those states are in the minority." Louisiana Commission contends that the Commission should not attempt to override state jurisdiction simply because a majority of states in a region may support imposing costs on unwilling states that do not benefit from transmission projects favored by the majority.[538] Louisiana Commission argues that states should not be required to cede their jurisdiction by engaging in any "consulting" committee structure required with respect to Long-Term Regional Transmission Planning,[539] because granting each state one vote in a multi-state body cannot replace the meaningful exercise of state jurisdiction within a state's borders.[540]

[537] Mississippi Commission Reply Comments at 2-3.

[539] Louisiana Commission Initial Comments at 28-29.

[540] Louisiana Commission Reply Comments at 16.

214. Conversely, ACEG disputes these claims, which ACEG states are "incorrect and misconstrue the NOPR."[541] ACEG highlights the fact that the NOPR does not include resource preferences in its proposed planning criteria, factors, or benefits, nor does the NOPR exclude consideration of non-renewable resources from transmission planning.[542] ACEG further notes that the NOPR proposes to direct transmission planners to plan the system to "meet transmission needs driven by changes in the resource mix and demand," requiring transmission planners to consider the resource mix as a whole, which necessarily requires considering all types of resources.[543] New Jersey Commission agrees, stating that the Commission did not propose in the NOPR "to unduly favor, mandate, or subsidize forms of generation," but rather "to ensure that the bulk electricity system maintains reliability and satisfies evolving consumer demands, whether driven by public policy requirements or voluntary goals, at the lowest reasonable cost."[544] Moreover, New Jersey Commission argues, allocating the cost of Long-Term Regional Transmission Facilities only to those states with relevant public policy goals "would allow the remaining states to free ride, and effectively force the states with public policy

[541] ACEG Reply Comments at 18.

[542] *Id.* at 18-19.

[543] *Id.* at 19.

[544] New Jersey Commission Initial Comments at 3.

goals to subsidize the provision of normal electricity service in other states in order to pursue their own policies."[545]

i. Other Issues

215. NRECA requests that the Commission clarify that the final rule, consistent with the Commission's obligation under FPA section 217(b)(4), "is intended to facilitate and support 'bottom-up' transmission planning to meet the transmission needs of [load-serving entities] to provide reliable and economical service to consumers."[546]

216. Some commenters argue that the final rule will not withstand judicial scrutiny if it does not permit regional flexibility.[547] For example, US Chamber of Commerce explains that the interstate power grid includes investor-owned utilities, publicly-owned utilities, and electric cooperatives, which can be members of RTOs/ISOs, power pooling arrangements, joint-ownership agreements, or subject to traditional vertically-integrated structures.[548] According to US Chamber of Commerce, imposing a new regional transmission planning regime on all these various entities would ignore the compromises and benefits that led to the status quo.[549] Relatedly, Southern and SERTP Sponsors argue

[545] *Id.* at 20.

[546] NRECA Initial Comments at 17-21.

[549] *Id*.

that the legal viability of the final rule will be threatened if the Commission fails to respect the FPA's fundamental jurisdictional roles by not providing states and transmission providers with the opportunity and flexibility to adapt their planning processes.[550]

j. Miscellaneous Concerns

217. MISO seeks clarification from the Commission that the term "transmission planning region" has the same meaning as in Order No. 1000, where MISO may comprise a single transmission planning region despite including multiple transmission zones or local balancing authorities.[551]

218. California Municipal Utilities state that transmission planning should not be a vehicle to centralize resource choices, but instead should reflect the choices made by state and local authorities.[552] Similarly, Mississippi Commission argues that Long-Term Regional Transmission Planning should be driven by state-specific concerns and needs and that regional priorities should be subordinated to state priorities.[553] Mississippi Commission asks that the Commission not issue a final rule but instead establish proceedings to address specific concerns with certain regional transmission planning

[550] Southern Initial Comments at 1; Southern Reply Comments at 3; SERTP Sponsors Initial Comments at 1; SERTP Sponsors Reply Comments at 1-2.

[551] MISO Initial Comments at 24.

[552] California Municipal Utilities Reply Comments at 2.

[553] Mississippi Commission Initial Comments at 3.

processes on a more limited basis.[554] Southern argues that Long-Term Regional Transmission Facilities in non-RTO/ISO transmission planning regions must have the support of affected states, as these facilities stem from resource and load assumptions that are not the result of those states' planning and procurement processes.[555] Southern urges the Commission to maintain the appropriate transmission planning and state-driven supply- and demand-side relationships, which Order No. 1000 preserved.[556] SERTP Sponsors argue that the Commission should avoid mandates that could largely result in transmission expansion or infrastructure decisions that lead to investments borne, largely, by retail electricity consumers that lack the consent and support of the state authorities vested with the responsibility to protect those consumers.[557]

219. Several commenters agree with the Commission that any final rule should apply to transmission providers in both RTO/ISO and non-RTO/ISO transmission planning regions.[558] However, several commenters disagree and argue that the final rule, or certain specified requirements in the final rule, should apply only to RTO/ISO transmission

[558] *See, e.g.*, AEE Reply Comments at 11; MISO Reply Comments at 3; PIOs Reply Comments at 2-3; SEIA Reply Comments at 5; SREA Initial Comments at 47; TAPS Initial Comments at 70.

planning regions.[559] Nevada Commission argues that the RTOs/ISOs "may be better suited" than other regions for the transmission planning that the NOPR proposes.[560] Utah Division of Public Utilities stresses the need for regional flexibility, noting that transmission providers located outside of RTOs/ISOs already coordinate on transmission planning with many non-Commission-jurisdictional entities.[561]

220. SEIA rebuts the claims of Southern and Louisiana, Utah, Mississippi, and Alabama Commissions that state planning processes already interact well with transmission planning and support customers' transmission needs.[562] SEIA and SREA assert that non-RTO/ISO transmission planning regions do not engage in sufficient or transparent transmission planning.[563] Specifically, SEIA states, the transmission planning processes in non-RTO/ISO regions are rife with issues, including the use of inconsistent and inaccurate data and an exclusionary and insufficiently transparent process.[564] Further, SEIA states that the end result of an integrated resource planning process may be

[559] *See, e.g.*, Mississippi Commission Initial Comments at 16; Utah Division of Public Utilities Reply Comments at 1-2.

based on inconsistent and inaccurate data,[565] the process is "sometimes disjointed,"[566] and the process is a voluntary process in which the planning authority must accept, and not verify, the information provided.[567]

221. SREA rebuts Southern's contention that Southern's transmission planning processes are adequate, noting that Southern itself has presented testimony to the Georgia Commission conceding that it is unable to perform more robust transmission planning due to limitations in its software and models.[568] SREA argues that throughout the Southeast, transmission planning is not a priority and that integrated resource planning is not a substitute for robust transmission planning.[569] SREA explains that the NOPR borrows many of the qualities of integrated resource planning and applies them to transmission planning, including scenario-based evaluation and use of 20-year planning horizons, and that many states have integrated resource planning rules and guidelines that recognize the value of long-term planning.[570]

[570] *Id*.

222. EPSA states that the Commission should focus not on socializing transmission costs but on reducing transaction costs, accelerating lagging processes, and adopting market-based solutions like open seasons.[571]

223. GridLab states that there is evidence to suggest that changes in resource mix, demand, and weather will lead to significant changes in the value of regional transmission facilities in the 2030s, though GridLab asserts that these changes may increase or decrease the value of regional transmission facilities. Accordingly, GridLab recommends that the Commission and stakeholders resist evaluating the success of this rulemaking based on arbitrary metrics related to each transmission provider's expansion of regional transmission facilities.[572]

3. Commission Determination

a. Participation in Long-Term Regional Transmission Planning

224. We adopt the NOPR proposal to require transmission providers in each transmission planning region to participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning, meaning regional transmission planning on a sufficiently long-term, forward-looking, and comprehensive basis to identify Long-Term Transmission Needs, identify transmission facilities that meet such needs, measure the benefits of those transmission facilities, and evaluate those

[571] EPSA Initial Comments at 7-8.

[572] GridLab Initial Comments at 9-10.

transmission facilities for potential selection in the regional transmission plan for purposes of cost allocation as the more efficient or cost-effective transmission facilities to meet Long-Term Transmission Needs.[573] We also adopt the NOPR proposal to require that Long-Term Regional Transmission Planning comply with the following existing Order Nos. 890 and 1000 transmission planning principles: (1) coordination; (2) openness; (3) transparency; (4) information exchange; (5) comparability; and (6) dispute resolution.[574] In developing their compliance filings, transmission providers and stakeholders should review the requirements set forth in Order No. 890 and Order No. 1000, and the Commission's orders on compliance filings submitted by transmission providers, for guidance as to what each of these transmission planning principles requires. For example, as a starting point, a transmission provider should review the orders addressing its own Order Nos. 890 and 1000 compliance filings and the compliance filings for transmission providers in its transmission planning region.

225. We also adopt specific requirements regarding how transmission providers must conduct Long-Term Regional Transmission Planning. Specifically, and as discussed

[573] We note that, while we have modified this definition of Long-Term Regional Transmission Planning from the NOPR proposal, the modified definition does not substantively change the steps involved in Long-Term Regional Transmission Planning from those proposed in the NOPR. Rather, the revised definition merely clarifies the steps that transmission providers must take in conducting Long-Term Regional Transmission Planning.

[574] Order No. 1000, 136 FERC ¶ 61,051 at PP 146, 151. We do not address these principles in detail here.

further below, we require transmission providers in each transmission planning region[575] to: (1) identify Long-Term Transmission Needs and Long-Term Regional Transmission Facilities to meet those needs through the development of Long-Term Scenarios[576] that satisfy the requirements set forth in this final rule; (2) use and measure, at a minimum, a set of seven required benefits[577] to evaluate Long-Term Regional Transmission Facilities over a time horizon that covers, at a minimum, 20 years starting from the estimated in-service date of each transmission facility; and (3) evaluate Long-Term Regional Transmission Facilities to determine whether they are more efficient or cost-effective transmission solutions to meet Long-Term Transmission Needs and use selection criteria (in collaboration with states and other stakeholders) that provide the opportunity for transmission providers to select such Long-Term Regional Transmission Facilities.

[575] In response to MISO's request, MISO Initial Comments at 24, we clarify that this final rule does not alter the meaning of "transmission planning region" as used in Order No. 1000. A transmission planning region is one in which transmission providers, in consultation with stakeholders and affected states, have agreed to participate for purposes of regional transmission planning and development of a single regional transmission plan. Order No. 1000-A, 139 FERC ¶ 61,132 at P 272; Order No. 1000, 136 FERC ¶ 61,051 at P 160.

[576] The requirements related to Long-Term Scenarios are discussed below.

[577] As discussed further below in the Evaluation of the Benefits of Regional Transmission Facilities section, these seven benefits are: (1) Benefit 1, Avoided or Deferred Reliability Transmission Facilities and Aging Transmission Infrastructure Replacement; (2) Benefit 2(a), Reduced Loss of Load Probability, or Benefit 2(b), Reduced Planning Reserve Margin; (3) Benefit 3, Production Cost Savings; (4) Benefit 4, Reduced Transmission Energy Losses; (5) Benefit 5, Reduced Congestion Due to Transmission Outages; (6) Mitigation of Extreme Weather Events and Unexpected System Conditions; and (7) Capacity Cost Benefits from Reduced Peak Energy Losses.

226. These requirements together establish a long-term, forward-looking, and more comprehensive approach to regional transmission planning, which will ensure that transmission providers identify, evaluate, and select more efficient or cost-effective transmission solutions to address Long-Term Transmission Needs. Long-Term Regional Transmission Planning, as set forth in this final rule, requires regional transmission planning based on a multitude of drivers of Long-Term Transmission Needs and provides the opportunity for transmission providers to meet those needs by selecting more efficient or cost-effective Long-Term Regional Transmission Facilities.

227. In considering the comments received on this proposal, we strike a careful balance. On the one hand, we believe that there is an inherent risk in transmission providers waiting for the near-term certainty that some commenters appear to believe is necessary[578] before planning to address transmission needs. As explained in the Overall Need for Reform section above, doing so may result in transmission providers relying on relatively inefficient and less cost-effective piecemeal transmission solutions to address these needs shortly before they manifest, to the detriment of customers. On the other hand, we acknowledge the inherent uncertainty involved in planning to meet Long-Term Transmission Needs and that this uncertainty means that forward-looking regional transmission planning entails certain risks, including the risk that transmission needs may change over time. In this final rule, we balance these risks, requiring planning to meet

[578] *See, e.g.*, NRG Initial Comments at 8 (arguing that there are unlikely to be any "no regrets" options).

Long-Term Transmission Needs, while imposing requirements on how Long-Term Regional Transmission Planning is conducted, as discussed further herein, to mitigate uncertainty. To adequately prepare for the future, transmission providers need to make decisions in the present that are grounded in a thorough, informed analysis of the factors that drive Long-Term Transmission Needs.

228. As discussed in the Overall Need for Reform section, these factors are together driving rapid changes in the Long-Term Transmission Needs that transmission providers must plan to meet to continue to provide an affordable, reliable supply of electricity to customers, but neither transmission infrastructure nor regional transmission planning processes are keeping pace. Consequently, the Commission's existing regional transmission planning requirements are no longer just and reasonable, as they increasingly result in transmission investment decisions occurring outside of regional transmission planning processes and instead through generator interconnection processes and local transmission planning processes that typically plan to meet discrete, nearer-term transmission needs. In addition, the record demonstrates that transmission providers have made substantial investments in in-kind replacement transmission facilities, which generally are not identified through more long-term, forward-looking, or comprehensive transmission planning. This final rule aims to ensure that transmission providers, through their regional transmission planning processes, identify, evaluate, and select Long-Term Regional Transmission Facilities that more efficiently or cost-effectively address Long-Term Transmission Needs, helping to ensure just and reasonable rates.

229. We disagree with arguments that the Commission should not require Long-Term Regional Transmission Planning because, certain commenters claim, doing so will introduce excessive uncertainty into regional transmission planning, transmission providers will make forecasting errors, or the final rule will result in regional transmission planning that is speculative.[579] To the contrary, we believe that the reforms adopted in this final rule account for and seek to reduce the inherent uncertainty in forward-looking regional transmission planning, while ensuring that transmission providers, through their regional transmission planning processes, identify, evaluate, and select Long-Term Regional Transmission Facilities that more efficiently or cost-effectively address Long-Term Transmission Needs, thus helping to ensure just and reasonable rates.[580] In fact, by requiring transmission providers to use Long-Term Scenarios in Long-Term Regional Transmission Planning, this final rule provides transmission providers with a critical tool for managing uncertainty, facilitating regional transmission planning that accounts for a range of potential futures, as well as an assessment of the likelihood of each scenario manifesting, when identifying, evaluating, and selecting Long-Term Regional Transmission Facilities. Further, as discussed in the Evaluation and Selection of Long-Term Regional Transmission Facilities section below, we require transmission providers to reevaluate Long-Term Regional Transmission

[579] Louisiana Commission Initial Comments at 4-5; NRG Initial Comments at 3-4; Ohio Consumers Initial Comments at 5.

[580] *See* Policy Integrity Initial Comments at 6 (arguing that future uncertainty requires scenario planning).

Facilities in certain circumstances, which will provide transmission providers with yet another such tool.

230. Moreover, notwithstanding allegations to the contrary, we believe that Long-Term Regional Transmission Planning is a logical and reasonable extension of current regional transmission planning processes, which also manage uncertainty and plan for future regional transmission needs. The key difference, which we address through this final rule, is that these existing regional transmission planning processes are conducted in a manner that is not sufficiently long-term, forward-looking, or comprehensive such that transmission providers are not identifying Long-Term Transmission Needs. As a result, transmission providers are failing to identify or evaluate regional transmission facilities that would more efficiently or cost-effectively address those Long-Term Transmission Needs, and consequently, are missing the opportunity to select such regional transmission facilities. Our reforms in this final rule remedy these deficiencies.

231. Further, we believe that Long-Term Regional Transmission Planning as set forth in this final rule provides adequate safeguards against excessive transmission development in response to speculative transmission needs. For example, this final rule requires transmission providers to develop multiple plausible and diverse Long-Term Scenarios based upon best available data, which will allow transmission providers to better understand how certain categories of factors will give rise to Long-Term Transmission Needs, and requires transmission providers to update their assumptions

periodically, as discussed further below.[581] In developing these Long-Term Scenarios, transmission providers are required to treat more certain drivers of Long-Term Transmission Needs differently than less certain drivers, and must provide opportunities for stakeholder engagement. Further, the final rule grants substantial flexibility to transmission providers to develop an evaluation process and selection criteria that will provide them with the opportunity to select Long-Term Regional Transmission Facilities in a way that maximizes benefits accounting for costs over time without over-building transmission facilities. Consistent with the existing Order No. 1000 regional transmission planning processes, the final rule does not require transmission providers to select any regional transmission facilities as part of Long-Term Regional Transmission Planning. Finally, we require transmission providers to reevaluate previously selected Long-Term Regional Transmission Facilities in certain circumstances, as discussed further below in the Reevaluation section.

232. The regional transmission planning and cost allocation requirements in this final rule, like those of Order Nos. 890 and 1000, are focused on the transmission planning *process*, and do not require any substantive outcomes from this process.[582] We disagree with certain commenters' assertions that this final rule favors, promotes, or subsidizes particular types of generation resources over others, or otherwise engages in generation

[581] *See* New Jersey Commission Initial Comments at 10-11.

[582] *See, e.g.*, Order No. 1000, 136 FERC ¶ 61,051 at P 12.

planning.[583] Instead, this final rule requires transmission providers to participate in Long-Term Regional Transmission Planning through their regional transmission planning process that identifies Long-Term Transmission Needs, evaluates the benefits of Long-Term Regional Transmission Facilities to meet those needs, and provides the opportunity for transmission providers to select Long-Term Regional Transmission Facilities that are more efficient or cost-effective transmission solutions to those needs. We reiterate that, as discussed below in the Evaluation and Selection of Long-Term Regional Transmission Facilities section, any selected Long-Term Regional Transmission Facilities must satisfy transmission provider-developed selection criteria that maximize benefits accounting for costs over time without over-building transmission facilities, which ensures that the costs of such transmission facilities are outweighed by the benefits they deliver to customers.

233. We disagree with commenters that argue that the factors giving rise to Long-Term Transmission Needs, such as state laws dictating specific generation resource mixes, are irreconcilable with effective transmission planning.[584] These changes are occurring independent of any action that we take in this final rule, and they are being driven by a wide variety of factors. This final rule provides transmission providers with the tools that they need to respond to these factors, requiring that they conduct Long-Term Regional

[583] Alabama Commission Initial Comments at 7-8; Louisiana Commission Initial Comments at 12, 19-21; Potomac Economics Initial Comments at 3-4; Utah Division of Public Utilities Initial Comments at 2; Vistra Initial Comments at 11.

[584] *See* ELCON Initial Comments at 9 ("ELCON has always believed that planning for disparate state energy priorities is at odds with market-driven, efficient, and cost-effective transmission planning.").

Transmission Planning to identify, evaluate, and select Long-Term Regional Transmission Facilities that are more efficient or cost-effective regional transmission solutions to the Long-Term Transmission Needs that these factors drive.

234. We disagree with Louisiana Commission and former Kansas Commission Chairman Keen's claims that Long-Term Regional Transmission Planning will threaten the reliability of the transmission system. We acknowledge that reliability needs are evolving; for example, the increasing frequency and severity of high-impact extreme weather events threatens grid reliability. We believe that Long-Term Regional Transmission Planning—in addition to existing Order No. 1000 regional transmission planning and cost allocation requirements—is needed to support the reliable operation of transmission systems, given these changes. As the Commission and the North American Electric Reliability Corporation have noted, the transmission system may not be adequately prepared for extreme weather events and the increasing frequency of these events must be planned for to ensure system reliability.[585] We thus view our action in this final rule as complementary to other steps that the Commission has taken in recent years to bolster system reliability.[586]

[585] FERC, North American Electric Reliability Corporation, *Winter Storm Elliot Report: Inquiry into Bulk-Power System Operations During December 2022* (Nov. 2023), https://www.ferc.gov/media/winter-storm-elliott-report-inquiry-bulk-power-system-operations-during-december-2022; FERC, North American Electric Reliability Corporation, *The February 2021 Cold Weather Outages in Texas and the South Central United States* (Nov. 2021), https://www.ferc.gov/media/february-2021-cold-weather-outages-texas-and-south-central-united-states-ferc-nerc-and.

[586] *See, e.g.*, *Transmission Sys. Planning Performance Requirements for Extreme Weather*, Order No. 896, 88 FR 41262 (June 23, 2023), 183 FERC ¶ 61,191 (2023); *One-*

235. Further, we disagree with the contention of Louisiana Commission and Vistra that Long-Term Regional Transmission Planning will distort the efficient functioning of Commission-jurisdictional wholesale markets by subsidizing uneconomic generation or by distorting price signals. As discussed further below, we require transmission providers, as part of Long-Term Regional Transmission Planning, to assess the costs and measure the benefits of regional transmission facilities that address Long-Term Transmission Needs and to develop evaluation processes and selection criteria that provide the opportunity to select those transmission facilities as more efficient or cost-effective regional transmission solutions to those Needs. While the addition of any new transmission facility necessarily affects Commission-jurisdictional wholesale markets, the requirements set forth in this final rule ensure that transmission providers will have the opportunity to select more efficient or cost-effective Long-Term Regional Transmission Facilities that provide value to transmission customers and support the efficient functioning of wholesale markets by addressing Long-Term Transmission Needs.

236. We also disagree with Vistra's contention that Long-Term Regional Transmission Planning somehow will assign all, or a disproportionately high share, of interconnection-related network upgrade costs to load or undermine the incentives for generation developers to site new generation resources in ways that minimize transmission system

---

Time Info. Reports on Extreme Weather Vulnerability Assessments, Order No. 897, 88 FR 41447 (June 27,2023), 183 FERC ¶ 61,192 (2023).

upgrade costs. Rather, because transmission providers will now engage in Long-Term Regional Transmission Planning to identify, evaluate, and select more efficient or cost-effective regional transmission facilities to address Long-Term Transmission Needs, Long-Term Regional Transmission Facilities will be planned in a more efficient and cost-effective manner than if transmission facilities meeting a narrower set of transmission needs were left to be identified through the generator interconnection process. Indeed, numerous commenters explain that the piecemeal expansion of the transmission system is highly inefficient and results in higher costs for transmission customers,[587] in part because the costs of interconnection-related network upgrades ultimately are passed on to consumers.

237. We strike another careful balance in this final rule. On the one hand, we recognize transmission providers' need for sufficient flexibility to implement Long-Term Regional Transmission Planning in their transmission planning regions to reflect regional differences, such as different market structures.[588] On the other hand, we must ensure that transmission providers' regional transmission planning processes result in just and reasonable rates, which, as discussed above in the Overall Need for Reform section, necessitates that they plan on a sufficiently long-term, forward-looking, and comprehensive basis such that transmission providers are identifying, evaluating, and

[587] *See, e.g.*, NYISO Initial Comments at 30; PIOs Initial Comments at 9-10.

[588] The Commission also recognized the need for sufficient flexibility in regional transmission planning to reflect regional differences in Order No. 1000. *See* Order No. 1000, 136 FERC ¶ 61,051 at P 61.

selecting more efficient or cost-effective regional transmission facilities to address Long-Term Transmission Needs. We believe that the balance struck in the final rule will ensure that Commission-jurisdictional rates are just and reasonable and not unduly discriminatory or preferential and, thus, we reject requests for flexibility that exceeds that provided in this final rule.

238. In particular, we reject requests that, instead of requiring transmission providers to implement Long-Term Regional Transmission Planning in accordance with the requirements adopted in this final rule, we set forth principles and objectives articulating our concerns with existing regional transmission planning processes and give transmission providers the flexibility to propose revisions to their processes to address those concerns.[589] Having found existing regional transmission planning and cost allocation requirements to be unjust and unreasonable, we have an obligation under FPA section 206 to adopt reforms that remedy the deficiencies identified in this final rule. We also believe that such an approach would fail to adequately address the deficiencies described above in the Overall Need for Reform section, namely that transmission providers are not currently required to: (1) perform a sufficiently long-term assessment of transmission needs that identifies Long-Term Transmission Needs; (2) adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs; and (3) consider the broader set of benefits of regional transmission facilities

[589] ISO-NE Initial Comments at 20; ISO RTO Council Initial Comments at 4-5, 8-9; MISO Initial Comments at 22-23.

planned to meet those Long-Term Transmission Needs. We further believe that establishing requirements rather than principles will ensure a sufficiently robust process for Long-Term Regional Transmission Planning while providing sufficient clarity about that process to avert conflict among stakeholders, as noted by AEP.[590]

239. We also disagree with commenters that argue that this final rule should apply to only RTO/ISO transmission planning regions. The Commission's existing regional transmission planning requirements, which, as described above in the Overall Need for Reform section, we find to be deficient, apply in RTO/ISO and non-RTO/ISO transmission planning regions alike; without the Long-Term Regional Transmission Planning Requirements adopted herein, transmission providers in both RTO/ISO and non-RTO/ISO transmission planning regions will continue to be at risk of undertaking investments in relatively inefficient or less cost-effective transmission infrastructure, the costs of which are ultimately recovered through Commission-jurisdictional rates. Accordingly, while we acknowledge differences between RTO/ISO and non-RTO/ISO transmission planning regions, we find that transmission providers in all transmission planning regions must implement Long-Term Regional Transmission Planning as required in this final rule to ensure that Commission-jurisdictional rates are just and reasonable and not unduly discriminatory or preferential. Additionally, we note that many of the requirements established in this final rule provide for regional flexibility, including, but not limited to, the requirements to develop Long-Term Scenarios,

[590] AEP Reply Comments at 2-4.

determine which factors in each required category of factors do not affect Long-Term Transmission Needs and need not be considered, develop methods to measure the benefits of Long-Term Regional Transmission Facilities, design an evaluation process and selection criteria, and establish a Long-Term Regional Transmission Cost Allocation Method.

240. We acknowledge that certain transmission planning regions already conduct some regional transmission planning on a relatively forward-looking, proactive basis. We do not intend to undermine progress made in these transmission planning regions, and our goal is to set a floor, not a ceiling. We decline to prejudge whether any existing regional transmission planning process meets the requirements set forth in this final rule and accordingly reject requests that we do so.[591] We note that, if a transmission provider believes that it participates in a regional transmission planning process that fulfills the requirements adopted in this final rule, it may describe in its compliance filing how its process meets these requirements.

241. We expect Long-Term Regional Transmission Planning to enhance the existing regional transmission planning and cost allocation processes required by Order No. 1000. Except as set forth in this final rule, we do not require that any transmission provider replace or otherwise make changes to its existing Order No. 1000-compliant regional transmission planning processes that plan for reliability or economic transmission needs, or the associated Order No. 1000-compliant regional cost allocation method(s).

[591] *See, e.g.*, Ameren Initial Comments at 8.

Transmission providers may continue to rely on their existing regional transmission planning and cost allocation processes to comply with Order No. 1000's requirements related to transmission needs driven by reliability concerns or economic considerations.

242. We also do not alter the existing Order No. 1000 requirement to consider transmission needs driven by Public Policy Requirements in the regional transmission planning process. Instead, we clarify that we will deem transmission providers to be in compliance with this existing requirement by conducting Long-Term Regional Transmission Planning in accordance with the requirements set forth in this final rule. As discussed below, we require transmission providers to incorporate a variety of factors into the development of Long-Term Scenarios, which include, among others, certain federal, state, and local laws and regulations. Therefore, we find that transmission providers that implement Long-Term Regional Transmission Planning and satisfy the requirements set forth in this final rule will comply with the requirement in Order No. 1000 to participate in a regional transmission planning process that considers, and has associated cost allocation provisions related to, transmission needs driven by Public Policy Requirements.

243. We understand—and acknowledge comments submitted in this proceeding explaining—that transmission providers in some transmission planning regions have developed processes to consider transmission needs driven by Public Policy Requirements through their regional transmission planning processes that they wish to

retain.[592] In their filings made to comply with this final rule, transmission providers may propose to continue using some or all aspects of the existing regional transmission planning and cost allocation processes that they use to consider transmission needs driven by Public Policy Requirements. Transmission providers must nevertheless comply with the Long-Term Regional Transmission Planning requirements set forth in this final rule, such that continued use of existing regional transmission planning and cost allocation processes related to transmission needs driven by Public Policy Requirements will not supplant transmission providers' obligation to comply with this final rule. In their filing to comply with this final rule, transmission providers that wish to continue to use some or all of their existing regional transmission planning and cost allocation processes to consider transmission needs driven by Public Policy Requirements must demonstrate that continued use of any such processes does not interfere with or otherwise undermine Long-Term Regional Transmission Planning as set forth in this final rule.

244. Similarly, we allow transmission providers to propose a regional transmission planning process that simultaneously plans for shorter-term reliability and economic transmission needs, as well as Long-Term Transmission Needs, as outlined in this final rule, through a combined process. Transmission providers proposing to address all of these transmission needs in a single regional transmission planning process must demonstrate that the unified regional transmission planning process continues to comply with Order No. 1000, as well as with the Long-Term Regional Transmission Planning

[592] CAISO Reply Comments at 17-18; New York Transco Initial Comments at 5.

requirements set forth in this final rule, by demonstrating that such a combined process is consistent with or superior to the requirements of both Order No. 1000 and this final rule. However, in the case that the requirements of Order No. 1000 and this final rule conflict, the requirements of this final rule prevail, and transmission providers must demonstrate that their proposed regional transmission planning process is consistent with or superior to the applicable requirements in this final rule.

245. We reject requests to require transmission providers to simultaneously plan for all such transmission needs through a single regional transmission planning process, however.[593] We recognize that such a combined process has potential benefits and do not prohibit such an approach, but at this time we believe that the benefits of requiring such a combined process on a generic basis may be outweighed by the difficulty of transitioning to such a process from existing regional transmission planning processes. Therefore, we do not require in this final rule that transmission providers plan for all reliability and economic transmission needs and Long-Term Transmission Needs through a single regional transmission planning process. Further, we believe that Long-Term Regional Transmission Planning, as set forth in this final rule, meets many of the same objectives as would such a combined regional transmission planning process because, by identifying Long-Term Transmission Needs and considering a broad set of benefits when evaluating Long-Term Regional Transmission Facilities, the existing regional transmission planning processes for economic and reliability needs may ultimately come to address only

[593] *See, e.g.*, ACEG Initial Comments at 30-31.

residual needs not already addressed through Long-Term Regional Transmission Planning.

246. With respect to the request by PIOs to mandate that the base cases used in Order No. 1000 regional transmission planning processes and Long-Term Scenarios in Long-Term Regional Transmission Planning be defined in the same process,[594] we decline to adopt this proposal. The record is inadequate to assess the impact that such a requirement would have on existing Order No. 1000 regional transmission planning processes, and whether this proposal would work across the differing transmission planning processes in each transmission planning region. With respect to the proposals by Clean Energy Buyers, Cypress Creek, and Policy Integrity,[595] these proposals were not among the proposals included in the NOPR and are beyond the scope of this proceeding, and therefore we decline to adopt them.

247. We also reject requests to incorporate local transmission planning into Long-Term Regional Transmission Planning specifically or regional transmission planning more generally,[596] as well as requests to require transmission providers to evaluate and approve local transmission facilities in regional transmission planning.[597] This final rule sets forth

[594] PIOs Initial Comments at 44-46.

[595] Clean Energy Buyers Initial Comments at 9-10; Cypress Creek Reply Comments at 10-12; Policy Integrity Supplemental Comments at 3.

[596] AEE Initial Comments at 3, 38.

[597] OMS Initial Comments at 16-17.

requirements that will enhance the transparency of local transmission planning and examine opportunities for right-sizing in-kind replacements of existing transmission facilities, including local transmission facilities, but the Commission in the NOPR did not propose other changes to local transmission planning processes and therefore these requests are beyond the scope of this final rule.

248. As discussed in detail below, we require transmission providers to satisfy specific requirements in implementing Long-Term Regional Transmission Planning, including requirements to: (1) use a transmission planning horizon of no less than 20 years into the future in developing Long-Term Scenarios; (2) reassess and revise those scenarios at least once every five years; (3) incorporate into the Long-Term Scenarios a set of Commission-identified categories of factors that give rise to Long-Term Transmission Needs; (4) develop a plausible and diverse set of at least three Long-Term Scenarios; (5) perform sensitivity analyses of uncertain operational outcomes during multiple concurrent and sustained generation and/or transmission outages due to an extreme weather event across a wide area; and (6) use "best available data" in developing Long-Term Scenarios.

249. Before turning to these topics, however, we address two preliminary matters: the definition of Long-Term Regional Transmission Facility; and our jurisdiction to adopt these reforms.

b. Definition of Long-Term Regional Transmission Facility

250. We modify the NOPR proposal and define Long-Term Regional Transmission Facility for purposes of this final rule as a regional transmission facility, as defined in

Order No. 1000, that is identified as part of Long-Term Regional Transmission Planning to address Long-Term Transmission Needs.[598] In so doing, we clarify that some Long-Term Regional Transmission Facilities may be selected in a regional transmission plan for purposes of cost allocation, while others may be considered for selection but not be selected.

251. This modification also clarifies that Long-Term Regional Transmission Facilities are a subset of regional transmission facilities as defined in Order No. 1000. Further, consistent with Order No. 1000,[599] a selected Long-Term Regional Transmission Facility is a regional transmission facility that has been selected pursuant to a Commission-approved Long-Term Regional Transmission Planning process in a regional transmission plan for purposes of cost allocation because it is a more efficient or cost-effective solution to Long-Term Transmission Needs.

252. We disagree with PJM that Order No. 1000's requirements related to regional transmission planning processes addressing transmission needs driven by reliability concerns or economic considerations will be unclear given the definition of Long-Term Regional Transmission Facility, and we find unpersuasive PJM's contention that Long-Term Regional Transmission Planning will inadvertently cause the re-litigation of aspects

[598] In the NOPR, the Commission proposed to define a Long-Term Regional Transmission Facility as a transmission facility identified as part of Long-Term Regional Transmission Planning and selected in the regional transmission plan for purposes of cost allocation to address transmission needs driven by changes in the resource mix and demand. NOPR, 179 FERC ¶ 61,028 at P 252 n.398.

[599] Order No. 1000, 136 FERC ¶ 61,051 at P 63.

of those existing processes. If a regional transmission facility is selected in an existing Order No. 1000 regional transmission planning process, the rules of, as well as the regional cost allocation method for, that existing process apply to the selected regional transmission facility. If a Long-Term Regional Transmission Facility is selected in Long-Term Regional Transmission Planning, then the rules of, and the Long-Term Regional Cost Allocation Method for, Long-Term Regional Transmission Planning apply to that Long-Term Regional Transmission Facility.

c. Legal Authority to Adopt Reforms for Long-Term Regional Transmission Planning

253. We reaffirm our conclusion in the NOPR that we are acting within the Commission's legal authority under FPA section 206 by requiring transmission providers to participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning. The FPA grants the Commission authority over the transmission of electric energy in interstate commerce, which includes transmission on the interconnected national grids.[600] FPA section 205 requires that the rates charged by any public utility in connection with such transmission—as well as the rules and regulations affecting such rates—be just and reasonable, and further requires that public utilities file with the Commission the practices affecting such rates.[601] Under FPA section 206, when the Commission determines that any rate or any practice affecting such

[600] *New York v. FERC*, 535 U.S.at 16-17 (citing 16 U.S.C. 824(b)).

[601] 16 U.S.C. 824d.

rate is unjust, unreasonable, or unduly discriminatory or preferential—as we find above with respect to transmission planning practices—the Commission must determine the just and reasonable rate or practice to be followed.[602] Transmission planning and cost allocation processes are practices affecting the rates charged by public utilities in connection with the Commission-jurisdictional transmission of electric energy in interstate commerce.[603] No commenter has claimed otherwise.

254. Despite this, a number of commenters claim that the specific transmission planning requirements we adopt in this final rule infringe on the authority reserved to the states by FPA section 201 or are otherwise barred by certain prudential or constitutional principles. As a threshold matter, we believe that commenters' concerns with respect to our jurisdiction or authority to adopt this final rule mainly arise from factual misunderstandings or mischaracterizations about what Long-Term Regional Transmission Planning will and will not require transmission providers to do. As explained above, this final rule requires transmission providers in each transmission planning region to participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning and to conduct Long-Term Regional Transmission Planning in accordance with the requirements set forth in this final rule. Transmission providers are required to identify Long-Term Transmission Needs, identify

[602] 16 U.S.C. 824e.

[603] *See S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 55-59; *accord Emera Me. v. FERC*, 854 F.3d at 673-74.

