[535] Order No. 1000, 136 FERC ¶ 61,051 at PP 11-12, 42-44; Order No. 1000-A, 139 FERC ¶ 61,132 at PP 3-6; *see also* Order No. 1920, 187 FERC ¶ 61,068 at P 16 ("The reforms in Order No. 1000 included: (1) regional transmission planning; (2) transmission needs driven by Public Policy Requirements; (3) nonincumbent transmission developer reforms; (4) regional and interregional cost allocation, including a set of principles for each category of cost allocation; and (5) interregional transmission coordination. The reforms focused on the process by which transmission providers engage in regional transmission planning and the associated cost allocation rather than on the outcomes of the process.").

[536] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 278 (describing the rule as implementing "incremental process improvements").

1920, as discussed above.[537] Order No. 1920 is well within the Commission's ordinary remit and technical expertise of regulating practices affecting interstate transmission rates, unlike the cases discussed above which involved agency forays into areas well beyond their ordinary purview, such as EPA regulating the generation resource mix, Occupational Safety and Health Administration (OSHA) regulating the general public health, or the IRS addressing health insurance policy. Nor is this an instance in which the Commission has acted against a backdrop of contrary congressional action.[538]

178. Moreover, the Commission in Order No. 1920 acted in a fundamentally *responsive* capacity to require more effective transmission planning processes and cost allocation to ensure cost-effective and reliable Long-Term Regional Transmission Planning in light of preexisting forces beyond the Commission's control that give rise to transmission needs.[539] This stands in contrast to cases in which the Supreme Court has applied the major questions doctrine, which involved agency actions that, in themselves, affirmatively and proactively caused the transformative consequences that the Court

[537] *See supra* Federal/State Division of Authority section.

[538] Arguments to the contrary suggesting, for example, that the Commission is attempting to implement the "Green New Deal," rest on the incorrect premise that the Commission is attempting to preferentially favor renewable resources or influence the generation mix. Moreover, even the references cited in the rehearing requests describe the "Green New Deal" as a broad set of goals aimed at achieving net zero carbon emissions, without specific policies, rather than a specific proposal to enact the sort of transmission planning process and cost allocation reforms at issue in Order No. 1920. *See, e.g.*, Arizona Commission Rehearing Request at 4-5.

[539] *See supra* Federal/State Division of Authority section (noting that these forces would continue to exist, driving transmission needs, even absent Commission action).

identified as demonstrative of extravagant exercises of agency power.[540] For similar reasons, it is incorrect to ascribe to Order No. 1920, which aims to ensure that Long-Term Transmission Needs are met more efficiently and cost-effectively, the economic consequences associated with the construction of new transmission infrastructure, as the need for this infrastructure would still exist independent of Order No. 1920.[541]

179. In particular, arguments asserting that Order No. 1920 will impose "billions or trillions of dollars in transmission cost[s]"[542] claims that attempt to link the transmission

[540] *See, e.g.*, *West Virginia*, 597 U.S. at 721, 724-25 (addressing EPA rule seeking to "substantially restructure the American energy market"); *Nat'l Fed'n of Indep. Bus.*, 595 U.S. at 117 (addressing agency rule requiring vaccination or medical testing); *UARG*, 573 U.S. at 321-22 (addressing agency change in statutory interpretation subjecting millions of sources to permitting requirements).

[541] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 278 ("The incremental process improvements required by the final rule, however, do not fundamentally change the economic or political stakes of ensuring that Commission-jurisdictional rates remain just and reasonable."); *id.* PP 92-93; *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 51 (noting the expense associated with construction of transmission infrastructure at the time of the promulgation of Order No. 1000). No case applying the major questions doctrine has done so solely based on the economic consequences of the agency action at issue or suggested that agencies are not empowered to address significant problems falling within their general grants of statutory authority. *Cf., e.g.*, *N.Y. v. FERC*, 535 U.S. at 11, 17 (affirming Commission order adopting reforms restructuring electricity markets); *Flyers Rts. Educ. Fund, Inc. v. U. S. Dep't of Transp.*, 810 F. App'x 1, 3 (D.C. Cir. 2020) (explaining that *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502 (2009) "permits, but does not require, an agency to act incrementally"); *WildEarth Guardians v. EPA*, 751 F.3d 649, 655-56 (D.C. Cir. 2014) (summarizing *Defs. of Wildlife v. Gutierrez*, 532 F.3d 913 (D.C. Cir. 2008), upholding a decision to focus on a comprehensive approach). Creating such a rule would be inconsistent with the Supreme Court's discussion of the history of the major questions doctrine reflecting its application only in extraordinary cases, and then only upon a detailed consideration of the statutory context. *See West Virginia*, 597 U.S. at 721.

[542] Undersigned States Rehearing Request at 15; *see* Designated Retail Regulators

costs of achieving a "net zero" carbon emission policy as "caused by Order No. 1920"[543] are not supported by the record and, instead, depend entirely on an unfounded logical leap. These arguments incorrectly portray the consequences of decisions made by other actors,[544] which represent preexisting and independent forces driving transmission needs that are outside of the Commission's control,[545] as attributable to Order No. 1920. As noted above, such arguments fundamentally reverse cause and effect by mischaracterizing Order No. 1920's process-focused requirements that transmission providers adequately *plan* for these drivers of Long-Term Transmission Needs—which requirements do not seek to achieve any substantive outcome or direct the construction of any particular transmission facilities—as *causing* these transmission needs.[546] This has no basis in fact. The drivers of these transmission needs (including those that flow from the policy decisions of actors lawfully entitled to make such choices) and the costs associated with building transmission infrastructure to meet such needs will exist

---

Rehearing Request at 15-16.

[543] Arizona Commission Rehearing Request at 16.

[544] In particular, Order No. 1920 is neutral on the policy choices that may drive certain of these decisions, including whether "net zero" is an appropriate policy goal; these questions are not for the Commission to resolve.

[545] *See supra* Order No. 1920 Does Not Attempt to Control the Generation Mix or Intrude in Areas of State Authority section (explaining that Order No. 1920 is resource neutral, treating these exogenous forces that drive Long-Term Transmission Needs as inputs to Long-Term Regional Transmission Planning).

[546] *See supra* Order No. 1920 Does Not Attempt to Control the Generation Mix or Intrude in Areas of State Authority section.

independent of Order No. 1920's requirements. Indeed, because a major focus of Order No. 1920 is ensuring that more efficient or cost-effective transmission facilities are evaluated and selected, not only would these needs still exist absent the Commission's action but we expect that meeting these needs would impose *higher* costs on ratepayers.

180. We therefore continue to conclude that Order No. 1920 is not a transformative exercise of Commission authority, whether in magnitude or character, and FPA section 206 is not a surprising basis for the Commission's action, meaning that the major questions doctrine does not apply here.[547] The Supreme Court's decision in *EPSA* and D.C. Circuit decisions in *California Independent System Operator v. FERC*[548] and *South Carolina Public Service Authority v. FERC* further confirm the inapplicability of the major questions doctrine to Order No. 1920. Each of those cases addressed the scope of the Commission's authority under FPA section 206 over "practice[s] . . . affecting" rates, the same grant of statutory authority supporting issuance of Order No. 1920, and are thus of particular significance here.[549]

181. In *EPSA* and *CAISO*, the Courts' statutory construction limiting the Commission to regulating practices "directly affecting" rates was motivated by the same concern animating the major questions doctrine: effectuating congressional intent by ensuring that

[547] Order No. 1920, 187 FERC ¶ 61,068 at PP 278-279.

[548] 372 F.3d 395 (D.C. Cir. 2004) (*CAISO*).

[549] *See EPSA*, 577 U.S. at 277-78; *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 56-57; *CAISO*, 732 F.3d at 399-404.

the Commission's exercise of this authority was reasonably constrained by more than the definitional possibilities as to what constitutes a "practice . . . affecting" rates.[550] *South Carolina Public Service Authority v. FERC* considered the scope of this authority as applied to the same context presented here, transmission planning and cost allocation processes, in reviewing the highly similar Order No. 1000. The court held that "[r]eforming the practices of failing to engage in regional planning and *ex ante* cost allocation for development of new regional transmission facilities is not the kind of interpretive 'leap' that concerned the court in *CAISO* but rather involves a core reason underlying Congress' instruction in [FPA] Section 206."[551] It likewise distinguished *MCI*—one of the cases the Supreme Court in *West Virginia* discussed as part of the lineage of the major questions doctrine—holding that FPA section 206 "cannot be fairly viewed as the type of 'subtle device' at issue" in that case.[552]

---

[550] *See EPSA*, 577 U.S. at 277-78 (adopting the "directly affecting" construction of FPA section 206(a) because "[t]aken for all it is worth, that statutory grant could extend FERC's power to some surprising places" given that markets in all of electricity's inputs might affect the supply of power and "markets in just about everything" might affect load-serving entities' demand); *CAISO*, 372 F.3d at 400 (explaining that ambiguity, in statutory construction, is not a creature of definitional possibilities but of statutory context); *id.* at 401 (rejecting the argument that there is an "infinitude of acceptable definitions for what constitutes a 'practice' to give [the Commission] the authority to regulate anything done by or connected with a regulated utility, as any act or aspect of such an entity's corporate existence could affect, in some sense, the rates").

[551] *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 57.

[552] *Id.* at 56.

182. Thus, *EPSA* and *CAISO* reflect that the Supreme Court and the D.C. Circuit already have construed the statutory grant of authority to the Commission over practices affecting rates in FPA section 206 as imposing guardrails to ensure consistency with congressional intent and to avoid the use of this authority in ways that would implicate the major questions doctrine. *South Carolina Public Service Authority v. FERC*, in turn, applied these guardrails in the same context as Order No. 1920 and found that the Commission was acting within its statutory authority to address "a core reason underlying Congress' instruction in [FPA] Section 206."[553] Particularly given the major questions doctrine's focus on discerning congressional intent as to the scope of a legislative delegation,[554] these cases further support our conclusion (in addition to the discussion already set forth) that the major questions doctrine does not require enhanced skepticism of Order No. 1920.[555]

183. We are, therefore, unpersuaded by arguments that the major questions doctrine should apply to Order No. 1920. Claims that Order No. 1920 presents a major question because the Commission has overstepped the jurisdictional boundaries set forth in the FPA and intruded into areas of state authority[556] are mistaken because the Commission

---

[553] *Id.* at 57.

[554] *See West Virginia*, 597 U.S. at 721-23.

[555] *See supra* Order No. 1920 Is Consistent with the FPA and Precedent Regarding the Commission's Authority section (explaining, as discussed in Order No. 1920 and not disputed on rehearing, that Order No. 1920 is consistent with the Supreme Court's decision in *EPSA*).

[556] *See* Undersigned States Rehearing Request at 14-15 (citing *Ala. Ass'n of*

has acted well within its authority to regulate practices affecting interstate transmission rates, honoring the jurisdictional divide set forth by Congress in the FPA.[557] Arguments that the Commission is misusing the FPA to enact preferential policies[558] are misplaced for the same reasons. As already discussed, arguments invoking the purported economic consequences of Order No. 1920[559] misattribute the costs of constructing transmission

---

Realtors v. HHS, 594 U.S. at 764 (finding that one consideration favoring application of the major questions doctrine was that the agency action "intrudes into an area that is the particular domain of state law: the landlord-tenant relationship")); *id.* at 16 (arguing that the Commission was attempting to determine "what resources should be powering the grid twenty years into the future"); Designated Retail Regulators Rehearing Request at 15-19 (similar); Arizona Commission Rehearing Request at 5-6; Utah Commission Rehearing Request at 7-8; *cf.* Ohio Commission Federal Advocate Rehearing Request at 20 ("FERC points to no 'clear congressional authorization' for it to use its power under the FPA to facilitate federal, state, Tribal, local, and corporate policies . . . .").

[557] *See supra* Federal/State Division of Authority section; Order No. 1920, 187 FERC ¶ 61,068 at PP 263-267. We also reiterate, in response to arguments that the Supreme Court in *West Virginia* found it "'highly unlikely that Congress would leave to agency discretion the decision of how much . . . generation there should be over the coming decades' on a resource-by-resource basis," Undersigned States Rehearing Request at 15 (quoting *West Virginia*, 597 U.S. at 729; also citing "the breadth of the transmission grid [and] the importance of electricity in everyday life"), that "the Court did not determine that energy policy and the mix of generation resources are *in every instance* a major question." Order No. 1920, 187 FERC ¶ 61,068 at P 276; *see also id.* PP 277-278. In any event, Order No. 1920 still would not implicate the major questions doctrine because it is not aimed at this end.

[558] *See* Undersigned States Rehearing Request at 16-17; Designated Retail Regulators Rehearing Request at 16-17; Arizona Commission Rehearing Request at 3 n.2, 4, 20.

[559] *See* Undersigned States Rehearing Request at 14-15; Designated Retail Regulators Rehearing Request at 15-16; Utah Commission Rehearing Request at 8; *cf.* Arizona Commission Rehearing Request at 16 (citing the cost of achieving net-zero on the transmission grid).

infrastructure to Order No. 1920. Regardless, while the economic impact is relevant to this inquiry, the major questions doctrine is a nuanced, context-specific doctrine that does not require clear congressional authorization for every agency action that may have significant economic consequences or addresses a significant problem.[560]

184. We also are not persuaded by SERTP Sponsors' arguments that, unless the Commission grants its requests for clarification, Order No. 1920 runs afoul of the major questions doctrine, encroaches on state jurisdiction, or otherwise exceeds the Commission's authority. SERTP Sponsors do not clearly set forth the basis for many of their purported concerns regarding the Commission's statutory authority or application of the major questions doctrine, or even which arguments raise these concerns. For instance, while SERTP Sponsors identify Sections II.A.1 and II.C.3 of their argument as particularly raising these concerns,[561] in their Statement of Issues they more broadly state that the clarifications in "Sections II.A and II.C" of their argument are necessary to avoid intruding into state jurisdiction or application of the major questions doctrine.[562] But it is far from clear, and SERTP Sponsors do not explain, why many of the requested clarifications in Sections II.A and II.C would be necessary to avoid SERTP Sponsors'

[560] *See id.*; *cf. also* Arizona Commission Rehearing Request at 6 ("Under *West Virginia*, a major doctrinal change in the law, and the making of a federal rule that fundamentally reshapes policy, has to be done pursuant to an express statement of Congress"); Idaho Commission Rehearing Request at 6.

[561] SERTP Sponsors Rehearing Request at 39; *see also id.* at 41, 43 (issue statements 1 and 15).

[562] *Id.* at 44-45.

stated concerns about the Commission failing to afford adequate respect to state-approved integrated resource plans and load-serving entities' supply obligations or otherwise implicate concerns that the Commission is intruding into state jurisdiction.[563] Certain of SERTP Sponsors' other claims that, absent clarification, other aspects of Order No. 1920 would exceed the Commission's authority, are single-sentence assertions that provide little or nothing to illuminate why they believe this is the case.[564]

185. We address SERTP Sponsors' requests for clarification on their substance at various points in our discussion below. In several instances, we find that SERTP Sponsors have failed to plead their arguments that, absent their requested clarification, the Commission has exceeded its authority with the specificity required on rehearing, and

[563] *See, e.g.*, *id.* at 7-8 (arguing that states should be allowed to lengthen the time, upon agreement or motion, to reach an agreement as to cost allocation method); *id.* at 8 (requesting clarification on voluntary funding opportunities); *id.* at 11-12 (arguing that Long Term Transmission Needs have been defined in a circular fashion and that transmission providers should have discretion to use their expertise where they lack certain information); *id.* at 12-17 (requesting clarification that the factors affecting a single assumption will not necessarily have an additive effect; clarification on how specific factors will be identified; clarification on whether the Commission has expanded what constitutes legally binding obligations; and rehearing regarding adoption of Factor Category Seven).

[564] *See id.* at 41 ("Absent the requested clarification in section II.A.2, the six-month period permitted for states to negotiate an extension of the time period [*sic*] for negotiating *ex ante* or *ex post* state agreements on cost allocation, Order No. 1920 is contrary to FPA section 201, is *ultra vires*, and arbitrary and capricious"); *id.* ("Absent the requested clarification in section II.A.3, Order No. 1920 is contrary to FPA section 201 because it effectively mandates selection and/or construction of an LTRTF."); *id.* at 43 ("Absent the clarifications requested in section II.C.2.d, requiring the utilization of Factor Category Seven intrudes into matters involving retail customers subject to state regulation, thereby being ultra vires and contrary to FPA section 201.").

we reject them on that basis.[565] Regardless, to the extent that we do not grant those requests for clarification, whether in whole or in part, we find that the explanations in Order No. 1920 and herein establishing that Order No. 1920 is within the Commission's authority, does not unlawfully intrude into state areas of reserved authority, and does not implicate the major questions doctrine render SERTP Sponsors' arguments to the contrary unpersuasive. Where we believe further additional explanation is warranted in response to addressing a specific request for clarification made by SERTP Sponsors, we provide that explanation in conjunction with addressing the relevant request for clarification.

D. Other Issues

1. Requests for Rehearing

186. Several of the parties seeking rehearing argue that Order No. 1920 is not supported by the D.C. Circuit's decision in *South Carolina Public Service Authority v. FERC*, asserting that the Commission has attempted to direct substantive outcomes affecting the generation resource mix. Arizona Commission contends that Order No. 1000 "confined mandatory consideration [of factors affecting transmission needs] to pertinent laws and regulations, whereas Order No. 1920 now mandates consideration of broader 'policy goals,'" which are "more nebulous political agendas susceptible to significant fluctuations."[566] It contends that the Commission "is not authorized to compel Arizona to

[565] *See ZEP Grand Prairie Wind, LLC*, 183 FERC ¶ 61,150, at P 10 (2023); *see also Ind. Util. Regul. Comm'n v. FERC*, 668 F.3d 735, 736 (D.C. Cir. 2012)

[566] Arizona Commission Rehearing Request at 12-13 (arguing also that Arizona

use specific energy resources."[567] Montana Commission, West Virginia Commission, and Wyoming Commission argue that Order No. 1000 was upheld in *South Carolina Public Service Authority v. FERC* because of its light touch, which did not mandate a "backstop" *ex ante* cost allocation method to a voluntary state agreement, whereas Order No. 1920 has placed states in the untenable position of either agreeing to unjust and unreasonable cost allocations or having that burden foisted on them by default.[568] They further assert that Order No. 1920's "influence over the selection of transmission projects will inevitably affect resource planning and selection at the state level," invading the jurisdiction of the states.[569] Utah Commission argues that Order No. 1920, unlike Order No. 1000, "patently dictates outcomes and cost allocation and does so to discriminate and favor the policy preferences of certain preferred stakeholders."[570]

---

law "does not allow the [Arizona Commission] to adopt, create, or mandate energy policy goals, and Order No. 1920's effort to compel the [Arizona Commission] to do so is unlawful" and that Order No. 1920's approach will lead to unjust cost allocations wherein states without renewable policy objectives must absorb costs generated by the transmission of renewable energy).