Long-Term Regional Transmission Facilities that meet such needs, measure the benefits of these Long-Term Regional Transmission Facilities, and evaluate these Long-Term Regional Transmission Facilities for potential selection. As such, this final rule does not regulate, aim at, or otherwise attempt to influence integrated resource planning, the generation mix, decisions related to the siting and construction of transmission facilities or generation resources, or any other matters reserved to states under FPA section 201.

255. As discussed in the Introduction and Background section above, the requirements of this final rule build upon more than a quarter century of significant actions taken by the Commission on transmission planning and cost allocation, beginning with the Commission's initial open access reforms in Order No. 888. In 2007, the Commission issued Order No. 890 to address identified deficiencies in the *pro forma* OATT based on more than 10 years of experience since the issuance of Order No. 888. Most recently, in 2011, the Commission issued Order No. 1000, which required transmission providers to develop a regional transmission plan after evaluating whether regional transmission facilities may be more efficient or cost-effective than transmission facilities identified in local transmission planning processes and to consider transmission needs driven by Public Policy Requirements. These practices serve as the foundation for regional transmission planning, and this final rule leaves them in place.

256. As described above, however, we have identified specific gaps in the Order No. 1000 framework—namely, that regional transmission planning practices do not perform a sufficiently long-term assessment of transmission needs, adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs, or

consider the broader set of benefits of regional transmission facilities. In this final rule, we direct reforms to close these gaps without otherwise disturbing the regional transmission planning structure required by Order No. 1000, which was fully affirmed on appeal in the face of similar objections to those raised here.[604]

257. Critically, as in Order No. 1000, our focus continues to be on ensuring that Commission-jurisdictional regional transmission planning processes are just and reasonable and that, as a result of improvements to the regional transmission planning and cost allocation processes, Commission-jurisdictional rates remain just and reasonable.[605] And, as in Order No. 1000, while the improvements to the regional transmission planning and cost allocation processes will ensure that potentially more efficient or cost-effective regional transmission facilities are evaluated for potential selection and have a cost allocation method available if they are selected, this rule does not mandate development of any particular transmission facility.

258. Consistent with the regional transmission planning and cost allocation reforms adopted in Order No. 1000, and in response to commenters arguing otherwise,[606] we

[604] *See S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 55-64 (rejecting arguments that the requirement to engage in regional transmission planning, as prescribed in Order No. 1000, exceeded the Commission's jurisdiction under FPA section 206, interfered with traditional state authority reserved under FPA section 201, or improperly interpreted and applied FPA section 202(a)).

[605] *See id*. at 63-64 (affirming that the Commission was acting within its jurisdiction because its planning mandate "relates wholly to electricity transmission, as opposed to electricity sales" and "is directed at ensuring the proper functioning of the interconnected grid spanning state lines").

[606] Alabama Commission Initial Comments at 7; Kansas Ratepayer Advocates

affirm that this final rule does not authorize or require any entity to adopt a particular siting plan for Long-Term Regional Transmission Facilities that transmission providers select; or to forego state-jurisdictional siting proceedings where they are necessary; or to begin construction on such Long-Term Regional Transmission Facilities. Even where transmission providers select a Long-Term Regional Transmission Facility, the relevant transmission developer typically must secure a variety of other permits and authorizations before beginning to construct the facility, including those that are subject to state jurisdiction. Nothing in this final rule changes otherwise applicable siting laws or requirements.

259. Similarly, this final rule does not change existing mechanisms for cost-recovery through retail rates; authorize or require states or state commissions to change the laws or regulations that govern the conduct of integrated resource planning or request for proposal processes; authorize or require transmission providers or transmission developers to bypass any applicable state-regulated integrated resource planning or request for proposal processes; or authorize or require states or public utilities to adopt a different mix of generation resources than would otherwise be the case. Comments suggesting otherwise do not accurately represent the Commission's proposed requirements in the NOPR or the requirements adopted in this final rule,[607] which seeks

to ensure that transmission providers plan for Long-Term Transmission Needs, however those needs arise.[608]

260. We disagree with Southern and SERTP Sponsors' characterization of Long-Term Regional Transmission Planning as a Commission-regulated integrated resource planning/request for proposal process.[609] Similarly, comments that suggest that this final rule intends to "revamp the energy grid's mix of generation resources writ large"[610] are incorrect. We understand these comments to argue that the Commission seeks reforms to regional transmission planning and cost allocation processes so that it can direct or influence investments toward particular resources, as would an entity engaged in integrated resource planning. In this final rule, the Commission neither aims to influence the resource mix, nor, as a practical matter, could the final rule achieve such an outcome.

[610] Undersigned States Reply Comments at 4; *see also* Louisiana Commission Initial Comments at 6, 12-13 (arguing that the FPA does not allow the Commission to "enact[] sweeping energy policy changes that would have far-reaching, nation-wide effects" or to favor one form of generation over another).

261. Instead, the final rule merely requires transmission providers to account for observable changes affecting the transmission system. The final rule neither directs those changes, nor does it require any entity, including a state, to approve changes to any subject within its jurisdiction. As with Order Nos. 890 and 1000, which built on the Commission's open access reforms in Order No. 888, this final rule *responds* to changes in the electric industry that have arisen in the years since the Commission's last regulatory action related to transmission planning. As discussed above in the Overall Need for Reform section, this final rule responds to evolving reliability concerns, including the increasing frequency of high-impact extreme weather events; changes in electricity demand, including significant load growth that is projected to increase in coming years; changes in supply, including federal, federally-recognized Tribal, state, and local laws and policies that affect the future resource mix; changes in the economics of generation, transmission, and storage technologies; corporate, governmental, and utility commitments to rely on certain generation resources; and other factors as discussed in this final rule.

262. We emphasize that these changes, which are affecting and will continue to drive transmission needs, are not within the Commission's control and, in many cases, are beyond the Commission's jurisdiction. We do not aim to influence these drivers of transmission needs through the requirements in this final rule.[611] However, the

[611] *See EPSA*, 577 U.S. 260 at 282 (citing *Oneok, Inc. v. Learjet, Inc.*, 575 U.S. 373, 385 (2015)).

Commission has an obligation under the FPA to ensure that Commission-jurisdictional transmission rates remain just and reasonable, and we affirm—consistent with the Commission's actions in Order Nos. 890 and 1000—that the Commission has the requisite authority to account for the effects of these changes driving transmission needs in Commission-jurisdictional transmission planning processes.[612]

263. We also emphasize, and no commenter contests, that this final rule directly regulates transmission planning and cost allocation processes, which are practices that affect the rates for the transmission of electric energy in interstate commerce. Importantly, it directly regulates *only* those practices, and it *does not* directly regulate any matter reserved to the states by FPA section 201. Moreover, in doing so, this final rule is not aiming to *indirectly* regulate any matter reserved to the states by FPA section 201. Instead, our aim here is to improve on the Commission's existing transmission planning and cost allocation processes *for the express purpose* of addressing identified deficiencies with those processes.

264. As the U.S. Supreme Court has recognized, it is true that almost any action that the Commission takes with respect to regulating the practices affecting the rates for the transmission of or the wholesale sale of electric energy in interstate commerce will have "*some* effect, in either the short or long term" on matters reserved to the states'

[612] *Cf. EPSA*, 577 U.S. at 281-82 ("When FERC regulates what takes place on the wholesale market, as part of carrying out its charge to improve how that market runs, then no matter the effect on retail rates, 824(b) imposes no bar.").

jurisdiction.[613] But those effects, inevitable as they may be, are "of no legal consequence" to determining whether this final rule infringes on the states' authority under FPA section 201.[614] Instead, such effects are a "fact of economic life" for the electric industry, given Congress's decision in the FPA to divide jurisdiction over the industry, including both generation and transmission, into spheres of Commission and state jurisdiction that are not "hermetically sealed" from one another.[615] Accordingly, Commission regulation of Commission-jurisdictional practices affecting transmission may "have natural consequences" for generation.[616] But, even where that happens, that does not defeat federal jurisdiction.

265. Rather, as in *EPSA*, what matters is that this final rule aims to regulate and, in fact, does regulate only practices that affect the transmission of electric energy in interstate commerce, which are squarely within the Commission's jurisdiction under the FPA. As in Order Nos. 890[617] and 1000,[618] this final rule aims to improve Commission-regulated transmission planning *processes*, in this instance by ensuring that they are sufficiently long-term, forward-looking, and comprehensive such that they are capable of identifying

[613] *Id*. at 281 (emphasis added).

[614] *Id*.

[615] *Id*.

[616] *Id*.

[617] Order No. 890, 118 FERC ¶ 61,119 at P 3.

[618] Order No. 1000, 136 FERC ¶ 61,051 at P 12.

and meeting Long-Term Transmission Needs.[619] Thus, this final rule ensures just and reasonable Commission-jurisdictional rates and practices by ensuring that transmission providers have adequate processes to identify Long-Term Transmission Needs and to identify, evaluate, and select Long-Term Regional Transmission Facilities that more efficiently or cost-effectively address those needs.

266. Moreover, as in *EPSA*, what also matters is that "every aspect of the [final rule] happens exclusively" as part of a process that is subject to the Commission's jurisdiction and governs exclusively how those processes work.[620] In aiming to improve transmission planning processes, this final rule does not require that transmission providers achieve any particular substantive *outcome* of those processes, including either the selection or construction of any specific transmission facilities. The final rule patently does not aim to alter states' or the nation's generation mix or otherwise regulate matters that are within state jurisdiction. Indeed, to the contrary, our rationale in this final rule is "all about, and only about, improving" the relevant matters under the Commission's jurisdiction.[621] Nor is it clear how, under commenters' theory, the final rule could be argued to regulate matters under states' jurisdiction, given that the final rule does not require investment in any particular transmission facilities, and could not, even indirectly, ensure investments in any particular set of generating facilities that may rely on such transmission facilities.

[620] *Id*. at 282.

[621] *Id.* (citing *Oneok, Inc. v. Learjet, Inc.*, 575 U.S.at 385).

267. Despite some commenters' claims,[622] nothing in this final rule requires states to subsidize other states' public policies and, indeed, this final rule requires, consistent with long-established Commission and court precedent, that transmission customers within a transmission planning region need only pay costs that are "roughly commensurate" with the benefits that transmission providers estimate they will receive from a regional transmission facility.[623] Thus, the final rule ensures that transmission customers nationwide are not required to pay for Long-Term Regional Transmission Facilities from which they do not benefit.

268. The reforms in the final rule require greater transparency regarding the benefits that would result from the development of Long-Term Regional Transmission Facilities, but these reforms also continue to allow flexibility, as under Order No. 1000, for the transmission providers in each transmission planning region to determine the appropriate method for allocating to transmission customers the costs of any selected Long-Term Regional Transmission Facility. Rather than force transmission providers to adopt a particular cost allocation method that would necessarily result in customers in one state subsidizing the costs of customers in another state, as these commenters allege, the final

[622] Alabama Commission Initial Comments at 8-9; Louisiana Commission Initial Comments at 6, 9-10; Mississippi Commission Reply Comments at 2-3; Ohio Commission Federal Advocate Initial Comments at 4-6; Ohio Consumers Reply Comments at 14.

[623] *See Ill. Com. Comm'n v. FERC*, 756 F.3d 556, 562 (7th Cir. 2014) (*ICC v. FERC III*); *ICC v. FERC I*, 576 F.3d at 477; *Sw. Power Pool, Inc.*, 182 FERC ¶ 61,141, at P 12 (2023).

rule affords significant new opportunities for Relevant State Entities to inform the evaluation process, selection criteria, and cost allocation method adopted by the transmission providers in a transmission planning region. We believe that the requirements for greater transparency regarding the benefits of proposed transmission facilities, the increased opportunities for state engagement in evaluation, selection, and cost allocation, the flexibility for transmission providers in each transmission planning region to determine their own cost allocation methods, and the requirement that any cost allocation method must ensure costs are allocated in a manner that is at least roughly commensurate with estimated benefits provide robust assurance that the cost allocation methods ultimately proposed under the final rule will not result in improper cost subsidization. Ultimately, the Commission must review and accept each cost allocation method proposed under the final rule to ensure that it is just and reasonable and consistent with the final rule's requirements.

269. As discussed in the Evaluation of the Benefits of Regional Transmission Facilities section below, this final rule requires transmission providers to use and measure a set of seven required benefits to evaluate Long-Term Regional Transmission Facilities. The measurement of these benefits represents the value that the transmission providers expect a particular Long-Term Regional Transmission Facility to provide to transmission customers in the transmission planning region. As further discussed in the Regional Transmission Planning Cost Allocation section below, this final rule requires transmission providers to provide a forum for Relevant State Entities to negotiate a cost allocation method and/or a process for determining future cost allocation methods for

Long-Term Regional Transmission Facilities, which enables robust participation by those entities. Moreover, the cost allocation methods required by this final rule are intended to ensure that costs are allocated in a manner that is at least roughly commensurate with the estimated benefits that a Long-Term Regional Transmission Facility provides to transmission customers.

270. The benefits this rule requires to be used and measured—which provide an important source of transparency regarding any resulting allocation of costs to transmission customers—reflect objective, measurable changes in transmission system conditions, rather than achievement of state public policies. For example, even if a state's public policy is one driver of a Long-Term Transmission Need, these benefits of a Long-Term Regional Transmission Facility resolving that need are well understood and measurable, including, for example, reducing the cost of generating electricity by allowing for the increased dispatch of suppliers that have lower incremental costs of production, minimizing energy losses incurred in transmitting electricity, and lowering the number or duration of loss of load events. Transmission providers will evaluate Long-Term Regional Transmission Facilities for selection considering these benefits that these facilities would provide, and these benefits accrue to the transmission customers that fund their construction. In other words, under this final rule, customers pay for a more reliable and economic transmission system as identified through open and transparent Long-Term Regional Transmission Planning, and any state's ratepayers only fund the construction of Long-Term Regional Transmission Facilities that provide them

with such benefits that are at least roughly commensurate with the costs of those facilities.

271. We turn now to commenters' specific jurisdiction arguments. As an initial matter, we acknowledge that, in addition to granting authority to the Commission over the transmission of electric energy in interstate commerce, FPA section 201 also reserves certain authority to the states.[624] As such, we agree with Southern that Congress sought in enacting the FPA to ensure the "continued exercise of state power"[625] over certain matters. However, the requirements in this final rule respect and do not unlawfully infringe on state authority. Rather, as discussed above, the Commission is acting in an area squarely within its jurisdiction—transmission planning and cost allocation—by requiring transmission providers to engage in Long-Term Regional Transmission Planning to remedy deficiencies in the current transmission planning and cost allocation processes, which we conclude are unjust and unreasonable.

[624] *See* 16 U.S.C. 824(a)-(b)(1); *New York v. FERC*, 535 U.S. at 20-21 ("It is, however, perfectly clear that the original FPA did a good deal more than close the gap in state power identified in [*Pub. Utils. Comm'n of R.I. v. Attleboro Steam & Elec. Co.*, 273 U.S. 83 (1927) (*Attleboro*)]. The FPA authorized federal regulation not only of wholesale sales that had been beyond the reach of state power, but also the regulation of wholesale sales that had been *previously subject* to state regulation. More importantly, as discussed above, the FPA authorized federal regulation of interstate *transmissions* as well as of interstate wholesale sales, and such transmissions were not of concern in *Attleboro*." (emphasis in original) (internal citations omitted)).

[625] Southern Initial Comments at 16 (quoting *Oneok, Inc. v. Learjet, Inc.*, 575 U.S. at 385).

272. We acknowledge that Long-Term Regional Transmission Planning will affect matters that are within the states' jurisdiction. As stated, this is inevitable. Effective transmission planning necessarily involves taking into account assumptions about the generation resources that will be available, because transmission needs arise from the relative amounts, locations, and timing of supply (i.e., generation) and of demand (i.e., load); indeed, existing transmission planning processes also take into account these assumptions.[626] Our action in this final rule simply modifies the scope and duration of these assumptions to ensure that regional transmission planning processes are conducted on a sufficiently long-term, forward-looking, and comprehensive basis by requiring transmission providers to evaluate factors that give rise to Long-Term Transmission Needs.

273. Southern and SERTP Sponsors acknowledge that the NOPR proposed to require transmission providers to incorporate the results of state-sanctioned integrated resource planning as factors in developing Long-Term Scenarios, but they insist that Long-Term Regional Transmission Planning will intrude upon state authority if we do not require Long-Term Scenarios to be *limited* to those state-sanctioned resources.[627] This assertion is incorrect for at least three reasons. First, the public utilities whose integrated resource

[626] *See*, *e.g.*, Xcel Initial Comments at 13, 16 & n.26 (discussing generation resource assumptions made in existing Order No. 1000 regional transmission planning and cost allocation processes).

[627] SERTP Sponsors Initial Comments at 15-17; Southern Initial Comments at 18-19.

plans are approved by state commissions are not the only entities whose decisions may influence the development of generation resources within a particular transmission planning region. For example, a wide variety of private enterprises, publicly-owned utilities, and electric cooperatives have made commitments to fund the development of certain generation resources, and transmission providers may reasonably determine that these procurement decisions give rise to Long-Term Transmission Needs. Second, making generation resource assumptions for the purpose of performing transmission planning does not result in any legally-binding determination on a matter within a state's jurisdiction, let alone undermine a state's ability to ultimately decide what generation resources to build, and on what timetable.[628] Third, as Southern and SERTP Sponsors concede,[629] many existing integrated resource planning processes do not identify specific generation resources beyond a particular point in time. Other integrated resource planning processes may not result in a set of state-sanctioned generation resources and

[628] We disagree with Southern's and SERTP Sponsors' contention that the inclusion of such non-binding assumptions about generation resources in transmission planning will "bias" subsequent state resource decisions. *See* Southern Initial Comments at 19; SERTP Sponsors Initial Comments at 17 n.20. As Kentucky Commission Chair Chandler argues, the NOPR's reforms do not foreclose states' decision making on generation. Kentucky Commission Chair Chandler Reply Comments at 3. We also disagree with North Carolina Commission and Staff's contention that merely requiring transmission providers to use and measure production cost savings in evaluating Long-Term Regional Transmission Facilities "could conflict with state-jurisdictional resource decisions." North Carolina Commission and Staff Initial Comments at 7. If nothing else, Long-Term Regional Transmission Planning will provide public utilities and state commissions the opportunity to develop longer-term, forward-looking, robust assessments that can inform future decision making.

[629] SERTP Sponsors Initial Comments at 16; Southern Initial Comments at 19.

may instead serve merely as a guide for the relevant public utility.[630] As a result, relying on such integrated resource planning processes exclusively to identify Long-Term Transmission Needs would fail to ensure that regional transmission planning processes are conducted on a sufficiently long-term, forward-looking, and comprehensive basis and therefore would fail to ensure just and reasonable Commission jurisdictional-rates. To be clear, we are not in this final rule attempting to denigrate or diminish the importance of integrated resource planning. Rather, in the context of Long-Term Regional Transmission Planning, integrated resource planning is reasonably considered one of several categories of factors used to develop Long-Term Scenarios and identify Long-Term Transmission Needs.

274. In that light, Southern's and SERTP Sponsors' argument—that we should limit transmission providers to state-approved resources and prohibit non-binding assumptions about the resource mix and demand—does not safeguard but in fact subverts the FPA's division between federal and state authority. As stated above, were we to require that transmission providers limit their assumptions to only state-sanctioned generation resources, we would be requiring transmission providers to ignore many of the factors that, as demonstrated by this record, transmission providers must reasonably consider to plan on a sufficiently long-term, forward-looking, and comprehensive basis. Instead, it is

[630] *See, e.g.*, SREA Reply Comments at 2-3 (arguing, in response to Alabama Commission, that Alabama has no formal integrated resource plan process upon which the Commission could encroach).

within our jurisdiction to determine the factors that transmission providers must incorporate in order to identify Long-Term Transmission Needs.

275. Commenters' arguments that the final rule would not withstand judicial scrutiny under the "major questions doctrine" are similarly unfounded. For example, some commenters appear to misinterpret *West Virginia v. EPA* as standing for the proposition that "the nation's energy policy and generation mix is a 'major question' and that an agency must have direct authorization from Congress to assert jurisdiction" over these matters.[631] As an initial matter, as noted above, the aim of this final rule is not to influence the generation mix or energy policy more broadly, but to ensure that Commission-jurisdictional transmission providers are planning for Long-Term Transmission Needs in a manner that is just and reasonable and results in just and reasonable Commission-jurisdictional rates.

276. In any case, the Court did not determine that energy policy and the mix of generation resources are *in every instance* a major question. Instead, in *West Virginia v. EPA*, the U.S. Supreme Court considered a specific agency action in light of a specific statutory provision and concluded that the Environmental Protection Agency's (EPA) exercise of authority was a "major question" based on a variety of factors specific to that context—including whether the EPA's administrative action was a "transformative"

[631] SERTP Sponsors Initial Comments at 17-18; Southern Initial Comments at 20; *see also* Undersigned States Reply Comments at 3 ("National-scale energy grid regulation is a 'major question' because of the massive economic consequences involved in such regulation.").

expansion of its power, whether the EPA had relevant technical and policy expertise, whether the relevant statutory provision was "ancillary" to the broader statutory construct, and whether the EPA's administrative action implicated significant economic and political questions.[632]

277. Commenters have not attempted a similar analysis of whether courts should construe this final rule as a "major question,"[633] and we find that their contentions that courts ought to do so are based on the factual mischaracterizations discussed above. In any event, this final rule neither transforms nor expands the Commission's authority; it merely applies existing authority, based on the Commission's expertise and experience, to identify and remedy deficiencies in existing regional transmission planning and cost allocation processes.[634] As with Order Nos. 890 and 1000, the Commission is promulgating a final rule pursuant to FPA section 206 to address those deficiencies in order to ensure that transmission planning practices, a subject long-regulated by the Commission and well within its area of expertise, remain just and reasonable and not unduly discriminatory or preferential. To that end, this final rule requires further reforms

[632] *West Virginia v. EPA*, 597 U.S. at 710, 724-725, 729, 731-32; *see also Biden v. Nebraska*, 143 S. Ct. 2355, 2372-2374 (2023) (applying *West Virginia v. EPA's* mode of analysis).

[633] *See* Harvard ELI and Policy Integrity Supplemental Comments at 2 (arguing that Undersigned States, for example, "overlook key requirements of the major questions doctrine").

[634] *See, e.g.*, *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 68-69. *Cf. PJM Power Providers Grp. v. FERC*, 88 F.4th at 274.

to regional transmission planning and cost allocation processes so that they are sufficiently long-term, forward-looking, and comprehensive. And while the transmission planning required in this final rule may be more forward-looking, long-term, and comprehensive than the status quo, as a matter of the Commission's jurisdiction, it is fundamentally no different than the regional transmission planning already required by the Commission and upheld by appellate courts.[635] In short, the differences in transmission planning required by this final rule represent differences in degree, not kind, from the Commission's longstanding regulations. As such, they are a far cry from the "transformative expansion" of the EPA's authority on which the Court relied in *West Virginia v. EPA* to find that the issue presented therein represented a major question not delegated to the agency to decide.

278. Just as it is clear that incremental improvements to practices that the courts have already determined fall squarely within the Commission's jurisdiction do not constitute a "transformative expansion" or "extraordinary grant" of regulatory authority to which the major questions doctrine may apply, so too is it clear that the other ancillary factors cited by the Court are similarly inapplicable. The final rule's incremental process improvements, while necessary to ensure just and reasonable Commission-jurisdictional rates, do not have the "vast economic and political significance" that would implicate the

[635] *See, e.g., S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 48-49; *see also* Harvard ELI and Policy Integrity Supplemental Comments at 4-7.

major questions doctrine.[636] The Commission's regulation of interstate transmission rates will have an effect on billions of dollars in customer charges and, in that generic sense, is of political interest to many. The incremental process improvements required by the final rule, however, do not fundamentally change the economic or political stakes of ensuring that Commission-jurisdictional rates remain just and reasonable.

279. Likewise, the Commission's continued assertion of authority over regional transmission planning and cost allocation processes does not resemble the EPA's assertion of authority related to the electric system that the Court found to be beyond that agency's expertise.[637] Here, the Commission undisputedly bears the relevant expertise over the interstate transmission system.[638] Nor does the Commission rely on a "backwater" statutory provision to achieve its reforms.[639] The Commission relies on FPA sections 205 and 206, which the Court has held "unambiguously authorize[]" the Commission to assert jurisdiction over interstate transmission[640] and extends an

[636] *West Virginia v. EPA*, 597 U.S. at 735 (J. Gorsuch, concurring).

[637] *West Virginia v. EPA*, 597 U.S. at 729 (finding relevant that EPA itself admitted it lacked expertise to project "system-wide trends in areas such as electricity transmission, distribution, and storage").

[638] *Cf. Amerada Hess Pipeline Corp. v. FERC*, 117 F.3d 596, 600-01 (D.C. Cir. 1997) ("[The Federal Energy Regulatory Commission] is entrusted with administering the regulations relating to oil pipelines and has an expertise in the field *based on that jurisdiction*." (emphasis added)).

[639] *West Virginia v. EPA*, 597 U.S. at 729.

[640] *New York v. FERC*, 535 U.S. at 19.

authority—indeed, a duty—to ensure that the practices directly affecting such rates are just and reasonable.[641] This provision was not ancillary to the statutory scheme but, rather, central to Congress' aim to ensure that the Commission possessed adequate authority to regulate interstate transmission beyond the reach of state power.[642] Finally, commenters do not point to Congress's "conspicuous[] and repeated[]" rejection of legislation that would enact reforms similar to those adopted in the final rule.[643]

280. We also disagree with Undersigned States' legal claim that allowing "one [s]tate [to] effectively require other [s]tates to subsidize their own vision of what resources should be used in electricity generation" would violate the Constitution's "equal sovereignty doctrine."[644] As discussed above, the final rule categorically does not require states to subsidize other states' public policies or generation decisions. To the contrary, consistent with the cost causation principle, this final rule requires customers to pay for a share of the costs of new Long-Term Regional Transmission Facilities only to the extent that *they* benefit from those facilities and, even then, any share they pay for must be roughly commensurate with the benefits they receive.[645]

[645] *See supra* note 623 and accompanying discussion.

281. Moreover, according to Undersigned States, the equal sovereignty doctrine dictates that the nation "is a union of [s]tates, equal in power, dignity and authority, each competent to exert that residuum of sovereignty not delegated to the United States by the Constitution itself."[646] But, "neither the Supreme Court nor any other court has ever applied that principle as a limit on the Commerce Clause or other Article I powers."[647] Instead, Courts have found that "the Constitution does not contain any textual provision suggesting an equal sovereignty limit on Congress's Article I powers generally or on the Commerce Clause in particular."[648] As relevant here, pursuant to the Constitution's Commerce Clause,[649] Congress duly enacted the FPA, which in turn empowers the Commission to regulate the rates and practices affecting rates for the transmission of electricity in interstate commerce.[650] Under the FPA, the Commission is "unambiguously authorize[d] . . . to take state policies into account to the extent that such policies affect [the Commission's] statutorily prescribed area of focus . . . ."[651]

282. The nature of the interconnected transmission system is such that states naturally affect one another in pursuing policies available to them while exercising the authority reserved to them under FPA section 201.[652] For the reasons explained in this final rule, we conclude that transmission providers must participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning, and we find that transmission providers must have the opportunity to select Long-Term Regional Transmission Facilities that more efficiently or cost-effectively address Long-Term Transmission Needs. Our role within our federal system is not to "unreasonably interfere with" nor to "pass judgement on state and local policies and objectives,"[653] including where such policies and objectives have incidental interstate effects.[654] Nor need we, because even if one state's public policy is a driver of a Long-Term Transmission Need,

---

best of the situation [these systems] produce").

[652] *See Elec. Power Supply Ass'n v. Star*, 904 F.3d at 524 (describing the effects on interstate sales resulting from states' exercise of powers reserved to them under FPA section 201 as "an inevitable consequence of a system in which power is shared between state and national governments" (citing *Hughes v. Talen Energy Mktg., LLC*, 578 U.S. 150, 164 (2016)).

[653] *N.J. Bd. Pub. Utils. v. [654] *See Coal. for Competitive Elec. v. Zibelman*, 906 F.3d 41, 56 (2d Cir. 2018) (collecting Commission orders sanctioning state-jurisdictional programs incidentally affecting wholesale markets).

the costs of a Long-Term Regional Transmission Facility that transmission providers select will be allocated to transmission customers only to the extent that they benefit from that facility and only to a degree that is at least roughly commensurate with the benefits that facility provides to them. That approach is consistent with Commission precedent and commenters have not demonstrated that this framework results in impermissible cross-subsidization among states.[655]

283. Finally, in response to NRECA's request, we confirm that the final rule is consistent with the Commission's obligation under FPA section 217(b)(4). As articulated in *South Carolina Public Service Authority v. FERC*, FPA section 217(b)(4) requires the Commission to "facilitate the planning of a reliable grid," and we do so by "seek[ing] to ensure that adequate transmission capacity is built to allow load-serving entities to meet their service obligations."[656] This final rule seeks to ensure precisely the same goal, and it therefore satisfies the Commission's obligation under FPA section 217(b)(4).

[655] For example, PJM incorporates transmission needs driven by Public Policy Requirements into the assumptions stage of its regional transmission planning process to identify needed reliability and economic regional transmission facilities for potential selection and cost allocation, rather than through a separate and distinct process to identify and allocate the costs of transmission facilities selected to address transmission needs driven by Public Policy Requirements. The Commission found PJM's approach complied with the requirement in Order No. 1000 to consider transmission needs driven by Public Policy Requirements in regional transmission planning and cost allocation processes. *PJM Interconnection, L.L.C.*, 142 FERC ¶ 61,214, at PP 109-120 (2013), *order on reh'g and compliance*, 147 FERC ¶ 61,128, at PP 66-71 (2014).

[656] 762 F.3d at 90.

B. Development of Long-Term Scenarios

1. NOPR Proposal

284. In the NOPR, the Commission proposed to require transmission providers to develop Long-Term Scenarios as part of Long-Term Regional Transmission Planning. The Commission proposed to define Long-Term Scenarios as a tool to identify the transmission planning region's needs driven by changes in the resource mix and demand—and enable the evaluation of transmission facilities to meet such transmission needs—across multiple scenarios that incorporate different assumptions about the future electric power system over a sufficiently long-term, forward-looking transmission planning horizon. The Commission explained that a scenario is a hypothetical sequence of events that includes assumptions used to forecast transmission needs. The Commission also stated that assumptions used to forecast transmission needs driven by changes in the resource mix and demand include: forecasts of the level and pattern (i.e., hourly and seasonal variability) of future electricity demand; the quantity, location, and type of resource additions and retirements; and other relevant forecasts about the electric power system that are used as inputs to the transmission model and determine the need for new transmission facilities over the transmission planning horizon. In addition, the Commission noted that other relevant assumptions might include forecasts for natural gas prices, increasing outage trends due to extreme weather and climatic trends, and other future events.

285. The Commission also proposed in the NOPR to require that transmission providers use Long-Term Scenarios to evaluate potential regional transmission facilities

needed to meet transmission needs driven by changes in the resource mix and demand to identify the more efficient or cost-effective regional transmission facilities.[657]

2. Comments

a. General Comments

286. Of the commenters specifically addressing the proposal to require Long-Term Scenarios in Long-Term Regional Transmission Planning, the majority support scenario-based planning.[658] Clean Energy Buyers state that Long-Term Scenarios are critical to Long-Term Regional Transmission Planning because its success will depend on the quality of forecasting.[659] Form Energy states that long-term scenario review will ensure that transmission upgrades address future needs in a cost-effective and environmentally friendly manner.[660] LADWP asserts that Long-Term Scenarios are critical to developing

[657] NOPR, 179 FERC ¶ 61,028 at P 84.

[658] *See* ACEG Initial Comments at 6; AEP Initial Comments at 7-8; Amazon Initial Comments at 2-3; BP Initial Comments at 4; California Commission Initial Comments at 1-2, 5-6, 21; California Energy Commission Initial Comments at 1-2; City of New York Initial Comments at 7; Clean Energy Associations Initial Comments at 10; Clean Energy Buyers Initial Comments at 11; Duke Initial Comments at 10; Eversource Initial Comments at 10; Exelon Initial Comments at 5; Form Energy Initial Comments at 2-3; GridLab Initial Comments at 10; Handy Law Initial Comments at 9-10; Indicated PJM TOs Initial Comments at 7-8; LADWP Initial Comments at 2; NARUC Initial Comments at 4; National Grid Initial Comments at 10-11; PIOs Initial Comments at 14; PPL Initial Comments at 4; SEIA Initial Comments at 4-5; Southeast PIOs Initial Comments at 42; SREA Initial Comments at 39; State Agencies Initial Comments at 14; State Officials Supplemental Comments at 1 (citing US Climate Alliance Initial Comments); US Climate Alliance Initial Comments at 2; WE ACT Initial Comments at 3; WIRES Initial Comments at 6.

[660] Form Energy Initial Comments at 3.

an effective transmission system that ensures reliability, while also providing flexibility to support the delivery of renewable energy.[661] NARUC states that Long-Term Scenarios are a flexible planning tool for addressing the uncertainty involved in identifying transmission needs driven by changes in the resource mix and demand and that using them will ensure that transmission providers adequately assess the potential benefits of regional transmission facilities.[662]

287. Southeast PIOs claim that Long-Term Scenarios are essential to improving current transmission planning processes in the Southeast.[663] SREA argues that Long-Term Regional Transmission Planning is not occurring in MISO South and states that scenario planning is contentious but necessary.[664]

288. California Energy Commission requests that the Commission clarify that transmission providers may rely on scenarios developed by other agencies, as currently CAISO relies on analyses conducted by California Energy Commission and California Commission.[665] Relatedly, New York Commission and NYSERDA and ISO-NE highlight the importance of state-led identification of public policy needs and their impact

[661] LADWP Initial Comments at 2.

[662] NARUC Initial Comments at 4.

[663] Southeast PIOs Initial Comments at 42, 46.

[664] SREA Initial Comments at 39-41.

[665] California Energy Commission Initial Comments at 2.

on scenario assumptions.[666] New York Commission and NYSERDA state that, especially in a single-state RTO/ISO like NYISO, the state should be afforded a central role in determining the scenarios to be studied.[667] ISO-NE also believes that reliance on states is consistent with prior Commission orders permitting transmission providers to rely on a committee of state regulators to identify transmission needs driven by Public Policy Requirements.[668]

289. PJM States suggest that the Commission's proposal for state involvement in the development of Long-Term Scenarios could be interpreted as more limited than its proposal for state involvement with respect to Long-Term Regional Cost Allocation and ask that the Commission clarify that retail regulators have a primary role in both. PJM States warn that, if a retail regulator disagrees with the scenarios or benefits metrics used to select a transmission project, it is unlikely to receive regulatory approval.[669]

290. Cypress Creek asserts that the Commission should require the use of a defined and standardized set of baseline assumptions to ensure that scenario projections are realistic,

[666] New York Commission and NYSERDA Initial Comments at 7; ISO-NE Initial Comments at 25-26.

[667] New York Commission and NYSERDA Initial Comments at 8.

and that deviation should only be allowed if the proposal is consistent with or superior to the *pro forma*.[670]

291. Concerned Scientists state that the Commission should reject comments arguing that uncertainty prohibits scenario-based planning, and instead endeavor to create a transmission planning process that properly acknowledges and addresses that uncertainty. Concerned Scientists state that uncertainty does not prohibit long-term transmission planning but rather necessitates the evaluation of multiple plausible scenarios to identify investments that will perform well over a variety of possible future conditions. Concerned Scientists explain that, just as utilities and generator developers do not shy away from an uncertain future when building new generation resources, transmission investments should also be informed by, but not avoided due to, future uncertainty. Concerned Scientists state that the Commission's proposed Long-Term Scenarios requirements are a reasonable minimum for responsible transmission planning.[671]

292. Other commenters support the NOPR proposal to require Long-Term Scenarios in transmission planning but have reservations.[672] Many of these commenters argue that the NOPR is too prescriptive and ask for greater flexibility so that the Long-Term Scenario

[670] Cypress Creek Reply Comments at 5-8.

planning already occurring in their respective transmission planning region will comply with any final rule.[673] For example, OMS points to such flexibility as key to the success of MISO's long-term transmission planning processes.[674] SERTP Sponsors argue that the Commission should not make Long-Term Scenarios even more prescriptive because such an approach would likely result in litigation and delay.[675]

293. American Municipal Power believes that transmission providers should conduct Long-Term Scenarios in a highly collaborative way with the full and active participation of all stakeholders.[676] Similarly, Six Cities recommend that Long-Term Scenarios be coordinated between state and local regulatory authorities to reflect varying policies. Six Cities recommend that, in CAISO, Long-Term Scenarios should consider the procurement choices of non-jurisdictional utilities, such as Six Cities, as well as policy portfolios provided by California Commission.[677]

294. Some commenters oppose the NOPR proposal to require Long-Term Scenarios in Long-Term Regional Transmission Planning.[678] Dominion argues for maximum

flexibility for planning assumptions to support reliable and affordable transmission service for customers.[679] Idaho Commission states that any prescription for scenario analysis should be supported by clear evidence of a deficiency.[680] Instead of specific scenario planning requirements, Nebraska Commission states that the Commission should provide general guidelines and as much flexibility as possible to transmission providers, who—along with state regulatory officials—are best situated to evaluate the needs of each transmission planning region.[681]

295. Potomac Economics questions the NOPR's proposal to require Long-Term Scenarios, stating that it will force RTOs/ISOs to plan and commit to sizable transmission investment costs based on uncertain factors and unreasonable speculation on factors such as the location of future generation, retirements, grid enhancing technologies, and transmission reconfiguration options.[682] Potomac Economics also questions the usefulness of Long-Term Scenarios, asserting that future congestion patterns will be increasingly uncertain given that the higher penetration of intermittent resources will cause larger fluctuations in transmission flows, making it more difficult to accurately estimate the benefits of transmission upgrades.[683] Potomac Economics argues that many

[679] Dominion Initial Comments at 10-12.

[683] *Id*. at 2.

of the most beneficial transmission upgrades address very specific constraints, are smaller in size, can be difficult to identify in advance, and can be very sensitive to modest changes in generation and load.[684]

b. Applying Scenario Planning to Reliability and Economic Planning

296. California Commission and City of New York assert that the Commission should require the use of Long-Term Scenarios in all transmission planning processes—not just Long-Term Regional Transmission Planning.[685] City of New York argues that such a requirement would enable consideration of a broad range of potential future system conditions across multiple planning categories.[686] Similarly, NYISO states that the final rule should authorize, but not require, the use of multiple alternative scenarios in existing transmission planning processes. NYISO states that doing so would enhance its ability to anticipate and solicit more efficient, holistic transmission solutions, which would support system reliability and resilience.[687]

297. In contrast, certain commenters oppose requiring transmission providers to incorporate some form of scenario analysis into their existing reliability and economic

[684] *Id*. at 3.

[685] California Commission Initial Comments at 22-24; City of New York Initial Comments at 7.

[686] City of New York Initial Comments at 7.

[687] NYISO Initial Comments at 14-15.

regional transmission planning processes.[688] Duke contends that the Commission should avoid disrupting existing regional transmission planning processes that work well.[689] MISO notes that, while this type of scenario-based planning has been applied to economic transmission planning processes and could be applied to existing reliability transmission planning processes, such application should be flexible and tailored to the unique needs of each transmission provider, adding that scenario-based planning requires considerable time and resources.[690]

3. Commission Determination

298. We adopt, with modification, the NOPR proposals to require transmission providers in each transmission planning region to (1) develop and use Long-Term Scenarios as part of Long-Term Regional Transmission Planning and (2) use those Long-Term Scenarios to identify and evaluate Long-Term Regional Transmission Facilities needed to meet Long-Term Transmission Needs. As further explained in subsequent sections of this final rule, we find that these requirements regarding the development and use of Long-Term Scenarios in Long-Term Regional Transmission Planning strike a reasonable balance between ensuring that Long-Term Regional Transmission Planning reasonably identifies Long-Term Transmission Needs over a sufficiently long-term,

[688] Duke Initial Comments at 2, 10-11; Eversource Initial Comments at 19; MISO Initial Comments at 32; NESCOE Initial Comments at 23; PJM Initial Comments at 54-56.

[689] Duke Initial Comments at 2, 10-11.

[690] MISO Initial Comments at 32.

forward-looking transmission planning horizon and providing sufficient flexibility for transmission providers to develop and use Long-Term Scenarios in a way that reflects the unique characteristics of their respective transmission planning regions.

299. We first address the definition of Long-Term Transmission Needs. For purposes of this final rule, Long-Term Transmission Needs are transmission needs identified through Long-Term Regional Transmission Planning by, among other things and as discussed in this final rule, running scenarios and considering the enumerated categories of factors. As explained in the NOPR, the drivers of transmission needs are diverse and include, but are not limited to, evolving reliability concerns, changes in the resource mix, and changes in demand. For example, as identified in the NOPR, reliability concerns giving rise to Long-Term Transmission Needs include, among other things, the increasing frequency of high-impact extreme weather events, the increasing reliance by transmission system operators on regional integration and coordination to reliably serve load, the operational challenges created by the increasing share of variable resources entering the resource mix, and changes in electric demand patterns such as shifts in load profiles caused by, for example, the emergence of large loads associated with evolving industrial and commercial needs such as the growth in data centers, and increased electrification of energy end uses.[691]

300. In the NOPR, the Commission referred to transmission needs identified through Long-Term Regional Transmission Planning largely as needs driven by changes in the

[691] *See* NOPR, 179 FERC ¶ 61,028 at PP 45, 51.

resource mix and demand.[692] Nevertheless, we agree with commenters who correctly note that there are additional drivers of Long-Term Transmission Needs,[693] and, as noted above, the Commission itself contemplated in the NOPR that Long-Term Regional Transmission Planning would consider drivers beyond those tied directly to changes in supply and demand. We therefore clarify that, although changes in the resource mix and demand are important drivers of Long-Term Transmission Needs, they represent only a subset of such drivers. In addition, we note that Long-Term Transmission Needs are similar in kind to transmission needs identified through existing regional transmission planning processes established under Order No. 1000. Where Long-Term Transmission Needs differ is their identification through the long-term, forward-looking, and more comprehensive regional transmission planning and cost allocation processes established in this final rule. Accordingly, in this final rule, we refer to the transmission needs that are identified through Long-Term Regional Transmission Planning as Long-Term

[692] *Id*.

[693] *See, e.g.*, AEE Initial Comments at 7-8 (noting that reforms are needed to meet transmission needs driven by "market forces, state policies, and new reliability and resilience imperatives"); ELCON Initial Comments at 4 ("[L]ong term scenario planning should not be limited to anticipated resource mix but also take into consideration impacts on reliability and congestion management."); New Jersey Commission Initial Comments at 2 ("[T]he Board stresses that most of the reforms the Commission is proposing would be necessary even in the absence of 'changes in the resource mix and demand.'") (citing NOPR, 179 FERC ¶ 61,028 at P 24); Renewable Northwest Initial Comments at 8 (noting how current transmission planning processes ignore both "trends in future generation and the impact of extreme weather events") (citing NOPR, 179 FERC ¶ 61,028 at P 51); Southeast PIOs Initial Comments at 7-8 (noting that both intensifying "changes in the generation mix" and "increasingly common extreme weather and high-intensity, low frequency events" burden the existing transmission system).

Transmission Needs. The identification of Long-Term Transmission Needs and Long-Term Regional Transmission Facilities to potentially meet those needs is accomplished through the use of Long-Term Scenarios in Long-Term Regional Transmission Planning.

301. As discussed in the Requirement for Transmission Providers to Use a Set of Seven Required Benefits section of this final rule, we require transmission providers to measure and use a set of seven required benefits in Long-Term Regional Transmission Planning. Transmission providers must use this same set of benefits to help to inform their identification of Long-Term Transmission Needs. For example, in this final rule we require transmission providers to measure and use production cost savings in Long-Term Regional Transmission Planning. As such, when transmission providers are working to identify Long-Term Transmission Needs, areas of significant congestion on the transmission system—where Long-Term Regional Transmission Facilities could reduce congestion and in turn facilitate production cost savings—may indicate a Long-Term Transmission Need.

302. We adopt the definition of Long-Term Scenarios proposed in the NOPR,[694] with modification. We define Long-Term Scenarios as scenarios that incorporate various assumptions using best available data inputs about the future electric power system over a

[694] In the NOPR, the Commission proposed to define Long-Term Scenarios as a tool to identify transmission needs driven by changes in the resource mix and demand—and enable the evaluation of transmission facilities to meet such transmission needs—across multiple scenarios that incorporate different assumptions about the future electric power system over a sufficiently long-term, forward-looking transmission planning horizon. NOPR, 179 FERC ¶ 61,028 at P 84.

sufficiently long-term, forward-looking transmission planning horizon to identify Long-Term Transmission Needs and enable the identification and evaluation of transmission facilities to meet such transmission needs. We make this modification to clarify the intent of the definition proposed in the NOPR, rather than modify the definition in substance.

303. Certain commenters assert that the Commission should not require transmission providers to develop Long-Term Scenarios due to the inherent uncertainty of forecasting future transmission needs over a long transmission planning horizon. We acknowledge the inherent uncertainty involved in planning to meet Long-Term Transmission Needs. However, we believe that such uncertainty is mitigated by using Long-Term Scenarios themselves, as noted by Concerned Scientists and NARUC.[695] Scenario planning allows transmission providers to evaluate whether Long-Term Regional Transmission Facilities are beneficial in more than one scenario. Transmission providers may also examine whether Long-Term Transmission Needs appear in one or more scenarios. Scenario planning also allows transmission providers to consider a broader range of future circumstances and be better prepared for changes in the electric power system.[696] Finally, transmission providers may use scenario planning to determine whether identified Long-Term Regional Transmission Facilities provide sufficient benefits across more than one

[695] Concerned Scientists Reply Comments at 18-19; NARUC Initial Comments at 4 (citing NOPR, 179 FERC ¶ 61,028 at PP 86, 88).

[696] *See* Policy Integrity Reply Comments at 2.

scenario when considering whether to select such facilities, as also noted by NARUC.[697] Moreover, we adopt requirements for Long-Term Scenarios, as discussed further below, to ensure they are based on reasonable assumptions and better reflect future transmission system conditions and uncertainties in those future circumstances. In sum, incorporating Long-Term Scenarios into Long-Term Regional Transmission Planning provides an appropriate approach to ensure just and reasonable rates by accounting for the increasing uncertainty in the accuracy of assumptions over longer (i.e., over 10 years) transmission planning horizons and mitigating the risks of under-building or over-building Long-Term Regional Transmission Facilities.

304. Further, we disagree with commenters that suggest that the Commission should not establish specific Long-Term Scenario requirements and that imposing general principles is sufficient to ensure just and reasonable rates. We find that Long-Term Regional Transmission Planning that does not incorporate Long-Term Scenarios that meet the requirements of this final rule would fail to ensure that transmission providers identify Long-Term Transmission Needs, as well as identify and evaluate Long-Term Regional Transmission Facilities to address those needs. For example, relying on a single forecast of future transmission system conditions may limit transmission providers' and stakeholders' confidence in identified Long-Term Transmission Needs, and accordingly the evaluation of Long-Term Regional Transmission Facilities to address those needs. Further, failure to incorporate Long-Term Scenarios would increase the

[697] NARUC Initial Comments at 4.

likelihood of piecemeal and relatively inefficient or less cost-effective transmission development. Accordingly, we find that requiring transmission providers to develop and use Long-Term Scenarios that meet the requirements established in this final rule as part of Long-Term Regional Transmission Planning will ensure that Commission-jurisdictional rates are just and reasonable and not unduly discriminatory or preferential.

305. Additionally, as stated above and in response to commenters that emphasize the importance of collaboration in developing Long-Term Scenarios, this final rule retains the requirements for an open, coordinated, and transparent local transmission planning process established in Order No. 890 and further required for regional transmission planning in Order No. 1000.[698] For example, consistent with the transparency transmission planning principle,[699] transmission providers must make transparent the methodology, criteria, assumptions, and data used to develop each Long-Term Scenario. Moreover, as described below, this final rule requires that transmission providers provide meaningful opportunity for stakeholder input, including from state and local regulators, as well as non-jurisdictional entities, into the factors used to develop Long-Term Scenarios.

306. In response to PJM's request that the Commission clarify that the role of the state regulator is primary in developing Long-Term Scenarios, we note that, as described in the

[698] Order No. 1000, 136 FERC ¶ 61,051 at PP 150-152; Order No. 890, 118 FERC ¶ 61,119 at P 435.

[699] Order No. 890, 118 FERC ¶ 61,119 at P 471.

Stakeholder Process and Transparency determination within the Categories of Factors section, transmission providers retain the ultimate responsibility for transmission planning.[700] As such, transmission providers have discretion, subject to the limits imposed in this final rule, to weigh more heavily one source of information over another, such as weighing information related to a factor provided by a state regulator more heavily than information provided by other stakeholders. In response to California Energy Commission, we find that the final rule does not preclude transmission providers from relying on scenarios developed by state agencies, provided that the Commission finds that the OATT provisions governing those Long-Term Scenarios' development comply with the Long-Term Scenarios requirements of this final rule (e.g., transmission planning horizon and stakeholder input requirements). We decline to require the use of Long-Term Scenarios in all transmission planning processes, as requested by California Commission and City of New York. The record in this proceeding does not demonstrate that the incorporation of Long-Term Scenarios in existing Order No. 1000 regional transmission planning processes is necessary to ensure that Long-Term Regional Transmission Planning is just and reasonable. In response to NYISO's request that

[700] *Id*. P 454 ("In response to the suggestion by some commenters that we require transmission providers to allow customers to collaboratively develop transmission plans with transmission providers on a co-equal basis, we clarify that transmission planning is the tariff obligation of each transmission provider, and the *pro forma* OATT planning process adopted in this [f]inal [r]ule is the means to see that it is carried out in a coordinated, open, and transparent manner, in order to ensure that customers are treated comparably. Therefore, the ultimate responsibility for planning remains with transmission providers.").

transmission providers be allowed to use scenario planning in their existing Order No. 1000 regional transmission planning processes, while we agree that such a practice may offer benefits, we find that any such request amending existing transmission planning processes must be submitted in an FPA section 205 filing separate from their compliance filings to this final rule.[701]

C. Long-Term Scenarios Requirements

1. Transmission Planning Horizon

a. NOPR Proposal

307. In the NOPR, the Commission proposed to require transmission providers to develop Long-Term Scenarios as part of Long-Term Regional Transmission Planning using no less than a 20-year transmission planning horizon.[702]

308. The Commission preliminarily found that a 20-year transmission planning horizon requirement strikes a reasonable balance between the current transmission planning horizons used in many transmission planning regions and the 30-year or longer transmission planning horizon proposed by some ANOPR commenters. The Commission noted that the 30-year or longer transmission planning horizon was criticized by other commenters as speculative or too uncertain. The Commission also

[701] We note that an exception to the requirement to file a separate FPA section 205 filing applies if transmission providers were to propose a unified transmission planning process, as discussed above. *See supra* Participation in Long-Term Regional Transmission Planning section.

[702] NOPR, 179 FERC ¶ 61,028 at PP 97-100.

stated that a 20-year transmission planning horizon requirement may be reasonable because some transmission providers use a 20-year transmission planning horizon in existing regional transmission planning processes. In addition, the Commission stated that a 20-year transmission planning horizon would allow for sufficient time to identify, plan, and obtain siting and permitting approval for and to construct regional transmission facilities to meet long-term regional transmission needs, including those that may take longer than the average amount of time to go from the planning stage to in-service. Finally, the Commission stated that a 20-year transmission planning horizon would allow transmission providers to better leverage economies of scale by sizing transmission facilities to meet not only nearer-term transmission needs, but also longer-term transmission needs driven by changes in the resource mix and demand over time. The Commission preliminarily found that by assessing transmission needs over a longer time horizon—for example, starting in year six[703] through year 20 of the transmission planning horizon—Long-Term Regional Transmission Planning should be able to identify more efficient or cost-effective regional transmission facilities to address these needs.[704]

[703] The Commission noted that the North American Electric Reliability Corporation defines the long-term transmission planning horizon as covering year six through year 10 and beyond. *Id.* P 94 n.160.

[704] *Id.* PP 97-99 (footnotes omitted).

b. Comments

i. Support for 20-Year Transmission Planning Horizon

309. Many commenters support the Commission's proposal to require transmission providers to develop Long-Term Scenarios as part of Long-Term Regional Transmission Planning using no less than a 20-year transmission planning horizon.[705] Several commenters generally consider a 20-year transmission planning horizon to be reasonable,

[705] ACORE Initial Comments at 1; Advanced Energy Buyers Initial Comments at 7; AEE Initial Comments at 8; AEP Initial Comments at 5, 8-12; Amazon Initial Comments at 2-3; BP Initial Comments at 4-5; Breakthrough Energy Initial Comments at 12-13; Breakthrough Energy Supplemental Comments at 1; California Water Initial Comments at 14-15; Certain TDUs Initial Comments at 3, 19; Clean Energy Associations Initial Comments at 10; Clean Energy Buyers Initial Comments at 12; Clean Energy States Initial Comments at 2; Concerned Scientists Reply Comments at 18-19; Cypress Creek Reply Comments at 4; DC and MD Offices of People's Counsel Initial Comments at 8; Environmental Groups Supplemental Comments at 2; Eversource Initial Comments at 14; Form Energy Initial Comments at 2; Georgia Commission Initial Comments at 2-3; GridLab Initial Comments at 5; Idaho Power Initial Comments at 4; Illinois Commission Initial Comments at 6; Indicated US Senators and Representatives Initial Comments at 1; Interwest Initial Comments at 4-5; ITC Initial Comments at 9-11; LADWP Initial Comments at 2; Minnesota State Entities Initial Comments at 4; National and State Conservation Organizations Initial Comments at 1; National Grid Initial Comments at 12-13; Nevada Commission Initial Comments at 7; New England for Offshore Wind Initial Comments at 2; New Jersey Commission Initial Comments at 9-10; NextEra Initial Comments at 62; NYISO Initial Comments at 2; Pacific Northwest State Agencies Initial Comments at 2; PG&E Initial Comments at 2; Policy Integrity Initial Comments at 10; PIOs Initial Comments at 15; R Street Initial Comments at 6; SEIA Initial Comments at 6; SoCal Edison Initial Comments at 11-12; Southeast PIOs Initial Comments at 43; SPP Initial Comments at 5-6; SPP Market Monitor Initial Comments at 4-5; State Officials Supplemental Comments at 1 (citing US Climate Alliance Initial Comments at 2); US Climate Alliance Initial Comments at 2; US DOE Initial Comments at 10; Vermont Electric and Vermont Transco Initial Comments at 2; Vermont State Entities Initial Comments at 5; WE ACT Initial Comments at 3.

acceptable, or appropriate.[706] Some commenters argue that a 20-year transmission planning horizon provides a reasonable balance between shorter- and longer-term transmission planning horizons.[707] National Grid states that a 20-year transmission planning horizon balances the benefits of prospective transmission planning with the greater uncertainty that comes with forecasting system needs over a longer period.[708] Numerous commenters argue that a 20-year transmission planning horizon will help to improve the efficiency and cost of developing transmission and to assess future transmission needs.[709]

310. New Jersey Commission argues that a 20-year transmission planning horizon should help to make long-term multi-driver transmission projects viable by identifying needs and opportunities in a timeframe that allows states to have a meaningful conversation about voluntarily funding such projects.[710] Policy Integrity argues that it is crucial to model what is going to be needed *over* the next 20 years to ensure that short-

[710] New Jersey Commission Initial Comments at 9-10, 28.

and medium-term transmission projects are built efficiently, stating that a longer transmission planning horizon is reasonable in the context of long-lived transmission assets with long lead times.[711]

311. US DOE asserts that there is sufficient evidence to extend the transmission planning horizon to a minimum of 20 years for Long-Term Regional Transmission Planning to capture power sector changes that occur during transmission development.[712] PIOs note that panelists at the November 2021 Technical Conference suggested a 20-year transmission planning horizon is necessary, in part, due to long-term public policy goals.[713] Acadia Center and CLF similarly argue that transmission planners should plan over long-term horizons to factor in predictable trends, such as timelines required under state laws and policies.[714]

312. Several commenters emphasize that a transmission planning horizon of 20 years is sufficient to account for the amount of time needed to develop transmission projects, considering the complexity and challenges of major transmission development.[715] Eversource states that a long-term perspective is necessary to take advantage of the

[711] Policy Integrity Initial Comments at 10.

economies of scale that large transmission projects can enable, as well as to incorporate anticipated changes in generation and load beyond the traditional transmission planning horizon.[716] Illinois Commission states that a 20-year transmission planning horizon is necessary to properly plan and build transmission and generation resources.[717] LADWP states that a 20-year transmission planning horizon provides enough time for transmission projects to be developed and placed in service when such projects require new rights-of-way without becoming too speculative.[718] NextEra contends that a 20-year transmission planning horizon will ensure that transmission planners anticipate and plan transmission facilities for needs driven by changes in the resource mix and demand.[719]

313. PIOs state that a 20-year transmission planning horizon should be the minimum timeframe, explaining that because transmission facilities can take 15 years to plan, permit, and construct, a 20-year transmission planning horizon can result in just-in-time planning, where the transmission plan is developed shortly before the process for siting and permitting must begin.[720] GridLab asserts that a 20-year transmission planning horizon might identify regional transmission needs that occur after year 10, as well as

[719] NextEra Initial Comments at 62-63.

[720] PIOs Initial Comments at 15.

transmission projects that would be selected and approved in later transmission planning cycles.[721]

314. Clean Energy States support quick adoption of at least a 20-year planning horizon because many of their member states have established 100% clean energy power sector or zero-carbon goals for their state economies by 2040 or 2050.[722] California Municipal Utilities, on the other hand, support a 20-year transmission planning horizon, but caution that transmission costs identified can be significant and could rely upon speculative resources that may not come to fruition, namely off-shore wind development.[723]

315. Many commenters highlight transmission planning regions with existing long-term transmission planning that either does or will conform to the 20-year transmission planning horizon proposed in the NOPR.[724] MISO commits to continue using its 20-year forecast period under this proposed reform.[725] SPP states that it currently performs a 20-

[725] MISO Initial Comments at 33.

year assessment that incorporates Long-Term Scenarios at least once every five years.[726] New York Transco notes that NYISO's transmission planning process utilizes multiple cases and scenarios over a 20-year evaluation horizon.[727] Acadia Center and CLF note that ISO-NE recently gained Commission approval for longer-term transmission studies to undertake long-term transmission planning to 2050.[728]

316. CAISO states that it currently approves transmission projects in its annual transmission planning process based on a 10-year outlook, although the CAISO OATT allows for a longer 20-year transmission horizon outlook to reliably and cost-effectively account for California's greenhouse gas and renewable energy objectives.[729] CAISO explains that its 20-year outlook does not include a process for approving specific transmission projects, but rather allows considerations beyond 10 years to inform decisions in its annual transmission planning process.[730] California Municipal Utilities also highlight CAISO's existing transmission planning processes, noting that its 20-year transmission outlook calls for an estimated combined capital cost of $30.5 billion.[731]

NextEra notes that, while many transmission planning regions use or will use a 20-year transmission planning horizon, no requirements exist to ensure that these practices persist.[732]

317. Several commenters reference existing long-term planning processes as support for the Commission's proposed 20-year transmission planning horizon.[733] NextEra and ACEG explain that longer time horizons are embedded into existing integrated resource plans, through law or common practice, and extend into and beyond 2040 to meet ambitious resource goals.[734] R Street argues that, for benchmarking purposes, 20- to 25-year planning horizons have been a best practice for integrated resource planning for decades.[735]

[734] ACEG Reply Comments at 4-5; NextEra Initial Comments at 62-63.

[735] R Street Initial Comments at 6.

318. LADWP asserts that the proposed 20-year transmission planning horizon is likely the least disruptive horizon because of its current use by many transmission providers. LADWP further argues that a consistent transmission planning horizon will optimize asset investment and minimize public impacts; facilitate planning, coordination, and development of large-scale regional transmission projects; and ensure that transmission providers consider the same end point assessments of the evolving resource mix, environmental requirements that develop beyond a typical 10-year period, and significant maintenance and retirement issues.[736]

ii. Requests for Flexibility

319. Several commenters recommend that the Commission provide transmission providers in each transmission planning region with the flexibility to propose other transmission planning horizons that may be appropriate and beneficial based on their planning processes.[737] APS states that it is not convinced that a prescriptive approach will yield the benefits that the Commission seeks.[738]

[738] APS Initial Comments at 3.

320. NESCOE states that there is not one "right" transmission planning horizon and that it does not support a one-size-fits-all transmission planning horizon requirement.[739] NESCOE requests that the Commission allow transmission providers in each transmission planning region to demonstrate that existing tariff provisions are consistent with or superior to a final rule mandating a minimum transmission planning horizon, explaining—along with ISO-NE—that ISO-NE's Tariff does not provide a prescribed timeframe to request transmission analyses based on state-provided scenarios.[740] Relatedly, California Commission suggests that, instead of mandating a 20-year transmission planning horizon, the Commission should adopt NYISO's recommendation to provide transmission providers with the discretion, up to 20 years, to plan for their needs.[741]

321. PG&E understands that not every transmission need identified in the latter years of a 20-year transmission planning horizon will require immediate selection resolution, and it therefore asks the Commission to give individual transmission planning regions the flexibility to determine how to allow for monitoring and updating planning assumptions for transmission projects that meet transmission needs beyond 10 years.[742] ISO-NE

[739] NESCOE Initial Comments at 23-24.

[740] ISO-NE Initial Comments at 22-23; NESCOE Initial Comments at 24-25.

[741] California Commission Initial Comments at 11-12 (citing NYISO ANOPR Initial Comments at 37).

[742] PG&E Initial Comments at 4-6.

argues that the Commission should permit an approach that allows (but does not require) a transmission planning horizon beyond 10 years because the 20-year transmission planning horizon could potentially limit the identification of system issues during interim years, inhibit adaptation to evolving policies, and preclude the transmission planning process from considering public policies that may include shorter timeframes, which may limit the ability to adapt to emerging needs or changing laws.[743] NESCOE contends that a rigid 20-year transmission planning horizon may be counterproductive and could divert resources focused on meeting requests under ISO-NE's longer-term transmission planning process to study a time horizon that states, stakeholders, and ISO-NE may not find useful.[744]

322. OMS argues that the final rule should permit flexibility in transmission planning horizons and enable transmission planning regions to meet objectives through routine scenario-based planning within an appropriate study window.[745] Industrial Customers assert that transmission planning horizons should consider the time to identify, plan, and obtain siting and permitting approval to construct regional transmission facilities, and that timing can vary dramatically by region. Industrial Customers believe a stringent 20-year transmission planning horizon could create more uncertainty, resulting in stranded

[743] ISO-NE Initial Comments at 22-23.

[744] NESCOE Initial Comments at 24-25.

[745] OMS Initial Comments at 4-5.

transmission investments and increased transmission rates because it is difficult, if not impossible, to forecast transmission needs and requirements 20 years into the future.[746]

323. PJM States recommend, and Clean Energy Associations agree, that instead of requiring a transmission planning horizon of a particular length, the Commission should require each transmission provider to demonstrate that the transmission planning horizon it chooses is adequate to achieve the goals of Long-Term Regional Transmission Planning.[747]

324. New York State Department recommends that the final rule allow states to determine the appropriate transmission planning horizon since New York Public Service Commission has already issued orders directing long-term transmission and distribution planning with undefined terms.[748] EEI and US Chamber of Commerce explain that state regulators may not appreciate a rigid 20-year transmission planning horizon requirement given that some state resource procurement processes use a 10-year outlook, and the proposed transmission planning process may thus make resource decisions that are not state-sanctioned.[749] Consistent with their Coordinated Grid Planning Process, New York Commission and NYSERDA assert that the Commission should allow state regulators to

[749] EEI Initial Comments at 11; US Chamber of Commerce Initial Comments at 6.

help determine the appropriate transmission planning horizon, especially in a single-state RTO/ISO such as NYISO.[750]

325. Louisiana Commission states that a 20-year transmission planning horizon may be longer than the planning horizon utilized in state integrated resource planning, explaining that its integrated resource planning rules allow for a 20-year default planning period, but also for alternative periods, and more importantly, require 5-year action plans.[751]

326. APPA argues, and TANC concurs, that the Commission should allow transmission planning regions to incorporate cost and benefit-tracking mechanisms to reduce the risk of speculative transmission projects.[752]

iii. Requests for a Different Transmission Planning Horizon

327. Several commenters argue that a 20-year transmission planning horizon is too long.[753] Indicated PJM TOs contend that the Commission should ensure that transmission planning horizons result in the identification of transmission facilities that

[750] New York Commission and NYSERDA Initial Comments at 10-12.

can be realistically planned and developed, and that 20 years may be too long given rapidly changing technology, generation mix, and demand patterns.[754] Mississippi Commission also favors a shorter transmission planning horizon, arguing that there is too much uncertainty to plan 20 to 40 years into the future.[755] NRECA argues that a 20-year transmission planning horizon may allow more alternatives to be considered, but cost efficacy is not guaranteed. Further, NRECA argues that planning beyond 10 years will by necessity devolve into a top-down process that would, at best, relegate actual load-serving entity resource plans and demand forecasts to a secondary status or, at worst, ignore them altogether, violating FPA section 217(b)(4).[756]

328. PJM Market Monitor states that uncertainty increases significantly as the transmission planning horizon is extended, and the transmission planning process should be both long-term and flexible, allowing transmission planners to change plans as reality changes.[757] Similarly, US Chamber of Commerce asserts that, as the length of the transmission planning horizon increases, the number of assumptions increases and the quality of assumptions decreases, rendering costs and benefits less certain. US Chamber of Commerce states that today's transmission grid was not forecasted at the turn of the

[754] Indicated PJM TOs Initial Comments at 10.

[757] PJM Market Monitor Initial Comments at 3.

century, and, thus, forecasts made today for a similar period are likely to under or over-shoot transmission needs due to new and advancing generation technologies with commercial operation timeframes not yet known.[758] Nebraska Commission states that a 20-year transmission planning horizon may reduce the transmission planning process to an academic exercise due to the amount of speculation necessarily involved.[759]

329. Industrial Customers state that the Commission has not ruled against transmission planning horizons under 15 years and has acknowledged that the average time needed to develop and build a transmission project is 10 years.[760] Industrial Customers assert that, contrary to the Commission's view, most transmission planners use 10-year transmission planning horizons, and transmission investment should be driven by shorter timeframes to plan for economic and reliability needs.[761] Ohio Consumers note that the 5-year timeframe used by PJM's DFAX method is characterized by high uncertainty, so a longer timeframe would exacerbate inaccuracies.[762]

330. Several commenters argue that a 10-year transmission planning horizon could reduce speculation, such as with respect to the changing resource mix.[763] NRG states that

[763] Nebraska Commission Initial Comments at 3-4; NRG Initial Comments at 6-9,

a shorter, 10-year transmission planning horizon would fit within the time horizon necessary to make transmission investment decisions and still reflect regional policy goals.[764] Utah Commission notes that NorthernGrid's members in 2020 adopted a 10-year transmission planning horizon and objects to being compelled to abandon that planning horizon in favor of a one-size-fits-all mandate.[765]

331. PJM and Exelon advocate for a 15-year transmission planning horizon to reduce uncertainty and enhance reliability.[766] Exelon argues that a 15-year transmission planning horizon may yield less uncertain forecasts that are more likely to be actionable and better align with target dates in public policies.[767] PJM argues that its current 15-year transmission planning horizon is sufficient to plan and develop needed transmission, and that forecasts of fuel prices, load trends, generation retirement, and other relevant parameters become more uncertain the further one looks out. Moreover, PJM asserts, a longer transmission planning horizon leads to a greater probability that a transmission provider will commit to a transmission project that will look unfortunate in hindsight.[768]

332. Some commenters argue that a transmission planning horizon longer than 20 years may be warranted to capture the longer-term benefits of transmission facilities.[769] ACEG recommends that the Commission consider up to a 40-year transmission planning horizon to match the expected life of most transmission assets.[770] CARE Coalition argues that a 40-year transmission planning horizon would be consistent with standard practice in economics and public policy of evaluating benefits over the life of the asset, and that the long lead time to develop transmission facilities justifies a longer planning horizon.[771]

iv. Opposition to Requests for a Different Transmission Planning Horizon

333. Several commenters dispute claims that a 20-year transmission planning horizon introduces risks from uncertainty and that a shorter planning horizon is more appropriate.[772] Southeast PIOs claim that the risk of unaddressed transmission needs grows over time because of long lead times needed for transmission development, and that SERTP's 10-year transmission planning horizon prevented Georgia Power from

using that process to plan for its long-term North Georgia Reliability & Resilience Plan and its goal to integrate 6,000 MW of renewable resources by 2035.[773] Southeast PIOs assert that a longer transmission planning horizon will put future transmission needs on the radar for transmission planners and, if updated frequently, allow transmission providers to select transmission facilities conditional on subsequent transmission planning cycles, which affords planners flexibility to determine the need for the facility and whether there are more cost-effective alternatives.[774] ACORE notes that the NOPR addresses the uncertainty about the future by requiring the use of multiple Long-Term Scenarios that are revised every three years.[775]

334. Several commenters state that the transmission planning horizon should not extend beyond 20 years to avoid overly speculative long-term forecasts.[776] Entergy asserts that looking beyond 20 years would increase the likelihood of errors, risk billions of dollars in investments that may prove to be misguided, and amplify the risk of planning a transmission system that poorly aligns with actual future needs.[777] Illinois Commission

states that a transmission planning horizon longer than 20 years would make it difficult to accurately predict the factors relevant to transmission planning.[778] Clean Energy Buyers propose that transmission providers seeking to adopt a transmission planning horizon beyond 20 years should be required to demonstrate the justness and reasonableness of that transmission planning horizon.[779]

335. Certain TDUs and Louisiana Commission oppose a 40-year transmission planning horizon.[780] Certain TDUs emphasize that, as evidenced by the Michigan Thumb Loop transmission project, assumptions such as the resource mix can change in as few as seven years.[781] Louisiana Commission argues that longer periods, such as the 40-year transmission planning horizon proposed by some commenters, will greatly increase the risk for errors and wasted investments. According to Louisiana Commission, transmission planning horizons should neither exceed the availability of reasonable data and assumptions nor create unnecessary risks that ratepayers will be required to fund transmission facilities that do not deliver expected benefits.[782]

v. Meaning and Scope of Transmission Planning Horizon

336. Several commenters request that the Commission define the 20-year transmission planning horizon as a simple 20-year period, and not a 20-year period starting from the estimated in-service date of the transmission facilities, which would result in forecasting transmission needs beyond 20 years.[783] Kentucky Commission Chair Chandler states that the usefulness of Long-Term Regional Transmission Planning and measuring benefits 20 years after a transmission project's in-service date will decrease if each project's relative benefits cannot be adequately measured and identified.[784] PPL argues that tying the transmission planning horizon to the study date rather than the solution in-service date will facilitate a more realistic, certain, and simple transmission planning process and reduce the need for additional analysis.[785] US Chamber of Commerce adds that beginning at the in-service date of the transmission facilities would extend the effective transmission planning horizon to 25-30 years, thereby further increasing the uncertainty of Long-Term Regional Transmission Planning; thus, US Chamber of Commerce argues the Commission should use the 20-year transmission planning horizon as a ceiling, rather than a floor, consistent with the far end of most state planning horizons, which would

[784] Kentucky Commission Chair Chandler Reply Comments at 2.

[785] PPL Initial Comments at 6.

protect transmission planners from being forced to plan beyond the requirements of applicable state law.[786]

337. Policy Integrity requests that the Commission clarify the details of the 20-year time horizon, stating that it is unclear whether the Commission intended the 20-year time horizon for Long-Term Regional Transmission Planning to be tied to construction commencing in year 20.[787] ISO-NE and Policy Integrity seek clarification that, if the Commission requires that transmission providers must study what is needed over the next 20 years, transmission providers are not precluded from evaluating what needs to be built in the short and medium terms.[788] Industrial Customers assert that the proposed 20-year transmission planning horizon is unclear because some commenters interpret the Commission's proposal as requiring a 20-year transmission planning horizon for Long-Term Regional Transmission Planning,[789] while others argue it requires a 20-year transmission planning horizon in existing regional transmission planning processes.[790]

338. Several commenters support a 20-year transmission planning horizon if Long-Term Scenarios are used to inform the development of transmission facilities but not used

to select transmission facilities or to dictate construction.[791] TANC does not believe that a 20-year transmission planning horizon should be used for local transmission planning processes or selection.[792] Nebraska Commission states that using a 20-year transmission planning horizon for only research, study, and projections will avoid speculation, increased costs, and unjust and unreasonable rates.[793] NRECA asserts that using a 20-year transmission planning horizon in Long-Term Regional Transmission Planning to select transmission projects will not produce the granularity and certainty needed to assign costs to beneficiaries.[794] Similarly, Ohio Consumers argue that too little is known about the location of future loads and resources and the direction of power flows over 20 years to use a 20-year transmission planning horizon for cost allocation purposes.[795] NRG argues that use of a 20-year transmission planning horizon to allocate costs will lead to unjust and unreasonable outcomes, and instead, a 10-year transmission planning horizon is appropriate.[796] New England Systems state that the Commission should adjust

[791] NARUC Initial Comments at 5; Nebraska Commission Initial Comments at 3; Northwest and Intermountain Initial Comments at 7, 13; NRECA Initial Comments at 23, 29; NRG Initial Comments at 6-9, 14; Ohio Consumers Initial Comments at 20; *see also* Dominion Reply Comments at 4-5 (citing NARUC Initial Comments at 5); PJM States Reply Comments at 9 (citing NARUC Initial Comments at 5).