[567] *Id.* at 13.

[568] *See* Montana Commission Rehearing Request at 2-4; West Virginia Commission Rehearing Request at 10-12; Wyoming Commission Rehearing Request at 2-4.

[569] *See* Montana Commission Rehearing Request at 4; West Virginia Commission Rehearing Request at 12; Wyoming Commission Rehearing Request at 4.

[570] Utah Commission Rehearing Request at 8 n.17.

187. Undersigned States and Designated Retail Regulators argue that Order No. 1920 "mandates transmission planning criteria that marginalize the input from Relevant Electric Retail Regulatory Authorit[ies] [(RERRAs)] in transmission planning, instead favoring selected generation."[571] In particular, they argue that Order No. 1920 adopts monolithic nationwide criteria that remove the states' role in planning and cost allocation, and that those criteria are "designed to allow the preferred policy goals of certain states, utilities, and corporate interests to dictate transmission planning for all," rather than prioritizing reliability and consumer impacts.[572] Similarly, Georgia Commission argues that Order No. 1920 "violates the states' reserved decision-making power by requiring that the states measure their long-term transmission plans against seven factors identified in the Order."[573]

188. Relatedly, Montana Commission, West Virginia Commission, and Wyoming Commission argue that Order No. 1920 undermines states' role in transmission planning and ratemaking, and does not result in just and reasonable rates.[574] In particular, they

[571] Undersigned States Rehearing Request at 7-8; *see id.* at 24-26; Designated Retail Regulators Rehearing Request at 8, 24-26.

[572] Undersigned States Rehearing Request at 24; *id.* at 26 ("With its rigid planning and cost allocation criteria, the Rule will result in the imposition of massive transmission costs necessary to accomplish certain states' policy goals upon other states."); Designated Retail Regulators Rehearing Request at 24-26 (similar).

[573] Georgia Commission Rehearing Request at 4.

[574] *See* Montana Commission Rehearing Request at 6-7 (arguing that a significant share of the costs of transmission facilities are allocated to retail customers, a question which is best left to the expertise of the states); West Virginia Commission Rehearing

assert that under Order No. 1920, transmission providers would be required to plan projects while considering the policy goals of various states (e.g., decarbonization), such that "the leading transmission projects may not be the most economical, let alone necessary, but for the policy goals of other states."[575] They contend that the costs allocated to retail customers may exceed the benefits that state policy recognizes from regional transmission projects, such that state commissions "would be forced to either assign unjust and unreasonable rates to retail customers, or deny the utility a potentially significant portion of its expected cost recovery."[576] Arizona Commission argues that Order No. 1920 usurps state authority mandating that it "apply rates that are fair and reasonable and not to cost share with rate payers who did not cause (and do not benefit from) a particular cost."[577]

Request at 9-10; Wyoming Commission Rehearing Request at 6-8.

[575] *See* Montana Commission Rehearing Request at 6-7; West Virginia Commission Rehearing Request at 9-10; Wyoming Commission Rehearing Request at 7-8.

[576] Montana Commission Rehearing Request at 6-7 (noting that the Montana Commission typically conducts *post hoc* rather than *ex ante* rate reviews and that it is not clear that Order No. 1920 is designed to accommodate this process); West Virginia Commission Rehearing Request at 9-10; Wyoming Commission Rehearing Request at 7-8.

[577] Arizona Commission Rehearing Request at 20-22 (claiming that Order No. 1920 "usurps the Arizona Constitution and its methodology" because it "provides several factors that must be considered in transmission planning and cost allocation" which "include neither the fairness nor reasonableness of the costs nor any consideration of who causes the costs mandated by the FPA").

189. Arizona Commission also states that it owes its existence to the Arizona Constitution and that it has plenary power to set just and reasonable rates and charges collected by public service corporations.[578] It asserts that even the Arizona state legislature is "precluded by state constitutional law from legislating rate making decisions," and contends that, by the same token, the federal government "is certainly precluded from directing Arizona utilities to adopt energy plans that could cost hundreds of billions of dollars to Arizona consumers."[579]

190. On rehearing, Undersigned States again argue that Order No. 1920 is beyond the Commission's authority because, if the FPA were interpreted to authorize the rule, it "would likely violate the Constitution's equal sovereignty doctrine."[580] They argue that Order No. 1920 "sets up a scheme where one state can effectively require other states to subsidize their own public policy agenda—a core, sovereign state function."[581] Undersigned States also now bring a single sentence argument that "even if the Rule were supported by statutory authorization . . . then it would violate the nondelegation

[578] *Id.* at 7-9.

[579] *Id.* at 8-9.

[580] Undersigned States Rehearing Request at 18-19.

[581] *Id.* (arguing that Order No. 1920 subverts the democratic process, encroaches on state prerogatives, and is inconsistent with principles of cooperative federalism (citing *Coyle v. Smith*, 221 U.S. 559, 567 (1911); *Franchise Tax Bd. v. Hyatt*, 578 U.S. 171, 179 (2016); *Stearns v. Minn.*, 179 U.S. 223, 245 (1900); *Shelby Cnty. v. Holder*, 570 U.S. 529, 544 (2013)).

doctrine," on the theory that Congress is entirely precluded from delegating any "major policy question[s]" to agencies.[582]

191. Ohio Commission Federal Advocate contends that in issuing Order No. 1920 the Commission has violated the Commerce Clause because Commission authority "does not reach . . . attempts to use it to assist utilities and corporations with meeting their goals and commitments."[583] It particularly asserts that "[t]he U.S. Supreme Court has held that in the absence of federal legislation, commerce is generally open to control by states" and that Order No. 1920 will disproportionately benefit certain states, e.g., those with policies in favor of electrification of the transportation and building sectors.[584]

2. Commission Determination

192. We find that arguments that Order No. 1920 is not supported by the D.C. Circuit's decision in *South Carolina Public Service Authority v. FERC* upholding Order No. 1000 are erroneous because, as the court in that case put it, they "misperceive[ ] what the

[582] *Id.* at 17-18 (citing *Paul v. U.S.*, 140 S. Ct. 342, 342 (2019) (Mem.) (Kavanaugh, J., statement respecting denial of certiorari); *Indus. Union Dep't, AFL-CIO v. Am. Petroleum Inst.*, 448 U.S. 607, 685-86 (1980) (Rehnquist, J., concurring in judgment); *A.L.A. Schechter Poultry Corp. v. U.S.*, 295 U.S. 495 (1935)).

Hood & Sons, Inc. v. Du Mond*, 336 U.S. 525 (1949); *N.Y. v. U.S.,* 505 U.S. 144 (1992); *Printz v. United States*, 521 U.S. 898 (1997)).

[584] *Id.* (also arguing that Order No. 1920 will also benefit certain types of generation developers).

Commission has required in the Final Rule."[585] Order No. 1920 is directed toward ensuring just and reasonable rates by requiring Long-Term Regional Transmission Planning, including requiring transmission providers to evaluate which Long-Term Regional Transmission Facilities will more efficiently or cost-effectively address Long-Term Transmission Needs.[586] As in *South Carolina Public Service Authority v. FERC*,[587] the Commission has declined to impose obligations to "mandate development of any particular transmission facility,"[588] change applicable siting requirements and processes,[589] or "change existing mechanisms for cost-recovery through retail rates."[590] Order No. 1920 "does not regulate, aim at, or otherwise attempt to influence integrated resource planning, the generation mix, decisions related to the siting and construction of transmission facilities or generation resources, or any other matters reserved to states

[586] Order No. 1920, 187 FERC ¶ 61,068 at PP 134, 667, 721-723.

[587] *See S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 57-58 (explaining that the Commission did not impose obligations to build or mandatory processes to construct transmission facilities in the regional transmission plan and disavowed that it was purporting to determine what needs to be built, where it needs to be built, and who needs to build it); *see id.* at 62 ("The orders neither require facility construction nor allow a party to build without securing necessary state approvals.").

[588] Order No. 1920, 187 FERC ¶ 61,068 at P 257; *see id.* P 419 ("We are not requiring that transmission providers select any particular Long-Term Regional Transmission Facility and therefore are not directing the development of any particular transmission facilities.").

[589] *See id.* P 258.

[590] *Id.* P 259.

under FPA section 201."[591] Under Order No. 1920, like Order No. 1000, "the substance of a regional transmission plan and any subsequent formation of agreements to construct or operate regional transmission facilities remain within the discretion of the decision-makers in each planning region."[592] The Commission also maintains Order No. 1000's light touch as to regional cost allocation: "[i]t does not dictate how costs are to be allocated. Rather, the Rule provides for general cost allocation principles and leaves the details to transmission providers to determine in the planning processes."[593]

193. We disagree with the arguments in the rehearing requests that Order No. 1920 attempts to direct substantive outcomes, including as to the generation resource mix.[594] As already explained, Order No. 1920 remains process-focused and does not seek to achieve particular substantive outcomes, influence or direct the generation mix, preferentially favor certain transmission facilities, or require unlawful subsidization of

[591] *Id.* P 254; *see also id.* P 256 ("[W]e direct reforms to close these gaps without otherwise disturbing the regional transmission planning structure required by Order No. 1000, which was fully affirmed on appeal in the face of similar objections to those raised here.").

[592] *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 58.

[593] *Id.* at 81; *see, e.g.*, Order No. 1920, 187 FERC ¶ 61,068 at PP 268-269, 723, 916, 954, 1291-1294.

[594] *See* Arizona Commission Rehearing Request at 12-13; Montana Commission Rehearing Request at 3-4; West Virginia Commission Rehearing Request at 10-12; Wyoming Commission Rehearing Request at 2-4; Utah Commission Rehearing Request at 8 n.17.

state policies.[595] While it requires consideration of certain categories of factors in assessing Long-Term Transmission Needs,[596] these factors are resource-neutral and, within the broad parameters set by Order No. 1920, transmission providers have significant discretion in developing Long-Term Scenarios that further precludes the Commission from attempting to dictate outcomes.[597] Moreover, as described, transmission providers must consult with and consider the positions of the Relevant State Entities as to how to account for factors related to state public policies in Long-Term Regional Transmission Planning assumptions.

194. We disagree with claims that Commission has departed from the "light touch" of Order No. 1000 because Order No. 1000 did not mandate a "backstop" *ex ante* cost allocation method to a voluntary State Agreement Process.[598] As *South Carolina Public Service Authority v. FERC* recognized and upheld, Order No. 1000 required transmission providers to file an *ex ante* cost allocation method.[599] Order No. 1920 did not diminish

[599] *See S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 53 ("The cost-allocation

states' role compared to Order No. 1000 but, instead, increased the available opportunities for robust participation by Relevant State Entities to seek to reach agreement on a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process.[600] By virtue of these requirements, Order No. 1920 is more solicitous of state input and uses an even lighter touch than Order No. 1000 in this respect. As discussed elsewhere,[601] we take further steps in this rehearing order to strengthen states' role in Long-Term Regional Transmission Planning and cost allocation for Long-Term Regional Transmission Facilities.

195. We are also not persuaded by arguments that Order No. 1920 exceeds the Commission's authority because it thwarts the role of RERRAs[602] or unlawfully intrudes on the authority of state bodies that regulate retail rates.[603] Order No. 1920 "does not

---

reforms in Order No. 1000 require each transmission provider to include in its OATT a method (or set of methods) for allocating *ex ante* the costs of new regional transmission facilities that complies with six regional cost allocation principles." (citing Order No. 1000, 136 FERC ¶ 61,051 at P 558)); *see id.* at 82-87 (rejecting challenges to the Commission's authority to adopt such reforms).

[600] *See id.* PP 5, 268, 1291.

[607] *See supra* Federal/State Division of Authority section(explaining that Order No. 1920 is not directed at achieving substantive outcomes and that the categories of factors are resource-neutral); *supra* Order No. 1920 Does Not Require Unlawful

196. We are also not persuaded by Undersigned States' argument[608] that if Order No. 1920 were authorized by the FPA, the FPA would violate equal sovereignty principles. The Commission in Order No. 1920 explained at length its reasons for rejecting that argument.[609] On rehearing, Undersigned States repeat their arguments from their comments on the NOPR while failing to engage with, let alone rebut, the Commission's reasoning in Order No. 1920.[610] We therefore sustain Order No. 1920's rejection of this argument for the reasons stated therein. We particularly note that Undersigned States have pointed to no precedent applying the equal sovereignty doctrine in circumstances comparable to those here.[611]

Subsidization of State Policies section (explaining that arguments that the Commission is requiring subsidization of state policies are incorrect and unpersuasive).

[608] Undersigned States Rehearing Request at 18-19.

[609] Order No. 1920, 187 FERC ¶ 61,068 at PP 280-282 (explaining that this argument was not supported by precedent and is incorrect because Order No. 1920 does not require subsidization of other states policies or generation decisions).

[610] *See* Undersigned States Rehearing Request at 18-19; Order No. 1920, 187 FERC ¶ 61,068 at P 212 & n.535 (citing Undersigned States Reply Comments at 5-6).

[611] *See* Order No. 1920, 187 FERC ¶ 61,068 at PP 280-282. In addition to the discussion in Order No. 1920, we observe that, unlike here, the cases on which Undersigned States rely addressed the validity of direct and *de jure* limitations of the rights of certain states relative the rights provided to other states. *See Franchise Tax Bd. v. Hyatt,* 578 U.S. at 178 (explaining that Nevada "has applied a special rule of law applicable only in lawsuits against its sister States"); *Shelby Cnty. v. Holder*, 570 U.S. at 544 ("And despite the tradition of equal sovereignty, the Act applies to only nine States (and several additional counties)."); *Coyle v. Smith*, 221 U.S. at 579 ("Has Oklahoma been admitted upon an equal footing with the original states? If she has, she, by virtue of her jurisdictional sovereignty as such a state, may determine for her own people the proper location of the local seat of government."); *cf. Stearns v. Minn.*, 179 U.S. at 244-45 (discussing the validity of certain provisions of the enabling act admitting Minnesota

197. Also unpersuasive is Undersigned States' nondelegation argument.[612] To begin with, this argument was not raised prior to rehearing, as required by the Commission's Rule of Practice and Procedure 713(c)(3).[613] We typically do not consider arguments raised for the first time on rehearing, unless those arguments could not have been previously presented, e.g., claims based on information that only recently became available or concerns prompted by a change in material circumstances.[614] Commenters had the opportunity to raise this argument, but did not do so.[615]

[613] *See* 18 CFR 385.713(c)(3) (providing that any request for rehearing must "[s]et forth the matters relied upon by the party requesting rehearing, if rehearing is sought based on matters not available for consideration by the Commission at the time of the final decision or final order").

[614] *See Ala. Power Co.*, 179 FERC ¶ 61,128, at P 15 (2022); *KEI (Me.) Power Mgmt. (III) LLC*, 173 FERC ¶ 61,069, at P 38 n.77 (2020); *Tex. E. Transmission, LP*, 141 FERC ¶ 61,043, at P 19 (2012) ("We do so because (1) our regulations preclude other parties from responding to a request for rehearing and (2) such behavior is disruptive to the administrative process because it has the effect of moving the target for parties seeking a final administrative decision." (quotation marks omitted)); *Calpine Oneta Power v. Am. Elec. Power Serv. Corp.*, 114 FERC ¶ 61,030, at P 7 (2006); *Iroquois Gas Transmission Sys., L.P.*, 86 FERC ¶ 61,261, at 61,949 (1999)); *Ocean State Power II*, 69 FERC ¶ 61,146, at 61,548 (1994); *NO Gas Pipeline v. FERC*, 756 F.3d 764, 770 ("We finally note that Jersey City's alleged constitutional claim of actual bias is also barred as untimely. Jersey City has shown us nothing of record to establish that it raised this issue before FERC's issuance of the initial order.").

[615] *See U.S. v. L.A. Tucker Truck Lines, Inc.*, 344 U.S. 33, 37 (1952) ("Simple fairness to those who are engaged in the tasks of administration, and to litigants, requires as a general rule that courts should not topple over administrative decisions unless the administrative body not only has erred but has erred against objection made at the time appropriate under its practice."); *cf. Reytblatt v. U.S. Nuclear Regul. Comm'n*, 105 F.3d

198. In any event, a statute does not violate the nondelegation doctrine so long as Congress has set forth an "intelligible principle" to guide the delegee's exercise of authority.[616] Undersigned States fail to apply (or even acknowledge) this test, address the precedent setting it forth, or engage with the text of the FPA.[617] Instead, distinct from their major questions doctrine argument, they assert a *per se* bar on Congress delegating "major policy questions" to agencies.[618] They cite no case adopting this sweeping rule,[619] and we therefore decline to apply this approach here.[620] Moreover, Undersigned States'

715, 723 (D.C. Cir. 1997) (agencies are not required to respond to untimely comments).

[616] *Whitman v. Am. Trucking Ass'ns*, 531 U.S. at 472 (citing *J.W. Hampton, Jr., & Co. v. United States*, 276 U.S. 394, 409 (1928)); *see also Fox Television Stations, Inc.*, 556 U.S. at 536; *Nat'l Postal Pol'y Council v. Postal Regul. Comm'n*, 17 F.4th 1184, 1192 (D.C. Cir. 2021).

[617] *Cf. Gundy v. United States*, 588 U.S. 128, 146 (2019) (plurality opinion) ("We have sustained authorizations for agencies to set "fair and equitable" prices and "just and reasonable" rates." (citing *Yakus v. United States*, 321 U.S. 414, 422, 427 (1944); *FPC v. Hope Nat. Gas Co.*, 320 U.S. 591 (1944)).

[618] *See* Undersigned States Rehearing Request at 17-18.

[619] *See id.* (citing *Paul v. U.S.*, 140 S. Ct. at 342 (2019) (Mem.) (Kavanaugh, J., statement respecting denial of certiorari) (expressly recognizing that "the Court has not adopted a nondelegation principle for major questions"); *Union Dep't, AFL-CIO v. Am. Petroleum Inst.*, 448 U.S. at, 685-86 (Rehnquist, J., concurring in judgment) (similar); *A.L.A. Schechter Poultry Corp. v. United States*, 295 U.S. 495).