[796] NRG Initial Comments at 6-9, 14.

the NOPR's focus on transmission planning horizons toward an evolutionary and evidence-based transmission planning process aimed at mitigating avoidable costs for operating generation out of economic merit order and at improving the utilization of renewable resources that experience curtailment due to congestion.[797]

339. Some commenters support a 20-year transmission planning horizon only if the latter portion of the planning horizon is not used to direct the development of transmission facilities.[798] SERTP Sponsors state that the Commission should not require that regional transmission expansion be based on transmission planning horizons that are incompatible with the planning horizons used for integrated resource planning or supply-side resource plan development, or that involve a degree of speculation that the states comprising a transmission planning region are not willing to accept.[799] SPP Market Monitor contends that if the Commission requires all RTOs/ISOs to perform a 20-year study, the final rule should also provide guidance on how information determined in that long-term study will be used. SPP Market Monitor supports a secondary, shorter-term

[797] New England Systems Initial Comments at 21-22.

[799] SERTP Sponsors Initial Comments at 20.

transmission planning horizon of 10 years that could be based on the results of the longer-term 20-year studies.[800]

340. Shell suggests that the 20-year transmission planning horizon include a developmental "Actionable Period" for the first 10 years, during which developers may be willing to invest in generation projects, or the RTOs/ISOs or utilities may be willing to commit to and authorize the construction of new transmission. Shell proposes that there would be an "Indicative Period" for the following 10 years, which would be used to drive the Actionable Period so that the Commission establishes a process that converges and integrates short, medium, and long-term planning. Shell asserts that its proposal could foster more comprehensive and efficient Long-Term Regional Transmission Planning and inform existing regional transmission planning processes.[801] To remove speculative assumptions from Long-Term Regional Transmission Planning, Arizona Commission similarly suggests that the Commission divide the 20-year transmission planning horizon into two equal parts: a "more certain" forecast and a "flexible" forecast.[802] Likewise, APS recommends that the Commission adopt a 20-year transmission planning horizon for "potential projects" and a 10-year planning horizon for "planned projects" to provide greater regional flexibility.[803]

[800] SPP Market Monitor Initial Comments at 5-6.

[801] Shell Initial Comments at 19-23.

[802] Arizona Commission Initial Comments at 3-4.

[803] APS Initial Comments at 3-4.

341. Kansas Commission, Mississippi Commission, and NRECA state that the results of Long-Term Regional Transmission Planning should be considered informational only.[804] Kansas Commission requests that the Commission establish solid evidentiary and policy bases to support a 20-year transmission planning horizon before imposing such a requirement.[805] Mississippi Commission believes that transmission construction decisions should use a 10-year transmission planning horizon.[806]

342. Some commenters rebut arguments that Long-Term Regional Transmission Planning should be performed for informational purposes only.[807] ACEG contends that adopting the proposed transmission planning methods is essential to accomplishing the Commission's responsibilities and that less stringent requirements have not led to much-needed development of high-capacity transmission throughout the country. ACEG further states that providing informational reports will do little to remedy undue discrimination and achieve actual transmission plans.[808] DC and MD Offices of People's Counsel state that the potential benefits to ratepayers and other stakeholders of a 20-year transmission planning horizon is significantly diminished if transmission planning is

[804] Kansas Commission Initial Comments at 13-14; Mississippi Commission Reply Comments at 6; NRECA Initial Comments at 23.

[808] ACEG Reply Comments at 10.

simply an academic exercise, without actual impact on future transmission development.[809] SEIA argues that the Commission should mandate that scenarios developed under the final rule be used in transmission planning rather than for informational purposes only or contingent on the approval of state regulators.[810]

343. Business Council for Sustainable Energy states that transmission planning should consider the length of time that it takes for transmission assets to be built and the estimated useful life of those facilities.[811] California Municipal Utilities argue, and TANC concurs, that any lengthening of the transmission planning horizon must be accompanied by consumer protections that guard against speculative siting of generation and a rigorous re-evaluation of planning assumptions and other relevant factors, such as commercial viability of transmission projects and the associated resources.[812]

c. Commission Determination

344. We adopt the NOPR proposal to require transmission providers in each transmission planning region to develop Long-Term Scenarios as part of Long-Term Regional Transmission Planning using no less than a 20-year transmission planning horizon. We further clarify that using a transmission planning horizon of no less than 20

[809] DC and MD Offices of People's Counsel Reply Comments at 5.

[810] SEIA Reply Comments at 2.

[811] Business Council for Sustainable Energy Initial Comments at 4.

[812] California Municipal Utilities Initial Comments at 3; TANC Initial Comments at 10.

years means that transmission providers must develop Long-Term Scenarios to identify Long-Term Transmission Needs that will materialize in the 20 years or more following the commencement of the Long-Term Regional Transmission Planning cycle.

345. In requiring a transmission planning horizon of not less than 20 years, we strike a balance. On the one hand, a 20-year transmission planning horizon extends far enough into the future that transmission providers can proactively identify Long-Term Transmission Needs that could be met with more efficient or cost-effective Long-Term Regional Transmission Facilities; in contrast, as discussed below, a transmission planning horizon less than 20 years may limit transmission providers' ability to adequately plan for Long-Term Transmission Needs. Specifically, as described in the NOPR, a 20-year transmission planning horizon allows for more time between when a transmission facility is identified to meet a future transmission need, and when the transmission need materializes, allowing for sufficient time to identify, plan, obtain siting and permitting approval for, and construct Long-Term Regional Transmission Facilities. Moreover, as some commenters observe, several transmission providers, including MISO, SPP, and NYISO, already use a 20-year transmission planning horizon. On the other hand, based on the record before us, we find that there may be sufficient uncertainty with regard to system conditions and transmission needs beyond a 20-year horizon such that it may be challenging for transmission providers to forecast Long-Term Transmission Needs across that time period, especially for those transmission providers that do not presently conduct, and thus do not have experience with, long-term regional transmission planning. Accordingly, we decline to adopt a requirement to use a transmission planning horizon

that exceeds 20 years. However, this does not preclude transmission providers from proposing to use a transmission planning horizon of more than 20 years.

346. We clarify that transmission providers must plan for the entire duration of the 20-year transmission planning horizon. Specifically, transmission providers must, among other requirements established in this final rule, develop and use Long-Term Scenarios to identify Long-Term Transmission Needs occurring in any period of the 20-year transmission planning horizon and to evaluate potential transmission solutions to those needs.

347. Certain commenters either misstate aspects of the proposed 20-year transmission planning horizon or request clarification regarding the horizon.[813] We specify that the transmission planning horizon starts at the beginning of the Long-Term Regional Transmission Planning cycle and ends 20 years from that date. The transmission planning horizon is not tied to the in-service date of any identified transmission solution; rather, potential transmission solutions are identified after identifying Long-Term Transmission Needs that manifest during the 20-year transmission planning horizon.

348. We disagree with commenters that assert that a 20-year transmission planning horizon could result in Long-Term Regional Transmission Planning based on speculative transmission needs[814] or, relatedly, that a 20-year transmission planning horizon is only

[813] Kentucky Commission Chair Chandler Reply Comments at 2; National Grid Initial Comments at 12-13; PJM States Initial Comments at 3; PPL Initial Comments at 6; US Chamber of Commerce Initial Comments at 6.

[814] *E.g.*, TANC Initial Comments at 10.

appropriate if Long-Term Scenarios are not used to select Long-Term Regional Transmission Facilities.[815] We find these assertions to be unfounded. In fact, the Long-Term Regional Transmission Planning requirements adopted in this final rule are designed to avoid over-building transmission in response to speculative transmission needs through a series of tools and safeguards, discussed at length above.[816] To highlight just one of these safeguards, as discussed in the Evaluation and Selection of Long-Term Regional Transmission Facilities section of this final rule, we require transmission providers to reevaluate certain previously selected Long-Term Regional Transmission Facilities in some circumstances to confirm that the Long-Term Regional Transmission Facility continues to meet the transmission providers' selection criteria. This reevaluation process will help ensure that the continued selection of Long-Term Regional Transmission Facilities is based on the use of updated information regarding the existence of a Long-Term Transmission Need and the benefits that transmission providers expect a Long-Term Regional Transmission Facility to provide.

349. We disagree with commenters that assert that the Commission should adopt a shorter transmission planning horizon.[817] A transmission planning horizon of less than

[815] NARUC Initial Comments at 5; Nebraska Commission Initial Comments at 3; Northwest and Intermountain Initial Comments at 7, 13; NRECA Initial Comments at 23, 29; NRG Initial Comments at 6-9, 14; Ohio Consumers Initial Comments at 20; *see also* PJM States Reply Comments at 9 (citing NARUC Initial Comments at 5).

[816] *See supra* Participation in Long-Term Regional Transmission Planning section.

[817] Exelon Initial Comments at 4, 7-8; Industrial Customers Initial Comments at 18; Mississippi Commission Initial Comments at 34; Nebraska Commission Initial Comments at 3-4; NRECA Initial Comments at 27-28; NRG Initial Comments at 6-9, 14;

20 years would fail to sufficiently capture Long-Term Transmission Needs given that at least some of the drivers of such needs extend up to 20 years into the future (e.g., many state laws include requirements to be met 15 to 20 years in the future). Additionally, a shorter minimum transmission planning horizon may not allow for sufficient time to develop Long-Term Regional Transmission Facilities with long lead-time requirements or to compare alternative transmission solutions to identify more efficient or cost-effective transmission solutions to meet Long-Term Transmission Needs.

350. We disagree with commenters that assert requiring a 20-year transmission planning horizon is incompatible with planning horizons used with state integrated resource planning.[818] In addition to the discussions in the Overall Need for Reform and Legal Authority to Adopt Reforms for Long-Term Regional Transmission Planning sections regarding state integrated resource planning, we note that regardless of the planning horizon used in a state integrated resource planning process, the results of that process can be incorporated into Long-Term Regional Transmission Planning to identify Long-Term Transmission Needs. In fact, as explained in State-Approved Utility Integrated Resource Plans and Expected Supply Obligations for Load-Serving Entities (Factor Category Three) section below, integrated resource plans are part of the Categories of Factors and thus, transmission providers must incorporate information on

Omaha Public Power Initial Comments at 3-4; PJM Initial Comments at 5, 58-62; US Chamber of Commerce Initial Comments at 6; Utah Commission Initial Comments at 13.

[818] SERTP Sponsors Initial Comments at 21.

the load-serving entities' projected loads and resources over the planning horizon. The fact that a state integrated resource plan does not extend out a full 20 years—or extends further into the future—does not change the obligation for transmission providers to incorporate the information that is available over the 20-year transmission planning horizon.

351. In response to ISO-NE, and Policy Integrity,[819] the 20-year transmission planning horizon is distinct from the requirement to calculate benefits of an identified Long-Term Regional Transmission Facility over a minimum of 20 years from the estimated in-service date, as discussed in the Required Benefits section.

2. Frequency of Long-Term Scenario Revisions

a. NOPR Proposal

352. In the NOPR, the Commission proposed to require each transmission provider to develop Long-Term Scenarios at least every three years, by reassessing whether the data inputs and factors incorporated in the previously developed Long-Term Scenarios need to be updated and then revising the Long-Term Scenarios as needed to reflect updated data inputs and factors. The Commission also proposed to require that the development of Long-Term Scenarios be completed within three years, before the next three-year assessment commences.[820]

[819] ISO-NE Initial Comments at 23; Policy Integrity Initial Comments at 5.

[820] NOPR, 179 FERC ¶ 61,028 at P 97.

353. The Commission preliminarily found that a three-year frequency requirement balances the need of transmission providers to reassess changes in the resource mix and demand, as technology, markets, and policies have the potential to rapidly change, against the burden of developing Long-Term Scenarios that can take a year or longer to produce. The Commission stated that this three-year frequency requirement would allow transmission providers to identify new transmission needs driven by changes in the resource mix and demand during the interim years of the transmission planning period, and update previously identified transmission needs, if warranted.[821]

b. Comments

i. Support for Frequency of Long-Term Scenario Revisions

354. Many commenters support the Commission's proposal to require transmission providers in each transmission planning region to develop Long-Term Scenarios at least every three years, by reassessing whether the data inputs and factors incorporated in their previously developed Long-Term Scenarios need to be updated and then revising the Long-Term Scenarios as needed to reflect updated data inputs and factors.[822] Arizona

Commission and Interwest state that the proposed three-year process aligns with their existing regional transmission planning processes.[823] Several commenters assert that this proposal allows for Long-Term Scenarios to remain accurate and account for material technological, political, environmental, and operational developments in the energy industry,[824] with some commenters indicating that past experience demonstrates that the energy industry is rapidly changing.[825] For example, PIOs share that MISO recently recognized assumptions in its MISO Transmission Expansion Plan did not capture the rate of change for the region's fuel mix.[826]

355. Pennsylvania Commission states that routine reviews could update information and data, justify modifications to transmission plans, and reduce the risk of uneconomic

transmission investments.[827] ELCON notes that the proposed three-year reassessment provides the opportunity to consult recent data and update the probability of each scenario, which will produce better outcomes in the transmission planning process.[828] Joint Consumer Advocates state that long-term transmission plans must be revisited regularly and with sufficient frequency to ensure that they remain accurate and account for material developments.[829] AEE states that triennial updates will provide a suitable amount of time for stakeholders to complete comprehensive studies while also ensuring that scenarios do not become stale as advanced energy technology deployment scales more rapidly and policy changes disrupt existing assumptions.[830]

356. Louisiana Commission avers that the proposed three-year reassessment will prevent transmission providers from ignoring changes that might better reflect future assumptions.[831] PIOs state that a three-year update will also help address issues that could occur if a transmission provider is too aggressive or conservative when defining

[827] Pennsylvania Commission Initial Comments at 5.

[828] ELCON Initial Comments at 11.

[829] Joint Consumer Advocates Initial Comments at 8.

[830] AEE Initial Comments at 8-9.

[831] Louisiana Commission Reply Comments at 9.

scenarios.[832] DC and MD Offices of People's Counsel recommend that plans be updated every three years.[833]

357. Entergy and Interwest state that a three-year reassessment cycle balances the need for recent data and the time and resources needed to develop the updates.[834] LADWP states that a rolling near-term planning horizon provides the long-term transmission planning process with up-to-date information without being too frequent.[835] New Jersey Commission notes that reassessments more frequent than every three years would be overly burdensome.[836] Similarly, Nebraska Commission states that a frequency shorter than every three years would require almost constant updates from transmission providers, which would drive up costs, while a frequency longer than three to five years could risk the underlying information becoming stale between revisions.[837]

358. Certain TDUs suggest that the Commission address concerns that a three-year review period would put significant strain on transmission provider resources by clarifying that three-year assessments would review the key drivers and assumptions behind a transmission plan with updates as needed for material changes rather than a

[832] PIOs Initial Comments at 17.

[833] DC and MD Offices of People's Counsel Reply Comments at 2.

[834] Entergy Initial Comments at 11; Interwest Initial Comments at 6.

[835] LADWP Initial Comments at 3.

[836] New Jersey Commission Initial Comments at 11.

[837] Nebraska Commission Initial Comments at 4.

rerun of the full transmission planning process. In addition, Certain TDUs state that a three-year reassessment of initial transmission plans would result in more transparency and consideration of alternatives in the transmission planning process.[838] In contrast, PJM requests that the Commission clarify that Long-Term Scenarios would be completely updated with new data, updated factors, and the best information available at least every three years, not merely partially reassessed. PJM also requests that the Commission clarify that scenario evaluations will not overlap, as re-runs are expensive, and a predictable three-year clock will make the process run smoothly.[839]

359. AEP requests that the Commission require all transmission planning regions to continuously follow the same, consistent three-year transmission planning cycles to align future efforts and ease burdens on transmission providers and developers operating in multiple transmission planning regions and to promote better coordination among regions concerning potential interregional transmission solutions.[840]

360. Southeast PIOs support the NOPR proposal to require transmission providers to reassess and revise Long-Term Scenarios every three years, arguing that it would synchronize with existing state processes and ensure that long-term regional transmission plans remain an up-to-date resource for state planning.[841] Similarly, Certain TDUs argue

[838] Certain TDUs Reply Comments at 7.

[839] PJM Initial Comments at 6, 63-64.

[840] AEP Initial Comments at 5, 8, 13-14; AEP Reply Comments at 5.

[841] Southeast PIOs Reply Comments at 25.

that a five-year transmission planning cycle is too long and that a three-year transmission planning cycle would be more likely to account for unforeseen changes, helping to prevent inefficient transmission development and balance planning for future needs with the need to quickly identify material changes to planning assumptions.[842]

ii. Concerns about Frequency of Long-Term Scenario Revisions

361. Some commenters urge the Commission to provide flexibility for transmission providers to determine the frequency at which they must develop Long-Term Scenarios by reassessing whether the data inputs and factors incorporated in their previously developed Long-Term Scenarios need to be updated and then revising the Long-Term Scenarios as needed to reflect updated data inputs and factors.[843] EEI requests that the Commission allow transmission providers in each transmission planning region to initiate a new Long-Term Scenario process in lieu of a refresh of old Long-Term Scenarios.[844] California Commission and Omaha Public Power argue that requiring transmission providers to reassess and revise Long-Term Scenarios at least every three years will

[842] Certain TDUs Reply Comments at 5-6.

[843] Ameren Initial Comments at 12-13; American Municipal Power Initial Comments at 33; California Commission Initial Comments at 16; Duke Initial Comments at 11; ISO-NE Initial Comments at 24; MISO Initial Comments at 28-29; MISO TOs Initial Comments at 17; NARUC Initial Comments at 6-7; NESCOE Initial Comments at 25-26; OMS Initial Comments at 4-5; Pacific Northwest State Agencies Initial Comments at 15; Vermont State Entities Initial Comments at 5; WIRES Initial Comments at 7.

[844] EEI Initial Comments at 12.

create a significant compliance burden without improving planning outcomes, such as forecast accuracy.[845]

362. MISO TOs argue that flexibility is warranted because MISO is already implementing Long-Term Regional Transmission Planning, as well as reassessing its data as needed.[846] MISO states that the NOPR proposal is overly prescriptive, may not reflect stakeholder and regional needs, and could result in a compliance exercise without the prospect of transmission expansion.[847] NESCOE and OMS suggest that the Commission require transmission providers to reassess Long-Term Scenarios at regular intervals but leave the timing of that reassessment to the transmission planning region.[848] MISO also recommends that the Commission allow transmission providers to reuse Long-Term Scenarios as long as they update the relevant input data to reflect the latest available information.[849]

363. Duke asserts that the Commission should allow transmission planning regions to propose their own cycles to reassess and revise Long-Term Scenarios to meet the needs of the region, keep pace with markets and policies across the country, and align their

[845] California Commission Initial Comments at 16; Omaha Public Power Initial Comments at 3.

[846] MISO TOs Initial Comments at 17.

[847] MISO Initial Comments at 28.

[848] NESCOE Initial Comments at 25-26; OMS Initial Comments at 4-5.

[849] MISO Initial Comments at 29.

processes with state integrated resource planning processes.[850] Similarly, WIRES requests a variance to the proposed three-year scenario reassessment requirement because three years may be too short and could potentially be disruptive or increase costs. WIRES further asks that the Commission clarify that transmission providers are not required to reassess previously approved transmission projects as part of their triennial review process.[851]

364. Pacific Northwest State Agencies state that the Commission should set three years as a minimum and provide transmission planning regions with the flexibility to work with states to determine the appropriate schedule for developing Long-Term Scenarios.[852] Similarly, Vermont State Entities and Pennsylvania Commission argue that transmission planning regions should have the flexibility to conduct reassessments at intervals shorter than every three years.[853]

365. NYISO recommends that the final rule should allow transmission planning regions to modify or add to their Long-Term Scenarios to account for changes that would significantly affect their analysis when they occur instead of waiting for the next transmission planning cycle. NYISO further requests that the Commission clarify that, if

[850] Duke Initial Comments at 12.

[851] WIRES Initial Comments at 7.

[852] Pacific Northwest State Agencies Initial Comments at 15.

[853] Pennsylvania Commission Initial Comments at 5; Vermont State Entities Initial Comments at 5.

a transmission planning region requires more than three years to complete a given transmission planning cycle, it may extend the three-year time period. In addition, NYISO requests that the Commission permit transmission providers in each transmission planning region to commence the next Long-Term Regional Transmission Planning cycle using current information even if the prior transmission planning cycle is running in parallel. NYISO adds that the Commission should allow transmission planning regions to use their existing Long-Term Scenarios for the duration of a Long-Term Regional Transmission Planning cycle, even if it runs beyond three years, to avoid stopping and re-starting that cycle due to changes in circumstances.[854]

366. Some commenters raise concerns that the proposal to require development of Long-Term Scenarios at least every three years may create overlapping planning assessments and suggest ways to avoid that situation.[855] ISO-NE states that the timeframe for Long-Term Regional Transmission Planning should account for all the elements of the process, such as implementing the process for selecting transmission solutions, before the next long-term study begins. ISO-NE indicates that this will allow subsequent Long-Term Regional Transmission Planning studies to account for the

[854] NYISO Initial Comments at 19.

[855] Eversource Initial Comments at 15; ISO-NE Initial Comments at 24; NESCOE Initial Comments at 26; PJM Initial Comments at 63.

outcomes of the preceding transmission planning cycle and avoid unnecessary study overlap between cycles.[856]

367. Eversource suggests that the Commission require completion of project selection before the development of the next set of Long-Term Scenarios, arguing that it would undermine the project selection process if the current three-year Long-Term Scenario cycle fails to include selected transmission facilities from the prior three-year cycle.[857]

368. Similarly, NESCOE is concerned that the three-year Long-Term Scenario cycle requirement is inflexible and could interfere with existing procedures in New England. NESCOE states that ISO-NE's longer-term transmission planning process requires that a planning process be concluded before a new one can begin, and that a request for a longer-term transmission study may be submitted to ISO-NE no earlier than six months after the conclusion of the prior study.[858]

369. Some commenters argue that requiring transmission providers to reassess and revise their Long-Term Scenarios every three years may be too frequent and costly, asserting that between every three and five years may be more appropriate.[859] ITC avers that a three-year transmission planning cycle for Long-Term Regional Transmission

[856] ISO-NE Initial Comments at 24.

[857] Eversource Initial Comments at 15.

[858] NESCOE Initial Comments at 26.

[859] ACEG Initial Comments at 7, 25; Breakthrough Energy Initial Comments at 12-13; EEI Initial Comments at 12; Indicated PJM TOs Initial Comments at 11-12; ITC Initial Comments at 5, 9-11; Pine Gate Initial Comments at 19-20.

Planning would exceed the capabilities of the transmission providers administering the process.[860] Likewise, NRECA asserts that developing multiple Long-Term Scenarios and updating them every three years will require significant time and resources, as well as substantial changes in transmission planning throughout the country. NRECA asserts that existing power supply and transmission planning models employ different assumptions that cannot be used to prepare 20-year Long-Term Scenarios, much less update them every three years.[861]

iii. Support for Different Frequency of Long-Term Scenario Revisions

370. Western PIOs support mandating a two-year timeframe for revision, as three years may be too long and therefore may miss important updated data inputs.[862]

371. Shell argues that the Commission should require transmission providers to reassess and revise their Long-Term Scenarios every five years, asserting that the proposal to use three years could create too much uncertainty and delay the development of renewable generation being developed to comply with state climate objectives and resource adequacy requirements in forward-looking capacity markets.[863] Indicated PJM TOs argue that three years may be insufficient to perform relevant studies and

[860] ITC Initial Comments at 10.

[861] NRECA Initial Comments at 23 (citing GDS Assocs., Report, at 8-10 (Aug. 17, 2022)).

[862] Western PIOs Initial Comments at 30.

[863] Shell Initial Comments at 18-19.

recommend that the Commission provide transmission providers with the flexibility to adopt four- or five-year transmission planning cycles.[864]

372. Exelon argues that a three-year transmission planning cycle is too short, as it is unlikely that transmission needs will surface within three years, and that conducting a study so soon could create uncertainty that recently selected transmission projects will be revisited. Exelon instead recommends that the final rule adopt a five-year transmission planning cycle requirement with a provision that requires transmission providers to initiate a new cycle sooner, with good reason, to better align with the time needed to permit and construct new transmission infrastructure.[865]

373. Similarly, PPL argues that a five-year transmission planning cycle will allow sufficient time for one transmission planning cycle to be completed before the subsequent cycle commences.[866] Pine Gate states that a five-year transmission planning cycle is warranted given the size and complexity of transmission planning regions and the time needed to receive and incorporate stakeholder feedback and to achieve consensus on cost allocation. Pine Gate further notes that a five-year transmission planning cycle would more closely align the results of Long-Term Regional Transmission Planning with the time horizons for reliability planning and other transmission planning processes.[867]

---

[864] Indicated PJM TOs Initial Comments at 11-12.

[865] Exelon Initial Comments at 9.

[866] PPL Initial Comments at 6.

[867] Pine Gate Initial Comments at 20-21.

374. SPP argues in favor of the update procedures in its current transmission planning processes rather than the three-year schedule for updating Long-Term Scenarios proposed in the NOPR. SPP states that it performs a 20-year assessment that incorporates Long-Term Scenarios at least once every five years and that, on an annual basis, SPP assesses data inputs and factors incorporated into the assessment.[868]

iv. Miscellaneous Comments

375. Several commenters state that the Commission should regularly review transmission planning processes and assumptions to account for new developments.[869] Pattern Energy states that the best way to make 20-year transmission plans useful is for their outputs to be fed into near-term (i.e., five-to-seven-year horizon) transmission planning activities.[870]

376. ELCON recommends that the Commission hold a technical conference after the first three-year reassessment period for Long-Term Scenarios to allow transmission providers to offer their experiences with and best practices for Long-Term Regional Transmission Planning.[871]

c. Commission Determination

377. We modify the NOPR proposal to require transmission providers in each transmission planning region to reassess and revise the Long-Term Scenarios that they use in Long-Term Regional Transmission Planning at least once every five years. In implementing this requirement, transmission providers in each transmission planning region must reassess whether the data inputs and factors incorporated in previously developed Long-Term Scenarios need to be updated and then revise those Long-Term Scenarios, as needed, to reflect updated data inputs and factors. At the outset of a Long-Term Regional Transmission Planning cycle, transmission providers may develop the new Long-Term Scenarios either by crafting entirely new Long-Term Scenarios, or by updating the data inputs and factors of previously developed Long-Term Scenarios.

378. To assist transmission providers in implementing the requirement to reassess and revise Long-Term Scenarios used in Long-Term Regional Transmission Planning at least once every five years, we clarify that the process, which begins with the development of Long-Term Scenarios using best available data inputs, and proceeds to identifying Long-Term Transmission Needs, measuring the benefits of Long-Term Regional Transmission Facilities to address those needs, and evaluating and deciding whether to select Long-Term Regional Transmission Facilities (collectively, the Long-Term Regional Transmission Planning cycle),[872] must conclude at a date that is no later than five years after the date that it began.

[872] The Long-Term Regional Transmission Planning cycle encompasses all components of Long-Term Regional Transmission Planning, including each of these

379. While we find that the record supports a five-year interval before new Long-Term Scenarios must be developed, we also conclude that transmission providers should not need the full five-year period to reach the point in Long-Term Regional Transmission Planning at which they decide whether to select Long-Term Regional Transmission Facilities that they have evaluated. Accordingly, we require transmission providers to complete the steps of the Long-Term Regional Transmission Planning cycle and determine whether to select Long-Term Regional Transmission Facilities no later than three years from the date when the Long-Term Regional Transmission Planning cycle began.[873] Specifically, we find the record demonstrates that three years provides sufficient time for transmission providers to develop Long-Term Scenarios, identify Long-Term Transmission Needs, measure the benefits of Long-Term Regional Transmission Facilities to address those needs, and evaluate and decide whether to select Long-Term Regional Transmission Facilities.[874] At the same time, we are persuaded by

---

foundational steps.

[873] To be clear, nothing in this final rule prevents transmission providers from evaluating and selecting *additional* Long-Term Regional Transmission Facilities after year three of the Long-Term Regional Transmission Planning cycle and before the next five-year Long-Term Regional Transmission Planning cycle begins. However, if Long-Term Regional Transmission Facilities are selected at year three of the Long-Term Regional Transmission Planning cycle, those same Long-Term Regional Transmission Facilities cannot be de-selected during the remainder of the current five-year planning cycle.

[874] *See* ACORE Initial Comments at 10; Advanced Energy Buyers Initial Comments at 7; AEE Initial Comments at 8-9; AEP Initial Comments at 5, 8, 13-14; Amazon Initial Comments at 3; Arizona Commission Initial Comments at 4; BP Initial Comments at 4; Breakthrough Energy Supplemental Comments at 1; CAISO Initial Comments at 21; California Water Initial Comments at 15; Clean Energy Associations

commenters' concerns that requiring the Long-Term Regional Transmission Planning cycle to repeat at three-year intervals could be administratively burdensome, and that the benefit of updating Long-Term Scenarios every three years may not outweigh those additional burdens.[875] We therefore find that requiring selection decisions to occur within three years of commencing a Long-Term Regional Transmission Planning cycle, while allowing as long as five years between the commencement of each planning cycle, strikes an appropriate balance by ensuring timely identification, evaluation, and selection of more efficient or cost-effective Long-Term Regional Transmission Facilities, while balancing the administrative burden associated with updating the Long-Term Scenarios

Initial Comments at 10; Clean Energy Buyers Initial Comments at 13; DC and MD Offices of People's Counsel Initial Comments at 8; Entergy Initial Comments at 11; Idaho Power Initial Comments at 4; Interwest Initial Comments at 6-8; Joint Consumer Advocates Initial Comments at 8; Nevada Commission Initial Comments at 7; New England Offshore Wind Initial Comments at 2; New Jersey Commission Initial Comments at 11; NYISO Initial Comments at 18; Pacific Northwest State Agencies Initial Comments at 13-14; Pennsylvania Commission Initial Comments at 5; PG&E Initial Comments at 6; PIOs Initial Comments at 16; PJM Initial Comments at 5-6, 63; SEIA Initial Comments at 6; SPP Market Monitor Initial Comments at 6; US DOE Initial Comments at 11; Vermont State Entities Initial Comments at 5; WE ACT Initial Comments at 3.

[875] *See* Ameren Initial Comments at 12-13; American Municipal Power Initial Comments at 33; California Commission Initial Comments at 16; Duke Initial Comments at 11; ISO-NE Initial Comments at 24; MISO Initial Comments at 28-29; MISO TOs Initial Comments at 17; NARUC Initial Comments at 6-7; NESCOE Initial Comments at 25-26; OMS Initial Comments at 4-5; Pacific Northwest State Agencies Initial Comments at 15; Vermont State Entities Initial Comments at 5; WIRES Initial Comments at 7.

that form the basis for Long-Term Regional Transmission Planning during each planning cycle.[876]

380. We find that requiring transmission providers to reassess and revise Long-Term Scenarios used in Long-Term Regional Transmission Planning at least once every five years is necessary to ensure that the Long-Term Scenarios accurately reflect factors that may change over the five-year time span, such as changes in technology, load forecasts, or federal, federally-recognized Tribal, state, or local laws. Furthermore, regular scenario reassessment and revision may also address some of the uncertainty associated with Long-Term Regional Transmission Planning over a 20-year transmission planning horizon that some commenters assert may result in under-building or over-building transmission facilities.[877] As discussed below in the Specificity of Data Inputs section, nothing in this final rule prohibits transmission providers from updating the inputs used to inform Long-Term Scenarios during a Long-Term Regional Transmission Planning cycle.

381. As discussed in the Evaluation and Selection of Long-Term Regional Transmission Facilities section of this final rule, transmission providers must designate a point in the evaluation process at which they will make a decision to either select or not

[876] Accordingly, we decline NYISO's request to clarify that the transmission provider may extend the transmission planning cycle. As explained, we find that three years provides sufficient time to complete the actions necessary to make selection decisions.

[877] Industrial Customers Initial Comments at 15-16, 19-21; NRECA Initial Comments at 18-19, 28; Vistra Initial Comments at 7.

select the relevant Long-Term Regional Transmission Facility (or portfolio of such Facilities). Further, we clarify that transmission providers must conclude a Long-Term Regional Transmission Planning cycle before developing Long-Term Scenarios at the beginning of the next Long-Term Regional Transmission Planning cycle. Given that, as we state directly above, nothing in this final rule prevents transmission providers from evaluating and selecting additional Long-Term Regional Transmission Facilities after year three of the Long-Term Regional Transmission Planning cycle and before the next five-year Long-Term Regional Transmission Planning cycle begins, we further find that transmission providers must designate the point in time or action that concludes a Long-Term Regional Transmission Planning cycle. Such designation will ensure transparency regarding whether the transmission providers are engaging in the evaluation and selection of additional Long-Term Regional Transmission Facilities after year three of the Long-Term Regional Transmission Planning cycle.

382. Some commenters express concern that the proposal to reassess Long-Term Scenarios in concurrent Long-Term Regional Transmission Planning cycles would create uncertainty as to which cycle produced the controlling outcome and would burden stakeholders (e.g., requiring them to provide input on the development of Long-Term Scenarios for the next Long-Term Regional Transmission Planning cycle while also requiring them to provide input on Long-Term Regional Transmission Facilities being considered for selection from the previous Long-Term Regional Transmission Planning

cycle).[878] By providing for a period of up to two years between the date by which transmission providers are required to make a decision to select or not select Long-Term Regional Transmission Facilities and the date by which the next Long-Term Regional Transmission Planning cycle must commence, and by clarifying that transmission providers must conclude one Long-Term Regional Transmission Planning cycle before another begins, this final rule will appropriately minimize confusion regarding overlap between planning assessments. Specifically, this clarification will allow transmission providers to use in subsequent Long-Term Regional Transmission Planning cycles updated base or reference cases that include all Long-Term Regional Transmission Facilities that were selected in a previous Long-Term Regional Transmission Planning cycle, including those not yet in service. We find that including the selected Long-Term Regional Transmission Facilities in subsequent Long-Term Regional Transmission Planning cycles will improve the accuracy of Long-Term Regional Transmission Planning.

383. In response to WIRES's request,[879] we clarify that transmission providers need not routinely reevaluate selected Long-Term Regional Transmission Facilities. However, we note that, as discussed further in the Evaluation and Selection of Long-Term Regional Transmission Facilities section below, we require transmission providers to reevaluate

[878] Eversource Initial Comments at 15; ISO-NE Initial Comments at 24; NESCOE Initial Comments at 26.

[879] WIRES Initial Comments at 7.

previously selected Long-Term Regional Transmission Facilities in certain specified circumstances.

384. Given that we are requiring transmission providers in each transmission planning region to reassess and revise Long-Term Scenarios used in Long-Term Regional Transmission Planning at least once every five years, thus establishing the maximum length of the Long-Term Regional Transmission Planning cycle, we affirm that to the extent that transmission providers believe that a shorter Long-Term Regional Transmission Planning cycle is appropriate for their transmission planning region and circumstances, they may propose on compliance to conduct Long-Term Regional Transmission Planning more frequently than every five years.

385. We find AEP's request to require all transmission planning regions to follow the same-length transmission planning cycles is beyond the scope of this proceeding.[880] In the NOPR, we proposed frequency requirements related to the Long-Term Regional Transmission Planning cycles but did not propose a requirement for transmission providers to align their regional transmission planning cycles with those of the transmission providers in neighboring transmission planning regions.

386. While we do not establish a technical conference after the first Long-Term Regional Transmission Planning cycle, as ELCON requests,[881] the Commission has discretion to conduct additional proceedings at a future date if it finds they are warranted.

---

[880] AEP Initial Comments at 5, 8, 14; AEP Reply Comments at 5.

[881] ELCON Initial Comments at 11.

3. Categories of Factors

a. Requirement to Incorporate Categories of Factors

i. NOPR Proposal

387. In the NOPR, the Commission proposed to require transmission providers to incorporate specific categories of factors in the development of Long-Term Scenarios as part of Long-Term Regional Transmission Planning.[882] Specifically, the Commission proposed to require transmission providers to incorporate, at a minimum, the following categories of factors in the development of Long-Term Scenarios: (1) federal, state, and local laws and regulations that affect the future resource mix and demand;[883] (2) federal, state, and local laws and regulations on decarbonization and electrification; (3) state-approved utility integrated resource plans and expected supply obligations for load-serving entities; (4) trends in technology and fuel costs within and outside of the electricity supply industry, including shifts toward electrification of buildings and transportation; (5) resource retirements; (6) generator interconnection requests and

[882] NOPR, 179 FERC ¶ 61,028 at PP 104-112.