[620] This argument is also in tension with the Court's articulation of the major questions doctrine in *West Virginia*. *See* 597 U.S. at 721, 723 (explaining that the major questions doctrine applied only in extraordinary cases, based on specific statutory context and a variety of factors, and that "delegation[s]" to address major questions were permissible with clear congressional authorization); *cf. Paul v. U.S.*, 140 S. Ct. at 342 (Mem.) (Kavanaugh, J., statement respecting denial of certiorari) (recognizing that application of this test would overturn the aspect of major questions doctrine allowing Congress to "delegate to the agency the authority both to decide the major policy

single-sentence argument fails to explain the parameters of this test or how we would apply it to the statutory text of the FPA or Order No. 1920. And even were we to set aside the foregoing, we would still disagree that Order No. 1920 involves the delegation of such a "major policy question" for the reasons stated herein and in Order No. 1920.[621]

199. Finally, Ohio Commission Federal Advocate incorrectly claims that Order No. 1920 "violates the federal Commerce Clause" on the theory that Order No. 1920 may disproportionately benefit commerce in certain states, which have implemented policies allegedly favored by the rule, as compared to other states.[622] As discussed above, Order No. 1920 is a valid exercise of congressionally granted authority under the FPA. It does not favor particular state policies or transmission planning outcomes, but rather takes state policies as inputs into Long-Term Regional Transmission Planning.[623] Furthermore, the precedent that Ohio Commission Federal Advocate cites does not support concluding that a generally applicable Commission rule promulgated pursuant to its authority under the FPA (itself a valid exercise of Congress's Commerce Clause authority) violates the Commerce Clause if that rule may have disparate effects on commerce in various states.[624]

V. Long-Term Regional Transmission Planning

A. Requirement to Participate in Long-Term Regional Transmission Planning

1. Order No. 1920 Requirements

200. In Order No. 1920, the Commission required transmission providers in each transmission planning region to participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning, meaning regional transmission planning on a sufficiently long-term, forward-looking, and comprehensive basis to identify Long-Term Transmission Needs, identify transmission facilities that meet such needs, measure the benefits of those transmission facilities, and evaluate those transmission facilities for potential selection in the regional transmission plan for purposes of cost allocation as the more efficient or cost-effective transmission facilities to meet Long-Term Transmission Needs. The Commission required that Long-Term

---

Motors Corp. v. Tracy, 519 U.S. at 281-82, 287-88, 311-12 (addressing whether state sales and use taxes were impermissible as discriminatory under dormant Commerce Clause or Equal Protection Clause jurisprudence; holding that the taxes violated neither provision of the Constitution); *City of Phila. v. N.J.*, 437 U.S. at 623 (similarly addressing issues arising under dormant Commerce Clause jurisprudence, in the absence of controlling federal legislation, particularly as to whether New Jersey could close its borders to importation of certain waste); *H. P. Hood & Sons, Inc. v. Du Mond*, 336 U.S. at 545 ("Since the [state] statute as applied violates the [dormant] Commerce Clause and is not authorized by federal legislation pursuant to that Clause, it cannot stand."); *cf. Printz v. United States,*, 521 U.S. at 935 ("We held in *New York* that Congress cannot compel the States to enact or enforce a federal regulatory program. Today we hold that Congress cannot circumvent that prohibition by conscripting the State's officers directly."); *New York v. U.S.* 505 U.S. at 161 ("This litigation . . . concerns the circumstances under which Congress may use the States as implements of regulation . . . .").

Regional Transmission Planning comply with the following Order Nos. 890 and 1000 transmission planning principles: (1) coordination; (2) openness; (3) transparency; (4) information exchange; (5) comparability; and (6) dispute resolution.[625]

201. The Commission explained that Long-Term Regional Transmission Planning will enhance the existing regional transmission planning and cost allocation processes required by Order No. 1000. The Commission also stated that, except as set forth in Order No. 1920, it does not require any transmission provider to replace or otherwise make changes to its existing Order No. 1000-compliant regional transmission planning processes that plan for reliability or economic transmission needs, or the associated Order No. 1000-compliant regional cost allocation method(s). As such, the Commission explained, transmission providers may continue to rely on their existing regional transmission planning and cost allocation processes to comply with Order No. 1000's requirements related to transmission needs driven by reliability concerns or economic considerations.[626] The Commission also declined a request to mandate that the "base cases" used in Order No. 1000 regional transmission planning processes and the Long-Term Scenarios used in Long-Term Regional Transmission Planning be defined in the same process.[627]

---

[625] Order No. 1920, 187 FERC ¶ 61,068 at P 224.

[626] *Id.* P 241.

[627] *Id.* P 246.

202. The Commission further explained that Order No. 1920 does not alter the existing Order No. 1000 requirement to consider Public Policy Requirements in the regional transmission planning process, and further stated that it will instead deem transmission providers to be in compliance with this existing requirement by conducting Long-Term Regional Transmission Planning in accordance with the requirements set for in Order No. 1920.[628] The Commission allowed transmission providers to propose in their Order No. 1920 compliance filings to continue using some or all aspects of the existing regional transmission planning and cost allocation processes that they use to consider transmission needs driven by Public Policy Requirements. The Commission held that transmission providers nevertheless must comply with the Long-Term Regional Transmission Planning requirements set forth in Order No. 1920, such that continued use of existing regional transmission planning and cost allocation processes related to transmission needs driven by Public Policy Requirements will not supplant transmission providers' obligation to comply with Order No. 1920. The Commission required that, in their Order No. 1920 compliance filings, transmission providers that wish to continue to use some or all of their existing regional transmission planning and cost allocation processes to consider transmission needs driven by Public Policy Requirements must demonstrate that continued use of any such processes does not interfere with or otherwise undermine Long-Term Regional Transmission Planning as set forth in Order No. 1920.[629]

---

[628] *Id.* P 242.

[629] *Id.* P 243.

203. The Commission also allowed transmission providers to propose a regional transmission planning process that simultaneously plans for shorter-term reliability and economic transmission needs, as well as Long-Term Transmission Needs as defined in Order No. 1920, through a combined process. The Commission required transmission providers proposing to address all of these transmission needs in a single regional transmission planning process to demonstrate that such a unified regional transmission planning process continues to comply with Order No. 1000, as well as with the Long-Term Regional Transmission Planning requirements set forth in Order No. 1920, by demonstrating that such a combined process is consistent with or superior to the requirements of both Order Nos. 1000 and 1920. The Commission explained that, in the case that the requirements of Order Nos. 1000 and 1920 conflict, the Order No. 1920 requirements will prevail, and transmission providers must demonstrate that their proposed regional transmission planning process is consistent with or superior to the applicable Order No. 1920 requirements.[630]

204. As described further in the Implementation of Long-Term Regional Transmission Planning section below, in Order No. 1920, the Commission required transmission providers to explain on compliance how the initial timing sequence for Long-Term Regional Transmission Planning interacts with existing regional transmission planning processes. The Commission required transmission providers to provide in their explanations any information necessary to ensure that stakeholders understand this

[630] *Id.* P 244.

interaction, including at least the following two components. First, the Commission required transmission providers to address the possible interaction between the transmission planning cycle for Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes. The Commission recognized that there may be overlap in the time horizon for Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes and that these processes will likely inform each other.[631] Second, the Commission required transmission providers to address the possible displacement of regional transmission facilities from the existing regional transmission planning processes. The Commission recognized that it is possible that, in some cases, Long-Term Regional Transmission Facilities selected to address Long-Term Transmission Needs may provide near-term reliability or economic benefits, and thus could displace regional transmission facilities that are under consideration as part of existing regional transmission planning processes.[632]

2. Requests for Rehearing and Clarification

205. Multiple parties request rehearing and clarification on the requirement that, in their Order No. 1920 compliance filings, transmission providers that wish to continue to use some or all of their existing regional transmission planning and cost allocation processes to consider transmission needs driven by Public Policy Requirements must demonstrate

[631] *Id.* P 1071.

[632] *Id.* (citation omitted).

that continued use of any such processes does not interfere with or otherwise undermine Long-Term Regional Transmission Planning as set forth in Order No. 1920. Large Public Power requests clarification that the Commission will presume the existing regional transmission planning and cost allocation processes that transmission providers use to consider transmission needs driven by Public Policy Requirements to be just and reasonable. Large Public Power claims that this is an issue on which the Commission was not clear in Order No. 1920, because the Commission stated that Order No. 1920 "do[es] not alter the existing Order No. 1000 requirement to consider transmission needs driven by Public Policy Requirements in the regional transmission planning process," that transmission providers may propose to continue using these processes, and that transmission providers proposing to do so "must demonstrate that continued use of any such processes does not interfere with or otherwise undermine Long-Term Regional Transmission Planning as set forth in this final rule."[633] Large Public Power contends that its members see value in existing regional transmission planning processes that transmission providers use to consider transmission needs driven by Public Policy Requirements, and requests that the Commission not disrupt these processes—in particular the process conducted by NYISO. Large Public Power describes certain aspects of NYISO's regional transmission planning process and explains that the New

[633] Large Public Power Rehearing Request at 4-6 (quoting Order No. 1920, 187 FERC ¶ 61,068 at PP 242-243).

York Commission and the Commission each have approved these processes.[634] Large Public Power therefore requests that, in reviewing transmission providers' Order No. 1920 compliance filings, the Commission presume that these existing processes are just and reasonable, and argues that the Commission should not require transmission providers and their stakeholders to face the burden of demonstrating that these processes are just and reasonable.[635] If the Commission does not grant clarification, Large Public Power requests rehearing on the ground that the Commission did not advance in Order No. 1920 any "cogent rationale" for treating regional transmission planning processes that consider Public Policy Requirements differently from those that plan for reliability or economic transmission needs.[636]

206. Similar to Large Public Power's rehearing request, Pennsylvania Commission argues that requiring transmission providers in Order No. 1920 to demonstrate that continued use of existing regional transmission planning and cost allocation processes to consider transmission needs driven by Public Policy Requirements does not interfere with or otherwise undermine Long-Term Regional Transmission Planning is an abuse of discretion, and that the Commission failed to engage in reasoned decision making.[637] Pennsylvania Commission further argues that this requirement is inconsistent with the

[634] *Id.* at 6-9.

[635] *Id.* at 4, 6, 9.

[636] *Id.* at 7.

[637] Pennsylvania Commission Rehearing Request at 2.

Commission's statements that, outside the context of Long-Term Regional Transmission Planning, Order No. 1920 will not "otherwise disturb[] the regional transmission planning structure required by Order No. 1000" or "inadvertently cause the re-litigation of aspects of those existing processes."[638] Pennsylvania Commission contends that Order No. 1920 requires full re-litigation on compliance of all processes used to satisfy Public Policy Requirements, including PJM's State Agreement Approach because it addresses state Public Policy Requirements.[639] Pennsylvania Commission argues that the Commission should amend Order No. 1920 to either remove this compliance requirement, explicitly limit it to processes used for Long-Term Regional Transmission Planning, or to clarify that PJM's State Agreement Approach does not interfere with Long-Term Regional Transmission Planning and therefore would not be subject to re-litigation.[640]

207. Similarly, PJM States request that the Commission clarify that PJM's State Agreement Approach does not conflict with Order No. 1920, and that states within PJM can continue to pursue public policies through the voluntary election of the State

[638] Order No. 1920, 187 FERC ¶ 61,068 at PP 252, 256; *see* Pennsylvania Commission Rehearing Request at 2.

[640] *Id.*

Agreement Approach in its current form.[641] Pennsylvania Commission also supports and adopts the clarification request of PJM States.[642]

208. PIOs argue that existing Order No. 1000 regional transmission planning processes that plan for reliability or economic transmission needs are unjust, unreasonable, and unduly discriminatory, and they request rehearing of various aspects of Order No. 1920 to ensure that these existing processes complement Long-Term Regional Transmission Planning rather than conflict with and undermine it.[643] Citing a number of statements in Order No. 1920, PIOs contend that these existing regional transmission planning processes threaten the reliability of the transmission system, fail to build transmission infrastructure necessary to meet regional transmission needs over the long term, and instead invest in transmission facilities addressing narrower, shorter-term needs, which ultimately leads to transmission customers paying unjust and unreasonable rates.[644] PIOs contend that evidence in the record demonstrates that failing to address the "systemic inadequacies" of existing regional transmission planning processes or aligning them with Long-Term Regional Transmission Planning will perpetuate unjust and unreasonable rates.[645]

[644] *Id.* at 16-18.

[645] *Id.* at 20.

209. PIOs therefore request that the Commission amend Order No. 1920 in three ways. First, PIOs argue that the Commission should require transmission providers either to conduct a regional transmission planning process that simultaneously plans for shorter-term reliability and economic transmission needs and Long-Term Transmission Needs through a combined process or to align the methods of all regional transmission planning processes, including Long-Term Regional Transmission Planning.[646] Second, PIOs argue that the Commission should delineate clear boundaries between and align the timing of Long-Term Regional Transmission Planning and existing processes, such that transmission providers would address only the limited regional transmission needs that cannot be reasonably anticipated and cannot be addressed during a Long-Term Regional Transmission Planning cycle. Otherwise, PIOs contend, these processes all would identify transmission facilities over the same planning periods despite different underlying assumptions, benefits assessments, and cost allocation.[647] Third, PIOs argue that the Commission should require Long-Term Regional Transmission Planning and existing processes to use the same "base case" embodying transmission providers' best assessment of future system conditions. Otherwise, PIOs contend, transmission providers ultimately may identify redundant transmission facilities, fail to identify more efficient or

[646] *Id.* at 21-23.

[647] *Id.* at 23-24.

cost-effective Long-Term Regional Transmission Facilities, or be motivated to undermine Long-Term Regional Transmission Planning in favor of existing processes.[648]

3. Commission Determination

210. We decline to grant the clarification sought by Large Public Power that the Commission will presume the existing regional transmission planning and cost allocation processes that transmission providers use to consider transmission needs driven by Public Policy Requirements to be just and reasonable. We disagree with Large Public Power that Order No. 1920 was unclear as to how the Commission will evaluate any proposals transmission providers may make in their compliance filings to continue using some or all aspects of the existing regional transmission planning and cost allocation processes that they use to consider transmission needs driven by Public Policy Requirements. We also disagree with the Pennsylvania Commission that the Commission failed to engage in reasoned decision making. The Commission stated clearly in Order No. 1920, and we continue to find, that, while transmission providers may propose to retain existing Order No. 1000 regional transmission planning and cost allocation processes related to transmission needs driven by Public Policy Requirements, transmission providers that do so must demonstrate that continued use of any such processes does not interfere with or otherwise undermine Long-Term Regional Transmission Planning as set forth in Order No. 1920.[649] In other words, the Commission will not presume the existing regional

[648] *Id.* at 24-25.

[649] Order No. 1920, 187 FERC ¶ 61,068 at P 243; *see also id.* P 240 (declining to pre-judge whether any existing regional transmission planning processes meet the

transmission planning and cost allocation processes used to consider transmission needs driven solely by Public Policy Requirements are just and reasonable.

211. We also disagree with Large Public Power's argument that the Commission did not justify the differential treatment of regional transmission planning processes that consider transmission needs driven by Public Policy Requirements compared to those that plan for reliability or economic transmission needs. The Commission found that conducting Long-Term Regional Transmission Planning as set forth in Order No. 1920 is sufficient to comply with the Order No. 1000 requirement to consider Public Policy Requirements in the regional transmission planning process. In other words, Long-Term Regional Transmission Planning may subsume the purpose of existing regional transmission planning and cost allocation processes used to consider transmission needs driven by Public Policy Requirements. Given that potential, it is necessary and appropriate to require transmission providers to demonstrate that continued use of Order No. 1000 processes to consider transmission needs driven by Public Policy Requirements does not interfere with or otherwise undermine Long-Term Regional Transmission Planning under Order No. 1920. We also note that Order No. 1920 allows transmission providers to propose a regional transmission planning process that simultaneously plans for shorter-term reliability and economic transmission needs, as well as Long-Term Transmission Needs, through a combined process, and that transmission providers proposing to address all of these transmission needs in a single regional transmission

---

requirements of Order No. 1920).

planning process must demonstrate that the combined regional transmission planning process continues to comply with Order No. 1000, as well as with the Long-Term Regional Transmission Planning requirements set forth in Order No. 1920, by demonstrating that such a combined process is consistent with or superior to the requirements of both Order No. 1000 and Order No. 1920.[650]

212. Similarly, we disagree with the Pennsylvania Commission that this requirement is inconsistent with the Commission's statements that, except for Long-Term Regional Transmission Planning, Order No. 1920 will not "otherwise disturb[] the regional transmission planning structure required by Order No. 1000" or "inadvertently cause the re-litigation of aspects of those existing processes."[651] That said, we appreciate the Pennsylvania Commission's concern that Order No. 1920 requires re-litigation of PJM's State Agreement Approach and its request that the Commission limit the requirement to processes used for Long-Term Regional Transmission Planning. We also recognize PJM States' request for clarification that PJM's State Agreement Approach does not interfere or conflict with Long-Term Regional Transmission Planning. As the Commission explained in Order No. 1920, this requirement does not alter the existing Order No. 1000 requirement to consider transmission needs driven by Public Policy Requirements in the regional transmission planning process, and transmission providers will be deemed to be in compliance with this existing requirement by conducting Long-Term Regional

[650] *Id.* P 244.

[651] *Id.* PP 252, 256; *see* Pennsylvania Commission Rehearing Request at 2-3.

Transmission Planning in accordance with the requirements set forth in Order No. 1920.[652] Thus, Order No. 1920 allows transmission providers to propose in their Order No. 1920 compliance filings to continue using some or all aspects of the existing Order No. 1000 regional transmission planning and cost allocation processes that they use to consider transmission needs driven by Public Policy Requirements, if they so choose. But the Commission held that transmission providers nevertheless must comply with the Long-Term Regional Transmission Planning requirements set forth in Order No. 1920 and that continued use of existing Order No. 1000 regional transmission planning and cost allocation processes related to transmission needs driven by Public Policy Requirements alone is insufficient to comply with Order No. 1920. Stated differently, transmission providers that wish to continue to use some or all of their existing Order No. 1000 regional transmission planning and cost allocation processes to consider transmission needs driven by Public Policy Requirements must demonstrate that the continued use of any such processes does not interfere with or otherwise undermine Long-Term Regional Transmission Planning as set forth in Order No. 1920.[653]

213. With respect to PJM's State Agreement Approach specifically, we note that it is separate and apart from PJM's compliance with the Order No. 1000 requirement to consider transmission needs driven by Public Policy Requirements.[654] Therefore, PJM's

---

[652] Order No. 1920, 187 FERC ¶ 61,068 at P 242.

[653] *Id.* P 243.