[883] *Id.* P 104 n.189. The Commission explained that "state or federal laws or regulations" meant "enacted statutes (i.e., passed by the legislature and signed by the executive) and regulations promulgated by a relevant jurisdiction, whether within a state, municipality, or at the federal level."

withdrawals; and (7) utility and corporate commitments and federal, state, and local goals[884] that affect the future resource mix and demand.[885]

388. The Commission preliminarily found that incorporating, at a minimum, these categories of factors in the development of Long-Term Scenarios is appropriate because these categories of factors affect the future resource mix and demand, and their incorporation in Long-Term Scenarios is therefore essential to identifying transmission needs driven by changes in the resource mix and demand through Long-Term Regional Transmission Planning.[886] To the extent that transmission providers in a transmission planning region would like to incorporate additional categories of factors in the development of Long-Term Scenarios, the Commission proposed to require that they demonstrate on compliance with any final rule that the incorporation of more than the minimum categories is consistent with or superior to any final rule in this proceeding.[887]

389. Also, as discussed in the Coordination of Regional Transmission Planning and Generator Interconnection Processes section of the NOPR,[888] the Commission proposed to require that transmission providers consider in their Long-Term Regional

[884] *Id.* P 104 n.195. The Commission explained that "goal" meant "any commitment or statement expressed in writing that is not a law or regulation."

[885] *Id.* P 104.

[886] *Id.* P 105.

[887] *Id*.

[888] *Id.* PP 166-174.

Transmission Planning regional transmission facilities that address interconnection-related transmission needs that the transmission provider has identified multiple times in the generator interconnection process but that have never been constructed due to the withdrawal of the underlying interconnection request(s). The Commission proposed to require that transmission providers incorporate the specific interconnection-related needs identified through that proposed reform, in addition to one or more factors that more generally characterize generator interconnection withdrawals, as a factor in the generator interconnection requests and withdrawals category of factors in their development of Long-Term Scenarios.[889]

390. The Commission explained that incorporation of the categories of factors set forth above in developing Long-Term Scenarios would help facilitate the identification of transmission needs driven by changes in the resource mix and demand, which the Commission preliminarily found was necessary to ensure just and reasonable and not unduly discriminatory or preferential Commission-jurisdictional rates. The Commission explained that absent a requirement to incorporate these categories of factors in the development of Long-Term Scenarios, transmission providers may not incorporate known inputs that likely will affect the future resource mix and demand. Additionally, the Commission explained that transmission providers may not adequately identify transmission needs driven by changes in the resource mix and demand and evaluate the potential benefits of regional transmission facilities that may more efficiently or cost-

[889] *Id.* P 107.

effectively meet such needs. The Commission stated that, as an additional benefit, this requirement would provide clarity to transmission providers and stakeholders regarding which factors must be considered in scenario development.[890]

ii. Comments

(a) Requirement to Incorporate Categories of Factors

391. A number of commenters support the proposal to require transmission providers to incorporate in their development of Long-Term Scenarios the seven specific categories of factors identified in the NOPR.[891] Georgia Commission asserts that these categories of factors adequately capture the factors expected to drive changes in the resource mix and demand,[892] and APPA states that they reflect potential drivers of the need for new transmission.[893]

[893] APPA Initial Comments at 27-28.

392. AEE asks that the Commission clarify that consideration of each factor is mandatory, arguing that failing to take into account any of the seven listed categories of factors would risk under-investment in regional transmission facilities, which could result in unjust and unreasonable rates.[894] Evergreen Action and Pine Gate assert that the Commission should require that the seven factors are "incorporated" instead of "considered" in order to make clear that incorporation is not optional.[895] Otherwise, Pine Gate states, transmission providers may ignore certain categories relevant and critical to identifying needed transmission infrastructure.[896]

393. DC and MD Offices of People's Counsel also urge the Commission to require that all seven factor categories listed in the NOPR be included in Long-Term Scenarios.[897] DC and MD Offices of People's Counsel and ACEG state that the flexibility proposed in the NOPR could give transmission providers the option of not considering the last four factor categories.[898] SEIA recommends that the Commission establish guidelines on the information used to determine factors in the last four factor categories to ensure some level of certainty in how they are reflected in Long-Term Scenarios.[899]

394. Clean Energy Buyers support the NOPR proposal, arguing that requiring uniform categories of factors across transmission planning regions could promote efficiency and interregional coordination.[900] Southeast PIOs argue that broader consideration of resource trends and other transmission drivers through comprehensive scenarios will inform the decision-making of state authorities tasked with approving transmission facilities.[901] Indicated US Senators and Representatives express general support for proactive transmission planning that considers a broad range of factors.[902]

395. MISO TOs, MISO, and OMS state that existing MISO processes already identify and consider the proposed categories of factors to develop scenarios for transmission planning.[903] MISO TOs further claim that there is no need to require that MISO consider additional factors.[904] OMS supports the NOPR's proposed requirements as to the minimum categories of factors and asserts that the categories of factors proposed in the NOPR are all included in MISO's existing transmission planning processes.[905]

[900] Clean Energy Buyers Initial Comments at 14-15.

[904] MISO TOs Initial Comments at 18.

[905] OMS Initial Comments at 6.

396. Some commenters support the NOPR proposal because they note that it provides transmission providers with flexibility as to the specific factors they incorporate into their development of Long-Term Scenarios, as well as how they incorporate those factors.[906]

397. A few commenters support the NOPR proposal to allow transmission providers to incorporate additional categories of factors if they can demonstrate that doing so is consistent with or superior to the final rule.[907] Specifically, AEE states that the Commission should clarify that transmission providers can propose to consider other categories of factors.[908]

398. Pattern Energy states that the Commission should provide examples of how the categories of factors and their associated sensitivities may be modeled to ensure that each Long-Term Scenario is useful for Long-Term Regional Transmission Planning. For example, Pattern Energy asks whether the different scenarios alter the various assumptions for each (or some) of the factors. Alternatively, Pattern Energy asks whether the assumptions remained fixed across scenarios and different scenarios are designed to evaluate different transmission solutions.[909]

[909] Pattern Energy Initial Comments at 24.

(b) Requests for Flexibility

399. Some commenters argue that the Commission should give transmission providers more flexibility to determine the appropriate categories of factors or individual factors to include in their development of Long-Term Scenarios.[910] NESCOE contends that providing flexibility would be consistent with the Commission's approach in Order No. 1000, where it did not require the identification of transmission needs driven by any particular Public Policy Requirements.[911] PG&E argues that the Commission should allow transmission providers to experiment with how they define scenarios and factors to best reflect the policy and planning environments of their transmission planning regions.[912] EEI notes that not all of the factors listed in the NOPR may be relevant for all transmission planning regions during every long-term assessment and explains that private sector, federal, state, and local public policy goals may diverge or conflict, especially in multi-state regions.[913]

[910] Alabama Commission Initial Comments at 7; APPA Initial Comments at 27-28; Dominion Initial Comments at 25; Indicated PJM TOs Initial Comments at 8-9; MISO Initial Comments at 29; NARUC Initial Comments at 8-9; New York TOs Initial Comments at 11-12; NYISO Initial Comments at 8, 20; Pennsylvania Commission Initial Comments at 5-6; PG&E Initial Comments at 7.

[911] NESCOE Initial Comments at 27-28 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 207).

[912] PG&E Initial Comments at 7.

[913] EEI Initial Comments at 12-13.

400. ISO-NE requests that the Commission provide transmission providers with flexibility in the consideration of factors for inclusion in each scenario, noting that the factors may vary from study to study depending on the study objectives. Specifically, ISO-NE argues that the Commission should not require that each Long-Term Scenario account for and consistently reflect the first three categories of factors: federal, state, and local laws and regulations on the future resource mix, decarbonization and electrification, and state-approved integrated resource plans. ISO-NE emphasizes that the Commission should not require local laws to be consistently reflected in and accounted for in Long-Term Scenarios. ISO-NE argues that, in addition to being too prescriptive, such a requirement would introduce unnecessary and substantial administrative burdens and compliance risks with the possibility for inadvertent exclusion of a required law, regulation, or integrated resource plan. Moreover, ISO-NE contends, it would unnecessarily prevent testing of variations with these categories of factors, limiting the usefulness of scenario analysis.[914]

401. Idaho Commission and Idaho Power argue that the NOPR proposal is too prescriptive.[915] PJM advises the Commission not to include too many inflexible details in the implementation of the factors.[916] However, PJM generally supports the NOPR

[914] ISO-NE Initial Comments at 26-27.

[915] Idaho Commission Initial Comments at 3; Idaho Power Initial Comments at 5.

[916] PJM Initial Comments at 67.

proposal to create seven factors that should guide the development of scenarios with some additions and revisions.[917]

402. NYISO states that the Commission should not prescribe specific categories of factors that transmission providers must use and instead should allow each transmission planning region, in coordination with state entities and stakeholders, to determine to what extent and how the seven categories of factors should be applied.[918] SEIA disagrees, asserting that each proposed category of factors is broad enough to reflect regional differences within the category, but suggests that the Commission provide flexibility on implementation details. SEIA explains that the categories of factors do not set forth specific requirements on how much weight each factor should have in each Long-Term Scenario, what generation mix will result from the mix of factors, or what models to use. SEIA states that the Commission should allow transmission providers to include these implementation details in their manuals.[919]

403. Some commenters express support for some or all of the proposed categories of factors but request that the Commission provide transmission providers with flexibility in how they incorporate the factors into their development of Long-Term Scenarios.[920] For

[917] *Id*. at 6, 64.

[918] NYISO Initial Comments at 8, 20.

[919] SEIA Reply Comments at 3-4.

[920] Ameren Initial Comments at 9-12; APPA Initial Comments at 27-28; Arizona Commission Initial Comments at 5; Eversource Initial Comments at 16-17; ISO-NE Initial Comments at 26; LADWP Initial Comments at 3; TANC Initial Comments at 9-10.

example, TANC requests that the Commission allow transmission planning regions, in consultation with stakeholders, to exclude some of the proposed factors (i.e., regulatory and corporate goals or technology trends) from their development of Long-Term Scenarios.[921] TANC also advocates that the Commission should allow transmission planning regions to determine the manner in which other factors, namely trends, resource requirements, generator interconnection requests, and withdrawals, are incorporated in regional transmission planning studies. Although SPP states that most of the categories of factors are appropriate, it contends that requiring the listed factors to be incorporated, rather than considered, in development of Long-Term Scenarios could overburden the process.[922]

404. NEPOOL states that the categories of factors identified in the NOPR seem generic enough to allow implementation despite regional differences or changes in circumstances over time but contends that the Commission should carefully consider different market structures and potential changes to state policies to ensure that any requirement accommodates regional differences.[923] Pine Gate further requests clarification as to the degree of flexibility that the Commission will grant to transmission providers in how they incorporate each factor into Long-Term Scenarios.[924]

---

[922] SPP Initial Comments at 7-8.

[923] NEPOOL Initial Comments at 7.

[924] Pine Gate Initial Comments at 22-23.

(c) Concerns with the Requirement to Incorporate Categories of Factors

405. Large Public Power argues that the NOPR proposal ignores the Commission's fundamental responsibility to facilitate planning to meet the needs of load-serving entities, as well as Congress' recognition that load-serving entities themselves have a fundamental obligation to build transmission to meet their load.[925] Large Public Power asserts that the NOPR proposal to establish factors that look more broadly than the Commission's core obligations under the FPA threatens to undermine the needs of load-serving entities and their customers.[926] Further, Large Public Power contends that the Commission has no authority to direct the development of transmission facilities.[927] Similarly, some commenters voice concerns with the use of categories of factors to direct transmission investment.[928] Louisiana Commission states that the incorporation of speculative factors would result in a large-scale transmission build-out to accommodate the policy preference of some, at the cost of all.[929]

406. Undersigned States claim that the proposed requirement that each Long-Term Scenario "incorporate and be consistent" with certain factors does not address potentially

---

[925] Large Public Power Initial Comments at 19-20 (citing 16 U.S.C. 824q, (e)); *see also* NRECA Initial Comments at 17-18 (quoting 16 U.S.C. 824q(b)(4)), 19-20).

[927] *Id*. at 11 (citing 16 U.S.C. 824o(i)(2)).

[928] Industrial Customers Initial Comments at 11; Louisiana Commission Initial Comments at 17-19

[929] Louisiana Commission Initial Comments at 17-19.

irresolvable conflicts over how certain factors affect the future resource mix and demand.[930] PPL criticizes the NOPR for failing to explain how to translate the proposed factors into usable assumptions that can feed into transmission planning models, leading to increased uncertainty for transmission developers and greater difficultly in financing transmission projects or gaining siting approval.[931]

(d) Alternative Frameworks

407. Other commenters propose alternative frameworks for incorporating factors in the development of Long-Term Scenarios. PPL believes that the Commission's proposed categories of factors are largely overlapping and can be summarized and replaced by a single factor: reasonable expectations regarding the future resource mix and demand.[932] ENGIE suggests that, because the Commission's proposed factors may be too numerous for transmission providers to model, certain factors (i.e., laws, regulations, and announced retirements) should be fixed while others are varied or studied as sensitivities (i.e., costs, demand, and resource development trends).[933] PIOs state that the Commission must set minimum requirements for some factors, asserting that there is broad support for minimum requirements.[934]

---

[930] Undersigned States Initial Comments at 3.

[931] PPL Initial Comments at 8.

[932] *Id*. at 7.

[933] ENGIE Initial Comments at 3.

[934] PIOs Reply Comments at 10.

408. GridLab contends that the Commission's proposal to require that transmission providers incorporate specific categories of factors in the development of Long-Term Scenarios cannot be enforced and that such broad factors will not change investment outcomes. GridLab states that the proposed list of factors are a helpful minimum standard and recommends that the Commission focus on whether transmission providers have meaningfully incorporated them into Long-Term Regional Transmission Planning.[935] Further, GridLab avers that local laws and regulations and corporate commitments are difficult to incorporate into Long-Term Regional Transmission Planning in a bottom-up, meaningful way.[936] As an alternative, GridLab suggests that transmission providers could use aggregate assumptions and indicative scenario design and allow state and local agencies, as well as other stakeholders, to provide inputs into scenario development, and then evaluate whether the resulting scenarios are consistent with state, local, and corporate commitments.[937]

iii. Commission Determination

409. We adopt the NOPR proposal to require transmission providers in each transmission planning region to incorporate the seven specific categories of factors proposed in the NOPR, as modified in this final rule, in the development of Long-Term Scenarios. Specifically, as discussed in more detail below, transmission providers must

[935] GridLab Initial Comments at 21-22.

[936] *Id*. at 22.

[937] *Id*.

incorporate in the development of Long-Term Scenarios: (1) federal, federally-recognized Tribal,[938] state, and local laws and regulations affecting the resource mix and demand; (2) federal, federally-recognized Tribal, state, and local laws and regulations on decarbonization and electrification; (3) state-approved integrated resource plans and expected supply obligations for load-serving entities; (4) trends in fuel costs and in the cost, performance, and availability of generation, electric storage resources, and building and transportation electrification technologies; (5) resource retirements; (6) generator interconnection requests and withdrawals; and (7) utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs.[939] We address each of these categories of factors in the Specific Categories of Factors determination section below.

410. We find that existing regional transmission planning requirements fail to ensure that transmission providers adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs.[940] Many commenters in this proceeding, even some that may oppose the prescriptiveness of the requirement or otherwise request more flexibility in how transmission providers account for factors

[938] We emphasize that we are requiring transmission providers to incorporate laws and regulations into Long-Term Scenario development. As noted earlier, while we are providing this opportunity for federally-recognized Tribes to voluntarily participate, we are not imposing any requirements on them to participate.

[939] Modifications to the title of Factor Categories One, Two, Four, and Seven are discussed in the Specific Categories of Factors determination section.

[940] NOPR, 179 FERC ¶ 61,028 at PP 50-51.

affecting Long-Term Transmission Needs,[941] generally agree that the categories of factors outlined in the NOPR account for many of the known determinants of such needs. We find that incorporating the seven categories of factors in the development of Long-Term Scenarios is necessary because these categories of factors are essential to identifying Long-Term Transmission Needs. Further, we find that requiring transmission providers to incorporate the enumerated categories of factors in Long-Term Regional Transmission Planning will help to ensure that transmission providers are accounting for known and identifiable drivers of Long-Term Transmission Needs.

411. We are not persuaded by commenters' arguments that certain of the categories of factors may not be relevant in certain transmission planning regions and therefore that transmission providers should not be required to incorporate those categories of factors in the development of Long-Term Scenarios.[942] We decline to allow transmission providers to exclude some of the proposed categories of factors from being incorporated in the development of Long-Term Scenarios, as certain commenters request, because we conclude that each category of factors includes important determinants of Long-Term Transmission Needs. We are concerned that not requiring incorporation of all of the proposed categories of factors in Long-Term Scenarios would increase the likelihood that transmission providers will continue to underestimate—or omit entirely—certain known

[941] *See, e.g.*, EEI Initial Comments at 12-13; PJM Initial Comments at 64-67.

[942] See, *e.g.*, EEI Initial Comments at 12-13; SPP Initial Comments at 7-8.

determinants of Long-Term Transmission Needs in their regional transmission planning processes.

412. In response to AEE's request, we affirm that the seven categories of factors adopted in this final rule are the minimum set of known determinants of Long-Term Transmission Needs that transmission providers must incorporate into the development of their Long-Term Scenarios, and we decline to adopt the NOPR proposal to require transmission providers to demonstrate on compliance that the incorporation of additional categories of factors is consistent with or superior to any final rule in this proceeding.[943] Transmission providers may be aware of additional categories of factors beyond those adopted in this final rule that drive Long-Term Transmission Needs and, thus, should be incorporated into the development of Long-Term Scenarios. While transmission providers may incorporate additional categories of factors into the development of Long-Term Scenarios, we require in this final rule that each Long-Term Scenario remains plausible, as discussed further below.

413. We clarify that incorporating each category of factors into the development of Long-Term Scenarios means more than merely considering each category of factors in the development of Long-Term Scenarios.[944] Incorporating a category of factors in the development of Long-Term Scenarios means that transmission providers must use factors in the category, for each factor individually or collectively, to determine the assumptions

[943] AEE Initial Comments at 10.

[944] Evergreen Action Initial Comments at 4; Pine Gate Initial Comments at 22-23.

that will be used in the development of Long-Term Scenarios. Incorporating a category of factors into the development of Long-Term Scenarios does not require exacting precision; transmission providers may generalize how all of the discrete factors in a category of factors will, in the aggregate, affect the development of Long-Term Scenarios.[945] However, we expect that similar factors (or groups of factors) affecting a single assumption used in the development of Long-Term Scenarios will have an additive effect on that assumption.[946] We also expect that incorporating a category of factors into the development of Long-Term Scenarios will result in scenarios that differ from scenarios lacking that specific category of factors; that is, the incorporation of a category of factors should have a measurable impact on the Long-Term Scenario, compared to that same Long-Term Scenario, all else equal, if it had not incorporated that category of factors.

414. We believe that the best-available data requirement, which we adopt and discuss further below, should mitigate concerns that transmission providers may undermine

[945] For example, transmission providers could aggregate the effect of corporate goals by leveraging publicly available surveys of corporations' clean energy and electrification goals and then using those surveys to inform the assumptions used to develop Long-Term Scenarios (e.g., 10% more clean energy resources and 10% higher load growth for a Long-Term Scenario that assumes full achievement of those goals than in a Long-Term Scenario that does not consider such goals).

[946] For example, two independent factors that increase the likelihood of future electric storage resource development (e.g., (1) a state law requiring the deployment of at least 5 gigawatts of electric storage resources by 2030 and (2) a federal investment tax credit for the deployment of electric storage resources) would have a combined effect that exceeds the effect of either factor alone.

Long-Term Regional Transmission Planning by not incorporating categories of factors in a meaningful way.[947] The best-available data requirement will ensure that the data inputs that transmission providers use to incorporate categories of factors are timely, developed using best practices, and diverse and expert perspectives. We also clarify that, as a consequence of the requirement that all Long-Term Scenarios must be plausible, as well as the requirement that all Long-Term Scenarios must be diverse, both of which we adopt and discuss below, transmission providers must incorporate the categories of factors in the development of Long-Term Scenarios in a way that results in plausible and diverse Long-Term Scenarios.

415. As to the factors within each category that transmission providers must account for when they incorporate each category of factors in the development of Long-Term Scenarios, we require transmission providers to account for the factors that they have determined are likely to affect Long-Term Transmission Needs. As explained above, these Long-Term Transmission Needs include, but are not limited to, evolving reliability concerns and changes in the resource mix, and changes in demand. For each factor (or group of similar factors) within each category of factors that transmission providers identify, in coordination with stakeholders through an open and transparent process as described below, transmission providers must make a determination as to how that factor (or group of similar factors) is likely to affect Long-Term Transmission Needs. Transmission providers must then account for the factors that they have determined are

[947] *E.g.*, ACEG Initial Comments at 28.

likely to affect Long-Term Transmission Needs in the development of the Long-Term Scenarios used in Long-Term Regional Transmission Planning. We clarify, however, that transmission providers in a transmission planning region need not account for a factor, stakeholder-identified or otherwise, if they determine that factor is unlikely to affect Long-Term Transmission Needs.

416. We also clarify that a category of factors (e.g., Factor Category Two: federal, federally-recognized Tribal, state, and local laws and regulations on decarbonization and electrification) differs from a specific factor (e.g., a specific state law with a decarbonization requirement). We make this distinction because some commenters use only the word "factors" when describing the categories of factors proposed in the NOPR.[948]

417. We disagree with commenters that the categories of factors requirements are too prescriptive,[949] and we believe that the framework adopted in this final rule requiring transmission providers to incorporate categories of factors into the development of Long-Term Scenarios strikes the right balance between prescriptive requirements and flexibility. Transmission providers have discretion to determine whether specific factors must be accounted for within each category (i.e., if the specific factor will likely affect Long-Term Transmission Needs), how to account for specific factors in the development

[948] *E.g.*, AEE Initial Comments at 9; Evergreen Action Initial Comments at 4.

[949] ISO-NE Initial Comments at 26; NYISO Initial Comments at 8, 20; PJM Initial Comments at 67.

of Long-Term Scenarios (e.g., the method and data used to forecast resource retirements), and how to vary the treatment of each category of factors across Long-Term Scenarios (e.g., assume all forecasted resource retirements materialize in some but not all Long-Term Scenarios), so long as transmission providers assume that the laws, regulations, state-approved integrated resource plans, and expected supply obligations for load-serving entities identified in the first three categories of factors—that transmission providers have determined are likely to affect Long-Term Transmission Needs—are fully met (as discussed below). We believe that each proposed category of factors is broad enough to allow the transmission providers in each transmission planning region to reflect regional differences within the category, as noted by SEIA and NEPOOL.[950] In response to PG&E's request that we allow flexibility for transmission providers to use Long-Term Scenarios that best reflect the individual policy and planning environments in their specific transmission planning regions, and to Pattern Energy's questions about how categories of factors may be modeled,[951] we clarify that transmission providers have the flexibility to develop different Long-Term Scenarios specific to their transmission planning region and develop using assumptions based on the categories of factors.

418. In response to NESCOE, we decline to give transmission providers the flexibility to choose which of the proposed categories of factors to incorporate into Long-Term Scenarios, which NESCOE states would be consistent with the flexibility that the

[950] NEPOOL Initial Comments at 7; SEIA Reply Comments at 3-4.

[951] Pattern Energy Initial Comments at 24; PG&E Initial Comments at 7.

Commission provided to transmission providers in Order No. 1000, where it did "not . . . require the identification of any particular transmission need driven by any particular Public Policy Requirements."[952] As noted in The Overall Need for Reform section, there are deficiencies in the Commission's existing regional transmission planning requirements, including that they fail to ensure that transmission providers adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs. We are concerned that, if transmission providers have flexibility to choose which of the proposed categories of factors to incorporate into the development of Long-Term Scenarios, they will continue to underestimate—or omit entirely—certain known determinants of Long-Term Transmission Needs in their regional transmission planning processes. Additionally, we note that transmission needs are distinct from categories of factors: as explained above, categories of factors, and specific factors therein, form the basis for assumptions that will be used in the development of Long-Term Scenarios that transmission providers will then use to identify Long-Term Transmission Needs.

419. We also disagree with arguments that we are directing the development of specific transmission facilities.[953] As an initial matter, transmission providers retain discretion to

[952] NESCOE Initial Comments at 27-28 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 207).

[953] *E.g.*, Large Public Power Initial Comments at 20-21; *see also* Alabama Commission Initial Comments at 4; Industrial Customers Initial Comments at 10; Louisiana Commission Initial Comments at 17-19; Pennsylvania Commission Initial Comments at 6.

determine how specific factors will affect Long-Term Transmission Needs. Moreover, the categories of factors requirements adopted in this final rule do not create new transmission needs that did not previously exist, but rather, they improve regional transmission planning processes by requiring transmission providers to identify Long-Term Transmission Needs across a plausible and diverse range of future scenarios and to identify, evaluate, and select Long-Term Regional Transmission Facilities to address those needs. If transmission providers do not account in Long-Term Regional Transmission Planning for known determinants of Long-Term Transmission Needs, then those needs would still exist and would likely be resolved, if at all, in a relatively inefficient or less cost-effective manner (e.g., in a piecemeal fashion through local transmission planning processes and/or generator interconnection processes). We are not requiring that transmission providers select any particular Long-Term Regional Transmission Facility and therefore are not directing the development of any particular transmission facilities. Finally, we clarify that while the requirement for transmission providers to incorporate the seven categories of factors adopted in this final rule into the development of Long-Term Scenarios is intended to ensure that Long-Term Regional Transmission Facilities are identified for selection to more efficiently or cost-effectively address Long-Term Transmission Needs, we do not believe that concerns over whether a transmission provider appropriately implemented this requirement represent an appropriate basis on which to challenge the cost allocation for one or more individual Long-Term Regional Transmission Facilities. Rather, whether the allocation of costs is just and reasonable and not unduly discriminatory is governed by the requirement that

costs be roughly commensurate with benefits, as discussed in the Regional Transmission Cost Allocation section below.

420. We disagree with Large Public Power's argument that we are ignoring the Commission's fundamental responsibility to facilitate planning to meet the needs of load-serving entities.[954] As described below, we are requiring all Long-Term Scenarios to be consistent with and fully account for factors in Factor Category Three, which includes state-approved integrated resource plans and the expected supply obligations of load-serving entities. Therefore, transmission providers are required to plan to meet the needs of load-serving entities.

421. We decline to adopt more specific minimum requirements than those described herein for incorporating categories of factors in the development of Long-Term Scenarios, as requested by some commenters.[955] We believe that the requirements adopted herein, coupled with the other Long-Term Scenarios requirements, including the plausible and diverse and best available data requirements, are sufficiently detailed to address the need for reform without limiting regional flexibility.

b. Specific Categories of Factors

i. NOPR Proposal

422. In the NOPR, the Commission proposed to require transmission providers to incorporate, at a minimum, the following categories of factors in the development of Long-Term Scenarios: (1) federal, state, and local laws and regulations that affect the future resource mix and demand;[956] (2) federal, state, and local laws and regulations on decarbonization and electrification; (3) state-approved utility integrated resource plans and expected supply obligations for load-serving entities; (4) trends in technology and fuel costs within and outside of the electricity supply industry, including shifts toward electrification of buildings and transportation; (5) resource retirements; (6) generator interconnection requests and withdrawals; and (7) utility and corporate commitments and federal, state, and local goals that affect the future resource mix and demand.[957]

(a) Federal, Federally-Recognized Tribal, State, and Local Laws and Regulations That Affect the Future Resource Mix and Demand (Factor Category One)

(1) Comments

423. Many commenters support the proposed requirement that each Long-Term Scenario incorporate and be consistent with the federal, state, and local laws and

[956] NOPR, 179 FERC ¶ 61,028 at P 104 n.189. The Commission explained that "state or federal laws or regulations" meant "enacted statutes (i.e., passed by the legislature and signed by the executive) and regulations promulgated by a relevant jurisdiction, whether within a state or municipality, or at the federal level."

[957] *Id.* P 104.

regulations that affect the future resource mix and demand.[958] AEE, Clean Energy States, and Acadia Center and CLF argue that laws and regulations implementing clean energy and decarbonization policies will be key drivers in changes to the resource mix and demand.[959] Moreover, AEE notes, 38 states and the District of Columbia have adopted renewable portfolio standards, many of which have been enacted in statute and constitute binding commitments on utilities and retail energy providers.[960] Clean Energy States similarly assert that the 21 states (plus the District of Columbia and Puerto Rico) with 100% clean energy policies account for 42.3% of United States power sales as of 2020, 49.4% of United States customer accounts, and 51% of United States population.[961] Clean Energy States argue that altogether, these states could see an aggregated demand for 800 TWh of new energy generation to meet their targets.

[960] AEE Initial Comments at 10 (citing Energy Info. Admin., *Renewable Energy Explained, Portfolio Standards* (June 29, 2021), https://www.eia.gov/energyexplained/renewable-sources/portfolio-standards.php).

[961] Clean Energy States Initial Comments at 3 (citing Clean Energy States Alliance, *100% Energy Collaborative*, https://www.cesa.org/projects/100-clean-energy-collaborative/).

424. AEE, DC and MD Offices of People's Counsel, and SEIA agree that transmission providers should incorporate the effects of federal, state, and local laws and regulations on renewable energy development into development of Long-Term Scenarios.[962] City of New York states that government action that bears the force of law should be reflected in baseline transmission planning studies and not considered as merely one of multiple factors used to develop Long-Term Scenarios.[963]

425. Southeast PIOs argue that concerns that requiring the incorporation of local laws and regulations in the development of Long-Term Scenarios is unduly burdensome are misplaced at this stage because the details of how it will be done will be established during compliance proceedings.[964]

426. PIOs argue that the Commission should require the same level of engagement with Tribal governments as it does with states and that the Commission should clarify that Long-Term Scenarios must incorporate relevant aspects of Tribal policies.[965]

427. Acadia Center and CLF claim that the Commission should clarify that state laws and regulations that affect the future resource mix and demand include state laws and regulations that affect demand management, such as energy efficiency, distributed

[962] AEE Initial Comments at 17-18, 22; DC and MD Offices of People's Counsel Reply Comments at 5-6; SEIA Initial Comments at 7-8.

[963] City of New York Initial Comments at 7.

[964] Southeast PIOs Reply Comments at 26.

[965] PIOs Reply Comments at 15.

generation, flexible load, and demand response because laws and initiatives in this area will also affect transmission needs while providing grid solutions.[966]

428. Center for Biological Diversity states that the Commission must include all Executive Actions, not just laws and regulations, as factors in Long-Term Regional Transmission Planning. Center for Biological Diversity states that allowing transmission providers to decide whether to consider Executive Orders fails to provide stakeholders with the type of clarity that is a goal of the NOPR.[967]

429. As noted above, some commenters oppose the overall categories of factors requirement in this final rule and argue that requiring transmission providers to incorporate certain factors, such as laws and regulations that affect the resource mix, will force transmission providers to settle irresolvable conflicts among state policies and conduct transmission planning that accommodates the policy preferences of some, at the cost of all.[968]

430. Some commenters acknowledge that state laws and regulations may affect the future resource mix and demand but argue against mandatory inclusion such that they cannot discount certain federal, state, and local laws and regulations.[969] Idaho Power

[966] Acadia Center and CLF Initial Comments at 9.

[967] Center for Biological Diversity Initial Comments at 3, 9-12.

[968] Louisiana Commission Initial Comments at 17-18; Undersigned States Initial Comments at 3.

[969] Ameren Initial Comments at 9-10; NESCOE Initial Comments at 27-28; NYISO Initial Comments at 8, 20.

states that the NOPR proposal does not provide transmission providers with the flexibility necessary to create transmission planning regions that span multiple states and could cause non-jurisdictional entities to opt out of regional transmission planning.[970] NYISO states that the final rule should not require transmission providers to assume across all scenarios the full achievement of all federal, state, and local laws and regulations that could drive the need for transmission. NYISO also does not think that the final rule should require the identification of all federal, state, and local laws and regulations that may drive the need for transmission over the 20-year transmission planning horizon, but instead should provide each transmission planning region with flexibility.[971]

431. Although Duke agrees that many of the categories of factors identified in the NOPR capture a minimum list of factors that are expected to drive changes in the resource mix and demand, it does not support the inclusion of local laws and regulations.[972]

(2) Commission Determination

432. We adopt the NOPR proposal, with modification, to require transmission providers in each transmission planning region to incorporate Factor Category One: federal, federally-recognized Tribal, state, and local laws and regulations affecting the resource mix and demand, in the development of Long-Term Scenarios. We find that the

[970] Idaho Power Initial Comments at 7.

[971] NYISO Initial Comments at 8.

[972] Duke Initial Comments at 13-14.

factors in this category have been, and will continue to be, key drivers of Long-Term Transmission Needs and therefore must be accounted for in Long-Term Regional Transmission Planning. Accordingly, we find that failing to account for factors in Factor Category One would hamper the identification, evaluation, and selection of Long-Term Regional Transmission Facilities that are potentially more efficient or cost-effective solutions to Long-Term Transmission Needs.

433. We clarify that factors in Factor Category One include, among other things, legally binding obligations, incentives (e.g., tax credits), and/or restrictions promulgated by policymakers that will affect new or existing generators, or demand. Further, as discussed in the Additional Categories of Factors section below, we recognize that energy equity and justice laws and regulations are also potential factors within Factor Category One to the extent that they are likely to affect Long-Term Transmission Needs.

434. As discussed in further detail below in the Additional Categories of Factors section, we modify the NOPR proposal for Factor Category One to include federally-recognized Tribal laws and regulations affecting the resource mix and demand because we are persuaded by commenters that contend that such factors have a similar potential to affect Long-Term Transmission Needs as federal, state, and local laws and regulations. Federally-recognized Tribal laws and regulations mean the legally binding obligations, incentives, and/or restrictions promulgated by federally-recognized Tribes that will affect new or existing generators, or demand. We make similar modifications to Factor Category Two and Factor Category Seven, as discussed in the Factor Category Two and Factor Category Seven sections below.

435. We are not persuaded by Louisiana Commission's argument that requiring transmission providers to incorporate certain factors, such as federal, federally-recognized Tribal, state, and local laws and regulations affecting the resource mix and demand, would result in a transmission buildout that only accommodates the policy preferences of some stakeholders, at the cost of all transmission customers.[973] Similarly, we are not persuaded by Undersigned States' contention that policy differences among states may be irresolvable, and therefore the Commission should not require transmission providers to account for laws and regulations in their Long-Term Scenarios.[974] First, every policy choice—from federal tax incentives and state regulation of generation, down to local economic development policies—that changes the quantity and location of generation and load contributes to changes in transmission needs. Accordingly, all transmission buildout—whether it occurs through a local or regional transmission plan, or through a near-term transmission planning process or a more forward-looking one—is a reflection, at least in part, of federal, federally-recognized Tribal, state, and local laws and regulations that drive transmission needs. Rather than a unique feature of Long-Term Regional Transmission Planning, transmission planning of any kind will inherently reflect the policy choices of multiple decisionmakers, because the quantity and location of generation and load are shaped by multiple decisionmakers.

[973] Louisiana Commission Initial Comments at 17.

[974] Undersigned States Initial Comments at 3.

436. Second, we find that requiring transmission providers to properly account for known determinants of Long-Term Transmission Needs is necessary to ensure just and reasonable rates. Specifically, because, as described above, Long-Term Transmission Needs driven by disparate policy decisions would continue to exist, regardless of whether they were identified in Long-Term Regional Transmission Planning, failing to identify, evaluate, and select Long-Term Regional Transmission Facilities to address those needs will result in unjust and unreasonable rates. We note that some policy decisions are reflected in laws and regulations, which can affect load-serving entities' supply obligations, and in transmission planning regions with vertically integrated utilities, some policy decisions are reflected in the integrated resource plans approved by retail regulators.

437. We are not endorsing the merits of any specific federal, federally-recognized Tribal, state, or local laws and regulations or of any specific state-approved integrated resource plans. We emphasize that the Commission's policies are technology neutral, and we are not establishing a preference for certain types of generation or energy end uses. We acknowledge that, in some instances, a policy choice in one jurisdiction may reduce or negate the effect of a policy choice in another jurisdiction. However, the fact that certain factors may have conflicting effects on Long-Term Transmission Needs is not a basis to conclude that the effects of laws and regulations or state-approved integrated resource plans should be ignored or discounted.