[654] *See PJM Interconnection, L.L.C.*, 142 FERC ¶ 61,214, at P 142 (2013) ("We find PJM's proposed State Agreement Approach is not needed for PJM to comply with

State Agreement Approach is unaffected by Order No. 1920's requirement to justify continued use of regional transmission planning and cost allocation processes to consider transmission needs driven by Public Policy Requirements. In response to PJM States and Pennsylvania Commission, we note that Order No. 1920 does not prohibit PJM from continuing to use its existing State Agreement Approach. If the Relevant State Entities in PJM agree to rely on PJM's existing State Agreement Approach as an Order No. 1920 State Agreement Process that applies to selected Long-Term Regional Transmission Facilities, and PJM agrees, PJM must propose and demonstrate on compliance that its State Agreement Approach complies with all of the State Agreement Process requirements set forth in Order No. 1920.

214. We also disagree with PIOs' rehearing arguments related to existing regional transmission planning processes that plan for reliability and economic needs and the relationship of these processes to Long-Term Regional Transmission Planning. First, we decline PIOs' request that we require transmission providers to conduct a regional transmission planning process that simultaneously plans for shorter-term reliability and economic transmission needs and Long-Term Transmission Needs through a combined process. We continue to find that transmission providers may propose on compliance

---

the provisions of Order No. 1000 addressing transmission needs driven by public policy requirements. PJM's State Agreement Approach supplements, but does not conflict or otherwise replace, PJM's process to consider transmission needs driven by public policy requirements as required by Order No. 1000 . . . . Accordingly, the Commission need not find that the State Agreement Approach and corresponding cost allocation method comply with Order No. 1000.").

such a combined process, but we do not require that transmission providers do so because the difficulty of transitioning to this kind of combined regional transmission planning process may outweigh any potential benefits of requiring such a process.[655]

215. Furthermore, we find that requiring transmission providers to use a combined process to plan for shorter-term reliability and economic transmission needs and Long-Term Transmission Needs is unnecessary to address the deficiencies in existing regional transmission planning and cost allocation requirements that the Commission identified in Order No. 1920. Specifically, the Commission found that existing regional transmission planning and cost allocation requirements fail to require transmission providers to: (1) perform a sufficiently long-term assessment of transmission needs that identifies Long-Term Transmission Needs; (2) adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs; and (3) consider the broader set of benefits of regional transmission facilities planned to meet those Long-Term Transmission Needs.[656] Because we find that Order No. 1920's Long-Term Regional Transmission Planning and cost allocation requirements adequately remedy these deficiencies, we decline to impose the additional requirements that PIOs suggest.

216. Second, we find premature PIOs' arguments as to the need to align methods and timing between existing regional transmission planning processes and Long-Term Regional Transmission Planning. In Order No. 1920, the Commission required

[655] Order No. 1920, 187 FERC ¶ 61,068 at P 245.

[656] *Id.* P 114.

transmission providers to explain how Long-Term Regional Transmission Planning will interact with existing regional transmission planning processes to plan for transmission needs driven by reliability concerns or economic considerations, including their timing and the potential that Long-Term Regional Transmission Facilities may displace transmission facilities that are under consideration in those processes.[657] The Commission will evaluate the interaction between these processes on compliance and address any potential issues with this interaction in the orders on transmission providers' compliance filings.

217. Third, we disagree with PIOs as to the necessity of requiring that transmission providers use the same "base case" in existing regional transmission planning and in Long-Term Regional Transmission Planning. The Commission neither proposed such a requirement in the NOPR nor adopted one in Order No. 1920, and we are not persuaded to adopt PIOs' suggestion in this order. However, we note that nothing in Order No. 1920 precludes transmission providers from using the same base case in existing regional transmission planning and in Long-Term Regional Transmission Planning if they so choose.

[657] *Id.* PP 1071-1073.

B. Long-Term Scenarios Requirements

1. Requirement for Transmission Providers To Use the Seven Required Benefits To Help To Inform Their Identification of Long-Term Transmission Needs

a. Order No. 1920 Requirements

218. Order No. 1920 required transmission providers to participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning, which is defined as a multi-step process to: (1) identify Long-Term Transmission Needs; (2) identify transmission facilities that meet such needs; (3) measure the benefits of those transmission facilities; and (4) evaluate those transmission facilities for potential selection in the regional transmission plan for purposes of cost allocation.[658] Order No. 1920 defined Long-Term Transmission Needs as "transmission needs identified through Long-Term Regional Transmission Planning by, among other things and as discussed in this final rule, running scenarios and considering the enumerated categories of factors."[659]

219. Order No. 1920 generally addressed the identification of Long-Term Transmission Needs and the measurement of the benefits of Long-Term Regional Transmission Facilities separately.[660] The Commission stated, however, that transmission providers "must use [the seven required benefits] to help to inform their identification of Long-

[658] *Id.* P 224.

[659] *Id.* PP 39, 299.

[660] *E.g.*, *id.* P 224 (describing these two requirements as separate steps).

Term Transmission Needs."[661] The Commission provided an example of how transmission providers can use one of the required benefits (the production cost savings benefit, Benefit 3) to help identify Long-Term Transmission Needs.[662]

b. Requests for Rehearing and Clarification

220. PJM requests clarification that the Commission did not intend to require transmission providers to use any of the seven benefits outlined in Order No. 1920 to help inform the identification of Long-Term Transmission Needs. If the Commission did intend to require transmission providers to use the set of seven required benefits to help inform the identification of Long-Term Transmission Needs, PJM requests that the Commission grant rehearing, either to eliminate this requirement or to provide transmission providers with flexibility as to this requirement to accommodate regional differences. PJM asserts that Order No. 1920 contains only one discussion of a requirement for transmission providers to use the seven required benefits to help inform their identification of Long-Term Transmission Needs, and, as such, PJM questions whether the Commission intended to impose this requirement.[663] PJM further asserts that the Commission offered only one hypothetical example of how one of these seven

[661] *Id.* PP 301, 719; *see id.* P 667 n.1485, P 859 n.1910.

[662] *Id.* P 301 ("[W]hen transmission providers are working to identify Long-Term Transmission Needs, areas of significant congestion on the transmission system—where Long-Term Regional Transmission Facilities could reduce congestion and in turn facilitate production cost savings—may indicate a Long-Term Transmission Need.").

[663] PJM Rehearing Request at 24-26 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 301).

benefits might help inform the identification of Long-Term Transmission Needs, and PJM argues that the Commission did not provide any evidence, let alone substantial evidence, to demonstrate why transmission providers should be required to use the seven benefits to inform the identification of Long-Term Transmission Needs.[664] PJM further claims that requiring the use of all seven benefits outlined in Order No. 1920 to help inform the identification of Long-Term Transmission Needs is inconsistent with PJM's sponsorship model because, in such a model, transmission developers propose transmission facilities after and in response to identified transmission needs, such that using the benefits of such transmission facilities to identify transmission needs is circular.[665] PJM also asserts that the NOPR did not provide notice of the requirement that transmission providers use the seven benefits to help inform the identification of Long-Term Transmission Needs, and PJM therefore lacked opportunity to provide comments as to why the requirement is inappropriate for the PJM region.[666]

221. SERTP Sponsors argue that Order No. 1920 defines Long-Term Transmission Needs in a circular fashion by describing them as "transmission needs identified through Long-Term Regional Transmission Planning by, among other things and as discussed in this final rule, running scenarios and considering the enumerated categories of factors,"[667]

---

[664] *Id.* at 25.

[665] *Id.* at 25-26.

[666] *Id.* at 25 n.103.

[667] SERTP Sponsors Rehearing Request at 11 (quoting Order No. 1920, 187 FERC

but also requiring that the seven required benefits should inform the identification of Long-Term Transmission Needs.[668] SERTP Sponsors claim that this creates a potential chicken-or-egg conundrum, because Long-Term Transmission Needs are driven by factors and must be identified before the use and measurement of the seven required benefits to evaluate Long-Term Regional Transmission Facilities.[669]

222. PIOs request three clarifications related to the requirement that transmission providers use the seven benefits to help to inform the identification of Long-Term Transmission Needs.[670] First, PIOs request that the Commission clarify what "help to inform" means in this context, in order to avoid an outcome in which the seven benefits are only considered superficially rather than as meaningful determinants of Long-Term Transmission Needs. Second, PIOs request that the Commission clarify that transmission providers may not identify Long-Term Transmission Needs solely on the basis of one of the Order No. 1000 "silos," e.g., reliability. PIOs claim that, if a transmission provider were to identify Long-Term Transmission Needs solely based on reliability, for example, and then use the seven required benefits only to compare potential solutions, the resulting set of needs would be incomplete, and the resulting solutions would be inefficient. Third,

¶ 61,068 at P 39).

[668] *Id.* (citing Order No. 1920, 187 FERC ¶ 61,068 at P 719).

[669] *Id.*

[670] PIOs Rehearing Request at 59 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 301, 719).

PIOs request clarification that the requirement to use the seven required benefits to help identify Long-Term Transmission Needs applies equally to transmission providers that use a competitive bidding process and to those that use a sponsorship model. Regarding the sponsorship model in particular, PIOs also request clarification as to how the Commission envisions the process by which transmission providers could use the seven required benefits to help identify needs, without these needs being so granular that the transmission provider has effectively defined a specific project.[671]

c. Commission Determination

223. We agree with certain of the rehearing arguments raised by PJM and SERTP Sponsors and therefore we set aside the requirement for transmission providers to use the set of seven required benefits to help inform their identification of Long-Term Transmission Needs. Specifically, we find that PJM and SERTP Sponsors highlight potential challenges and difficulty transmission providers may have in implementing this requirement. As further explained below, although we find that it is appropriate to set this requirement aside, we clarify and emphasize that the identification of Long-Term Transmission Needs should rely on economic and reliability drivers.

224. In requiring transmission providers to use the set of seven required benefits to help to inform their identification of Long-Term Transmission Needs, the Commission intended in Order No. 1920 to ensure that transmission providers would use their experience evaluating both the reliability and economic benefits of transmission

[671] *Id.* at 59-60.

facilities—as reflected in the seven required benefits—and technical expertise assessing the transmission system to identify whether there are reliability issues or opportunities to relieve constraints that could be resolved through Long-Term Regional Transmission Facilities identified through Long-Term Regional Transmission Planning. Upon further consideration, we find that Order No. 1920's Long-Term Regional Transmission Planning requirements, including the requirements to develop Long-Term Scenarios using the minimum required Factor Categories,[672] to use the minimum required transmission planning horizon,[673] and to develop Long-Term Scenarios that are plausible and diverse,[674] taken together, will ensure that transmission providers identify Long-Term Transmission Needs.

225. Thus, we are clarifying here that the categories of factors will help transmission providers identify Long-Term Transmission Needs, consistent with the Commission's statements in Order No. 1920.[675] Potential Long-Term Regional Transmission Facilities that address Long-Term Transmission Needs, as identified by the Long-Term Scenarios

[672] Order No. 1920, 187 FERC ¶ 61,068 at P 409.

[673] *Id.* P 344.

[674] *Id.* P 414.

[675] *See id.* P 299 (stating that "the drivers of transmission needs are diverse and include, but are not limited to, evolving reliability concerns, changes in the resource mix, and changes in demand"); *id.* P 300 (stating that "Long-Term Transmission Needs are similar in kind to transmission needs identified through existing regional transmission planning processes established under Order No. 1000," which include both reliability and economic considerations).

and sensitivities, will then be evaluated for their economic and reliability benefits, which will ensure that Long-Term Regional Transmission Planning leads to transmission solutions that more efficiently or cost-effectively address reliability and economic transmission needs over the appropriate transmission planning horizon.[676]

226. Finally, because we are setting aside the requirement for transmission providers to use the set of seven required benefits to help inform their identification of Long-Term Transmission Needs, we find moot PIOs' request for clarification concerning this requirement.

2. Transmission Planning Horizon

a. Order No. 1920 Requirements

227. In Order No. 1920, the Commission required transmission providers in each transmission planning region to develop Long-Term Scenarios as part of Long-Term Regional Transmission Planning using no less than a 20-year transmission planning horizon. The Commission defined Long-Term Scenarios as scenarios that incorporate various assumptions using best available data inputs about the future electric power

[676] We note that this understanding that potential Long-Term Regional Transmission Facilities that address Long-Term Transmission Needs are evaluated for both reliability and economic benefits is consistent with the Commission's determination in Order No. 1920 that, while transmission providers have significant flexibility to determine a regionally appropriate *ex ante* cost allocation, such cost allocation may not be based on a siloed approach that assumes Long-Term Regional Transmission Planning addresses only reliability or only economic needs. However, as also noted below, transmission providers and Relevant State Entities have broad flexibility to recognize the different types of benefits provided by Long-Term Regional Transmission Facilities and allocate costs in proportion to those benefits. *See infra* General Benefits Requirements Related to Cost Allocation section.

system over a sufficiently long-term, forward-looking transmission planning horizon to identify Long-Term Transmission Needs and enable the identification and evaluation of transmission facilities to meet such transmission needs.[677] The Commission defined best available data inputs as data inputs that are timely, developed using best practices and diverse and expert perspectives, adopted via a process that satisfies the transmission planning principles of Order Nos. 890 and 1000, and reflect the list of factors that transmission providers account for in their Long-Term Scenarios.[678]

228. The Commission clarified that using a transmission planning horizon of no less than 20 years means that transmission providers must develop Long-Term Scenarios to identify Long-Term Transmission Needs that will materialize in the 20 years or more following the commencement of the Long-Term Regional Transmission Planning cycle.[679] The Commission explained that requiring a transmission planning horizon of not less than 20 years strikes a balance. On the one hand, the Commission stated, a 20-year transmission planning horizon extends far enough into the future that transmission providers can proactively identify Long-Term Transmission Needs that could be met with more efficient or cost-effective Long-Term Regional Transmission Facilities and allows sufficient time to identify, plan, obtain siting and permitting approval for, and construct more efficient or cost-effective Long-Term Regional Transmission Facilities. On the

[677] Order No. 1920, 187 FERC ¶ 61,068 at P 302.

[678] *Id.* P 633.

[679] *Id.* P 344.

other hand, the Commission found that there may be sufficient uncertainty regarding system conditions and transmission needs beyond a 20-year transmission planning horizon such that it may be challenging for transmission providers to forecast Long-Term Transmission Needs across that time period.[680]

229. In adopting the minimum 20-year transmission planning horizon requirement in Order No. 1920, the Commission disagreed that a 20-year transmission planning horizon could result in Long-Term Regional Transmission Planning based on speculative transmission needs. The Commission explained that the Long-Term Regional Transmission Planning requirements adopted in Order No. 1920 are designed to avoid over-building transmission in response to speculative transmission needs through a series of tools and safeguards, which include the requirement that transmission providers reevaluate Long-Term Regional Transmission Facilities in certain circumstances.[681]

230. The Commission also disagreed with requests that it adopt a shorter transmission planning horizon, reasoning that a shorter planning horizon would fail to sufficiently capture Long-Term Transmission Needs given that some drivers of such needs extend up to 20 years into the future. The Commission added that a shorter minimum transmission planning horizon might not allow for sufficient time to develop Long-Term Regional Transmission Facilities with long lead-time requirements or to compare alternative

[680] *Id.* P 345.

[681] *Id.* P 348.

transmission solutions to identify more efficient or cost-effective transmission solutions to meet Long-Term Transmission Needs.[682]

b. Requests for Rehearing and Clarification

231. Alabama Commission, Ohio Commission Federal Advocate, and Dominion seek rehearing of Order No. 1920's requirement that transmission providers in each transmission planning region develop Long-Term Scenarios as part of Long-Term Regional Transmission Planning using no less than a 20-year transmission planning horizon.[683]

232. Dominion contends that Order No. 1920 is arbitrary and capricious because the Commission failed to address Dominion's concerns regarding the use of a 20-year transmission planning horizon.[684] Dominion asserts that the Commission failed to address its NOPR comments, which argued that a 20-year transmission planning horizon runs the risk of essentially implementing a "transmission Integrated Resource Plan" that mandates potentially speculative transmission projects. Dominion avers that integrated resource plans are snapshots in time that show potential pathways for meeting future needs and are not concrete, definitive plans.[685] Dominion states that in its NOPR

[682] *Id.* P 349.

[683] Alabama Commission Rehearing Request at 4; Dominion Rehearing Request at 11-14; Ohio Commission Federal Advocate Rehearing Request at 20-21.

[684] Dominion Rehearing Request at 7, 12-15.

[685] *Id.* at 13-14 (citing Dominion NOPR Initial Comments at 18-19).

comments it explained that predicting the future resource mix is challenging and that numerous planning considerations that apply today could change over the next 20 years, which is why Dominion cautioned against requiring transmission providers to make investment and cost allocation decisions based on speculation 20 years into the future.[686]

233. According to Dominion, its NOPR comments also asserted that a 20-year transmission planning horizon requires using less reliable assumptions, which can lead to stranded or misallocated costs,[687] especially because cost allocation under Order No. 1920 could occur much earlier than before.[688] Dominion argues that planning further into the future decreases certainty, likely has diminishing returns, and requires transmission providers to deploy personnel with scarce planning expertise—a highly valuable resource—who could be used more efficiently by planning for likelier scenarios.[689]

234. Further, Dominion argues that because Order No. 1920 would not necessarily permit reevaluation in certain circumstances that could render a transmission project unnecessary—e.g., where changes in technology or load growth obviate the need for a project in a particular location—the reevaluation process is insufficient to address concerns regarding the speculative nature of a 20-year planning horizon.[690]

---

[686] *Id.* at 14 (citing Dominion NOPR Initial Comments at 20).

[687] *Id.* (citing Dominion NOPR Initial Comments at 20).

[688] *Id.*

[689] *Id.* at 15.

[690] *Id.* at 16-18.

235. Dominion also argues that the Commission arbitrarily dismissed its requests for flexibility to adopt a timeline that is suited to a particular transmission planning region to reduce the risk of selection of transmission projects that may not actually be needed.[691] Dominion states that, if the Commission must prescribe a minimum transmission planning horizon, it would be more reasonable to continue allowing PJM/Dominion Energy Virginia to use a 15-year forecast horizon, which strikes a balance between long-term needs and avoiding speculative projects, and to continue allowing South Carolina Regional Transmission Planning/Dominion Energy South Carolina to use a 10-year transmission planning horizon. Such transmission planning horizons, Dominion claims, would be more tailored to the transmission planning regions' needs.[692]

236. Ohio Commission Federal Advocate also asserts that the Commission acted arbitrarily and capriciously and violated the consumer protection provisions of the FPA by adopting the 20-year transmission planning horizon requirement. Ohio Commission Federal Advocate argues that a 20-year transmission planning horizon puts transmission planners in the "impossible position" of having to predict the resource mix and location of resources 20 years in the future and will lead to inefficient and potentially unnecessary investment decisions.[693] In the alternative to seeking rehearing on the 20-year transmission planning horizon requirement, Ohio Commission Federal Advocate requests

[691] *Id.* at 15.

[692] *Id.* at 12-13, 16.

[693] Ohio Commission Federal Advocate Rehearing Request at 20-21.

that the Commission clarify that the 20-year planning horizon should be informational only and should not be relied upon for investment decisions until the future can be better ascertained.[694] Similarly, Alabama Commission contends that a 20-year transmission planning horizon is likely to produce speculative outputs that lack sufficient basis for actionable planning decisions and that action on these outputs should be determined at the state level to avoid costly transmission facilities that are not actually needed.[695]

i. Commission Determination

237. We sustain the requirement that transmission providers in each transmission planning region develop Long-Term Scenarios as part of Long-Term Regional Transmission Planning using no less than a 20-year transmission planning horizon. The Commission's adoption of a 20-year transmission planning horizon was reasonable and supported by record evidence,[696] and the Commission did not disregard arguments to the contrary. As the Commission explained in Order No. 1920, a transmission planning horizon of less than 20 years would fail to sufficiently capture Long-Term Transmission Needs given that drivers of such needs can extend up to 20 years into the future, such as state laws that include requirements to be met 15 to 20 years in the future.[697] In addition,

[694] *Id.* at 21.

[695] Alabama Commission Rehearing Request at 4.

[696] *See* Order No. 1920, 187 FERC ¶ 61,068 at PP 309-318 (describing support for a transmission planning horizon of at least 20 years).

[697] *Id.* P 349.

a 20-year transmission planning horizon allows for more time between when a transmission facility is identified to meet a future transmission need and when the transmission need materializes, allowing for sufficient time to identify, plan, obtain siting and permitting approval for, and construct Long-Term Regional Transmission Facilities.[698]

238. Moreover, we continue to find that a shorter minimum transmission planning horizon may not allow for sufficient time to develop Long-Term Regional Transmission Facilities with long lead-time requirements or to compare alternative transmission solutions to identify more efficient or cost-effective transmission solutions to meet Long-Term Transmission Needs.[699] We therefore are not convinced by arguments that the Commission should have adopted a minimum transmission planning horizon shorter than 20 years.

239. We disagree with arguments that the minimum 20-year transmission planning horizon could result in the selection of speculative transmission projects or will lead to inefficient and potentially unnecessary investment decisions,[700] including Dominion's related argument that a 20-year transmission planning horizon runs the risk of "essentially implementing a transmission Integrated Resource Plan [] that mandates

[698] *Id.* P 345; *see also id.* P 312 (describing arguments of commenters whose comments supported a 20-year transmission planning horizon).

[699] *Id.* P 349.

[700] Alabama Commission Rehearing Request at 4; Dominion Rehearing Request at 11-15; Ohio Commission Rehearing Request at 20-21.

investments in potentially speculative transmission projects" or may result in imprecision and could lead to stranded or misallocated costs.[701] As the Commission found in Order No. 1920, the Long-Term Regional Transmission Planning requirements include tools and safeguards designed to avoid over-building transmission in response to speculative transmission needs.[702] These tools and safeguards include: (1) the requirement that transmission providers develop (and periodically update) multiple plausible and diverse Long-Term Scenarios based upon best available data; (2) transmission providers' flexibility to develop evaluation processes, including selection criteria, that will enable them to select Long-Term Regional Transmission Facilities in a way that maximizes benefits accounting for costs over time without over-building transmission facilities; and (3) the lack of a selection mandate.[703] We continue to find that, by facilitating regional transmission planning that accounts for a range of potential futures, Order No. 1920 ensures that transmission providers will be able to manage uncertainty, which, in turn, mitigates the risk of speculative transmission development.[704]

240. Although Dominion argues that the reevaluation process is insufficient to address concerns that a 20-year transmission planning horizon could lead to the selection of

[701] Dominion Rehearing Request at 13-14.

[702] Order No. 1920, 187 FERC ¶ 61,068 at P 348.

[703] *Id.* P 231.

[704] *Id.* P 229.

speculative transmission projects,[705] Dominion does not demonstrate how Order No. 1920's other tools and safeguards beyond the reevaluation requirement are individually or collectively insufficient to prevent over-building transmission in response to speculative transmission needs.[706] Moreover, robust scenario-planning allows transmission providers to compare the costs and benefits of Long-Term Regional Transmission Facilities under different future conditions, which informs selection and consequently helps to mitigate uncertainty.

241. In addition, as discussed later,[707] we also clarify that transmission providers must consult with and consider the positions of the Relevant State Entities as to how to account for factors related to states' laws, policies, and regulations in transmission planning assumptions, which will ensure that such factors are effectively accounted for in the development of Long-Term Scenarios. We believe this clarification mitigates Ohio Commission Federal Advocate's concerns that the 20-year transmission planning horizon could result in unnecessary investment.[708] With this clarification, Order No. 1920

---

[705] Dominion Rehearing Request at 16-18.

[706] For example, Order No. 1920 requires transmission providers to develop (and periodically update) multiple plausible and diverse Long-Term Scenarios based upon best available data, provides transmission providers with flexibility to develop evaluation processes, including selection criteria, that will enable them to select Long-Term Regional Transmission Facilities in a way that maximizes benefits accounting for costs over time without over-building transmission facilities, and lacks a selection mandate.

[707] *Infra* Stakeholder Process and Transparency section.

[708] We also note that the transparency requirements adopted herein, *see infra* Evaluation and Selection of Long-Term Regional Transmission Facilities, will provide states with additional insight into the efficiency and cost-effectiveness of any Long-Term

provides transmission providers with the tools and safeguards that they need to manage uncertainty and mitigate the risk of speculative regional transmission development while preserving the benefits of Long-Term Regional Transmission Planning.

242. For the same reason, we are unpersuaded by Alabama Commission's related argument that action on transmission plans should be determined at the state level to avoid costly transmission facilities that may not be needed. Nonetheless, as further discussed in this order, we clarify Order No. 1920 to require transmission providers to include and consider the perspective of Relevant State Entities in multiple ways, including: (1) to consult with and consider the positions of the Relevant State Entities and any other entity authorized by a Relevant State Entity as its representative as to how to account for factors related to states' laws, policies, and regulations when determining the assumptions that will be used in the development of Long-Term Scenarios; (2) to include any Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process that Relevant State Entities agree to in the transmittal or as an attachment to their compliance filings; (3) to consult with Relevant State Entities (a) prior to amending the *ex ante* Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process(es) agreed to by Relevant State Entities or (b) if Relevant State Entities seek for a transmission provider to amend the method on file; (4) to develop a reasonable number of additional scenarios, when requested by Relevant State Entities, for the purposes of informing the application of Long-Term Regional Cost

---

Regional Transmission Facilities that transmission providers select.

Allocation Method(s) or the development of cost allocation methods through the State Agreement Process(es); and (5) to make available, on a password-protected portion of OASIS or other password-protected website, a breakdown of the allocated costs, by zone (i.e., by transmission provider retail distribution service territory/footprint or RTO/ISO transmission pricing zone), and a quantification of the benefits imputed to each zone, as such benefits can be reasonably estimated, when a cost allocation method is agreed upon under a State Agreement Process or, if no State Agreement Process is used, at the time the transmission provider selects the Long-Term Regional Transmission Facility. These additional measures to involve states will resolve Alabama Commission's concern and prevent costly transmission facilities that are not actually needed from being constructed.

243. As to another argument raised by Alabama Commission, which we interpret to argue that Long-Term Regional Transmission Planning should serve only to inform other transmission planning processes, we continue to find that remedying the deficiencies in the Commission's existing regional transmission planning requirements requires that transmission providers adopt the requirements herein, which will allow them to identify and have the opportunity to select more efficient or cost-effective Long-Term Regional Transmission Facilities to meet Long-Term Transmission Needs.[709]

244. We disagree with Dominion's argument that the Commission failed to address commenters' request for flexibility regarding the length of the minimum transmission planning horizon. The Commission has already justified its decision not to adopt a

[709] Order No. 1920, 187 FERC ¶ 61,068 at P 914.

shorter transmission planning horizon, reasoning that a planning horizon of less than 20 years would be insufficient to capture Long-Term Transmission Needs, develop and construct Long-Term Regional Transmission Facilities with long lead-time requirements, and compare alternative transmission solutions to identify more efficient or cost-effective transmission solutions to meet Long-Term Transmission Needs.[710] The Commission explained why providing transmission providers with flexibility to choose a shorter transmission planning horizon would limit transmission providers' ability to adequately plan for Long-Term Transmission Needs and perpetuate the status quo, thus failing to address the deficiencies that the Commission identified in its existing regional transmission planning and cost allocation requirements.[711] Moreover, in adopting the 20-year minimum transmission planning horizon, the Commission struck a balance between, on the one hand, providing transmission providers with sufficient time to proactively identify Long-Term Transmission Needs and ultimately construct more efficient or cost-effective Long-Term Regional Transmission Facilities to meet those needs, and, on the

[710] *Id.* P 349.

[711] *See, e.g.*, *id.* PP 115-116 (finding that, under the status quo, most transmission planning regions do not plan beyond a 10-year transmission planning horizon, which prevents transmission providers from identifying Long-Term Transmission Needs and considering regional transmission facilities that may be more efficient or cost-effective solutions to address those needs and fails to take advantage of the potential for efficiencies or economies of scale that regional transmission facilities can provide).

other hand, avoiding uncertainty regarding system conditions and transmission needs beyond a 20-year horizon.[712]

245. Finally, we reiterate that, in this order, the Commission clarifies Order No. 1920 to increase the states' involvement in the Long-Term Transmission Planning Process to provide them with a greater role in determining Long-Term Transmission Needs, and ensuring that they are able to provide input into the method used to allocate the costs of Long-Term Regional Transmission Facilities.

246. For these reasons, we reject Dominion's request that the Commission allow PJM/Dominion Energy Virginia to continue to use a 15-year transmission planning horizon and South Carolina Regional Transmission Planning/Dominion Energy South Carolina to continue to use a 10-year transmission planning horizon.[713] Likewise, for these same reasons, we decline Ohio Commission Federal Advocate's request that the Commission clarify that Long-Term Scenarios resulting from a 20-year transmission planning horizon will be used for informational purposes only.

247. Further, we find unpersuasive Ohio Commission Federal Advocate's allegation that the Commission contravened the consumer-protection requirements of the FPA by adopting a 20-year minimum transmission planning horizon.[714] Ohio Commission Federal Advocate does not state how the 20-year minimum transmission planning

---

[712] *Id.* P 345.

[713] *See* Dominion Rehearing Request at 12-13, 16.

[714] *See* Ohio Commission Federal Advocate Rehearing Request at 20.

horizon contravenes the FPA nor does it specify which requirements of the FPA the Commission allegedly transgressed by adopting the 20-year minimum transmission planning horizon requirement. To the extent that Ohio Commission Federal Advocate is claiming that the 20-year minimum transmission planning horizon requirement will result in unjust and unreasonable rates, as discussed above, we have provided a number of flexibilities to increase the states' involvement in Long-Term Regional Transmission Planning and to ensure that there is a significant degree of transparency in Long-Term Regional Transmission Planning, both of which will ensure that rates are just and reasonable. Recognizing these additional flexibilities, we continue to find the required 20-year minimum transmission planning horizon is integral to the requirement that transmission providers conduct long-term, forward-looking, and more comprehensive regional transmission planning.[715] The Commission found that such a requirement is necessary to remedy the deficiencies that it identified in its existing regional transmission planning and cost allocation requirements[716] and will help transmission providers to identify, evaluate, and select more efficient or cost-effective transmission solutions to Long-Term Transmission Needs, which will help ensure just and reasonable rates.[717]

[715] *See* Order No. 1920, 187 FERC ¶ 61,068 at PP 345, 349.

[716] *Id.* P 134.

[717] *See id.* PP 345, 349.

3. Frequency of Long-Term Scenario Revisions

a. Order No. 1920 Requirements

248. In Order No. 1920, the Commission modified the NOPR proposal and required transmission providers in each transmission planning region to reassess and revise the Long-Term Scenarios that they use in Long-Term Regional Transmission Planning at least once every five years,[718] rather than at least every three years as the NOPR proposed.[719] The Commission explained that, in implementing this requirement, transmission providers in each transmission planning region must reassess whether the data inputs and factors incorporated in previously developed Long-Term Scenarios need to be updated and then revise those Long-Term Scenarios, as needed, to reflect updated data inputs and factors.[720] The Commission clarified that a Long-Term Regional Transmission Planning cycle, which begins with the development of Long-Term Scenarios using best available data inputs,[721] and proceeds to identifying Long-Term Transmission Needs, measuring the benefits of Long-Term Regional Transmission Facilities to address those needs, and evaluating and deciding whether to select Long-Term Regional Transmission Facilities, must conclude no later than five years after the

[718] *Id.* P 377.

[719] NOPR, 179 FERC ¶ 61,028 at P 97.

[720] Order No. 1920, 187 FERC ¶ 61,068 at P 377.

[721] At the outset of a Long-Term Regional Transmission Planning cycle, transmission providers may develop the new Long-Term Scenarios either by crafting entirely new Long-Term Scenarios or by updating the data inputs and factors for previously developed Long-Term Scenarios. *Id.*

date it began.[722] Transmission providers must complete these steps of the Long-Term Regional Transmission Planning cycle, including selection decisions, no later than three years from the date that the Long-Term Regional Transmission Planning cycle began.[723]

249. The Commission stated that nothing in Order No. 1920 prevents transmission providers from evaluating and selecting *additional* Long-Term Regional Transmission Facilities after year three of the Long-Term Regional Transmission Planning cycle and before the next five-year Long-Term Regional Transmission Planning cycle begins.[724] However, the Commission explained that, if Long-Term Regional Transmission Facilities are selected at year three of the Long-Term Regional Transmission Planning cycle, those same Long-Term Regional Transmission Facilities cannot be de-selected during the remainder of the current five-year planning cycle.[725]

250. The Commission found that, while three years provides sufficient time for transmission providers to complete the steps of the Long-Term Regional Transmission Planning cycle,[726] requiring the Long-Term Regional Transmission Planning cycle to repeat at three-year intervals could be administratively burdensome and the benefit of updating Long-Term Scenarios every three years may not outweigh those additional

---

[722] *Id.* P 378.

[723] *Id.* P 379.

[724] *Id.* P 379 n.873.

[725] *Id.*

[726] Order No. 1920, 187 FERC ¶ 61,068 at P 379 (citations omitted).

burdens.[727] Thus, the Commission found that requiring selection decisions to occur within three years of commencing a Long-Term Regional Transmission Planning cycle, while allowing as long as five years between the commencement of each planning cycle, strikes an appropriate balance between various benefits and burdens.[728] Order No. 1920 required that transmission providers conclude one Long-Term Regional Transmission Planning cycle before developing Long-Term Scenarios at the beginning of the next Long-Term Regional Transmission Planning cycle.[729]

251. Order No. 1920 also required transmission providers to designate a point in the evaluation process at which they will decide to either select or not select the relevant Long-Term Regional Transmission Facility (or portfolio of such Facilities) along with a point in time or action that concludes a Long-Term Regional Transmission Planning cycle.[730] The Commission further stated that transmission providers may propose on compliance to conduct Long-Term Regional Transmission Planning more frequently than every five years.[731]

[730] *Id.*

[731] *Id.* P 384.

b. Requests for Rehearing and Clarification

252. PIOs request rehearing of the Commission's decision to extend the Long-Term Regional Transmission Planning Cycle from three years to five years. They request that the Commission reduce the Long-Term Regional Transmission Planning cycle to three years.[732] PIOs argue that the Commission's decision to extend the Long-Term Regional Transmission Planning cycle from three years, as it proposed in the NOPR, to five years lacked support in the record, was not based on the Commission's findings, and was arbitrary and capricious given the urgency of the problem.[733] PIOs assert that the faster transmission drivers change, the more frequently Long-Term Scenarios should be updated.[734] PIOs contend that, in decreasing the frequency of Long-Term Regional Transmission Planning cycles, the Commission disregarded evidence that transmission drivers—e.g., reliability concerns, demand, interconnection request capacity—have changed at an accelerating pace, since the issuance of the NOPR.[735]

253. PIOs aver that under Order No. 1920, transmission providers complete the entire substance of the planning cycle projects in the first three years, followed by a "fallow period" for up to two years.[736] This structure, PIOs argue, fails to alleviate the purported

[732] PIOs Rehearing Request at 9-15.

[733] *Id.* at 6 (citations omitted).

[734] *Id.* at 10-11.

[735] *Id.* at 9-11 (citations omitted).

[736] *Id.* at 11 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 378-379).

administrative burdens associated with the NOPR's three-year proposal and undermines Order No. 1920's essential purpose of requiring transmission providers to identify and address rapidly-shifting and critical regional transmission needs with urgency.[737] PIOs assert that it is illogical for the Commission to claim that transmission providers need two additional years at the end of each cycle to update model inputs in preparation for the next transmission planning cycle when they initially assembled that same information, from scratch, in three years.[738]

254. In support of their request that the Commission grant rehearing and adopt the NOPR's proposed three-year transmission planning cycle, PIOs also assert that the structure of the five-year planning structure is unclear. PIOs argue that Order No. 1920 nearly contradicts itself by stating that transmission providers must "determine whether to select Long-Term Regional Transmission Facilities no later than three years" after the cycle begins and then adding that "nothing in this final rule prevents transmission providers from evaluating and selecting additional Long-Term Regional Transmission Facilities after year three" of the cycle and before the next cycle begins.[739] PIOs argue that, while these and similar statements are facially irreconcilable, they could be harmonized under a reading that would allow transmission providers to make final selection decisions on any Long-Term Regional Transmission Facilities up until the end

[737] *Id.* at 12.

[738] *Id.* at 12-13.

[739] *Id.* at 13 (quoting Order No. 1920, 187 FERC ¶ 61,068 at PP 379, 381).

of the five-year transmission planning cycle as long as they make a selection decision on at least one Long-Term Regional Transmission Facility before the end of year three.[740] According to PIOs, however, such a structure would undermine stakeholder concerns about changes to the planning process that occur mid-stream that would require re-running an analysis and would encourage transmission providers to make decisions when stakeholders are no longer at the table.[741] PIOs request that the Commission grant rehearing and adopt the NOPR's widely supported three-year transmission planning cycle.[742]

255. SERTP Sponsors request clarification as to what Order No. 1920 requires with respect to the inclusion of previously selected Long-Term Regional Transmission Facilities in updated base or reference cases that transmission providers use in the subsequent Long-Term Regional Transmission Planning cycle. SERTP Sponsors claim that Order No. 1920 may be inconsistent on this question because one section of the rule appears to require transmission providers to include such facilities in these updated base or reference cases while another section of the rule appears to provide flexibility on this issue.[743]

---

[740] *Id.* at 14.