(b) Federal, Federally-Recognized Tribal, State, and Local Laws and Regulations on Decarbonization and Electrification (Factor Category Two)

(1) Comments

438. Several commenters support the proposed requirement that Long-Term Scenarios incorporate federal, state, and local laws and regulations on decarbonization and electrification.[975] Illinois Commission notes that, in Illinois, the Climate and Equitable Jobs Act of 2021 will affect future demand and the supply mix and that Long-Term Regional Transmission Planning will be critical to meeting Illinois' policy goals.[976] New England for Offshore Wind states that electrification to meet New England states' greenhouse gas emissions mandates will dramatically increase electricity load and require massive amounts of clean energy.[977] Pattern Energy states that federal and state legislative efforts to promote decarbonization should be the basis of scenario modeling for generation and demand.[978] Center for Biological Diversity states that the Commission should identify decarbonization as an objective in Long-Term Regional Transmission

[975] Acadia and CLF Initial Comments at 9; Center for Biological Diversity Initial Comments at 7-9; Clean Energy Associations Initial Comments at 10-11; DC and MD Offices of People's Counsel Reply Comments at 6; Illinois Commission Initial Comments at 4-5; New England for Offshore Wind Initial Comments at 2-3; Pacific Northwest State Agencies at Initial Comments at 14; Pattern Energy Initial Comments at 26; Pine Gate Initial Comments at 23; PIOs Initial Comments at 17-18; Renewable Northwest Initial Comments at 19-22.

[976] Illinois Commission Initial Comments at 4-5.

[977] New England for Offshore Wind Initial Comments at 2-3.

[978] Pattern Energy Initial Comments at 26.

Planning because it has the authority and responsibility to prioritize decarbonization in the transmission planning process since these policies bear directly on the provision of transmission service.[979]

439. Nevada Commission acknowledges that other state policies and its own integrated resource planning process should be considered in Long-Term Regional Transmission Planning even though it does not support other state policies affecting Nevada ratepayers.[980] Utah Division of Public Utilities states that the impact of state policies should be part of the Long-Term Regional Transmission Planning scenario analysis.[981] Cypress Creek asserts that the Commission should include state policy requirements in a uniform set of assumptions that are applicable across all Long-Term Scenarios.[982]

(2) Commission Determination

440. We adopt the NOPR proposal, with modification, to require transmission providers in each transmission planning region to incorporate Factor Category Two: federal, federally-recognized Tribal, state, and local laws and regulations on decarbonization and electrification, in the development of Long-Term Scenarios. Similar to Factor Category One, we find that the factors in this category have been, and will

[979] Center for Biological Diversity Initial Comments at 7-9 (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 89-93).

[980] Nevada Commission Initial Comments at 8.

[981] Utah Division of Public Utilities Reply Comments at 4.

[982] Cypress Creek Reply Comments at 5-6.

continue to be, key drivers of Long-Term Transmission Needs and therefore must be accounted for in Long-Term Regional Transmission Planning. We clarify that this category of factors includes legally binding obligations, incentives, and/or restrictions that affect Long-Term Transmission Needs in different ways than Factor Category One, for example, by limiting the carbon intensity of electricity generation or electrifying energy end uses and thereby significantly increasing electricity use in certain sectors of the economy, such as transportation and building heating and cooling. We acknowledge that there could be overlap between Factor Categories One and Two because a certain law or regulation could reasonably be considered to fit into both categories. In such a circumstance, transmission providers must account for the law or regulation in one of the two categories, not both, to avoid double-counting of that factor's anticipated effect on Long-Term Transmission Needs. Since transmission providers must account for and be consistent with, and not discount, factors in the first three categories of factors equally once the transmission providers have determined that such a factor is likely to affect Long-Term Transmission Needs, we do not believe it is necessary to ensure that a certain factor is considered as part of Factor Category One instead of Factor Category Two (or vice versa), but rather it is only necessary to ensure that these factors are accounted for in the development of Long-Term Scenarios.

441. In addition, based on the record before us, we modify the NOPR proposal for Factor Category Two to include federally-recognized Tribal laws and regulations on decarbonization and electrification because we are persuaded by commenters that argue

that such factors have the same potential to affect Long-Term Transmission Needs as federal, state, and local laws and regulations on decarbonization and electrification.

442. Similar to our response in the Factor Category One section to commenters arguing that categories of factors involving federal, federally-recognized Tribal, state, and local laws and regulations would provide preference to some at the cost of all or result in irresolvable conflict,[983] we find that differences in if and how government entities promulgate laws and regulations concerning decarbonization and electrification (i.e., factors in Factor Category Two) do not diminish the effect of such laws and regulations. As such, Long-Term Scenarios must account for these key drivers of Long-Term Transmission Needs so that transmission providers can identify such needs through Long-Term Regional Transmission Planning and can identify, evaluate, and select Long-Term Regional Transmission Facilities to address those needs.

(c) State-Approved Utility Integrated Resource Plans and Expected Supply Obligations for Load-Serving Entities (Factor Category Three)

(1) Comments

443. Several commenters support the proposed requirement that each Long-Term Scenario incorporate state-approved integrated resource plans and expected supply obligations for load-serving entities.[984] NRECA and TAPS state that using Long-Term

[983] Louisiana Commission Initial Comments at 17-19; Undersigned States Initial Comments at 3. Comments originally summarized in PP 404-405.

[984] California Commission Initial Comments at 17; NRECA Initial Comments at 30; Pine Gate Initial Comments at 23; PIOs Initial Comments at 17-18; US Chamber of

Scenarios that satisfy expected load-serving entity supply obligations is consistent with FPA section 217(b)(4)'s directive to facilitate the planning and expansion of transmission to meet the reasonable needs of load-serving entities to satisfy their service obligations.[985] NRECA asserts that this category should be moved to the top of the list of categories of factors because state-approved integrated resource plans and load-serving entity supply obligations will incorporate state laws and regulations affecting resource mix, demand, decarbonization, and electrification. Additionally, NRECA contends that the changing characteristics of the distribution grid, such as distributed energy resources, storage, demand response, energy efficiency, and electrification of demand, will affect load-serving entity needs and should be incorporated in this category of factors.[986] Clean Energy Associations and ACEG agree.[987]

444. APPA and ACEG argue that the final rule should focus on the resource plans of load-serving entities and include a requirement for transmission providers to include in their Long-Term Regional Transmission Planning process a requirement to coordinate with load-serving entities.[988] ACEG argues that such a requirement is necessary because

not all load-serving entities either own generation or are overseen by a state regulator, meaning that they must rely on the Commission to ensure that transmission planning meets their needs.[989]

445. Several commenters clarify that they support the inclusion of load-serving entity demand as a factor in Long-Term Scenarios.[990] In addition, some commenters support the inclusion of load-serving entity generation resource planning as a factor in Long-Term Scenarios.[991] PIOs argue that the Commission should require load-serving entities to provide their generation and demand forecasts to transmission planning entities.[992] ACEG agrees and argues that PIOs' recommendation will decrease the burden on transmission planning entities and provide them with the information they need to determine the future resource mix.[993]

446. Entergy asserts that the Commission has identified the appropriate factors but explains that not all states conduct commission proceedings related to integrated resource plans and, for those states that do, the timelines are not necessarily the same. Thus,

[989] ACEG Reply Comments at 22-23.

[993] ACEG Reply Comments at 23.

Entergy requests that the Commission clarify that the term "state-approved utility integrated resource plans" will be construed broadly to include any resource plan developed and reviewed through a retail commission proceeding and submitted to the relevant transmission provider for use in Long-Term Regional Transmission Planning. Entergy asserts that such clarification would result in a range of benefits such as consistency of data with current local, state, and federal laws and expected retirements, additions, and corporate goals.[994]

(2) Commission Determination

447. We adopt the NOPR proposal to require transmission providers in each transmission planning region to incorporate Factor Category Three: state-approved integrated resource plans and expected supply obligations for load-serving entities, in the development of Long-Term Scenarios. We find it appropriate to require transmission providers to incorporate Factor Category Three because it reflects the outcomes of retail-level regulatory proceedings that will affect Long-Term Transmission Needs. Further, incorporation of Factor Category Three into Long-Term Scenarios will ensure that transmission providers properly account for resource planning and anticipated changes to demand, including increased integration of distributed energy resources. We note that the Commission shares concurrent jurisdiction over the bulk power system with retail regulators,[995] and we agree with commenters that note that FPA section 217(b)(4) directs

[994] Entergy Initial Comments at 15-16.

[995] *Compare* 16 U.S.C. 824d(a) (providing the Commission authority to regulate the rates charged by public utilities in connection with the transmission or wholesale sale

the Commission to facilitate the planning and expansion of transmission to meet the reasonable needs of load-serving entities to satisfy their service obligations.[996]

448. In response to commenters that note some retail regulators may review but not formally approve integrated resource plans, we clarify that, for this category of factors, state-approved integrated resource plans includes resource plans that are developed and reviewed through a retail proceeding in jurisdictions where the retail regulator does not formally approve such plans.[997] We grant Entergy's clarification request that the term "state-approved utility integrated resource plans" be construed broadly to include any resource plan developed and reviewed through a retail commission proceeding and submitted to the relevant transmission provider for use in Long-Term Regional Transmission Planning because it would enable a more complete consideration of state-approved integrated resource plans and expected supply obligations for load-serving entities.

---

of electric energy), *with id.* 824(a) (reserving certain state authorities).

[996] 16 U.S.C. 824q(b)(4) ("The Commission shall exercise the authority of the Commission under this chapter in a manner that facilitates the planning and expansion of transmission facilities to meet the reasonable needs of load-serving entities to satisfy the service obligations of the load-serving entities, and enables load-serving entities to secure firm transmission rights (or equivalent tradable or financial rights) on a long-term basis for long-term power supply arrangements made, or planned, to meet such needs.").

[997] Entergy Initial Comments at 15-16.

449. In response to APPA and ACEG's request for the Commission to require transmission providers to coordinate with load-serving entities,[998] we note that we require transmission providers, as described in further detail below, to provide an open and transparent process in their OATT that provides stakeholders, including load-serving entities, with a meaningful opportunity to propose potential factors and to provide input on how to account for specific factors in the development of Long-Term Scenarios.[999] However, in response to PIOs' request that the Commission require load-serving entities to provide their generation and demand forecast to transmission providers, we agree that such information will assist transmission providers in developing Long-Term Scenarios. Therefore, consistent with the information exchange transmission planning principle established in Order No. 890,[1000] we require load-serving entities that are taking transmission service pursuant to an OATT to provide transmission providers with

[998] ACEG Reply Comments at 22; APPA Initial Comments at 27-28.

[999] *See infra* Stakeholder Process and Transparency section.

[1000] The information exchange transmission planning principle requires network transmission customers to submit information on their projected loads and resources on a comparable basis (e.g., planning horizon and format) as used by transmission providers in planning for their native load. Point-to-point transmission customers are required to submit their projections for need of service over the planning horizon and at what receipt and delivery points. To the extent applicable, transmission customers should also provide information on existing and planned demand resources and their impact on demand and peak demand. Transmission providers, in consultation with their customers and other stakeholders, must develop guidelines and a schedule for the submittal of such customer information. Order No. 890, 118 FERC ¶ 61,119 at PP 486-487.

information on the load-serving entities' projected loads and resources over the planning horizon.

(d) Trends in Technology and Fuel Costs Within and Outside of the Electricity Supply Industry, Including Shifts Toward Electrification of Buildings and Transportation (Factor Category Four)

(1) Comments

450. Several commenters emphasize the importance of incorporating assumptions regarding shifts towards electrification in Long-Term Scenarios.[1001] Clean Energy Buyers assert that regional flexibility should not be used to diminish the representation in Long-Term Scenarios of significant load growth from the commercial and industrial sectors and electrification of transportation.[1002] Likewise, DC and MD Offices of People's Counsel assert that regional flexibility should be reflected in the actual inputs for these factors, rather than their inclusion in or exclusion from Long-Term Scenarios, noting, for example, that electrification forecasts in some areas are increasing load growth estimates by 30%.[1003] Clean Energy Associations argue that, to keep pace with changes in supply and demand, Long-Term Scenarios should incorporate aging

[1001] Clean Energy Associations Initial Comments at 11; Clean Energy Buyers Initial Comments at 15-16; DC and MD Offices of People's Counsel Initial Comments at 11-12; ENGIE Initial Comments at 3; PJM Market Monitor Initial Comments at 3.

[1002] Clean Energy Buyers Initial Comments at 15-16.

[1003] DC and MD Offices of People's Counsel Initial Comments at 11-12.

infrastructure and planned replacements, along with load and generation trends informed by both historical data and applicable policy drivers.[1004]

451. Other commenters emphasize the trends in specific technology costs, such as long-duration storage. ENGIE states that advances in longer-duration storage and advancing photovoltaic technologies may affect the ability to develop resources in areas previously considered to be uneconomic, which could affect the resource and demand mix.[1005] Form Energy argues that the inclusion of diverse, long-duration electric storage technologies would require significantly fewer new transmission needs.[1006]

452. Pine Gate supports the inclusion of trends in technology and fuel costs in Long-Term Scenarios; however, Pine Gate requests that the Commission clarify what type of data would constitute a "trend" and how it expects transmission providers to assure that trend-related input is objective and representative of the "best available data."[1007] Similarly, US DOE recommends that the Commission clarify whether the term "trends in technology and fuel costs" refers to trends in fuel cost and trends in technology, or rather trends in the cost of fuel and trends in the cost of technology. If the Commission is referring to the former, US DOE recommends that the Commission consider the phrase "trends in fuel costs and in the cost, performance, and availability of generation, storage,

[1004] Clean Energy Associations Initial Comments at 12.

[1005] ENGIE Initial Comments at 3.

[1006] Form Energy Initial Comments at 2-3.

[1007] Pine Gate Initial Comments at 24.

and transmission technologies." US DOE further recommends that the Commission provide a non-exhaustive list of examples of cost and technology trends that transmission planners could consider.[1008]

453. SEIA recommends that the Commission direct transmission providers to use the data and models used in NREL's Electrification Futures Study, Solar Futures Study, Storage Futures Study, and Transportation Futures Study.[1009] PIOs disagree with granting discretion to transmission providers to define trends in technology and fuel costs because PIOs state that it could empower them to distort the modeling process and create Long-Term Scenarios that are meaningless.[1010]

454. PIOs argue that the Commission should require transmission providers to use certain values for trends in technology and fuel costs within and outside of the electricity supply industry.[1011]

455. New York TOs argue that trends in technology costs are amorphous and therefore should not be prescribed as a required factor for transmission providers to consider.[1012] Similarly, PPL criticizes the Commission's proposed requirement that transmission providers forecast trends in technology without providing concrete assumptions to use, or

[1008] US DOE Initial Comments at 12-13.

[1009] SEIA Initial Comments at 10.

[1010] PIOs Initial Comments at 19.

[1011] *Id*. at 17-19.

[1012] New York TOs Initial Comments at 11-12.

without a guarantee for cost recovery for investments that are based on those uncertain forecasts.[1013]

(2) Commission Determination

456. We adopt the NOPR proposal, with modification, to require transmission providers in each transmission planning region to incorporate Factor Category Four: trends in fuel costs and in the cost, performance, and availability of generation, electric storage resources, and building and transportation electrification technologies, in the development of Long-Term Scenarios. We find it appropriate to require transmission providers to incorporate Factor Category Four into the development of Long-Term Scenarios because the relative cost of constructing and operating different types of generation or storage resources and the relative cost of electrifying certain energy end uses will affect Long-Term Transmission Needs. We further find that this requirement is necessary to ensure that transmission providers develop plausible Long-Term Scenarios that account for technological changes expected over the transmission planning horizon, facilitating transmission providers' identification of Long-Term Transmission Needs.

457. As requested by commenters, including US DOE, we modify this category of factors in the final rule to clarify that this category of factors is meant to capture changes in the cost, as well as the performance and availability, of certain technologies relevant to the electric industry.[1014] In response to commenters arguing that trends in technology

[1013] PPL Initial Comments at 8.

[1014] Pine Gate Initial Comments at 24; US DOE Initial Comments at 12.

costs are amorphous and should not be included in the final rule as a required category of factors, we disagree. However, as discussed above, we grant transmission providers discretion to determine whether specific trends identified in Factor Category Four are likely to affect Long-Term Transmission Needs and how to account for those specific trends in Long-Term Scenarios.[1015] As discussed in further detail below, transmission providers also have some discretion to discount or place more weight on the anticipated effects on Long-Term Transmission Needs due to factors in this category.

458. In response to comments from US DOE,[1016] we clarify that trends in fuel costs and in the cost, performance, and availability of generation, storage, and building and transportation electrification technologies may include, but are not limited to, cost and technology trends for: utility-scale generation construction costs for different generating technologies; distributed energy resources; storage technologies with differing duration limitations; carbon capture and sequestration; small modular nuclear; light-, medium-, and heavy-duty electric vehicles and electric vehicle supply equipment; and ground- and air-source heat pumps. While we agree with US DOE that transmission providers should consider trends in the cost, performance, and availability of transmission technologies as part of their evaluation of potential solutions to Long-Term Transmission Needs, we do not believe that these trends should be included as factors in this category because trends in the cost, performance, and availability of transmission technologies do not drive Long-

[1015] *See* New York TOs Initial Comments at 11-12; PPL Initial Comments at 8.

[1016] US DOE Initial Comments at 12-13.

Term Transmission Needs. We also agree with commenters that note that the effects of the factors in this category may vary significantly, such as shifts towards electrification leading to significant load growth, or cost reductions for emerging technologies, like long-duration electric storage resources, mitigating some new transmission needs.

(e) Resource Retirements (Factor Category Five)

(1) Comments

459. Several commenters support the proposed requirement that each Long-Term Scenario incorporate resource retirements as a category of factors.[1017] PJM Market Monitor states that PJM faces the potential for the retirement of large coal resources and that the PJM capacity market design and the transmission planning process need to identify these specific resources well in advance and ensure an efficient response to obviate the need for nonmarket cost-of-service contracts to retain generation while transmission is constructed.[1018]

460. PIOs and NYISO both argue that the Commission should further specify that transmission providers must incorporate expected trends in resource retirements rather

[1017] Breakthrough Energy Initial Comments at 14; NRECA Initial Comments at 31; NYISO Initial Comments at 24; PIOs Initial Comments at 21; SPP Market Monitor Initial Comments at 9; *see also* PJM Market Monitor at 3 ("PJM faces the potential retirement . . . of a significant amount of coal resources in the next five years. Both the PJM capacity market and design and the transmission planning process need to identify these specific resources well in advance and plan for their retirement in order to ensure an efficient response and to obviate the need for nonmarket cost of service contracts to retain the generation while transmission is constructed.").

[1018] PJM Market Monitor Initial Comments at 3.

than just announced retirements into Long-Term Scenarios.[1019] PIOs state the Commission should require transmission providers to (1) specify how they will use generator age and condition data to predict retirements, (2) include announced retirements, and (3) specify how they will reflect trends and incentives for distributed energy resources, as well as how they will quantify these trends.[1020]

461. NYISO states that the final rule should confirm that each transmission planning region has the authority and flexibility to account for likely resource retirements that have not been announced by the resource based on factors that include the facility's age, its emission profile, applicable laws and regulations, and other factors.[1021] Similarly, Pine Gate asserts that resource retirements should be included at the earliest opportunity as there is often a significant gap of time between when a public announcement is made and when the official notice of deactivation is communicated to the transmission provider.[1022]

462. SEIA states that transmission providers should only be required to include the retirement of resources that have provided notice of pending retirement pursuant to the applicable tariff provisions.[1023] PJM supports engaging in transparent economic impact analyses of generation resource retirements but asserts that such analyses might disclose

[1019] NYISO Initial Comments at 24; PIOs Initial Comments at 21.

[1020] PIOs Initial Comments at 21.

[1021] NYISO Initial Comments at 24.

[1022] Pine Gate Initial Comments at 24.

[1023] SEIA Initial Comments at 10.

confidential information about specific generators. Therefore, PJM contends that the Commission will need to provide clear direction on how it wishes to address these issues, especially since masking of data is not a practical solution once the transmission case is released.[1024]

(2) Commission Determination

463. We adopt the NOPR proposal to require transmission providers in each transmission planning region to incorporate Factor Category Five: resource retirements, in the development of Long-Term Scenarios. We find it appropriate to require transmission providers to incorporate Factor Category Five because resource retirements expected over the transmission planning horizon will affect Long-Term Transmission Needs. Commenters generally support requiring this category of factors, but commenters disagree as to how transmission providers should account for projected resource retirements that have not been publicly announced.[1025]

464. In response to those commenters, we clarify that, to develop plausible Long-Term Scenarios, transmission providers must, in incorporating Factor Category Five into the development of Long-Term Scenarios, account for likely resource retirements beyond those that have been publicly announced. The record indicates that resource retirements have significantly influenced the supply of electricity in the past and are expected to do

[1024] PJM Initial Comments at 6, 69.

[1025] NYISO Initial Comments at 24; Pine Gate Initial Comments at 24; PIOs Initial Comments at 21.

so in the coming decades.[1026] The North American Electric Reliability Corporation's 2021 Long-Term Reliability Assessment reports nearly 50 GW of confirmed thermal generation resource retirements by 2026 and acknowledges that many more are yet to be announced.[1027] In addition, the record reflects that publicly announced resource retirements are only a fraction of the resource retirements expected over the required 20-year transmission planning horizon.[1028] Given the significance of resource retirements, and the limited scope of publicly announced resource retirements, we find that transmission providers must account for expected retirements that have not been publicly

[1026] *See supra* note 241; Colorado Consumer Advocate Initial Comments, attach. 7 (US DOE, *Staff Report to the Secretary on Electricity Markets and Reliability* (Aug. 2017)) at 13-14 (stating that 132 GW of generation capacity retired between 2002 and 2016 – approximately 15% of the installed capacity in 2002 – due to the advantaged economics of natural gas-fired generation, low electricity demand growth, the deployment of variable energy resources, and regulatory requirements); *see also, e.g.*, AEP Initial Comments at 4 n.12.

[1027] SEIA Initial Comments at 9 (citing North American Electric Reliability Corporation, *2021 Long-Term Reliability Assessment*, at 30, 35 (Dec. 2021)). The North American Electric Reliability Corporation states that long-range retirement projects based on confirmed retirements could be "significantly understated" because generator retirement announcements can be made as late as 90 days prior to planned deactivation in some areas. The North American Electric Reliability Corporation 's 2021 reported retirements through 2026 increased 126% compared to the North American Electric Reliability Corporation's 2020 estimates; and the North American Electric Reliability Corporation's 2022 reported retirements through 2026 increased compared to the North American Electric Reliability Corporation 's 2021 retirements. *See* North American Electric Reliability Corporation, *2021 Long-Term Reliability Assessment*, at 35 (Dec. 2021); NERC, *2022 Long-Term Reliability Assessment*, at 17 (Dec. 2022).

[1028] For example, announced retirements account for less than half of MISO's projected retirements over a 20-year transmission planning horizon. *See* MISO Initial Comments at 35 (citing MISO, *MISO Futures Report*, at 14-19, (Dec. 2021), https://cdn.misoenergy.org/MISO%20Futures%20Report538224.pdf).

announced to meet this final rule's requirement that transmission providers develop a plausible set of Long-Term Scenarios.[1029]

465. We provide flexibility to transmission providers to propose on compliance with this final rule how to account for resource retirements that might take place over the transmission planning horizon, in addition to those that have been publicly announced. We note, for example, that transmission providers could propose to account for expected retirements by considering factors such as a generating facility's age, its emissions profile, its projected costs and revenues, and any applicable laws and regulations that may affect a generating facility's continued operation over the transmission planning horizon.[1030] To the extent that certain laws and regulations identified by stakeholders in Factor Categories One and Two will necessitate the retirement of certain resources, we reiterate that transmission providers must develop Long-Term Scenarios that are consistent with such laws and regulations.

466. In response to PJM's concerns that conducting transparent economic impact analyses of generation resource retirements could lead to the disclosure of confidential

[1029] *See infra* Types of Long-Term Scenarios section.

[1030] For example, MISO assumes age-based resource retirements which vary by resource type and scenario, over a 20-year transmission planning horizon. In a 2021 study, MISO assumes coal-fired resources will retire at age 46 in one scenario, and age 36 in another. MISO assumes utility-scale solar resources will retire at age 25 in every scenario. MISO also incorporates resource retirements announced by the resource owner, stated in an integrated resource plan, or filed in MISO's Attachment Y. *See* MISO Initial Comments at 35 (citing MISO, *MISO Futures Report*, at 14-19, (Dec. 2021), https://cdn.misoenergy.org/MISO%20Futures%20Report538224.pdf).

information about specific generators, we note that the Commission has previously acknowledged that tension exists between ensuring transparency in transmission planning processes and protecting confidential information, including commercially sensitive information.[1031] We note that we are not specifying how transmission providers must estimate resource retirements, and we clarify that transmission providers may include what they believe to be appropriate confidentiality protections in their proposals to account for resource retirements that might take place over the transmission planning horizon. The Commission will evaluate those proposals by using the established principles in Order No. 890,[1032] as well as precedent on existing confidentiality protections with respect to transmission planning that the Commission has previously found comply with the Order No. 890 principles, to guide its findings on whether such protections are appropriate.

(f) Generator Interconnection Requests and Withdrawals (Factor Category Six)

(1) Comments

467. Several commenters support the proposed requirement that each Long-Term Scenario incorporate generator interconnection requests and withdrawals.[1033] Pattern Energy argues that generation interconnection queues are indicative of the market for

[1031] *Sw. Power Pool, Inc.*, 137 FERC ¶ 61,227, at P 20 (2011).

[1032] Order No. 890, 118 FERC ¶ 61,119 at PP 471-476.

[1033] Breakthrough Energy Initial Comments at 14; Cypress Creek Reply Comments at 5-7.

generation capacity additions and should also be a major source for generation assumptions in both near-term and long-term scenario planning.[1034] SEIA supports the proposed requirement with the caveat that transmission providers should only include interconnection customers that have signed a facilities study agreement, or other applicable study agreement.[1035] Cypress Creek asserts that the Commission should require transmission providers to include the proposed generator interconnection requests in the queue that have completed a system impact study as part of a uniform set of assumptions applicable across all scenarios.[1036]

468. CAISO and MISO state that their regional transmission planning processes already include projects in the generator interconnection queue.[1037] MISO further explains that it considers the generator interconnection queue when determining the location where future generation will interconnect, but MISO also states that transmission providers and their stakeholders need to have flexibility, including how to consider trends in interconnection queue requests.[1038] Further, MISO argues that "generation interconnection requests and withdrawals" as stated in the NOPR is unclear regarding how the transmission provider must weigh withdrawals differently than requests.

[1034] Pattern Energy Initial Comments at 26.

[1035] SEIA Initial Comments at 10.

[1036] Cypress Creek Reply Comments at 5-7.

[1037] CAISO Initial Comments at 34; MISO Initial Comments at 35.

[1038] MISO Initial Comments at 35-36.

Therefore, MISO requests that the Commission revise the NOPR proposal to require transmission providers to "consider activity in the generation interconnection queue."[1039]

469. Nebraska Commission asserts that the Commission should not include interconnection request withdrawals as a factor because it does not follow the Commission's cost causation principles and would incentivize additional interconnection requests. For example, Nebraska Commission states, most interconnection requests in SPP are duplicative, and entities compare costs among their requests once they are analyzed. Nebraska Commission asserts that such requests could be used to game the transmission planning process, create additional backlogs in the interconnection queue, and shift costs from interconnection customers to transmission customers.[1040]

470. Likewise, Omaha Public Power claims that, until generator interconnection reform is enacted, the use of interconnection queues and withdrawals as factors will lead to scenario inaccuracy due to the size of interconnection backlogs and speculative nature of many queued projects.[1041] Dominion also opposes using the number and size of interconnection requests as a basis for transmission planning because speculative interconnection requests could stimulate transmission development in areas slated for development by private interests.[1042]

[1039] *Id*. at 36.

[1040] Nebraska Commission Initial Comments at 4-5.

[1041] Omaha Public Power Initial Comments at 3.

[1042] Dominion Reply Comments at 7-8.

471. PJM Market Monitor states that, while there are many comments on the significant renewable resources PJM will connect to its grid, based on historic completion rates and effective load carry capability derate factors, only 5.6% of renewable resources are expected to go into service.[1043]

(2) Commission Determination

472. We adopt the NOPR proposal to require transmission providers in each transmission planning region to incorporate Factor Category Six: generator interconnection requests and withdrawals, in the development of Long-Term Scenarios. We find it appropriate to require transmission providers to incorporate Factor Category Six because generation interconnection queues provide important information about future generation development over the transmission planning horizon and therefore affect Long-Term Transmission Needs. Multiple RTOs/ISOs explain that their regional transmission planning processes already account for generation projects in the interconnection queue, but MISO notes that transmission providers need flexibility in how to incorporate that data into the development of Long-Term Scenarios.[1044] In response to MISO's concerns, we reiterate that transmission providers have discretion to determine how to account for all factors, including interconnection requests and withdrawals, in Long-Term Scenarios.

[1043] PJM Market Monitor Initial Comments at 4.

[1044] MISO Initial Comments at 35-36

473. We disagree with commenters that argue that, because many interconnection requests are speculative and/or duplicative, requiring transmission providers to incorporate Factor Category Six into the development of Long-Term Scenarios will compromise the accuracy of Long-Term Scenarios, shift costs to transmission customers that should be borne by interconnection customers, or create an incentive for additional interconnection requests that could slow down interconnection queue processing.[1045] We note that over the years, and recently with Order No. 2023, transmission providers and the Commission have adopted changes to generator interconnection procedures to reduce the submission of speculative interconnection requests in the interconnection queue. For example, interconnection requests require significant financial commitments from the interconnection customer (e.g., application fees, study deposits, and site control requirements), which the Commission made more stringent in Order No. 2023.[1046] Noting that, as discussed above, transmission providers will have discretion as to how they account for factors in Long-Term Scenarios and may determine whether certain generator interconnection requests are speculative and/or duplicative, such that the requests are unlikely to affect Long-Term Transmission Needs, and then make corresponding adjustments to their Long-Term Scenarios. As discussed in further detail below, transmission providers can also account for uncertainty by discounting or putting

[1045] Dominion Reply Comments at 7-8; Nebraska Commission Initial Comments at 4-5; Omaha Public Power Initial Comments at 3.

[1046] Order No. 2023, 184 FERC ¶ 61,054 at P 490.

more weight on the anticipated effects on Long-Term Transmission Needs due to factors in this category. Additionally, we believe that the existence of a large number of interconnection requests in a certain area, even if some of those requests are speculative, indicates that generation developers have an interest in interconnecting resources in that area, which Long-Term Scenarios should take into account.

(g) Utility and Corporate Commitments and Federal, Federally-Recognized Tribal, State, and Local Policy Goals that Affect Long-Term Transmission Needs (Factor Category Seven)

(1) Comments

474. Some commenters generally support the proposed requirement to incorporate in Long-Term Scenarios utility and corporate commitments and federal, state, and local goals that affect the future resource mix and demand.[1047] ACEG contends that FPA section 217(b)(4) supports the Commission's proposed requirement to include public policies and utility and corporate renewable procurement goals within Long-Term Scenarios because load-serving entities' service obligations will depend upon both public

[1047] ACEG Initial Comments at 26-29; AEE Initial Comments at 10-11; Advanced Energy Buyers Initial Comments at 5-6; Amazon Initial Comments at 3-4; Center for Biological Diversity Initial Comments at 9-12; Environmental Groups Supplemental Comments at 2; Ørsted Initial Comments at 7; Pacific Northwest State Agencies at Initial Comments at 14; PIOs Initial Comments at 18-19; SEIA Initial Comments at 10; SREA Initial Comments at 41-46; *see also* Environmental Groups Supplemental Comments at 2 ("The electric industry is undergoing a major transformation driven by consumer, utility, and corporate preferences, state public policies, and the cost competitiveness of renewable energy. The Commission's transmission planning and cost allocation standards must be up to the challenge of enabling this transition while ensuring the continued provision of reliable and affordable electricity at just and reasonable rates.").

policies and the resource preferences of their customers.[1048] AEE highlights the role of local goals by noting that 29 of the 50 most populous cities in the United States have set clean or renewable energy targets.[1049]

475. Advanced Energy Buyers argue that private efforts to use more low- and zero-carbon electricity are significantly affecting the resource mix and in turn transmission needs, noting that since 2014, commercial and industrial customers have contracted for more than 52 GW of clean energy in the United States, with annual increases every year since 2016.[1050] Moreover, Advanced Energy Buyers state, corporate and industrial customer demand for renewable energy in the United States is expected to reach about 85 GW by 2030.[1051] Advanced Energy Buyers state that, in some markets, corporate demand is already a dominant driver of renewable energy deployment, as in Illinois, where corporate procurement accounted for roughly one-third of total renewable deployment.[1052] SEIA states that, for corporate commitments, transmission providers

[1048] ACEG Initial Comments at 26-29.

[1049] AEE Initial Comments at 10-11 (citing Third Way, *Utilities, Cities, and States with Clean Energy Targets* (July 30, 2021), https://www.thirdway.org/graphic/utilities-cities-and-states-with-clean-energy-targets).

[1056] Breakthrough Energy Initial Comments at 14-15.

477. LADWP, MISO, and NRECA support the inclusion of this category of factors as long as transmission providers are allowed to discount these factors in their analysis by assuming the goals or commitments may not be fully met.[1057] NRECA is concerned that factor category seven (utility and corporate commitments) carries a distinct risk of stranded transmission costs and therefore supports it being discounted.[1058] NRECA further states that it is concerned that stakeholders may try to use Long-Term Regional Transmission Planning to impose goals and commitments that lack the force of law.[1059] LADWP argues that the Commission should allow transmission planners to use discretion when identifying utility commitments and local goals.[1060] MISO is concerned about the inherent difficulty of modeling corporate commitments given the ambiguous nature of corporate footprints.[1061]

478. Several commenters oppose including utility and corporate commitments and/or federal, state, and local goals as a category of factors in Long-Term Scenarios.[1062] For

[1057] LADWP Initial Comments at 3; MISO Initial Comments at 36; NRECA Initial Comments at 32-33.

[1061] MISO Initial Comments at 36.

[1062] Alabama Commission Initial Comments at 6; California Commission Initial Comments at 20; Duke Initial Comments at 13; New York TOs Initial Comments at 11-12; Pennsylvania Commission Initial Comments at 6.

example, California Commission states that it is not clear what purpose would be served by requiring transmission providers to incorporate these commitments or goals into Long-Term Scenarios yet, at the same time, allowing them to discount such commitments or goals to account for their inherent uncertainty.[1063] New York TOs argue that corporate commitments are amorphous and therefore should not be prescribed as a required factor for transmission providers to consider. Moreover, New York TOs state that, if a goal is not codified as a law, it is not clear that it is sufficiently solidified and supported to be included as a factor.[1064]

479. PJM argues that the NOPR proposal to include corporate commitments as a factor in Long-Term Scenarios is vague, inappropriate, and impractical, because even if PJM is able to develop a record of information in the expansive PJM footprint, this information will likely be incomplete. PJM argues that the burden to ensure that a transmission provider is aware of corporate commitments and goals should be on the corporation or another interested party.[1065]

480. Illinois Commission states that transmission planning criteria should not include vague terms such as "corporate goals," which could mean multiple things and may already be accounted for.[1066] Alabama Commission states that corporate commitments

[1063] California Commission Initial Comments at 20.

[1064] New York TOs Initial Comments at 11-12.

[1065] PJM Reply Comments at 37-38 (citing PJM Initial Comments at 68).

[1066] Illinois Commission Initial Comments at 7.

and goals are not a sufficient basis for planning decisions as they are not law and accountability for achieving them is limited.[1067] Similarly, Pennsylvania Commission states that determinants for Long-Term Scenarios should not be based on speculative factors, arguing that factors that include federal, state, and local laws and regulations that affect the future resource mix and demand are preferable to factors that include utility, corporate, federal, state, and local goals or policies that have no enforcement mechanisms.[1068] PPL states that utility and corporate commitments are unlikely to be sufficiently firm or definitive to pass state siting review.[1069]

(2) Commission Determination

481. We adopt the NOPR proposal, with modification, to require transmission providers in each transmission planning region to incorporate Factor Category Seven: utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs, in the development of Long-Term Scenarios. We find it appropriate to require transmission providers to incorporate Factor Category Seven into the development of Long-Term Scenarios because the relevant commitments and goals represent known consumer preferences that have been, and will continue to be, key drivers of Long-Term Transmission Needs. We agree with commenters that argue that corporate demand for clean energy resources, as

[1067] Alabama Commission Initial Comments at 6.