[741] *Id.* at 13-14.

[742] *Id.* at 15. PIOs also argue that, for the small minority of entities that need more initial flexibility beyond the one-year period entities already have to file compliance filings, the Commission could allow for case-by-case extensions. *Id.*

[743] SERTP Sponsors Rehearing Request at 26-27 (citing Order No. 1920, 187

c. Commission Determination

256. We sustain the requirement that transmission providers in each transmission planning region reassess and revise the Long-Term Scenarios that they use in Long-Term Regional Transmission Planning at least once every five years.[744] We disagree with PIOs that the decision to extend the Long-Term Regional Transmission Planning cycle from three years to five years lacked support in the record, was not based on the Commission's findings, and was arbitrary and capricious.

257. First, we are not persuaded by PIOs' argument that, by extending the Long-Term Regional Transmission Planning cycle, the Commission acted inconsistently with its findings in Order No. 1920 that transmission needs are changing at an increasingly rapid pace.[745] In Order No. 1920, the Commission addressed the pace at which transmission drivers are changing, finding that transmission providers must reassess and revise their Long-Term Scenarios at least once every five years to ensure that the Long-Term Scenarios accurately reflect factors that may change over the five-year time span, such as changes in technology, load forecasts, or federal, federally-recognized Tribal, state, or local laws.[746] While transmission needs, and the factors driving those needs, are indeed changing rapidly, PIOs provide insufficient and unconvincing support for their argument

---

FERC ¶ 61,068 at PP 382, 1031).

[744] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 377.

[745] PIOs Rehearing Request at 9-11.

[746] Order No. 1920, 187 FERC ¶ 61,068 at P 380.

that a five-year Long-Term Regional Transmission Planning cycle is incapable of accounting for that pace of change. Further, we underscore that Order No. 1920 provides transmission providers with flexibility to address evolving transmission needs. For instance, nothing in Order No. 1920 prohibits transmission providers from updating the assumptions, inputs, and factors, used to inform Long-Term Scenarios during a Long-Term Regional Transmission Planning cycle,[747] and, to the extent that transmission providers believe that a shorter Long-Term Regional Transmission Planning cycle is necessary to account for the pace of change, they may propose on compliance to conduct Long-Term Regional Transmission Planning more frequently than every five years.[748]

258. Second, the Commission's decision to require that Long-Term Regional Transmission Planning cycles occur at least every five years was guided by comments in the record urging the Commission to address competing priorities, including: (1) ensuring timely identification, evaluation, and selection of more efficient or cost-effective Long-Term Regional Transmission Facilities; (2) providing transmission providers with sufficient flexibility to address regional differences; and (3) limiting the

[747] *See id.* PP 380-381. We also note that, consistent with Order No. 890's transparency transmission planning principle, Order No. 1920 requires transmission providers in each transmission planning region to publicly disclose (subject to any applicable confidentiality protections) information and data inputs that they use to create each Long-Term Scenario. *See id.* P 560 (citing Order No. 890, 118 FERC ¶ 61,119 at P 471).

[748] *See id.* P 384.

administrative burdens placed on transmission providers.[749] Order No. 1920's requirement that transmission providers reassess and revise the Long-Term Scenarios that they use in Long-Term Regional Transmission Planning at least once every five years strikes a reasonable balance between those priorities. Further, we disagree with PIOs' assertion that extending the Long-Term Regional Transmission Planning cycle from three years to five years does not ease administrative burdens or improve planning accuracy.[750] In Order No. 1920, the Commission decreased the frequency at which Long-Term Regional Transmission Planning cycles must occur, meaning that transmission providers have the option to develop fewer Long-Term Scenarios over a five-year period than they would have been required to develop under the NOPR proposal, thus decreasing the administrative burden associated with updating the Long-Term Scenarios that form the basis for Long-Term Regional Planning during each planning cycle.

259. Third, we are not persuaded by PIOs' argument that the structure of the Long-Term Regional Transmission Planning cycle is unclear or that its implementation will exclude meaningful stakeholder participation.[751] Order No. 1920 requires transmission providers to complete the steps of the Long-Term Regional Transmission Planning cycle and make selection decisions no later than three years from the date when the Long-Term

[749] *See id.* P 379.

[750] PIOs Rehearing Request at 12-13.

[751] *Id.* at 13-15.

Regional Transmission Planning cycle began.[752] To the extent that transmission providers decide to evaluate additional Long-Term Regional Transmission Facilities after year three but before the next Long-Term Regional Transmission Planning cycle begins, Order No. 1920 gives them the flexibility to do so.[753] One possible outcome of this structure is that transmission providers may make selection decisions on additional Long-Term Regional Transmission Facilities until the end of the five-year Long-Term Regional Transmission Planning cycle. But we disagree with PIOs' contention that Order No. 1920 could be read to allow transmission providers to make "final" selection decisions on "*any*" Long-Term Regional Transmission Facilities until the five-year Long-Term Regional Transmission Planning cycle's end so long as they make a selection decision on at least one Long-Term Regional Transmission Facility before the end of year three.[754]

260. Order No. 1920 requires that transmission providers complete their evaluation and selection processes in the first three years of a Long-Term Regional Transmission Planning cycle, including identifying Long-Term Regional Transmission Facilities that address the Long-Term Transmission Needs that transmission providers identified, estimating the costs and measuring the benefits of those facilities, and making a selection decision on those facilities, including a determination that is sufficiently detailed for

[752] Order No. 1920, 187 FERC ¶ 61,068 at PP 379, 955.

[753] *Id.* P 379 n.873.

[754] PIOs Rehearing Request at 14.

stakeholders to understand why particular facilities or portfolios of facilities were selected or not selected.[755] After transmission providers have completed these steps, no later than three years after the beginning of the Long-Term Regional Transmission Planning cycle, transmission providers may select "*additional*" Long-Term Regional Transmission Facilities, but they may not deselect any Long-Term Regional Transmission Facilities selected earlier in that Long-Term Regional Transmission Planning cycle.[756]

261. We therefore disagree with PIOs' argument that the five-year structure of the Long-Term Regional Transmission Planning cycle would encourage transmission providers to make planning decisions when stakeholders are "no longer at the table."[757] Such arguments are predicated on a misunderstanding of what Order No. 1920 requires. We emphasize that any Long-Term Regional Transmission Facilities selected after year three of the Long-Term Regional Transmission Planning cycle are selected in the Long-Term Regional Transmission Planning process. Thus, contrary to PIOs' suggestion, the requirements for selecting Long-Term Regional Facilities apply, including the transparency requirements adopted in Order No. 1920, should transmission providers

[755] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 955.

[756] *Id.* P 379 n.873

[757] PIOs Rehearing Request at 14.

choose to evaluate and select additional Long-Term Regional Transmission Facilities after year three of the Long-Term Regional Transmission Planning cycle.[758]

262. Finally, we provide clarification to SERTP Sponsors as to the inclusion of previously selected Long-Term Regional Transmission Facilities in the updated base or reference cases that transmission providers will use in subsequent Long-Term Regional Transmission Planning cycles. In most circumstances, we expect that transmission providers will include previously selected Long-Term Regional Transmission Facilities, including those that are not yet in service, in these updated planning models, and we continue to find that doing so will improve the accuracy of Long-Term Regional Transmission Planning.[759] We expect that if transmission providers conclude that previously-selected Long-Term Regional Transmission Facilities are not appropriate to use in a base case, they would provide an explanation to stakeholders who may be relying on the base case in future transmission planning or generator interconnection studies as to why these facilities are not included. Nevertheless, we clarify that Order No. 1920 does not *require* that transmission providers include previously selected Long-Term Regional Transmission Facilities in the planning models that they use in a subsequent Long-Term Regional Transmission Planning cycle, and we continue to find that it is appropriate to provide flexibility to transmission providers on how they update their planning models.[760]

---

[758] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 954.

[759] *See id.* P 382.

[760] *See id.* P 1031.

4. Categories of Factors

a. Requirement to Incorporate Categories of Factors

i. Order No. 1920 Requirements

263. In Order No. 1920, the Commission required transmission providers in each transmission planning region to incorporate in the development of Long-Term Scenarios seven specific categories of factors: (1) federal, federally-recognized Tribal, state, and local laws and regulations affecting the resource mix and demand; (2) federal, federally-recognized Tribal, state, and local laws and regulations on decarbonization and electrification; (3) state-approved integrated resource plans and expected supply obligations for load-serving entities; (4) trends in fuel costs and in the cost, performance, and availability of generation, electric storage resources, and building and transportation electrification technologies; (5) resource retirements; (6) generator interconnection requests and withdrawals; and (7) utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs.[761] The Commission found that incorporating these categories of factors in the development of Long-Term Scenarios is necessary because these categories are essential to identifying Long-Term Transmission Needs, and that incorporating them will ensure that transmission providers are accounting for known and identifiable drivers of Long-Term Transmission Needs.[762] The Commission stated that transmission

[761] *Id.* P 409.

[762] *Id.* P 410.

providers may not exclude any of the proposed categories of factors from the development of Long-Term Scenarios because each category of factors includes important drivers of Long-Term Transmission Needs, and that not incorporating all of the categories of factors will increase the likelihood that transmission providers will continue to underestimate or omit certain drivers of Long-Term Transmission Needs.[763]

264. The Commission explained that incorporating a category of factors in the development of Long-Term Scenarios requires transmission providers to use factors in the category, for each factor individually or collectively, to determine the assumptions that will be used in the development of Long-Term Scenarios.[764] The Commission stated that it expects that similar factors (or groups of factors) affecting a single assumption used in the development of Long-Term Scenarios will have an additive effect on that assumption.[765] Further, transmission providers must incorporate the categories of factors in the development of Long-Term Scenarios in a way that results in plausible and diverse Long-Term Scenarios.[766]

265. With respect to factors within each category of factors, Order No. 1920 requires that transmission providers account for the factors that they have determined are likely to affect Long-Term Transmission Needs. Order No. 1920 further requires transmission

[763] *Id.* P 411.

[764] *Id.* P 413.

[765] *Id.*

[766] *Id.* P 414.

providers, in coordination with stakeholders through an open and transparent process, to determine how each of those factors (or group of similar factors) is likely to affect Long-Term Transmission Needs. Transmission providers must then account for the factors that they have determined are likely to affect Long-Term Transmission Needs in the development of Long-Term Scenarios but need not account for a factor that they determine is unlikely to affect Long-Term Transmission Needs.[767]

266. The Commission stated that requiring transmission providers to incorporate the seven categories of factors into the development of Long-Term Scenarios strikes the right balance between prescriptive requirements and flexibility.[768] The Commission also stated that the final rule does not direct the development of specific transmission facilities because transmission providers retain discretion to determine how specific factors will affect Long-Term Transmission Needs.[769]

ii. Requests for Rehearing and Clarification

267. Arizona Commission argues that Order No. 1920's requirement that transmission providers use a specific set of "planning criteria," i.e., that transmission providers incorporate seven categories of factors in Long-Term Scenarios, is "simply a way of 'pre-cooking' outcomes."[770] Arizona Commission argues that this is inconsistent with the

[767] *Id.* P 415.

[768] *Id.* P 417.

[769] *Id.* P 419.

[770] Arizona Commission Rehearing Request at 18.

NOPR, which required transmission providers to implement a process, not achieve specific outcomes.[771]

268. SERTP Sponsors request that the Commission clarify or, in the alternative, grant rehearing to specify that Order No. 1920 does not require each factor to have an additive effect on a common assumption because, in their view, such a requirement would be arbitrary and capricious and not supported by substantial evidence.[772] SERTP Sponsors assert that requiring each factor to have an additive effect would undermine transmission providers' discretion over how to account for different factors.[773]

269. Further, SERTP Sponsors argue that the record does not demonstrate that each individual factor will have an additive effect, and a finding to this effect risks overstating the effect of each factor, which would render the resulting scenarios implausible and more likely to misidentify Long-Term Transmission Needs and Facilities.[774]

270. Designated Retail Regulators and Undersigned States request that the Commission grant rehearing on the grounds that the Order No. 1920 requirement to use the seven categories of factors in Long Term Regional Transmission Planning will overvalue transmission benefits and will result in unjust, unreasonable, and unduly discriminatory

[771] *Id.*

[772] SERTP Sponsors Rehearing Request at 12-13.

[773] *Id.* at 13.

[774] *Id.*

rates.[775] Designated Retail Regulators and Undersigned States argue that transmission planning assumptions should reflect regional differences, and that requiring transmission providers to develop Long-Term Scenarios that incorporate Order No. 1920's seven categories of factors will result in unjust and unreasonable rates because the categories of factors overlap and may result in double counting.[776] Designated Retail Regulators and Undersigned States also assert that there is insufficient evidence and analysis to conclude that use of the factors will result in cost-effective solutions.[777]

iii. Commission Determination

271. Regarding Arizona Commission's argument that Order No. 1920's requirement that transmission providers incorporate seven categories of factors into their development of Long-Term Scenarios predetermines outcomes in Long-Term Regional Transmission Planning, we reiterate that, in Order No. 1920, as clarified herein, the Commission gives transmission providers the tools necessary to respond to changing factors that drive Long-Term Transmission Needs.[778] As discussed below in further detail,[779] transmission providers must consult with and consider the positions of the Relevant State Entities and

[775] Designated Retail Regulators Rehearing Request at 8, 26; Undersigned States Rehearing Request at 8, 26.

[776] Designated Retail Regulators Rehearing Request at 8, 26-29; Undersigned States Rehearing Request at 8, 26-29.

[777] Designated Retail Regulators Rehearing Request at 8; Undersigned States Rehearing Request at 8.

[778] Order No. 1920, 187 FERC ¶ 61,068 at P 233.

[779] *Infra* Stakeholder Process and Transparency section.

any other entity authorized by a Relevant State Entity as its representative as to how to account for factors related to states' laws, policies, and regulations when determining the assumptions that will be used in the development of Long-Term Scenarios. The Commission also explained in both the NOPR and in Order No. 1920 that it is not requiring that transmission providers achieve any particular outcome via Long-Term Regional Transmission Planning,[780] and Order No. 1920 does not mandate selection of any Long-Term Regional Transmission Facilities.[781]

272. In response to SERTP Sponsors' request for clarification, we clarify that Order No. 1920 does not require transmission providers, when determining the assumptions that they will use when developing Long-Term Scenarios where similar factors (or groups of factors) affect a single assumption, to assume that the factors have additive effects on the relevant assumptions. The Commission stated in Order No. 1920 that it expected that similar factors (or groups of factors) affecting a single assumption used in the development of Long-Term Scenarios will have an additive effect on that assumption,[782] but we agree with SERTP Sponsors that this may not always be the case, and at times, similar factors may not have an additive effect on assumptions used to develop Long-

[780] *See, e.g.*, NOPR, 179 FERC ¶ 61,028 at PP 9, 245; Order No. 1920, 187 FERC ¶ 61,068 at PP 232, 266.

[781] Order No. 1920, 187 FERC ¶ 61,068 at PP 1026-1027.

[782] *Id.* P 413.

Term Scenarios. We also acknowledge that factors in different categories of factors may overlap.[783]

273. We clarify that, where factors may have overlapping effects on the planning assumptions, transmission providers must avoid double counting the effect that those factors have on assumptions used to develop Long-Term Scenarios. Specifically, where there is overlap between factors in Factor Categories One through Three and factors in Factor Categories Four through Seven, or a factor could arguably be considered in a Factor Category in the first three categories or the last four categories, transmission providers must incorporate that factor in the appropriate Factor Category in the first three categories.[784] Because Relevant State Entities and their designated representatives will participate in developing Long-Term Scenarios by informing how transmission providers account for the impact of individual factors, we believe that Relevant State Entities, working in concert with transmission providers, will be able to identify and minimize instances where factors overlap. Further, to the extent that factors in Factor Categories

[783] *Id.* P 440 ("We acknowledge that there could be overlap between Factor Categories One and Two because a certain law or regulation could reasonably be considered to fit into both categories. In such a circumstance, transmission providers must account for the law or regulation in one of the two categories, not both, to avoid double-counting of that factor's anticipated effect on Long-Term Transmission Needs."). As another example, a utility commitment in Factor Category Seven would overlap with an integrated resource plan if the utility commitment was incorporated in the development of the integrated resource plan.

[784] For example, if a transmission provider determines that a factor will affect Long-Term Transmission Needs, but the factor could arguably be incorporated in Factor Category Three or Factor Category Seven, the transmission provider must incorporate this factor in Factor Category Three.

One through Three have overlapping effects on planning assumptions, transmission providers must ensure that each Long-Term Scenario accounts for the factors in Factor Categories One through Three without double counting their effects on planning assumptions. Finally, although we agree with SERTP Sponsors that similar factors will not always have an additive effect on assumptions used to develop Long-Term Scenarios, where similar factors do not overlap, we clarify our expectation that similar factors (or groups of factors) affecting certain assumptions used in the development of Long-Term Scenarios will have a combined effect on those assumptions accordingly.

274. In response to SERTP Sponsors' argument that the requirements in Order No. 1920 risk overstating the effect of each factor, which would render the resulting scenarios implausible and more likely to misidentify Long-Term Transmission Needs, we explain that Order No. 1920 addresses this issue by allowing transmission providers to exercise discretion in how they account for each factor, provided that each Long-Term Scenario account for and be consistent with factors in the first three categories of factors.[785] As the Commission noted in Order No. 1920, incorporating a category of factors into the development of Long-Term Scenarios does not require exacting precision; transmission providers may generalize how all of the discrete factors in a category of factors will, in the aggregate, affect the development of Long-Term

[785] It is unclear whether SERTP Sponsors intended to argue that failure to grant clarification in this respect would result in Order No. 1920 exceeding the Commission's authority; to the extent they intended to do so, we find this argument has not been raised with the specificity required on rehearing. *See supra* Major Questions Doctrine section.

Scenarios.[786] In addition, the Commission held in Order No. 1920 that transmission providers have the discretion to determine whether specific factors must be accounted for within each category, how to account for specific factors in the development of Long-Term Scenarios, and how to vary the treatment of each category of factors across Long-Term Scenarios, provided that transmission providers assume that the laws, regulations, state-approved integrated resource plans, and expected supply obligations for load-serving entities that transmission providers have determined are likely to affect Long-Term Transmission Needs are fully met.[787] Finally, we believe that the clarification discussed below will mitigate SERTP Sponsors' concern by ensuring that the effects of factors used to develop Long-Term Scenarios are not overstated.

275. More specifically, Order No. 1920 states that transmission providers must give states and stakeholders a meaningful opportunity to provide timely input on how and what information to incorporate in Long-Term Scenarios, including how specific factors may affect Long-Term Transmission Needs.[788] We clarify below that, when incorporating planning for states' laws, policies, and regulations' into the development of Long-Term Scenarios, transmission providers must consult with and consider the positions of the Relevant State Entities and their designated representatives as to how

[786] Order No. 1920, 187 FERC ¶ 61,068 at P 413.

[787] *Id.* P 417.

[788] *Id.* P 528.

those requirements will be realized.[789] If, for example, states have laws regarding the future resource mix or decarbonization targets, the assumptions for how the power industry would need to evolve to meet those legal requirements should be developed in close consultation with the Relevant State Entities. We clarify that, for a state that has required integrated resource planning processes, transmission providers should include one of the state's preferred power system trajectories, including both the supply and demand side resource trajectory as appropriate, in each Long-Term Scenario, or include different state-preferred power system trajectories in different Long-Term Scenarios.

276. While we disagree with the rehearing arguments of Designated Retail Regulators and Undersigned States that the Order No. 1920 requirement to use the seven categories of factors in Long Term Regional Transmission Planning will result in overvaluing transmission benefits, we believe that the clarifications discussed herein will alleviate the concerns underlying their rehearing arguments. As an initial matter, we find arguments that the categories of factors overlap to be moot because, as clarified above, transmission providers should avoid double counting the effects of overlapping factors when developing Long-Term Scenarios. While these rehearing parties are correct that Order No. 1920 requires transmission providers to incorporate seven categories of factors, transmission providers retain specific discretion with respect to how they account for each individual factor within a category to develop the required Long-Term Scenarios.[790]

---

[789] *Infra* Stakeholder Process and Transparency section.

[790] *See, e.g.*, Order No. 1920, 187 FERC ¶ 61,068 at P 412 (allowing transmission providers to propose to use additional categories of factors); *id.* P 413 (clarifying that

Further, as discussed below,[791] we clarify that transmission providers must consult with and consider the positions of the Relevant State Entities and any other entity authorized by a Relevant State Entity as its representative as to how to account for factors related to states' laws, policies, and regulations when determining the assumptions that will be used in the development of Long-Term Scenarios, which will ensure that states have input into these factors and that these factors are not over or undervalued. We further note the Commission's finding in Order No. 1920 that transmission providers have discretion to reflect regional differences in the development of Long-Term Scenarios.[792]

277. We disagree with Designated Retail Regulators and with Undersigned States that Order No. 1920 provides insufficient evidence and analysis to conclude that use of the factors will result in cost-effective solutions. As discussed above and below, we, in this order, adopt a number of clarifications to ensure that states are consulted regarding the use of factors to develop Long-Term Scenarios, which, in turn, affect which Long-Term Regional Transmission Facilities are selected. We also emphasize that the states have a

---

incorporating categories of factors does not require exacting precision and allowing transmission providers to generalize how factors within the categories will, in the aggregate, affect the development of Long-Term Scenarios); *id.* P 415 (allowing transmission providers to determine whether specific factors will affect Long-Term Transmission Needs and allowing transmission providers not to account for specific factors that they determine do not affect such needs); *id.* P 417 (allowing transmission providers to determine how to account for specific factors within different Long-Term Scenarios).

[791] *Infra* Stakeholder Process and Transparency section.

[792] Order No. 1920, 187 FERC ¶ 61,068 at P 417.

significant role in working to create a cost allocation method that ensures any solutions that are selected have costs allocated appropriately to beneficiaries. Because of this involvement, we find that the potential risk of the categories of factors leading to solutions that are not cost-effective is diminished, particularly in light of the requirement that selection criteria used in Long-Term Regional Transmission Planning must seek to maximize benefits accounting for costs over time without over-building transmission facilities.[793] Finally, we add that Order No. 1920 included substantial evidence in the record to demonstrate that existing transmission planning and cost allocation processes were insufficient to ensure just and reasonable rates by inadequately accounting on a forward-looking basis for known determinants of Long-Term Transmission Needs.[794]

b. Specific Categories of Factors and the Treatment of Factors in the Development of Long-Term Scenarios

i. Order No. 1920 Requirements

278. As stated above, in Order No. 1920, the Commission found that incorporating the seven categories of factors in the development of Long-Term Scenarios was necessary. The Commission stated that transmission providers may not exclude any of the categories of factors from being incorporated into the development of Long-Term Scenarios because each category includes important determinants of Long-Term Transmission Needs, and failing to incorporate all of the proposed categories of factors into Long-Term Scenarios

[793] *Id.* P 964.

[794] *Id.* PP 112-133.

would increase the likelihood that transmission providers would continue to underestimate or omit known determinants of Long-Term Transmission Needs.[795] The Commission considered category-specific record evidence in support of its determination to adopt each of the seven categories of factors.[796] The Commission declined to adopt additional categories of factors proposed by commenters because of a lack of substantial record evidence, or a finding that the commenter-proposed category of factors is already accounted for in other parts of Long-Term Regional Transmission Planning.[797]

279. The Commission in Order No. 1920 also required transmission providers in each transmission planning region to assume that legally binding obligations (i.e., federal, federally-recognized Tribal, state, and local laws and regulations) are followed, state-approved integrated resource plans are followed, and expected supply obligations for load-serving entities are fully met.[798] The Commission therefore required each Long-Term Scenario to account for and be consistent with, and not discount, factors in the first three categories of factors (i.e., (1) federal, federally-recognized Tribal, state, and local laws and regulations affecting the resource mix and demand; (2) federal, federally-recognized Tribal, state, and local laws and regulations on decarbonization and

[795] *Id.* P 411.

[796] Order No. 1920, 187 FERC ¶ 61,068 at PP 448-449, 457-458, 464-466, 472-473, 481-484.

[797] *Id.* PP 492-494.

[798] *Id.* P 507.

electrification; and (3) state-approved integrated resource plans and expected supply obligations for load-serving entities) once transmission providers have determined that such a factor is likely to affect Long-Term Transmission Needs. The Commission found that it is necessary to prohibit the discounting of factors in the first three categories of factors because they are more certain drivers of Long-Term Transmission Needs, relative to factors in other Factor Categories.[799] Where two legally binding factors have conflicting or opposite implications for Long-Term Transmission Needs, however, transmission providers must reconcile this information while giving full effect to the maximum extent possible to all legally binding factors.[800]

280. The Commission allowed transmission providers to rely on the open and transparent stakeholder process discussed below to identify the factors in the first three required categories of factors. Transmission providers may independently identify factors in the first three categories of factors, but Order No. 1920 does not obligate transmission providers to do so.[801] Transmission providers retain the discretion to determine whether and how particular factors, including those in the first three categories of factors, are likely to affect Long-Term Transmission Needs.[802] Further, the Commission stated in Order No. 1920 that it expects that transmission providers will rely,

[799] *Id.*

[800] *Id.* P 515.

[801] *Id.* P 508.

[802] *Id.* PP 510, 512.

at least in part, on information that relevant federal, state, and local government entities, federally-recognized Tribes, utilities, and load-serving entities provide during the required open and transparent stakeholder process to determine if specific factors are likely to affect Long-Term Transmission Needs and how to account for those specific factors in Long-Term Scenarios.[803]

281. The Commission provided transmission providers with additional discretion in how they account for each factor in Factor Categories Four through Seven (i.e., (4) trends in fuel costs and in the cost, performance, and availability of generation, electric storage resources, and building and transportation electrification technologies; (5) resource retirements; (6) generator interconnection requests and withdrawals; and (7) utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs) compared to how they account for each factor in the first three categories. For purposes of developing plausible and diverse Long-Term Scenarios, Order No. 1920 requires transmission providers, after they have determined that a specific factor in Factor Categories Four through Seven is likely to affect Long-Term Transmission Needs over the transmission planning horizon, to assess the extent to which the anticipated effects on Long-Term Transmission Needs due to that factor are likely to be realized in part, in full, or exceeded.[804] Transmission providers may choose to discount or to put more weight on the effects of factors in Factor

[803] *Id.* P 511.

[804] *Id.* P 516.

Categories Four through Seven on Long-Term Transmission Needs, but only to the extent that each Long-Term Scenario remains plausible.[805]

282. The Commission disagreed with concerns that the additional flexibility afforded to transmission providers in how they account for each factor in Factor Categories Four through Seven could allow transmission providers to ignore these categories of factors. The Commission explained that Order No. 1920 requires transmission providers to incorporate all categories of factors in each Long-Term Scenario, even if they discount specific factors within the category, and requires all Long-Term Scenarios to be plausible.[806]

283. Further, the Commission explained that, because Order No. 1920 requires that all Long-Term Scenarios be consistent with and fully account for factors in Factor Category Three, which includes state-approved integrated resource plans and expected supply obligations of load-serving entities, the final rule does not ignore the Commission's fundamental responsibility under FPA section 217 to facilitate planning to meet the needs of load-serving entities.[807]

[806] *Id.*

[807] *Id.* P 420.

ii. Requests to Omit One or More Specific Categories of Factors

(a) Requests for Rehearing and Clarification

284. Designated Retail Regulators and Undersigned States request that the Commission grant rehearing on the grounds that Order No. 1920 requires transmission providers to consider several factors in Long-Term Regional Transmission Planning, and including these factors will result in rates that are unjust and unreasonable.[808] Arizona Commission avers that through Order No. 1920, the Commission is promoting certain preferred "green" energy generation resources by requiring transmission providers to incorporate seven categories of factors.[809] Arizona Commission states that these factors have political and policy considerations that do not belong in Arizona where the legislature has not mandated such costs, planning, or experimentation to the detriment of ratepayers.[810]

285. Designated Retail Regulators and Undersigned States both argue that Order No. 1920 usurps the role of the states in transmission planning by requiring that the plans and goals of some states, tribes, local governments, and private companies override the plans and goals of other entities while also forcing these entities to bear the cost burden.[811] Designated Retail Regulators and Undersigned States assert that Factor

[808] Designated Retail Regulators Rehearing Request at 7; Undersigned States Rehearing Request at 7.

[809] Arizona Commission Rehearing Request at 15.

[810] *Id.* at 22.

[811] Designated Retail Regulators Rehearing Request at 8; Undersigned States

Categories One, Two, Four, Six, and Seven unjustly involve the policy goals of state and local governments and the commitments of utilities, and thus impose construction costs upon ratepaying loads without sufficient and measurable benefits.[812] Designated Retail Regulators and Undersigned States both state that there is insufficient evidence and analysis to support that use of these factors will result in cost-effective solutions.[813]

286. Ohio Commission Federal Advocate requests that the Commission grant rehearing on the grounds that the Commission acted arbitrarily and capriciously and abused its discretion because Order No. 1920 requires transmission providers to incorporate unreasonable categories of factors in the development of Long-Term Scenarios.[814] Specifically, Ohio Commission Federal Advocate is concerned that several factors would encourage a massive transmission build-out at unjust and unreasonable rates and requests that the Commission grant rehearing to remove Factor Categories One, Two, Six, and Seven as these factors are highly speculative and subject to change.[815] Ohio Commission Federal Advocate asserts that the Commission has not engaged in reasoned decision making by asserting that a best-available-data requirement will ensure these factors are

Rehearing Request at 7-8.

[812] Designated Retail Regulators Rehearing Request at 28; Undersigned States Rehearing Request at 27-28.

[813] Designated Retail Regulators Rehearing Request at 8 (citation omitted); Undersigned States Rehearing Request at 8 (citation omitted).

[814] Ohio Commission Federal Advocate Rehearing Request at 15.

[815] *Id.* at 16-17.

incorporated in a meaningful way because even the best available data for a corporate commitment still amounts to nothing more than a corporate commitment.[816] Ohio Commission Federal Advocate claims that the Commission's attempt to mitigate the flaws of requiring transmission providers to incorporate factors in Factor Categories Four through Seven by allowing transmission providers to discount or give special weight to these factors is arbitrary and capricious. Further, Ohio Commission Federal Advocate asserts that Factor Categories Three, Four, and Five may be problematic if transmission projects are chosen to satisfy state or federal policies and, due to the other provisions of Order No. 1920, may not be properly cost allocated.[817]

287. Several petitioners request that the Commission grant rehearing on the grounds that the Order No. 1920 requirement to include Factor Category Seven (utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect long-term transmission needs) should be excluded from the development of Long-Term Scenarios.[818]

288. SERTP Sponsors argue that Factor Category Seven does not demonstrate reasoned decision making, is not supported by substantial evidence, and could intrude into matters

[816] *Id.* at 17.

[817] *Id.*

[818] Alabama Commission Rehearing Request at 4-5; Industrial Customers Rehearing Request at 49-54; Northern Virginia Rehearing Request at 4-7; NRECA Rehearing Request at 55; SERTP Sponsors Rehearing Request at 15-17; Virginia and North Carolina Commissions Rehearing Request at 6-8.

involving retail customers subject to state regulation in an unduly discriminatory and preferential manner.[819] SERTP Sponsors assert that utility or corporate commitments and local policy goals are fundamentally retail concerns with arrangements subject to state-regulated tariffs and proceedings, and that the other categories of factors already encompass the transmission needs from these arrangements.[820] SERTP Sponsors also request clarification that Factor Category Seven is not intended to give preferential treatment to certain retail customers, like corporations, over others.[821]

289. Industrial Customers state that the Commission did not satisfactorily explain in Order No. 1920 why it found unpersuasive comments on the NOPR questioning the inclusion of utility or corporate commitments in Factor Category Seven, given that such commitments may not be firm or could change over the transmission planning horizon.[822] Further, Industrial Customers assert that the Commission's attempt to alleviate concerns by emphasizing in Order No. 1920 that transmission providers "have discretion" to account for ambiguity concerning these commitments actually raises several additional issues.[823] Industrial Customers argue that there are no clear rules to guide such discretion and that there is an alleged contradiction with Order No. 1920's "earlier mandate to use

[819] SERTP Sponsors Rehearing Request at 16 (citations omitted).

[820] *Id.* at 15.

[821] *Id.* at 16.

[822] Industrial Customers Rehearing Request at 51 (citation omitted).

publicly available information on *goals* and aspirations around corporate energy purchasing strategies."[824] Industrial Customers add that one transmission provider, PJM, has publicly stated that it does not want such discretion due to the significant administrative burdens.[825]

290. Industrial Customers additionally state that Order No. 1920's inclusion of Factor Category Seven unduly discriminates against load that may be served by generation that may not be considered "clean energy."[826] Industrial Customers highlight the Commission's statement that Order No. 1920 responds to "corporate, governmental, and utility commitments to rely on *certain* generation resources" and argue that the word "certain" implies without definition or justification a limited subset within possible generation resources.[827]

291. Industrial Customers contend that many companies consider corporate sustainability and clean energy strategies to be proprietary and sensitive, so utilizing known and available corporate commitments and information without also having the underpinning analytical evidence cannot be reasonably relied on to inform future transmission planning scenarios.[828] Similarly, Industrial Customers state that Order

[824] *Id.* at 52 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 413).

[825] *Id.* at 52-53 (citing PJM NOPR Initial Comments at 68).

[826] *Id.* at 54-55 (citations omitted).

[828] *Id.* at 49-50.

No. 1920 does not demonstrate that corporate strategies and goals are known determinants or representative and reliable anecdotes able to be utilized in Long-Term Scenarios.[829]

292. Northern Virginia argues that the inclusion of "corporate commitments" as an independent factor in Category Factor Seven is arbitrary and capricious as this inclusion circumvents the planning process utilized by load serving utilities and state regulators to also meet these commitments.[830] Additionally, Northern Virginia states that corporate commitments are too ephemeral and uncertain to be included in Long-Term Scenarios, and asserts that transmission planning processes should utilize best data from utilities and state regulators that are required to plan to serve load.[831] Northern Virginia also argues that the Commission should not give special status to private corporations not charged with planning for the greater good, and that corporate commitments are not comparable to utility planning or governmental policy goals.[832] Northern Virginia states that any entities with corporate commitments can participate in existing stakeholder and customer processes.[833]

---

[829] *Id.* at 50.

[830] Northern Virginia Rehearing Request at 4.

[831] *Id.* at 3-4.

[832] *Id.* at 4.

[833] *Id.* at 7-9.

293. Virginia and North Carolina Commissions argue that the Commission should remove Factory Category Seven from the development of Long-Term Scenarios as transmission providers may not have the resources and should not be in a position to assess the reasonableness or accuracy of corporate or utility commitments.[834] Similarly, Virginia and North Carolina Commissions contend that it would be unreasonable to expect state entities to use their limited resources to evaluate and opine on such commitments or policy goals and that many states may be constrained from doing so if these commitments impact filings before the state entity.[835] Additionally, Virginia and North Carolina Commissions request that the Commission only permit the incorporation of public policy goals previously approved through a state regulatory process or, alternatively, clarify that transmission providers can fully discount any public policy factors that fall under Factor Category Seven.[836]

294. NRECA states that the Commission expanded the concept of Long-Term Transmission Needs well beyond reliability, economic, and public policy issues by adopting seven categories of factors, including Factor Category Seven.[837] NRECA

[834] Virginia and North Carolina Commissions Rehearing Request at 7.

[835] *Id.*

[836] *Id.* at 8 (citation omitted).

[837] NRECA Rehearing Request at 54-55.

asserts that the costs of facilities built to satisfy corporate commitments should be borne by the relevant corporations, not by those who do not benefit from the facility.[838]

295. Harvard ELI and PIOs request clarification to reframe Factor Category Seven.[839] Harvard ELI requests that the Commission clarify whether Factor Category Seven implements the existing requirement to plan for all transmission users on a comparable basis and further clarify that all long-term planning rules are similarly rooted in the open access comparability standard.[840] PIOs request clarification on whether required scenario factors additionally include city and consumer-side market preferences.[841]

(b) Commission Determination

296. We are unpersuaded by parties that request that the Commission set aside the requirement for transmission providers to incorporate the seven specified categories of factors into the development of Long-Term Scenarios, including requests to set aside the requirement to incorporate certain specific categories of factors. Nevertheless, we believe certain clarifications adopted herein will alleviate the concerns these parties raise on rehearing. Specifically, our clarification that transmission providers must consult with and consider the positions of the Relevant State Entities and any other entity authorized by a Relevant State Entity as its representative as to how to account for factors related to

[838] *Id.* at 55.