[1068] Pennsylvania Commission Initial Comments at 5-6.

[1069] PPL Initial Comments at 8.

demonstrated by the volume of bilateral corporate contracts with renewable energy resources, is already a major driver of changes in the resource mix and demand and that corporate and industrial customer demand for clean energy is projected to increase. We believe that it is necessary for transmission providers to incorporate publicly announced utility commitments in the development of Long-Term Scenarios. Such commitments may be ignored or overlooked in retail-level regulatory proceedings, but they nevertheless may have an impact on future changes in the resource mix and demand that must be accounted for to ensure the development of plausible Long-Term Scenarios.

482. We modify the NOPR proposal for Factor Category Seven to include federally-recognized Tribal goals that affect the resource mix and demand because we are persuaded by commenters that argue that such factors have the same potential to affect Long-Term Transmission Needs as federal, state, and local goals. We believe that federally-recognized Tribal goals should include publicly announced policy recommendations, such as energy vision reports.[1070] Further, as discussed under Additional Categories of Factors below, we recognize that energy equity and justice goals are potential factors within Factor Category Seven.

483. While federal, federally-recognized Tribal, state, and local goals may not have the same durability and binding impact of laws and regulations, we believe that it is appropriate for transmission providers to account for such goals in Long-Term Scenarios

[1070] *See, e.g.*, Columbia River Inter-Tribal Fish Comm'n, *Energy Vision for the Columbia River Basin* (Sept. 2022), https://critfc.org/wp-content/uploads/2022/09/CRITFC-Energy-Vision-Full-Report.pdf.

because these goals represent known preferences of governmental entities that affect Long-Term Transmission Needs. Such goals may improve or diminish the prospects of deploying certain technologies. For example, as AEE explains, local governments representing some of the most populous cities in the United States have established goals to have their cities' loads served by clean or renewable energy.[1071]

484. We disagree with commenters that argue that transmission providers should not be required to incorporate utility and corporate commitments into the development of Long-Term Scenarios because they may not be significant enough to drive Long-Term Transmission Needs or that accountability for achieving commitments and goals is too limited for these factors to be considered sufficiently firm.[1072] We acknowledge that utility and corporate commitments and governmental goals may be more likely to change over the transmission planning horizon than factors in other required factor categories; however, we are not persuaded that these commitments and goals are so speculative, amorphous, or unreliable that they should not be incorporated into Long-Term Scenarios at all. We emphasize that transmission providers have discretion, as discussed above, in how to account for these factors in the development of Long-Term Scenarios, and we

[1071] AEE Initial Comments at 10-11 (citing Third Way, *Utilities, Cities, and States with Clean Energy Targets* (July 30, 2021), https://www.thirdway.org/graphic/utilities-cities-and-states-with-clean-energy-targets).

[1072] Alabama Commission Initial Comments at 6; California Commission Initial Comments at 20; Illinois Commission Initial Comments at 7; New York TOs Initial Comments at 11-12; Pennsylvania Commission Initial Comments at 5-6; PJM Reply Comments at 37-38 (citing PJM Initial Comments at 68); PPL Initial Comments at 8.

note, as discussed in further detail below, that transmission providers can account for the uncertainty associated with the achievement of these commitments and goals by using discounting or putting more weight on the effects of these factors on Long-Term Transmission Needs in each of the required Long-Term Scenarios. Similarly, transmission providers have discretion to determine how to account for commitments and goals in Long-Term Scenarios if the effects of particular commitments or goals conflict with, negate, or duplicate the effects of other factors.

(h) Additional Categories of Factors

(1) Comments on Energy Equity and Justice

485. Some commenters argue that the Commission should include equity and energy justice considerations in Long-Term Regional Transmission Planning.[1073] Grand Rapids NAACP, agreeing with NASEO, urges the Commission to expand factors considered in Long-Term Regional Transmission Planning to include energy equity and justice.[1074] Grand Rapids NAACP also states that transmission providers should be required to

[1073] *See, e.g.*, California Energy Commission Initial Comments at 2; City of New York Initial Comments at 9; Clean Energy Buyers Initial Comments at 8-9; Grand Rapids NAACP Initial Comments at 12, 15, 21, 23; Grand Rapids NAACP Reply Comments at 2-3, 5; Montclair Congregation Supplemental Comments at 1; NARUC Initial Comments at 3-4; NASEO Initial Comments at 5; PIOs Initial Comments at 35-36; PIOs Reply Comments at 15; Policy Integrity Initial Comments at 28; WE ACT Initial Comments at 4-6.

[1074] Grand Rapids NAACP Reply Comments at 2 (citing NASEO Initial Comments at 5).

follow federal, state, and local laws addressing the need for energy equity and justice.[1075] In concordance with PIOs, Grand Rapids NAACP urges the Commission to address equity in the transmission planning process because doing so would encourage competition and lower consumer costs.[1076] Finally, Grand Rapids NAACP urges the Commission to encourage transmission providers to develop metrics that advance economic equity and environmental justice by facilitating consideration of the impact of transmission infrastructure on disadvantaged communities.[1077]

486. US DOE asserts that energy justice considerations will form an integral part of transmission planning. Specifically, US DOE states that transmission planning can identify potential sources, sinks, and locations of transmission expansion facilities and that identifying locations where frontline communities and historically underserved communities have faced long-standing impacts may affect the future resource mix.[1078] NESCOE agrees with US DOE and argues that regional transmission planning processes should accommodate state efforts to advance equity and environmental justice concerns.[1079] New England for Offshore Wind argues that without a transparent and

[1075] *Id.*

[1076] *Id.* (citing PIOs Initial Comments at 35, 36).

[1078] US DOE Initial Comments at 9.

[1079] NESCOE Reply Comments at 8-9.

inclusive transmission planning process, regional transmission planning efforts will be at odds with state policy on environmental justice.[1080]

487. PIOs state that the Commission should be clear that Long-Term Regional Transmission Planning complies with and incorporates relevant aspects of applicable federal, federally-recognized Tribal, state, and local environmental and energy justice policies—including future resource mix impacts, assignment of transmission benefits toward disadvantaged communities, and project selection.[1081]

488. CARE Coalition states that the Commission should consider issues of siting and the granting of permits that cause significant delays in construction of new transmission facilities.[1082] CARE Coalition emphasizes WE ACT's argument that a final rule should ensure that transmission planners and states "are cognizant about siting and the potential harms of transmission development to environmental justice communities."[1083] Relatedly, CARE Coalition highlights NRECA's argument that rural and poorer areas are

[1080] New England for Offshore Wind Initial Comments at 5.

[1081] PIOs Reply Comments at 15 (citing Grand Rapids NAACP Initial Comments at 12-15, 21-23 (listing notable federal, state, and local public policies requiring that equity and energy justice inform decision making processes); WE ACT Initial Comments at 6).

[1083] *Id.* at 4 (citing WE ACT Initial Comments at 6).

disproportionately burdened under the current regime because "siting decisions are primarily driven by technical and economic factors."[1084]

(2) Comments on Efficiency and Technology

489. NASEO argues that the Commission should expand its list of factors that transmission providers should include in Long-Term Regional Transmission Planning and Long-Term Scenarios to include increased energy efficiency of existing transmission lines, and the efficient use of existing rights of way.[1085] Invenergy suggests that the Commission expressly require consideration of advanced-stage merchant HVDC transmission as a factor in regional transmission planning scenarios.[1086] Invenergy highlights US DOE's proposal that transmission providers consider trends in the development of HVDC network technology, arguing, however, that such consideration should include incorporating and accounting for HVDC transmission facilities in transmission planning models and scenarios.[1087]

(3) Comments Regarding Enhanced Reliability and Interregional Transfer Capability

490. PJM recommends that the Commission require enhanced reliability and Interregional Transfer Capability as two additional categories of factors that transmission

[1084] *Id.* (citing NRECA Initial Comments at 39 n.111).

[1085] NASEO Initial Comments at 5.

[1086] Invenergy Initial Comments at 6-7.

[1087] Invenergy Reply Comments at 11 (citing US DOE Initial Comments at 13).

providers must incorporate into the development of Long-Term Scenarios.[1088] PJM envisions enhanced reliability to include, but not be limited to, storm hardening of critical facilities, reducing the number of critical CIP-014 facilities through transmission upgrades, coordination of infrastructure development with natural gas pipelines serving generation in the region, and ensuring redundancy of facilities, where appropriate, to address the threat of physical or cyber attacks.[1089] PJM envisions Interregional Transfer Capability to be established in accordance with the methodology that the Commission adopts in a subsequent order.[1090]

491. Invenergy agrees with the additional categories of factors that PJM proposes.[1091] ELCON supports the consideration of transfer capability between seams, which it asserts would provide transmission providers with the ability to develop and consider solutions that may solve for multiple drivers and offer greater benefits to more consumers.[1092] In contrast, AEE states that it disagrees with the additional categories of factors that PJM proposes, although it agrees with PJM that enhanced reliability planning is an important consideration.[1093]

[1088] PJM Initial Comments at 6, 13, 65-67.

[1090] *Id.* at 66-67.

[1091] Invenergy Reply Comments at 11.

[1092] ELCON Initial Comments at 8.

[1093] AEE Reply Comments at 20.

(4) Commission Determination

492. We recognize that some commenters ask the Commission to require transmission providers to incorporate several categories of factors in addition to those proposed in the NOPR in the development of Long-Term Scenarios. We decline to include energy equity and justice as a distinct and additional category of factors because we believe that these important energy equity and justice laws and regulations, or goals, that are likely to affect Long-Term Transmission Needs, are accounted for in Factor Category One: federal, federally-recognized Tribal, state, and local laws and regulations affecting the resource mix and demand, or Seven: utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs.[1094] Stakeholders will have a meaningful opportunity to identify any such factors as part of the open and transparent stakeholder process described below in the Stakeholder Process and Transparency section.

493. We decline to adopt Invenergy's recommendation that the Commission require transmission providers to include advanced-stage merchant HVDC transmission as an additional category of factors. The Commission did not propose specific requirements in the NOPR regarding merchant HVDC transmission facilities under development, and we are not persuaded by the evidence in the record that the Commission should include advanced-stage HVDC transmission facilities in the minimum set of known determinants

[1094] Grand Rapids NAACP Reply Comments at 2 (citing NASEO Initial Comments at 5).

of Long-Term Transmission Needs. We reiterate that transmission providers may be aware of additional categories of factors beyond those adopted in this final rule that drive Long-Term Transmission Needs and may incorporate additional categories of factors in the development of Long-Term Scenarios provided that each Long-Term Scenario remains plausible.

494. In response to PJM's request for the Commission to require enhanced reliability and Interregional Transfer Capability[1095] as additional categories of factors,[1096] we find that the record in this proceeding is insufficient to adequately consider whether to require transmission providers to adopt such categories of factors in this final rule. As noted in our response to Invenergy just above, transmission providers may incorporate additional categories of factors in the development of Long-Term Scenarios provided that each Long-Term Scenario remains plausible. We note that, in this final rule, we provide transmission providers with flexibility in how they develop Long-Term Scenarios to identify Long-Term Transmission Needs. We believe that other parts of this final rule enable transmission providers to account for enhanced reliability and Interregional

[1095] We define Interregional Transfer Capability for purposes of this final rule consistent with the definition of total transfer capability in the Commission's regulations as: "the amount of electric power that can be moved or transferred reliably from one area to another area of the interconnected transmission systems by way of all transmission lines (or paths) between those areas under specified system conditions, or such definition as contained in Commission-approved Reliability Standards." 18 CFR 37.6(b)(1)(vi). In the context of Interregional Transfer Capability, an "area" in the above definition would be a transmission planning region composed of transmission providers.

[1096] PJM Initial Comments at 6, 13, 65-67.

Transfer Capability by modeling sensitivities and using certain transmission benefits. As discussed below, we require transmission providers to develop at least one sensitivity analysis, applied to each Long-Term Scenario, to account for uncertain operational outcomes during multiple concurrent and sustained generation and/or transmission outages due to an extreme weather event across a wide area that determine the benefits of or need for Long-Term Regional Transmission Facilities. As discussed in the Evaluation of the Benefits of Regional Transmission Facilities section below, we require transmission providers to measure, and consider as part of Benefit 6, the benefits associated with any increase in Interregional Transfer Capability that a Long-Term Regional Transmission Facility would provide.

c. Treatment of Specific Categories of Factors

i. NOPR Proposal

495. The Commission proposed to require that each Long-Term Scenario that transmission providers use in Long-Term Regional Transmission Planning incorporate and be consistent with federal, state, and local laws and regulations that affect the future resource mix and demand; federal, state, and local laws and regulations on decarbonization and electrification; and state-approved integrated resource plans and expected supply obligations for load-serving entities. The Commission preliminarily found that it is reasonable to require transmission providers to assume that legally binding obligations and state utility regulator-approved plans will be followed and that expected supply obligations for load-serving entities will be fully met. As a result, the Commission explained that, under the proposal, transmission providers cannot discount

the factors included in the categories of federal, state, and local laws and regulations that affect the future resource mix; federal, state, and local laws and regulations on decarbonization and electrification; and state-approved integrated resource plans and expected supply obligations for load-serving entities.[1097]

496. In addition, the Commission proposed to require that each Long-Term Scenario that transmission providers use in Long-Term Regional Transmission Planning include trends in technology and fuel costs within and outside the electricity supply industry, including shifts toward electrification of buildings and transportation; resource retirements; and generator interconnection requests and withdrawals. For these particular categories of factors, the Commission proposed to provide transmission providers with flexibility in how they incorporate each factor into Long-Term Scenarios as long as transmission providers identify and publish specific factors for each of these categories, as further described below.[1098]

497. Further, the Commission proposed to require that each Long-Term Scenario incorporate utility and corporate goals and federal, state, and local goals that affect the future resource mix and demand. However, the Commission acknowledged that these categories of factors are less binding and more likely to change over time, and therefore their impact on the future resource mix and demand are less certain, than other categories of factors. For this reason, the Commission preliminarily found that it may be

[1097] NOPR, 179 FERC ¶ 61,028 at P 106.

[1098] *Id.* P 107.

appropriate for transmission providers to discount such goals to account for this uncertainty. The Commission explained that transmission providers would not be required to assume that utility and corporate goals and federal, state, and local goals that affect the future resource mix will be fully met.[1099]

ii. Comments

498. Several commenters, that generally support the NOPR proposal, support discounting and rebut arguments opposing discounting.[1100] NRECA, Exelon, and TAPS argue that the NOPR proposal to allow transmission providers to discount some categories of factors while weighing factors in other categories more heavily strikes an appropriate balance.[1101] Specifically, Exelon supports the NOPR proposal to allow for variation in the treatment of different categories of factors such as legislated energy policy, which it states should not vary by scenario, and non-binding targets, which it states may be discounted yet are important to consider.[1102] TAPS also supports the proposed flexibility in how transmission providers incorporate factors that are not federal,

[1099] *Id.* P 108.

[1100] Exelon Initial Comments at 10-11; Georgia Commission Initial Comments at 4; Illinois Commission Initial Comments at 7; NEPOOL Initial Comments at 7; NRECA Initial Comments at 32; TAPS Initial Comments at 2-3, 8.

[1102] Exelon Initial Comments at 10-11.

state, and local laws and regulations, state-approved integrated resource plans, and expected supply obligations for load-serving entities.[1103]

499. Some commenters express concerns that the NOPR proposal would allow transmission providers in each transmission planning region to discount, or not fully incorporate, some factors when developing Long-Term Scenarios.[1104] Clean Energy Associations state that certain factors (i.e., federal, state, and local policies, utility integrated resource plans, generator retirements, interconnection requests, corporate commitments, and trends in technology and fuel costs) can be quantified and should be reflected in Long-Term Scenarios without discounting.[1105] Clean Energy Buyers are concerned that the flexibility proposed in the NOPR for transmission providers to incorporate into their Long-Term Scenarios the categories of factors that include trends in fuel costs and technologies both inside and outside the electricity supply industry, including regarding shifts in electrification of transport and buildings, resource retirements, and generator interconnection requests and withdrawals, could delay the transmission build-out.[1106] ACEG recommends that the Commission presume that all factors are required to be incorporated (and not discounted or only considered) unless the

[1103] TAPS Initial Comments at 2-3, 8.

[1104] ACEG Initial Comments at 27-28; Amazon Initial Comments at 4; Clean Energy Associations Initial Comments at 10-11; Pine Gate Initial Comments at 23-25; PIOs Initial Comments at 18-19; SEIA Initial Comments at 8-10.

[1106] Clean Energy Buyers Initial Comments at 15-16.

Commission approves a request from the transmission providers in a transmission planning region not to include a factor.[1107] In response, California Municipal Utilities argue that mandating the use of specific factors would not account for the cost consequences of such mandates, which must be considered for any transmission planning requirements to be just and reasonable.[1108]

500. Several commenters object to the Commission's proposal to provide transmission providers with the flexibility to discount utility and corporate and federal, state, and local goals that affect the future resource mix and demand.[1109] Amazon states that transmission providers should not be allowed to discount clean energy goals in their development of Long-Term Scenarios without proving such discounting is just and reasonable by showing evidence that such goals have been unfulfilled in the past, or that those goals have been altered or abandoned.[1110]

501. PIOs state that the NOPR proposal to discount Factor Category Seven would allow transmission providers to game the results if their incentives are contrary to consumers' goals.[1111] SEIA urges the Commission to limit the flexibility given to transmission

[1107] ACEG Initial Comments at 27.

[1108] California Municipal Utilities Reply Comments at 5-6.

[1109] Amazon Initial Comments at 4; Clean Energy Associations Initial Comments at 10-11; Pine Gate Initial Comments at 24-25; PIOs Initial Comments at 18-19; SEIA Initial Comments at 8.

[1110] Amazon Initial Comments at 4.

[1111] PIOs Initial Comments at 18-19.

providers regarding this factor because SEIA believes that they would ignore certain factors if consideration is not mandatory.[1112] Further, Clean Energy Associations argue that utility, corporate, and federal, state, and local goals should be fully incorporated, without discounting targets not enshrined in law or regulation. If necessary, Clean Energy Associations contend, changes in non-binding obligations could be treated as a sensitivity or probabilistic change in one or more scenarios to determine how they might affect transmission development.[1113]

502. PIOs state that, when utilities make commitments affecting the future resource mix and consumer demand, they should be held to them and that granting transmission providers complete discretion to discount such factors could undermine the goals of the NOPR proposal. Thus, PIOs state, the Commission should set minimum requirements for some factors, including for incorporating corporate commitments into future resource mix estimates.[1114] PIOs assert that widespread support exists for these recommendations, citing ELCON as an example.[1115]

[1112] SEIA Initial Comments at 8.

[1113] Clean Energy Associations Initial Comments at 10-11.

[1114] PIOs Initial Comments at 17-18.

[1115] PIOs Reply Comments at 10-11 (citing ELCON Initial Comments at 4).

503. Pine Gate argues that transmission providers should be required to assume that utility and corporate and federal, state, and local goals that affect the future resource mix will be fully met in at least one of their Long-Term Scenarios.[1116]

504. In addition, Pattern Energy argues that the Commission should distinguish between generation assumptions and demand assumptions for purposes of 20-year transmission planning so that there is no ambiguity. For example, Pattern Energy states that transmission providers should not be permitted to utilize their planning for load growth to satisfy the requirement to plan for changing resources and demand. Pattern Energy asserts that transmission providers should be required to distinguish between modeling a changing resource mix and, separately, a changing demand profile, arguing that both are important and should be considerations in near-term and long-term transmission planning.[1117]

505. NYISO argues that the final rule should permit transmission providers to appropriately account for, in coordination with state and local entities and stakeholders, the likely effect of applicable laws and regulations on the need for transmission and to realistically appraise achievement of such laws and regulations.[1118]

506. Some commenters oppose the NOPR proposal to require that transmission providers incorporate applicable local laws and regulations in their development of Long-

[1116] Pine Gate Initial Comments at 25.

[1117] Pattern Energy Initial Comments at 26.

[1118] NYISO Initial Comments at 23.

Term Scenarios.[1119] Duke explains that although local laws and regulations for decarbonization and electrification may affect the resource mix and demand at the local level, it is unclear how such laws would have a material effect on regional transmission planning that warrants the additional burden of tracking and incorporating them into Long-Term Scenarios.[1120] Alabama Commission argues that local laws, regulations, and goals might change or conflict with the policy perspectives of other states.[1121] PPL claims that the NOPR proposal is impractical and will significantly increase uncertainty, which in turn will invite disagreement and litigation.[1122] PJM recommends that the Commission require transmission providers to only consider local laws, local regulations, and local goals to the extent that such laws, regulations, and goals are brought to their attention by states, other local regulators, or stakeholders.[1123]

iii. Commission Determination

(a) Treatment of Factors in the First Three Categories

507. With regard to the first three categories of factors,[1124] we require transmission providers in each transmission planning region to assume that legally binding obligations (i.e., federal, federally-recognized Tribal, state, and local laws and regulations) are followed, state-approved integrated resource plans are followed, and expected supply obligations for load-serving entities are fully met. Therefore, we require that each Long-Term Scenario account for and be consistent with, and not discount, factors in the first three categories of factors once the transmission providers have determined that such a factor is likely to affect Long-Term Transmission Needs. We believe it is necessary to prohibit discounting of factors in the first three categories of factors because they are more certain drivers of Long-Term Transmission Needs, relative to factors in other factor categories.

508. We clarify that transmission providers may rely on the open and transparent stakeholder process discussed below to identify the factors in the first three required categories of factors. More specifically, this final rule does not obligate transmission providers to independently identify all of the factors in the first three categories of

[1124] As explained above, the first three categories of factors are: (1) federal, federally-recognized Tribal, state, and local laws and regulations affecting the resource mix and demand; (2) federal, federally-recognized Tribal, state, and local laws and regulations on decarbonization and electrification; and (3) state-approved integrated resource plans and expected supply obligations for load-serving entities.

factors. We believe that it would be unduly burdensome and potentially impractical for transmission providers to independently identify all of the potential factors in the first three categories of factors, which will include numerous federal, federally-recognized Tribal, state, and local laws and regulations, as well as integrated resource plans and expected supply obligations for load-serving entities.[1125] However, transmission providers may, if they choose, independently identify factors in the first three categories of factors as part of the stakeholder process, discussed further in the Stakeholder Process and Transparency section below.

509. We believe that this clarification addresses PJM's request that we clarify that the burden of making the transmission provider aware of laws, regulations, and goals rests with stakeholders and not with the transmission provider itself.[1126] We also believe that this clarification mitigates the potential administrative burdens and compliance risks identified by ISO-NE, as well as the burden of incorporating factors identified by SPP.[1127]

[1125] The Commission has previously found that transmission providers "cannot later be faulted" for failing to consider projections of a need for service from a point-to-point transmission customer if such projections are not provided by the transmission customer. Order No. 890, 118 FERC ¶ 61,119 at P 487; *id.* ("We also believe that it is appropriate to require point-to-point customers to submit any projections they have of a need for service over the planning horizon and at what receipt and delivery points. . . . If the point-to-point customers do not submit such projections, then the transmission provider cannot later be faulted for failing to consider planning scenarios that might have taken into account reasonable projections of future system uses that were not the subject of specific service requests.").

[1126] PJM Initial Comments at 68.

[1127] ISO-NE Initial Comments at 26-27; SPP Initial Comments at 7-8.

510. In addition, as clarified above, transmission providers retain the discretion to determine whether particular factors, including those in the first three categories of factors, that stakeholders identify are likely to affect Long-Term Transmission Needs. Thus, transmission providers may determine, for example, that some stakeholder-identified local laws and regulations that fall within Factor Categories One and Two are unlikely to affect Long-Term Transmission Needs and therefore need not be accounted for in the development of Long-Term Scenarios. We believe that this clarification addresses concerns about the additional burden some commenters identified of tracking and incorporating local laws and regulations into the development of Long-Term Scenarios, as well as concerns that the inclusion of local laws and regulations in the first two categories of factors creates a burden for transmission providers to account for factors that are unlikely to affect Long-Term Transmission Needs.[1128]

511. We believe that the open and transparent stakeholder process discussed below in the Stakeholder Process and Transparency section will help transmission providers to ensure that each Long-Term Scenario accounts for factors in the first three categories of factors without discounting the effects of those factors on Long-Term Transmission Needs. We expect that transmission providers will rely, at least in part, on information that relevant federal, state, and local government entities, federally-recognized Tribes, utilities, and load-serving entities provide during the required open and transparent stakeholder process to determine if specific factors are likely to affect Long-Term

[1128] Duke Initial Comments at 13.

Transmission Needs and how to account for those specific factors in Long-Term Scenarios. We agree with NYISO regarding the value of coordination and clarify that transmission providers may work in coordination with government entities and stakeholders to determine how applicable laws and regulations may affect Long-Term Transmission Needs.[1129]

512. We recognize that some commenters raise concerns as to whether factors in the first three categories of factors can be fully achieved (e.g., a legislative requirement is met) or may have various levels of impact on Long-Term Transmission Needs.[1130] At the outset, we find it appropriate to assume legally binding obligations are met, unless and until there is a change in law. Government entities have an interest and ability to ensure that the requirements of laws and regulations are fully achieved. Similarly, utilities and load-serving entities, as well as the relevant retail regulator, have an interest in developing accurate integrated resource plans and expected supply obligations that can be fully achieved. Even in the limited circumstances in which these factors are not fully achieved, we expect the targets or requirements associated with these factors will be informative for purposes of identifying Long-Term Transmission Needs. We acknowledge that, for certain factors, there may be insufficient information for transmission providers to determine, or stakeholder disagreement about, how the factor will affect Long-Term Transmission Needs. In such instances, we clarify that

[1129] NYISO Initial Comments at 23.

[1130] *Id.*

transmission providers have discretion over how to account for a factor in the first three categories of factors in their Long-Term Scenarios as long as the assumptions in each Long-Term Scenario are consistent with legally binding obligations, state-approved integrated resource plans, and expected supply obligations of load-serving entities.

513. For example, when a legally binding obligation sets a minimum requirement or threshold (e.g., a state law requiring the deployment of at least 5 gigawatts of electric storage resources by 2030), transmission providers may develop Long-Term Scenarios assuming either the minimum amount of the requirement or more than the minimum amount of the requirement (e.g., modeling 10 gigawatts of electric storage resources deployed by 2030 instead of the minimum 5 gigawatts) but may not develop any Long-Term Scenarios that are inconsistent with that minimum (e.g., modeling only 2 gigawatts of electric storage resources deployed by 2030). We believe that these clarifications sufficiently address PPL's concerns regarding the uncertainty associated with how transmission providers are expected to translate factors, including local laws and regulations, into Long-Term Scenarios.[1131] We note that the requirement, discussed further below, that Long-Term Scenarios be plausible and diverse also clarifies how transmission providers must account for factors in the Long-Term Scenarios. That is, while transmission providers can model assumptions that exceed the minimum requirements of factors in the first three categories in developing Long-Term Scenarios, they can only exceed those minimum requirements such that each Long-Term Scenario

[1131] PPL Initial Comments at 8.

remains plausible.[1132] Similarly, the requirement that Long-Term Scenarios be diverse ensures that transmission providers will model the effect of factors on Long Term Transmission Needs in different ways, and thus that Long-Term Scenarios help to manage uncertainty over how factors will affect Long-Term Transmission Needs.

514. We disagree with ISO-NE's claim that requiring that each Long-Term Scenario account for and consistently reflect the first three categories of factors would unnecessarily prevent testing of variations with these categories of factors. Where a factor's effect is not clear on its face, transmission providers have discretion, within reason, to determine the likely effect of full achievement of the factor and reflect that into development of the Long-Term Scenarios. Transmission providers also are not limited to assuming only the minimum requirements of a factor are fully achieved in developing the Long-Term Scenarios.

515. We also are unpersuaded by commenter claims that local laws and regulations might conflict with state laws and regulations and, therefore, we should not include local laws and regulations in the first two categories of factors.[1133] However, we acknowledge that there may be limited circumstances when two legally binding factors have conflicting or opposite implications for Long-Term Transmission Needs. We clarify that,

[1132] Likewise, as discussed in the Treatment of Factors in the Last Four Categories section, transmission providers may only discount the effect of factors in the last four categories on Long-Term Transmission Needs such that each Long-Term Scenario remains plausible.

[1133] Alabama Commission Initial Comments at 5-6; PJM Initial Comments at 68.

in such circumstances, transmission providers shall reconcile this information while giving full effect to the maximum extent possible to all legally binding factors. For example, where two laws have equal and opposite effect, transmission providers may need to incorporate them as negating each other, as necessary to comply with the requirement to produce plausible Long-Term Scenarios. In circumstances when that is not possible because the legally binding factors support alternatives to the same assumption used to develop Long-Term Scenarios, transmission providers could use two or more of the three required Long-Term Scenarios, or develop additional Long-Term Scenarios, to capture the differences implied by each of the conflicting factors.

(b) Treatment of Factors in the Last Four Categories

516. We affirm that transmission providers have additional discretion in how they account for each factor in the last four categories of factors compared to how they account for each factor in the first three categories.[1134] After transmission providers have determined that a specific factor, stakeholder-identified or otherwise, is likely to affect Long-Term Transmission Needs over the transmission planning horizon, transmission providers must then assess the extent to which the anticipated effects on Long-Term Transmission Needs due to that factor are likely to be realized in full, in part, or

[1134] As explained above, the last four categories of factors are: (4) trends in fuel costs and in the cost, performance, and availability of generation, electric storage resources and building and transportation electrification technologies; (5) resource retirements; (6) generator interconnection requests and withdrawals; (7) utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs.

exceeded, for purposes of developing a plausible and diverse set of Long-Term Scenarios. For example, for a corporate commitment identified in Factor Category Seven, transmission providers can make a determination that only a fraction of that corporate commitment will actually be met, and the transmission providers can subsequently model more limited effects on Long-Term Transmission Needs due to that factor, in some or all Long-Term Scenarios. Likewise, transmission providers may put more weight on the factor by modeling more than the projected change in some or all Long-Term Scenarios to reflect the transmission providers' view regarding the likelihood that the anticipated effects on Long-Term Transmission Needs due to that factor will occur. Transmission providers may choose to discount or put more weight on the effects on Long-Term Transmission Needs due to factors in Factor Categories Four through Seven to account for uncertainty when developing plausible and diverse Long-Term Scenarios.

517. Several commenters generally support this flexibility to treat the last four categories of factors differently from the first three.[1135] We believe that requiring transmission providers to incorporate the last four categories of factors, but allowing transmission providers to discount the effects of factors within these categories, strikes an appropriate balance between requiring factors in these categories be given full weight, and allowing them to be excluded entirely in developing Long-Term Scenarios. We

[1135] APPA Initial Comments at 27-28; Exelon Initial Comments at 10-11 (citing NOPR, 179 FERC ¶ 61,028 at P 121); NRECA Initial Comments at 29-32; TAPS Initial Comments at 2-3, 8.

believe that these categories of factors affect Long-Term Transmission Needs, and absent a requirement to incorporate them, transmission providers may fail to identify, evaluate, and select more efficient or cost-effective Long-Term Regional Transmission Facilities to address those Long-Term Transmission Needs. On the other hand, these categories of factors are less certain than the first three categories and should not necessarily be given the same weight in developing Long-Term Scenarios as factors that are legally binding.

518. We disagree with the concern that this flexibility could allow transmission providers to ignore the last four factor categories[1136] because the final rule requires transmission providers to incorporate all categories of factors in each Long-Term Scenario, even if they discount specific factors within the category, and requires that all Long-Term Scenarios be plausible.[1137] We reiterate that transmission providers may only discount the effects of factors in these categories on Long-Term Transmission Needs such that each Long-Term Scenario remains plausible.

d. Stakeholder Process and Transparency

i. NOPR Proposal

519. The Commission proposed to require that transmission providers identify and publish on an Open Access Same-Time Information System (OASIS) or other public

[1136] *E.g.*, ACEG Initial Comments at 27-28; Amazon Initial Comments at 4; Clean Energy Associations Initial Comments at 10-11; Pine Gate Initial Comments at 23-25; PIOs Initial Comments at 18-19; SEIA Initial Comments at 8-10.

[1137] ACEG Initial Comments at 28; DC and MD Offices of People's Counsel Initial Comments at 11.

website a list of the factors that fall into each of the required categories of factors that they will incorporate in their development of Long-Term Scenarios. The Commission explained that transmission providers would be responsible for identifying all the factors they know of and are considering incorporating in the development of Long-Term Scenarios as part of Long-Term Regional Transmission Planning. The Commission also proposed to require transmission providers to revise the regional transmission planning processes in their OATTs to outline an open and transparent process that provides stakeholders, including states, with a meaningful opportunity to propose potential factors that transmission providers must incorporate in their development of Long-Term Scenarios, such as specific laws, regulations, goals, and commitments, and to provide input on how to appropriately discount factors that are less certain.[1138]

520. The Commission noted that, under Order No. 1000, transmission providers must already have procedures in their OATTs that give stakeholders a meaningful opportunity to submit proposed transmission needs driven by Public Policy Requirements and that allow transmission providers to identify, out of the larger set of potential transmission needs driven by Public Policy Requirements that stakeholders propose, those needs for which transmission facilities will be evaluated.[1139] Therefore, the Commission explained that transmission providers may be able to modify and expand these existing procedures

[1138] NOPR, 179 FERC ¶ 61,028 at P 109.

[1139] *Id.* P 110 (citing Order No. 1000, 136 FERC ¶ 61,051 at PP 206-207; Order No. 1000-A, 139 FERC ¶ 61,132 at P 335).

for identifying transmission needs driven by Public Policy Requirements to meet these proposed requirements regarding the identification of factors for incorporation into Long-Term Scenarios.[1140]

ii. Comments

(a) State Input

521. Several commenters emphasize the important role of stakeholders, including states, in identifying or commenting on the factors to be included in the development of Long-Term Scenarios.[1141] In addition, Southeast PIOs note that states do not currently engage in regional transmission planning processes to any meaningful degree, and therefore, the Commission should encourage their participation in shaping and conducting Long-Term Regional Transmission Planning.[1142]

522. Some commenters discuss the important role of states in identifying factors within specific category of factors.[1143] DC and MD Offices of People's Counsel assert that the final rule should explicitly require information on the factors to be provided by appropriate authorities, such as state agencies.[1144] New Jersey Commission supports the

[1140] *Id.*

[1141] APPA Initial Comments at 27-29; PIOs Initial Comments at 22; PJM Initial Comments at 70; Southeast PIOs Initial Comments at 45, 46-47.

[1142] Southeast PIOs Initial Comments at 45-46; State Officials Supplemental Comments at 1.

[1143] DC and MD Offices of People's Counsel Initial Comments at 12; New Jersey Commission Initial Comments at 14-15.

[1144] DC and MD Offices of People's Counsel Initial Comments at 12.

Commission's proposal to require that states have a meaningful opportunity to propose potential factors to be incorporated into the development of Long-Term Scenarios and to provide input on appropriately discounting less certain factors.[1145] NESCOE asserts that, if states do not play a central role in determining the factors, the proposed reforms will likely run into the problem that underlies the Order No. 1000 public policy transmission planning process in New England, where states do not have a decision-making role over project selection even though state laws or policies could be the driver for the project.[1146]

523. However, other commenters state that their existing processes are adequate for determining the relevant factors to include in Long-Term Regional Transmission Planning.[1147] PJM states that it currently has processes and standing committees that allow states and stakeholders to participate in discussions of factors to use in its transmission planning processes. For example, PJM asserts that its Independent State Agencies Committee is set up to receive feedback on transmission planning from states, and it discusses, among other things, assumptions used in the models, relevant regulatory initiatives and their impact, and alternative sensitivities, as well as what was discussed at other committee meetings. In addition, PJM states, it vets all proposed transmission

[1145] New Jersey Commission Initial Comments at 14-15.

[1146] NESCOE Initial Comments at 28-29.

[1147] MISO Initial Comments at 34-35; MISO TOs Initial Comments at 18; OMS Initial Comments at 6; PJM Initial Comments at 6, 64, 70-71.

solutions with its Transmission Expansion Advisory Committee before submitting them to the PJM board for approval.[1148]

(b) Transparency, Enforcement, and Accuracy

524. Cross Sector Representatives state that Long-Term Regional Transmission Planning processes should provide transparency for impacted stakeholders.[1149] SEIA argues that the Commission should adopt clear, uniform language that sets forth the specific goals and deliverables from the proposed Long-Term Regional Transmission Planning process for transmission providers to include in their tariffs, including language that mirrors the proposed list of categories of factors the Commission included in the NOPR.[1150]

525. Several commenters support the NOPR proposal to require transmission providers to post the list of factors that they will incorporate into their Long-Term Scenarios on a public website for stakeholder comment.[1151] Pine Gate recommends that the Commission further require that transmission providers identify and publish all factors that were considered but not incorporated.[1152]

[1148] PJM Initial Comments at 70-71.

[1149] Cross Sector Representatives Supplemental Comments at 1.

[1150] SEIA Reply Comments at 3-4 (citing PJM Initial Comments at 27-28).

[1151] Ameren Initial Comments at 11-12; APPA Initial Comments at 28; NESCOE Initial Comments at 28; Pine Gate Initial Comments at 25; PIOs Initial Comments at 22.

[1152] Pine Gate Initial Comments at 25.

526. Clean Energy Buyers state that, to ensure transparency and just and reasonable rates, the Commission should require that transmission providers post the details regarding any proposed or adopted discounting of factors on OASIS, including: (1) which factors are to be discounted; (2) the extent of the discounting; and (3) the justification for and derivation of the amount of discounting deemed appropriate.[1153]

527. GridLab and R Street propose modifications to the NOPR proposal regarding the role of stakeholders.[1154] GridLab proposes that state agencies, other stakeholders, and independent experts could play a dominant role in enforcing the Commission's requirement to incorporate specific categories of factors, and that the Commission would provide a common framework establishing guidelines on the kinds of factors that transmission providers should consider, at a minimum, in developing Long-Term Scenarios.[1155] In addition, R Street argues that governance mechanisms should drive the selection of data sets, methods, and assumptions behind these factors to promote objective accuracy.[1156]

iii. Commission Determination

528. We adopt the NOPR proposal, with modification, to require transmission providers in each transmission planning region to revise the regional transmission

[1153] Clean Energy Buyers Initial Comments at 16-17.

[1154] GridLab Initial Comments at 20-21; R Street Initial Comments at 7.

[1155] GridLab Initial Comments at 21.

[1156] R Street Initial Comments at 7.

planning processes in their OATTs to outline an open and transparent process that provides stakeholders, including federally-recognized Tribes and states, with a meaningful opportunity to propose potential factors and to provide timely input on how to account for specific factors in the development of Long-Term Scenarios.[1157] As discussed below, we also adopt the NOPR proposal, with modification, to require transmission providers to publish on the public portion of an OASIS or other public website: (1) the list of the factors in each of the seven required categories of factors that they will account for in their Long-Term Scenarios; (2) a description of each factor that they will account for in their Long-Term Scenarios; (3) a general statement explaining how they will account for each of those factors in their Long-Term Scenarios; (4) a description of the extent to which they will discount any factors in Factor Categories Four through Seven in each Long-Term Scenario; and (5) a list of the factors that they considered but did not incorporate in their Long-Term Scenarios.

529. We believe that a robust stakeholder process will ensure that transmission providers can identify which, and how, specific factors might influence Long-Term Transmission Needs over the transmission planning horizon. For this reason, consistent with Order No. 890's transmission planning principles,[1158] we require transmission

[1157] As an example, transmission providers would provide stakeholders with an opportunity to describe how a specific state law in the first category of factors will result in the development of new resources of a certain type, the retirement of existing resources, or changes in demand patterns due to increased electrification.

[1158] *See, e.g.*, Order No. 890, 118 FERC ¶ 61,119 at P 454.

providers to give stakeholders a meaningful opportunity to provide timely input on how and what information to incorporate in Long-Term Scenarios, including how to account for a specific factor in terms of how the factor may affect Long-Term Transmission Needs. We clarify that this meaningful opportunity for stakeholders to provide timely input includes the opportunity to propose factors, provide information and identify sources of best available data, propose how a factor may affect Long-Term Transmission Needs, and explain how that factor could be reflected in the development of Long-Term Scenarios, including the extent to which it is appropriate to discount the effects of certain factors on Long-Term Transmission Needs. We note that some transmission providers have existing processes in place that allow states and stakeholders to participate in discussions of factors, which transmission providers can propose, with any necessary modifications, to comply with this final rule.[1159]

530. We believe that affording stakeholders a meaningful opportunity to propose potential factors and to provide input on how to account for specific factors in the development of Long-Term Scenarios will help transmission providers to develop more accurate assumptions to serve as the basis for their Long-Term Scenarios. Specifically, with stakeholder input, transmission providers will be in a better position to determine which specific factors within each category of factors they should account for in the development of Long-Term Scenarios, as well as how best to incorporate them. Stakeholder input is particularly important for factors in the first three categories of

[1159] MISO Initial Comments at 34-35; PJM Initial Comments at 6, 64, 70-71.

factors because federal, state, and local government entities, federally-recognized Tribes, and utilities, load-serving entities, and their retail regulators that participate in the stakeholder process are distinctly positioned to provide transmission providers with vital information on how the factors over which they have authority or govern are likely to influence Long-Term Transmission Needs over the transmission planning horizon. Similarly, utilities, corporations, and governments that participate in the stakeholder process are distinctly positioned to provide transmission providers with vital information regarding factors in Factor Category Seven: utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs. The required stakeholder process ensures that all stakeholders, including states, can provide important and useful information concerning factors that they believe will affect Long-Term Transmission Needs.

531. We recognize that different stakeholders may provide information about the same factor that is contradictory – an issue identified by some commenters.[1160] Different stakeholders may also provide different analyses showing, for example, how a specific factor will affect resource additions and retirements. However, as we explain earlier, transmission providers have discretion regarding how to account for specific factors in their development of Long-Term Scenarios. In reviewing the information provided by stakeholders in the open and transparent stakeholder process, transmission providers may

[1160] *E.g.*, Undersigned States Initial Comments at 3 (citing NOPR, 179 FERC ¶ 61,028 at P 106).

weigh more heavily one source of information over another. To maintain transparency for stakeholders, transmission providers must include a general statement explaining how they will account for each factor in their Long-Term Scenarios on the public portion of an OASIS or other public website, as further described below.

532. We also believe that the information provided in the open and transparent stakeholder process will reduce the burden placed on transmission providers to identify and assess the impact of relevant factors for each category. For example, transmission providers can rely on the open and transparent stakeholder process to identify the multiple relevant local laws and regulations that are likely to influence Long-Term Transmission Needs over the transmission planning horizon. The same is true for the utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs in Factor Category Seven. During the stakeholder process, government entities, utilities, and corporate entities can identify their publicly announced goals and provide feedback on how the transmission providers can account for these publicly announced goals in Long-Term Scenarios. These entities will have an opportunity to provide information to help the transmission providers determine the likelihood that they will achieve their stated goals, which the transmission providers can then use to discount the specific factors in Factor Category Seven, if necessary.

533. With regard to the information about factors and categories of factors that transmission providers must publish on the public portion of an OASIS or other public website, we modify the proposal in the NOPR. We require transmission providers to

publish on the public portion of an OASIS or other public website: (1) the list of the factors in each of the seven required categories of factors that they will account for in their Long-Term Scenarios; (2) a description of each factor that they will account for in their Long-Term Scenarios; (3) a general statement explaining how they will account for each of these factors in their Long-Term Scenarios; (4) a description of the extent to which they will discount any factors in Factor Categories Four through Seven in each Long-Term Scenario; and (5) a list of the factors that they considered but did not incorporate in their Long-Term Scenarios.[1161] Transmission providers must post this information after stakeholders, including states, have had the meaningful opportunity to propose potential factors and to provide input on how to account for specific factors in the development of Long-Term Scenarios.

534. We believe that this transparency is necessary to make clear to stakeholders which specific factors transmission providers incorporate into Long-Term Scenarios and how they incorporate those factors. We believe the posting requirement will also provide greater transparency into how transmission providers develop Long-Term Scenarios (discussed below), as some commenters requested, while still providing transmission providers with flexibility regarding whether, and if so, how they choose to incorporate relevant factors.

[1161] As discussed above, transmission providers may not discount factors in Factor Categories One through Three.

535. In response to commenters requesting additional transparency,[1162] we require transmission providers to publish on the public portion of an OASIS or other public website the factors that were considered but not accounted for in the development of Long-Term Scenarios. We believe this requirement will help stakeholders understand which factors, either identified in the stakeholder process or independently identified by a transmission provider, the transmission providers in a transmission planning region have determined are unlikely to affect Long-Term Transmission Needs. This transparency also ensures that stakeholder-proposed factors are reviewed in a fair and non-discriminatory manner.

536. We decline to require transmission providers to publicly publish the justification for and derivation of the amount of discounting deemed appropriate, as requested by Clean Energy Buyers.[1163] We believe such a requirement to detail the rationale for the treatment of each factor in Factor Categories Four through Seven, across all Long-Term Scenarios, would create a time-consuming administrative burden for transmission providers that is not justified by the value of the additional information provided to stakeholders.

537. We decline to adopt modifications to the NOPR proposal that would diminish the role of the transmission providers in developing Long-Term Scenarios.[1164] Transmission

[1162] *E.g.*, Pine Gate Initial Comments at 25.

[1163] Clean Energy Buyers Initial Comments at 16-17.

[1164] *E.g.*, GridLab Initial Comments at 20-21; R Street Initial Comments at 7.

providers must provide stakeholders with a meaningful opportunity to propose potential factors and to provide input on how to incorporate specific factors in the development of Long-Term Scenarios, as described above. However, we reiterate that transmission providers are not required to incorporate stakeholder-identified factors into their development of Long-Term Scenarios merely because stakeholders propose them, if transmission providers determine that the factor is unlikely to influence Long-Term Transmission Needs over the transmission planning horizon. Consistent with Order No. 890, the ultimate responsibility for transmission planning remains with the transmission provider.[1165]

4. Number and Development of Long-Term Scenarios

a. NOPR Proposal

538. In the NOPR, the Commission proposed to require transmission providers to develop at least four distinct Long-Term Scenarios as part of Long-Term Regional Transmission Planning at least once during a transmission planning cycle.[1166] The Commission explained that it preliminarily found that using at least four distinct Long-

[1165] Order No. 890, 118 FERC ¶ 61,119 at P 454 ("In response to the suggestion by some commenters that we require transmission providers to allow customers to collaboratively develop transmission plans with transmission providers on a co-equal basis, we clarify that transmission planning is the tariff obligation of each transmission provider, and the *pro forma* OATT planning process adopted in this Final Rule is the means to see that it is carried out in a coordinated, open, and transparent manner, in order to ensure that customers are treated comparably. Therefore, the ultimate responsibility for planning remains with transmission providers.").

[1166] NOPR, 179 FERC ¶ 61,028 at PP 121-126.

Term Scenarios is a reasonable lower bound for the number of Long-Term Scenarios that transmission providers must evaluate in Long-Term Regional Transmission Planning. The Commission explained that this minimum number of Long-Term Scenarios would help to ensure that transmission providers conduct Long-Term Regional Transmission Planning that identifies more efficient or cost-effective regional transmission facilities to meet transmission needs driven by changes in the resource mix and demand. The Commission explained that to satisfy this requirement, transmission providers could develop a base case and three alternatives, or a low-, medium-, and high-level assumption for the factors that transmission providers (and their stakeholders) believe to be important to conduct Long-Term Regional Transmission Planning to more efficiently or cost-effectively meet transmission needs driven by changes in the resource mix and demand, along with a scenario that accounts for a high-impact, low-frequency event (as discussed below).[1167]

539. Consistent with the Order No. 890 transparency transmission planning principle,[1168] the Commission proposed to require transmission providers in each

[1167] *Id.* P 122.

[1168] The transparency transmission planning principle requires transmission providers to reduce to writing and make available the basic methodology, criteria, and processes used to develop transmission plans. Transmission providers must make sufficient information available to enable customers and other stakeholders to replicate the results of transmission planning studies. Order No. 890, 118 FERC ¶ 61,119 at P 471. Order No. 1000 applied this and other Order No. 890 transmission planning principles to regional transmission planning processes. Order No. 1000, 136 FERC ¶ 61,051 at P 151.

transmission planning region to publicly disclose (subject to any applicable confidentiality protections) information and data inputs they use to create each Long-Term Scenario. The Commission explained that this transparency requirement will allow stakeholders to understand how each scenario differs.

540. Similarly, consistent with the coordination transmission planning principle established in Order No. 890,[1169] the Commission proposed to require that transmission providers in each transmission planning region give stakeholders the opportunity to provide timely and meaningful input into the identification of which Long-Term Scenarios are developed. The Commission proposed to require transmission providers to revise the regional transmission planning processes in their OATTs to outline an open and transparent process that provides stakeholders, including states, with a meaningful opportunity to propose which future outcomes are probable and can be captured through assumptions made in the development of Long-Term Scenarios. Furthermore, the Commission proposed to require transmission providers to explain on compliance how their process will identify a plausible and diverse set of Long-Term Scenarios.[1170]

[1169] The coordination transmission planning principle requires transmission providers to provide customers and other stakeholders with the opportunity to participate fully in the transmission planning process. The transmission planning process must provide for the timely and meaningful input and participation of customers and other stakeholders regarding the development of transmission plans, allowing customers and other stakeholders to participate in the early stages of development. Order No. 890, 118 FERC ¶ 61,119 at PP 451-454.

[1170] NOPR, 179 FERC ¶ 61,028 at P 123.

b. Comments

541. Many commenters support requiring transmission providers in each transmission planning region to develop at least four distinct Long-Term Scenarios as part of Long-Term Regional Transmission Planning.[1171] GridLab and R Street state that this proposed requirement appropriately balances the need to address uncertainty and risk factors associated with long-term transmission planning while limiting the complexity of the transmission planning process.[1172] PJM says that employing multiple scenarios will ensure that transmission providers' plans reflect changing needs while avoiding the risk of over-building.[1173] SEIA states that requiring four distinct Long-Term Scenarios will allow transmission providers to reflect the uncertainty inherent in long-term planning.[1174] AEE states that the Commission should establish a minimum number of scenarios as a

[1171] ACORE Initial Comments at 10; Advanced Energy Buyers Initial Comments at 8; AEE Initial Comments at 8, 18; APPA Initial Comments at 29; Arizona Commission Initial Comments at 6; Concerned Scientists Reply Comments at 18-19; ELCON Initial Comments at 12; ENGIE Initial Comments at 4; Evergreen Action Initial Comments at 3; Georgia Commission Initial Comments at 4-5; GridLab Initial Comments at 12; ITC Initial Comments at 12; Nevada Commission Initial Comments at 8-9; New England for Offshore Wind Initial Comments at 2; NextEra Initial Comments at 65; Northwest and Intermountain Initial Comments at 12; NYISO Initial Comments at 25; Ørsted Initial Comments at 7; Southeast PIOs Initial Comments at 46; SPP Market Monitor Initial Comments at 6-7; US Chamber of Commerce Initial Comments at 7; US DOE Initial Comments at 14; Vermont Electric and Vermont Transco Initial Comments at 2.

[1173] PJM Initial Comments at 74.

[1174] SEIA Initial Comments at 11.

baseline for compliance with any final rule.[1175] New York TOs support requiring the use of multiple scenarios for Long-Term Regional Transmission Planning, noting that NYISO already incorporates multiple scenarios into its transmission planning processes.[1176] Nevada Commission notes that information from four scenarios could provide inputs into Nevada's integrated regional planning process and identify both local and regional needs.[1177]

542. Policy Integrity argues that the Commission should require more than four Long-Term Scenarios.[1178] Policy Integrity identifies planning efforts that have used more than four scenarios to illustrate that best practice counsels against reducing the number of required Long-Term Scenarios.[1179] Northwest and Intermountain state that, depending upon the size and characteristics of the transmission planning region, additional scenarios may be necessary to identify the transmission facilities that are most likely to ensure just

[1175] AEE Reply Comments at 18.

and reasonable rates.[1180] LADWP states that while developing more than four scenarios will likely be prudent in some instances such as special studies, four scenarios should be adequate for most Long-Term Regional Transmission Planning given the 20-year planning horizon and uncertainties.[1181]

543. Some commenters stress the importance of considering multiple Long-Term Scenarios and the uncertainty associated with future conditions.[1182] ACORE suggests that uncertainties in data can be addressed with multiple Long-Term Scenarios that are continuously revised instead of granting flexibility or encouraging discounting of certain factors.[1183] ENGIE states that a single base-case scenario is not effective at capturing trends in the resource mix and demand.[1184] New York Commission and NYSERDA state that Long-Term Scenarios should reflect a range of plausible long-term futures that are relevant to the state (or transmission planning region) and should account for the uncertainty associated with looking out over longer time horizons.[1185] On the other hand, R Street posits that whether scenario planning sufficiently captures information on the

[1185] New York Commission and NYSERDA Initial Comments at 8.

resource mix and demand depends more on the quality of inputs and scenario construction elements than the total number of scenarios.[1186]

544. Some commenters generally support requiring Long-Term Scenarios[1187] including scenarios examining the effects of high energy demand,[1188] and penetration of renewable resources.[1189]

545. Other commenters do not oppose this requirement.[1190]

546. Some commenters support requiring transmission providers to establish Long-Term Scenarios, but would modify the NOPR proposal to require a lower minimum number. AEP, Entergy, NRECA, Pine Gate, and Western PIOs support requiring at least three Long-Term Scenarios.[1191] CAISO argues that the Commission should not require transmission providers to develop a minimum of four Long-Term Scenarios because

[1186] R Street Initial Comments at 6.

[1187] Breakthrough Energy Supplemental Comments at 1; Clean Energy Associations Initial Comments at 11-12; Cross Sector Representatives Supplemental Comments at 1; PJM Initial Comments at 6, 71-72; RMI Supplemental Comments at 2; US Climate Alliance Initial Comments at 2; Western PIOs Initial Comments at 29.

there is no evidence, rationale, or justification for why four is the appropriate number of scenarios to develop.[1192] Instead, CAISO asserts that the Commission should grant transmission planners the flexibility to determine the minimum number of Long-Term Scenarios that are appropriate given the specific circumstances in their region and planning cycle. However, CAISO states that if Commission were to adopt a minimum number of Long-Term Scenarios, three Long-Term Scenarios is appropriate because it allows for a base case scenario and two sensitivity scenarios.[1193] Entergy and NRECA claim that three Long-Term Scenarios would better balance the burden with the benefit of developing an additional scenario.[1194] Pine Gate recommends that, instead of requiring a fourth scenario, the Commission should permit transmission providers in each transmission planning region to develop and use no less than three Long-Term Scenarios, and then to conduct either a fourth scenario or a sensitivity analysis on the most likely Long-Term Scenario to "account for uncertain operational outcomes that determine the benefits of or need for transmission facilities during high-impact, low frequency events" as proposed in the NOPR.[1195]

[1195] Pine Gate Initial Comments at 26 (citing NOPR, 179 FERC ¶ 61,028 at P 124).

547. National Grid argues that there is an inherent trade-off between the number of Long-Term Scenarios, the quality of the data underpinning the assessment, and the frequency of reassessments. National Grid concludes that a transmission provider should not be required to plan for a scenario that is impossible or not supported by its stakeholders solely to meet the requirement that four distinct Long-Term Scenarios be developed and studied.[1196] Xcel supports the use of scenarios but states that the proposed requirement to use at least four Long-Term Scenarios is too prescriptive.[1197] Relatedly, LADWP states that developing more than four Long-Term Scenarios may be prudent in some instances but that it would be inefficient and a waste of resources to require all transmission providers in each transmission planning region to do so.[1198]

548. Some commenters broadly oppose the NOPR proposal to require transmission providers in each transmission planning region to develop at least a minimum number or specific number of Long-Term Scenarios.[1199] California Commission argues that the NOPR's approach would interfere with regional transmission planning processes, such as CAISO's, that are closely coordinated with state resource planning and load forecasting

[1196] National Grid Initial Comments at 14-15.

[1198] LADWP Initial Comments at 4.

[1199] California Commission Initial Comments at 21-24; Duke Initial Comments at 15; Indicated PJM TOs Initial Comments at 9-10; ISO-NE Initial Comments at 28; ISO/RTO Council Initial Comments at 9; MISO Initial Comments at 20; NESCOE Initial Comments at 30; OMS Initial Comments at 5; PG&E Initial Comments at 6-7; SPP Initial Comments at 9-10; State Agencies Initial Comments at 14.

and already effectively identify transmission necessary to accommodate changes in the resource mix and demand.[1200] Duke argues that requiring a minimum number of Long-Term Scenarios, while also requiring one capture high-impact, low-frequency events, places greater importance on developing scenarios purely to satisfy the requirement than on gaining consensus about what scenarios are in fact plausible or most likely.[1201] MISO states that a prescriptive number of Long-Term Scenarios with specific factors included may introduce a level of granularity and complexity into Long-Term Regional Transmission Planning that impedes progress.[1202]

549. Some commenters request that the Commission provide transmission providers in each transmission planning region with the flexibility to determine how many Long-Term Scenarios to develop.[1203] US DOE supports a requirement to identify four scenarios as a reasonable lower bound, and supports the analysis of additional scenarios, including sensitivities, but asserts that the development of Long-Term Scenarios should not be prescriptive but, rather, the Commission should provide guidelines and give transmission

planning regions flexibility to work within those guidelines to capture reasonable sets of scenarios.[1204]

550. Some commenters propose that, if the Commission does not require a minimum number of Long-Term Scenarios, the Commission should instead require that transmission providers in each transmission planning region demonstrate, on compliance, why their proposed number of Long-Term Scenarios is appropriate.[1205] Duke asserts that the Commission should direct transmission providers to offer on compliance a process for Long-Term Scenario development that will capture enough sufficiently plausible scenarios with distinct sets of assumptions to adequately capture a consensus view of the most likely future state(s) to occur.[1206]

551. Other commenters call for the Commission to permit discretion on how transmission providers determine the number of Long-Term Scenarios to use.[1207] ISO-NE and ISO/RTO Council argue that the number of Long-Term Scenarios is an implementation detail that each transmission planning region should decide.[1208] NYISO

states that the final rule should permit each transmission planning region to conduct Long-Term Regional Transmission Planning using multiple Long-Term Scenarios that account for varying levels of achievement of local laws and regulations.[1209]

552. MISO opposes requiring transmission providers to evaluate a specific number of Long-Term Scenarios and proposes, instead, that the Commission require that future scenarios be developed and implemented for purposes of long-term regional transmission planning, leaving each transmission planning region to determine what and how many scenarios are appropriate. According to MISO, this approach would ensure consistency across the transmission planning regions in what is required while allowing for any needed variation within each region.[1210] Additionally, MISO notes that it developed the futures that it uses in its Long-Range Transmission Plan through extensive stakeholder processes and that these futures reflect the specific realities of its member utilities. MISO contends that allowing transmission providers to develop the number of Long-Term Scenarios they need, and at intervals appropriate for them, encourages stakeholder buy-in and more efficient allocation of planning resources.[1211]

553. California Municipal Utilities disagree with comments that urge prescriptive uniformity, arguing that uniformity involves high costs and lacks consumer protection

[1209] NYISO Initial Comments at 23.

[1210] MISO Initial Comments at 16, 20.

[1211] MISO Reply Comments at 9-10.

measures against speculative transmission projects.[1212] For example, California Municipal Utilities argue against the proposal from Western PIOs for the development of three common scenarios to be synchronized across the Western Interconnection because this proposal amounts to central resource planning, which is not consistent with the existing process in which state and local choices drive the planning process.[1213]

554. Louisiana Commission states that the Commission's proposal is overly prescriptive and that the Commission should provide for a more flexible approach that allows transmission providers, retail regulators, and other stakeholders to develop scenarios with appropriate, realistic, and reasonable assumptions. Louisiana Commission states that Long-Term Scenarios should be based on reasonable ranges of assumptions for load, and generation type and location. Louisiana Commission argues that the number of scenarios required is far less important than the quality of the data and assumptions used to develop them.[1214] MISO TOs agree that the NOPR proposal is overly prescriptive, stating that the Commission should not create unnecessary obstacles, but rather create a rule broad enough to incorporate existing processes.[1215]

555. Some commenters emphasize the need for an open and transparent process that provides stakeholders, including states, with a meaningful opportunity to provide timely

[1212] California Municipal Utilities Reply Comments at 5.

[1214] Louisiana Commission Reply Comments at 6-7.

[1215] MISO TOs Reply Comments at 13.

and meaningful input into which Long-Term Scenarios are developed.[1216] For example, California Commission, NRECA, Concerned Scientists, and US Climate Alliance support the NOPR proposal to require transmission providers to disclose—subject to any applicable confidentiality protections—information and data inputs that they use to create each Long-Term Scenario.[1217] ELCON states that the Commission should require each transmission provider to post all methodologies and inputs used in determining Long-Term Scenarios and factors to its OASIS.[1218] NRG claims that the NOPR proposes a central determination of particular actions based on collectively determined assumptions, which gives up a major advantage of competition – the requirement that market participants take an individual view based on available information of the future viability of any investment they might make.[1219]

556. NESCOE argues that states must play a central role in Long-Term Regional Transmission Planning. Specifically, NESCOE agrees with ISO-NE, which calls for the Commission to explicitly authorize states to have a central decision-making role at all

aspects of Long-Term Regional Transmission Planning, including "scenario analysis development," to ensure necessary additional investment for a reliable, clean energy future.[1220] Similarly, Nebraska Commission adds that state regulatory commissions should have a significant role in defining Long-Term Scenarios.[1221]

557. AEE requests that the Commission clarify the role of states in providing input to the development of Long-Term Scenarios.[1222]

558. GridLab states that the Commission should be prepared to act as the arbiter of stakeholder concerns about Long-Term Scenario design, similar to the role that state public utility commissions play in the integrated resource planning process, and that this may require new staff, resources, and the development of new expertise at the Commission.[1223]

c. Commission Determination

559. We adopt the NOPR proposal, with modification, to require transmission providers in each transmission planning region to develop at least three distinct Long-Term Scenarios as part of Long-Term Regional Transmission Planning. In implementing this requirement, transmission providers must develop, at least once during the five-year Long-Term Regional Transmission Planning cycle, at least three distinct Long-Term

[1220] NESCOE Reply Comments at 2 (citing ISO-NE Initial Comments at 2-4).

[1221] Nebraska Commission Initial Comments at 5-6.

[1222] AEE Initial Comments at 19.

[1223] GridLab Initial Comments at 11-12.

Scenarios that, at a minimum, incorporate the seven categories of factors listed in the Categories of Factors section above. We find that requiring transmission providers to develop at least three distinct Long-Term Scenarios as part of Long-Term Regional Transmission Planning strikes the appropriate balance between establishing a sufficient number of Long-Term Scenarios and the associated burden of developing and using Long-Term Scenarios in Long-Term Regional Transmission Planning. We also find that requiring transmission providers to develop at least three distinct Long-Term Scenarios instead of four, as proposed in the NOPR, is more consistent with the manner in which some transmission providers currently employ scenarios in their existing regional transmission planning process.[1224] We also reiterate, as stated in the NOPR, that if transmission providers produce a base-case Long-Term Scenario in Long-Term Regional Transmission Planning, that base case should be consistent with what the transmission provider determines is the most likely scenario to occur.[1225]

560. In addition, we adopt the NOPR proposal to require, consistent with Order No. 890's transparency transmission planning principle, transmission providers in each

[1224] *See, e.g.*, CAISO Initial Comments at 26 (explaining that "CAISO typically has utilized three scenarios in its public policy planning process, a base case scenario and two sensitivity scenarios"); Entergy Initial Comments at 13-14 (explaining that MISO currently uses three scenarios in its transmission planning process and arguing that the use of three scenarios enables "transmission providers to 'bookend' plausible outcomes to plan no-regrets additions to meet the grid, and then develop a scenario between those two to better inform the decision making"); NRECA Initial Comments at 35 n.100 (highlighting that MISO uses three scenarios in its transmission planning process).

[1225] NOPR, 179 FERC ¶ 61,028 at P 123.

transmission planning region to publicly disclose (subject to any applicable confidentiality protections) information and data inputs that they use to create each Long-Term Scenario.[1226] We also adopt the NOPR proposal to require transmission providers in each transmission planning region, consistent with Order No. 890's coordination transmission planning principle, to provide stakeholders an opportunity to provide timely and meaningful input into how Long-Term Scenarios are developed.[1227] Consistent with Order No. 890 and Order No. 1000's coordination transmission planning principle, we require transmission providers, with the input of their customers and other stakeholders, to craft coordination requirements that work for those transmission providers and their customers and other stakeholders. Furthermore, we adopt the NOPR proposal to require transmission providers to revise the regional transmission planning process in their OATTs to outline an open and transparent process that provides stakeholders, including

[1226] The transparency transmission planning principle requires transmission providers to reduce to writing and make available the basic methodology, criteria, and processes used to develop transmission plans. Transmission providers must make sufficient information available to enable customers and other stakeholders to replicate the results of transmission planning studies. Order No. 890, 118 FERC ¶ 61,119 at P 471. Order No. 1000 applied this and other Order No. 890 transmission planning principles to regional transmission planning processes. Order No. 1000, 136 FERC ¶ 61,051 at P 151.

[1227] The coordination transmission planning principle requires transmission providers to provide customers and other stakeholders with the opportunity to participate fully in the transmission planning process. The transmission planning process must provide for the timely and meaningful input and participation of customers and other stakeholders regarding the development of transmission plans, allowing customers and other stakeholders to participate in the early stages of development. Order No. 890, 118 FERC ¶ 61,119 at P 454.

states, with a meaningful opportunity to propose which future outcomes are probable and can be captured through assumptions made in the development of Long-Term Scenarios. We conclude that these requirements will help ensure that transmission providers will have the necessary information to identify Long-Term Transmission Needs and identify, evaluate, and select Long-Term Regional Transmission Facilities to address those needs. Furthermore, by requiring transmission providers to afford stakeholders a meaningful opportunity to propose future outcomes that are probable, we believe that this requirement helps to ensure that Long-Term Transmission Needs are being addressed in a more efficient or cost-effective manner.[1228]

561. We also note the important role of states in developing Long-Term Scenarios. As the Commission stated in Order No. 890 and Order No. 1000, and we reiterate here, our expectation is that "all transmission providers will respect states' concerns" when engaging in the regional transmission planning process.[1229] We strongly encourage states to participate actively in the development of Long-Term Scenarios, as well as in all other aspects of Long-Term Regional Transmission Planning. In response to NESCOE's and AEE's concerns about the role of state regulators in the development of Long-Term Scenarios and their use in Long-Term Regional Transmission Planning,[1230] we find that,

[1228] Order No. 1000, 136 FERC ¶ 61,051 at P 150.

[1229] *Id.* P 212; Order No. 890, 118 FERC ¶ 61,119 at P 574.

[1230] AEE Initial Comments at 8; NESCOE Reply Comments at 2 (citing ISO-NE Initial Comments at 2-4).

consistent with Order No. 890,[1231] transmission planning must be coordinated with interested stakeholders, including relevant state regulators that wish to participate in the Long-Term Regional Transmission Planning process. As reflected throughout this final rule, we recognize that states have a particularly important role to play in the development of Long-Term Regional Transmission Facilities and encourage transmission providers to work with states in a way that reflects that role in addition to complying with the relevant requirements established herein.

562. In response to commenters that argue that the Commission should require four or more Long-Term Scenarios,[1232] we affirm that nothing in this final rule precludes or prevents transmission providers from proposing to use more than three Long-Term Scenarios in Long-Term Regional Transmission Planning. To the extent that transmission providers, in consultation with stakeholders, conclude that using more than three Long-Term Scenarios is appropriate for Long-Term Regional Transmission

[1231] Order No. 890, 118 FERC ¶ 61,119 at P 574.

[1232] ACORE Initial Comments at 10; Advanced Energy Buyers Initial Comments at 8; AEE Initial Comments at 8; APPA Initial Comments at 29; Arizona Commission Initial Comments at 6; Concerned Scientists Reply Comments at 18-19; ELCON Initial Comments at 12; ENGIE Initial Comments at 4; Evergreen Action Initial Comments at 3; Georgia Commission Initial Comments at 4-5; GridLab Initial Comments at 12; ITC Initial Comments at 12; Nevada Commission Initial Comments at 8-9; New England for Offshore Wind Initial Comments at 2; NextEra Initial Comments at 65; Northwest and Intermountain Initial Comments at 12; NYISO Initial Comments at 25; Ørsted Initial Comments at 7; Southeast PIOs Initial Comments at 46; SPP Market Monitor Initial Comments at 7; US Chamber of Commerce Initial Comments at 7; US DOE Initial Comments at 14-15; Vermont Electric and Vermont Transco Initial Comments at 2.

Planning in their transmission planning region, those transmission providers may propose to use more than three Long-Term Scenarios in their compliance filings.

563. In response to California Commission's comments about the interaction between the development of Long-Term Scenarios and existing regional transmission planning processes,[1233] we believe the final rule, as modified from the NOPR proposal, addresses this concern and provides transmission providers with sufficient flexibility to tailor the development of Long-Term Scenarios to their transmission planning regions' specific needs or existing practices, as discussed elsewhere in this final rule.[1234]

5. Types of Long-Term Scenarios

a. NOPR Proposal

564. In the NOPR, the Commission proposed to require that each Long-Term Scenario incorporate, at a minimum, the categories of factors listed in the requirement above. As discussed in the Factors section of the NOPR,[1235] the Commission proposed that each Long-Term Scenario must be consistent with federal, state, and local laws and regulations that affect the future resource mix; federal, state, and local laws and regulations on decarbonization and electrification; and state-approved integrated resource plans. However, the Commission explained that each Long-Term Scenario may vary according

[1233] California Commission Initial Comments at 23.

[1234] *See supra* Categories of Factors, Requirement to Incorporate Categories of Factors section; Categories of Factors, Stakeholder Process and Transparency section.

[1235] NOPR, 179 FERC ¶ 61,028 at PP 104-112.

to assumptions about the remaining categories of factors described in the NOPR, as well as with respect to other characteristics of the future electric power system. The Commission explained that it neither proposed to require the development of a specific Long-Term Scenario or specific set of Long-Term Scenarios, nor did it propose to require that transmission providers identify the relative likelihood of different Long-Term Scenarios except where transmission providers develop a base case scenario, as described more fully below.[1236]

565. The Commission proposed to require transmission providers in each transmission planning region to develop a plausible and diverse set of Long-Term Scenarios.[1237] The Commission explained that the set of at least four Long-Term Scenarios must be: (1) plausible, that is they must reasonably capture probable future outcomes, and (2) diverse in the sense that transmission providers must be able to distinguish distinct transmission facilities or distinct benefits of similar transmission facilities in each scenario. The Commission proposed to require that if the transmission providers in a transmission planning region use a base case scenario, that scenario should be consistent with the scenario that the transmission providers determine to be the most likely scenario to occur.

[1236] *Id.* P 121.

[1237] The Commission noted that different assumptions about the factors and data inputs used to develop Long-Term Scenarios and other characteristics of the future electric power system determine whether the set of Long-Term Scenarios are plausible and diverse.

b. Comments

566. Some commenters support the Commission's proposal to require transmission providers in each transmission planning region to develop a plausible and diverse set of Long-Term Scenarios.[1238] For example, GridLab agrees that the Commission should require that transmission providers demonstrate that their Long-Term Scenarios capture a reasonable range of possible futures. GridLab argues that scenarios that are too conservative will lead to similar load-resource and transmission portfolio scenarios, which limits the value of scenario planning in managing uncertainty and risk.[1239] Illinois Commission argues that the NOPR's proposed requirement for diverse and plausible scenarios is important, and that Long-Term Scenarios must consider a wide array of conditions.[1240]

567. Some commenters discuss the need for certain types of Long-Term Scenarios.[1241] Certain TDUs and PIOs argue that, although Long-Term Scenarios should include

[1238] APPA Initial Comments at 29; Clean Energy Buyers Initial Comments at 17; DC and MD Offices of People's Counsel Initial Comments at 13; GridLab Initial Comments at 11 & n.12; Illinois Commission Initial Comments at 7; Mississippi Commission Reply Comments at 9; NARUC Initial Comments at 10; NESCOE Initial Comments at 32; New York Commission and NYSERDA Initial Comments at 8; SPP Market Monitor Initial Comments at 7.

anticipated levels of generation, they should also include "book end" scenarios of high- and low-load growth.[1242] Clean Energy Associations argue that, because the Inflation Reduction Act provides for significant funding for electrification, at least some scenarios should evaluate transmission needs under higher-than-anticipated load growth.[1243]

568. PJM describes four scenarios that it might use: (1) a low uncertainty scenario with known inputs, such as legislative and regulatory laws and announced deactivations and load forecasts; (2) a medium uncertainty scenario that includes state and local goals and economic retirement analysis; (3) a higher uncertainty scenario that adds more speculative and aspirational goals; and (4) a high-impact-low-frequency resilience evaluation scenario that includes low-probability, high-impact events. PJM states that the scenarios should be: (1) based on a clearly defined, robust set of factor development criteria grounded in customer needs; (2) capable of adapting to an evolving set of future system conditions; and (3) crafted to produce the appropriate level of transmission.[1244]