[839] Harvard ELI Rehearing Request at 9-11; PIOs Rehearing Request at 61.

[840] Harvard ELI Rehearing Request at 9-11.

[841] PIOs Rehearing Request at 61.

states' laws, policies, and regulations when determining the assumptions that will be used in the development of Long-Term Scenarios will help ensure that each Long-Term Scenario reflects states' preferences and future needs. However, with respect to Factor Category Seven, we set aside the requirement to include corporate commitments, as discussed further below.

297. We continue to find that existing regional transmission planning requirements fail to ensure that transmission providers adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs. We reiterate that requiring transmission providers to incorporate the seven categories of factors into the development of Long-Term Scenarios is necessary because without doing so, transmission providers will fail to adequately consider drivers of Long-Term Transmission Needs.[842]

298. With regard to Arizona Commission's claim that Order No. 1920 favors "green" energy,[843] we reiterate that nothing in Order No. 1920 favors, promotes, or subsidizes particular types of generation resources over others and that the Commission's policies are technology and fuel neutral. Order No. 1920 does not endorse the merits of any laws and regulations or of any specific state-approved integrated resource plans.[844] Rather, we reiterate that states play a vital role in identifying the factors, especially in Factor Categories One, Two, and Seven, that transmission providers account for in Long-Term

[842] Order No. 1920, 187 FERC ¶ 61,068 at P 410.

[843] Arizona Commission Rehearing Request at 15.

[844] Order No. 1920, 187 FERC ¶ 61,068 at PP 232, 437.

Regional Transmission Planning. We are unpersuaded by Arizona Commission and NRECA that the categories of factors requirements in Order No. 1920 include policy factors that have not been previously considered in regional transmission planning.[845] In Order No. 1000, the Commission required transmission providers to establish procedures that provide for the consideration of transmission needs driven by Public Policy Requirements in the local and regional transmission planning processes.[846]

299. We are not persuaded by arguments that Factor Category One and Factor Category Two, which include state and local laws and regulations, will unjustly impose the policy goals of certain state and local governments on others.[847] We reiterate that transmission planning of any kind will inherently reflect the policy choices of multiple decisionmakers because the quantity and location of generation and load are shaped by multiple decisionmakers.[848] In this case, we expect transmission providers to work with states to ensure the way those state laws and regulations are incorporated into Long-Term Scenarios reflects states' preferred implementation of those laws and regulations. We also reiterate that transmission providers must appropriately value the effect of states'

[848] Order No. 1920, 187 FERC ¶ 61,068 at P 435.

policy decisions in regional transmission planning in order to ensure just and reasonable rates.[849]

300. Parties argue that the Commission's categories of factors requirements will impose formidable costs upon ratepaying loads that neither caused the need for the construction of additional transmission facilities nor measurably benefit from that construction and therefore are unjust and unreasonable and unduly discriminatory and preferential.[850] We disagree. The requirements of Order No. 1920, as clarified herein, ensure that Relevant States Entities, which represent consumers, have a voice in how factors within the categories of factors are accounted for, the development of Long-Term Scenarios that results from those factors, and the allocation of costs after a Long-Term Regional Transmission Facility is selected.[851] Nothing in Order No. 1920 changed the Commission's policy that costs must be allocated in a manner that is at least roughly commensurate with benefits, which ensures that ratepayers are not paying unjust and unreasonable rates.[852]

---

[849] *Id.* P 436.

[850] *E.g.*, Designated Retail Regulators Rehearing Request at 28; Ohio Commission Federal Advocate Rehearing Request at 16-17; Undersigned States Rehearing Request at 27-28.

[851] *See infra* Stakeholder Process and Transparency section; Requests for Additional Flexibility Regarding Long-Term Scenarios Requirements section.

[852] *See, e.g.*, Order No. 1920, 187 FERC ¶ 61,068 at PP 419, 1419, 1471, 1513.

301. We also disagree with arguments from Designated Retail Regulators and Undersigned States that there is insufficient evidence and analysis to support the conclusion that use of Factor Categories One, Two, Four, Six, and Seven will result in cost-effective solutions.[853] We believe the collaboration between transmission providers and Relevant State Entities, where relevant, will ensure that those categories of factors are incorporated into the development of Long-Term Scenarios that identify Long-Term Regional Transmission Facilities that both meet the needs of states and provide reliability and economic value. At the same time, we believe that transmission providers cannot identify more efficient or cost-effective solutions to Long-Term Transmission Needs if they undervalue or entirely omit the consideration of some or all of the seven categories of factors.[854] The Commission based its determination for each category of factors on record evidence specific to each category of factors indicating that each required category of factors is essential to identifying Long-Term Transmission Needs.[855] To the extent states may be concerned about the resulting cost allocation, we note certain clarifications below that provide greater opportunities for input to Relevant State Entities with respect to cost allocation.[856]

---

[853] *E.g.*, Designated Retail Regulators Rehearing Request at 8; Undersigned States Rehearing Request at 8.

[854] *E.g.*, Order No. 1920, 187 FERC ¶ 61,068 at PP 120, 228.

[855] *Id.* P 410; *see also id.* PP 391-395, 423-424, 438, 443-445, 450-452, 459, 467, 474-477 (summarizing record evidence that indicates that the seven categories of factors are essential to identifying Long-Term Transmission Needs).

[856] *See infra* Requests for Additional Flexibility Regarding Long-Term Scenarios

302. For this reason, we also disagree with Ohio Commission Federal Advocate that the categories of factors requirements are unreasonable, arbitrary, and capricious, and will encourage a massive transmission build-out at unjust and unreasonable rates. We continue to find that the categories of factors that Order No. 1920 requires transmission providers to incorporate into the development of Long-Term Scenarios reflect the wide variety of drivers of Long-Term Transmission Needs and therefore are necessary to ensure the identification of more efficient or cost-effective transmission solutions to such needs. We also note that, in Order No. 1920, the Commission responded to concerns that certain categories of factors are too speculative or subject to change and should not be incorporated into the development of Long-Term Scenarios.[857] Further, the Commission justified the framework for treating different types of categories of factors differently in the development of Long-Term Scenarios.[858]

303. However, we set aside, in part, the requirement for transmission providers to incorporate seven specific categories of factors in the development of Long-Term Scenarios. Specifically, we set aside the requirement for transmission providers to incorporate corporate commitments[859] in Factor Category Seven when developing Long-

---

Requirements section.

[857] Order No. 1920, 187 FERC ¶ 61,068 at PP 229, 231, 473.

[858] *Id.* PP 484, 507.

[859] We clarify that we distinguish in this context between "corporate commitments" and utility commitments that are made by transmission providers and load-serving entities, regardless of their corporate form.

Term Scenarios. We find that requiring transmission providers to consider corporate commitments when developing Long-Term Scenarios may introduce the risk of one class of transmission users cross-subsidizing another class of transmission users. We clarify that we continue to require transmission providers to consider corporate commitments that are likely to affect Long-Term Transmission Needs as part of Long-Term Regional Transmission Planning to the extent that these commitments affect transmission customers' transmission needs, because transmission providers must plan for the needs of all transmission customers on a comparable basis under Order Nos. 888, 890, and 1000.[860] As such, we find that it is unnecessary to require transmission providers to separately identify corporate commitments as a factor in their development of Long-Term Scenarios given that the effects of such commitments will be sufficiently incorporated into Long-Term Regional Transmission Planning through the incorporation of other Factor Categories, such as Factor Category Three (state-approved integrated resource plans and expected supply obligations for load-serving entities).

304. We agree with Harvard ELI's argument that transmission providers must consider how the contracts and purchasing plans of all transmission customers may affect Long-Term Transmission Needs in a comparable way to how transmission providers must consider utility purchasing plans and decisions. However, we disagree with Harvard ELI

[860] *See, e.g.*, Order No. 890, 118 FERC ¶ 61,119 at P 435 ("The Commission has broad authority to remedy undue discrimination by ensuring that transmission providers plan for the needs of their customers on a comparable basis. That fundamental requirement was adopted in Order No. 888 and the reforms adopted herein should ensure that it will be implemented properly." (footnote omitted)).

that the Commission's existing open access comparability standard requires transmission providers to plan for all transmission *users* on a comparable basis. Instead, as noted above, the open access comparability standard requires planning for transmission *customers* on a comparable basis. We emphasize this distinction because, in the context of Order No. 1920, transmission "users" could refer to retail customers of load-serving entities, and those load-serving entities are either transmission providers or transmission customers of transmission providers. In focusing on transmission users, Harvard ELI's request would inappropriately expand scope of the open access comparability standard to include retail customers. Therefore, we deny Harvard ELI's requested clarification.

305. Finally, we deny Northern Virginia's request to assign transmission facility costs related to corporate commitments through the Large Generator Interconnection Procedures. The Commission did not propose such a requirement in the NOPR and, as such, this request is beyond the scope of this proceeding.

306. Aside from corporate commitments, we otherwise sustain the requirement for transmission providers in each transmission planning region to incorporate Factor Category Seven into the development of Long-Term Scenarios, while recognizing the role of states in the incorporation of this category. Specifically, transmission providers must incorporate utility commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs into the development of Long-Term Scenarios. While we require transmission providers to incorporate this category of factors into the development of Long-Term Scenarios, we emphasize that, where relevant, each of the factors within the category should be the subject of discussion

with the states who have the policy goals, and their preferences as far as how to integrate these goals should be taken into account when developing Long-Term Scenarios. We also find that utility commitments and federal, federally-recognized Tribal, state, and local policy goals could be drivers of Long-Term Transmission Needs.

307. We disagree with SERTP Sponsors and Industrial Customers that this requirement does not constitute reasoned decision making or engage with counterarguments in Order No. 1920 and note, as described above, that the requirement to incorporate Factor Category Seven into the development of Long-Term Scenarios was based on record evidence.[861] Further, the Commission acknowledged commenter concerns that utility, federally-recognized Tribal, and governmental goals may be more likely to change over the transmission planning horizon than factors in other required Factor Categories.[862] However, the Commission did not find that these commitments and goals are so speculative, amorphous, or unreliable that they should not be incorporated into Long-Term Scenarios at all.[863]

308. We also disagree with arguments that the inclusion of Factor Category Seven is unduly discriminatory or preferential.[864] The Commission requires that transmission

[861] Order No. 1920, 187 FERC ¶ 61,068 at PP 474-477 (summarizing record evidence indicating that Factor Category Seven is essential to identifying Long-Term Transmission Needs).

[862] *Id.* P 484.

[863] *Id.*

[864] SERTP Sponsors Rehearing Request at 16; Industrial Customers Rehearing

providers plan for all transmission customers' transmission needs on a comparable basis.[865] We clarify that Factor Category Seven, as modified above, is not intended to single out certain utility commitments or federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs; instead, Factor Category Seven, as modified above, captures factors that are not fully represented in the other six categories of factors and also affect Long-Term Transmission Needs. As noted in Order No. 1920, transmission providers have discretion to determine whether a proposed factor in Factor Category Seven likely affects Long-Term Transmission Needs[866] and how such factors in Factor Category Seven should be considered,[867] but we clarify such discretion must be applied in a manner that ensures comparability among transmission customers. We also clarify that "certain generation resources" in Order No. 1920's reference to "corporate, governmental, and utility commitments to rely on certain generation resources," which, as modified on rehearing, is now "governmental and utility commitments," does not refer to a certain resource type, or limit consideration of such government or utility commitments to only those commitments to rely on renewable resources.[868] Rather, this requirement means that transmission providers must consider

---

Request at 54.

[865] *See, e.g.*, Order No. 890, 118 FERC ¶ 61,119 at P 435.

[866] Order No. 1920, 187 FERC ¶ 61,068 at PP 415, 417.

[867] *Id.* P 516

[868] *Id.* P 261; Industrial Customers Rehearing Request at 55.

the generation resources that a federal, state, or local government entity, federally-recognized Tribe, or utility has chosen to rely on regardless of the resource type.

309. In response to Virginia and North Carolina Commissions' request as to whether transmission providers may discount public policy factors within Factor Category Seven to zero, we reiterate that, with respect to Factor Category Seven, transmission providers have discretion as to how they account for these factors. We also clarify that transmission providers may conclude that certain factors within Factor Category Seven do not affect Long-Term Transmission Needs and, therefore, do not need to account for them when incorporating Factor Category Seven into the development of Long-Term Scenarios.[869]

310. Regarding Industrial Customers' concern that the quality of information on utility commitments make Factor Category Seven unworkable, we note the clarification below that transmission providers may rely on the open and transparent stakeholder process to identify the factors in Factor Category Seven, as modified above, in the same manner that they may rely on the open and transparent stakeholder process to identify the factors in Factor Categories One through Three.[870] We continue to believe that federal, state, and local government entities, federally-recognized Tribes, utilities, load-serving entities, and

[869] Order No. 1920, 187 FERC ¶ 61,068 at P 415.

[870] *Supra infra* Stakeholder Process and Transparency section (clarifying that transmission providers have no independent obligation to identify factors in Factor Category Seven and may rely on stakeholders to identify factors in Factor Category Seven).

their retail regulators that participate in the stakeholder process are distinctly well-positioned to provide transmission providers with vital information regarding factors in Factor Category Seven, as modified above.[871] In response to Industrial Customers' claim that the best information may be confidential,[872] we clarify that transmission providers may include what they believe to be appropriate confidentiality protections in their compliance proposals to account for proprietary commitments. The Commission will evaluate those proposals by using the established principles in Order No. 890,[873] as well as precedent on existing confidentiality protections with respect to transmission planning that the Commission has previously found comply with the Order No. 890 transmission planning principles.

311. We disagree with Industrial Customers' argument that the Commission's emphasis on transmission provider discretion is problematic.[874] Order No. 1920, with Factor Category Seven as modified above, strikes the right balance by allowing transmission providers discretion as to the treatment of factors within Factor Category Seven when

[871] Order No. 1920, 187 FERC ¶ 61,068 at P 530.

[872] Industrial Customers Rehearing Request at 49-50.

[873] Order No. 890, 118 FERC ¶ 61,119 at PP 471-476; *see also* Order No. 1920, 187 FERC ¶ 61,068 at P 466 (clarifying that transmission providers may include what they believe to be appropriate confidentiality protections in their proposals to account for resource retirements that might take place over the transmission planning horizon).

[874] Industrial Customers Rehearing Request at 51-53.

developing Long-Term Scenarios. In contrast to Industrial Customers' claim,[875] we do not believe that transmission providers need clear rules or standards for implementing their discretion over incorporating Factor Category Seven, as modified above, in the development of Long-Term Scenarios. We find that transmission providers can rely on their expert judgement and the information provided to them through the open and transparent stakeholder process to develop three plausible Long-Term Scenarios for purposes of identifying Long-Term Transmission Needs. Furthermore, we continue to find that concerns regarding the administrative burden of identifying specific factors are addressed by allowing transmission providers to rely on the open and transparent stakeholder process to identify factors.[876] We find that our clarification that transmission providers may rely on the open and transparent stakeholder process to identify the factors in Factor Category Seven,[877] as well as our decision to exclude corporate commitments from that Factor Category, renders moot Industrial Customers' claim that Order No. 1920 forces transmission providers to account for corporate energy commitments and goals of "all potentially known or capable-of-being known energy commitments or contracts."[878]

312. We recognize that utility commitments and federal, federally-recognized Tribal, state, and local policy goals in Factor Category Seven may initially surface as retail

---

[875] *Id.* at 52.

[876] Order No. 1920, 187 FERC ¶ 61,068 at P 508.

[877] *See infra* Stakeholder Process and Transparency section.

[878] Industrial Customers Rehearing Request at 53.

concerns that are addressed through arrangements with retail providers;[879] however, this fact does not obviate the need for transmission providers to account for them in the development of Long-Term Scenarios. We acknowledge that there could be an overlap between Factor Category Seven, as modified above, and other categories (e.g., integrated resource plans in Factor Category Three), because utility commitments and policy goals may be addressed through arrangements with retail providers. As discussed above,[880] transmission providers should avoid double counting the anticipated effects that those factors have on assumptions used to develop Long-Term Scenarios where the impact of factors overlaps, such that transmission providers must incorporate those factors once in the appropriate Factor Categories One through Three, not Factor Categories Four through Seven.

313. We disagree with NRECA's claim that the inclusion of Factor Category Seven expands the definition of Long-Term Transmission Needs beyond reliability, economic, or public policy issues. The Commission was clear that the drivers of transmission needs are diverse and include, but are not limited to, evolving reliability concerns, changes in

[879] SERTP Sponsors Rehearing Request at 15. In light of the discussion above, we continue to conclude that Order No. 1920—including Factor Category Seven, as modified—is within the Commission's authority notwithstanding that considerations relevant to Factor Category Seven may also arise in the context of retail transactions. *See supra* Order No. 1920 Is Consistent with the FPA and Precedent Regarding the Commission's Authority section (explaining that where the Commission regulates within its statutory authority, that regulation does not run afoul of the jurisdictional lines drawn in the FPA irrespective of any effects on areas of reserved state authority).

[880] *Supra* Requirement to Incorporate Categories of Factors section.

the resource mix, and changes in demand.[881] Foundationally, and consistent with our clarification that economic drivers contribute to Long-Term Transmission Needs,[882] we find that all seven categories of factors in Order No. 1920 pertain to Long-Term Transmission Needs because they affect the reliable and economic operation of the interconnected transmission system. The categories of factors requirements are intended to address certain deficiencies in the Commission's existing regional transmission planning requirements, including the failure to ensure that transmission providers adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs.[883]

iii. Other Specific Required Categories of Factors

(a) Requests for Rehearing and Clarification

314. NRECA requests rehearing of the Commission's holding in Order No. 1920 that transmission providers have the discretion to determine that factors in Factor Category Three (state-approved integrated resource plans and expected supply obligations for load-serving entities) may not affect Long-Term Transmission Needs.[884] NRECA argues that

[881] Order No. 1920, 187 FERC ¶ 61,068 at P 299.

[882] *See supra* Requirement for Transmission Providers To Use the Seven Required Benefits To Help To Inform Their Identification of Long-Term Transmission Needs section.

[883] Order No. 1920, 187 FERC ¶ 61,068 at P 418.

[884] NRECA Rehearing Request at 37-39 (citing Order No. 1920, 187 FERC ¶ 61,068 PP 507, 510); *see also* East Kentucky Rehearing Request at 2-3 (arguing that Order No. 1920 violates FPA section 217(b)(4) by treating state-approved integrated resource plans and expected supply obligations for load-serving entities as discretionary

Order No. 1920 is in error because the Commission took action in this regard that is at odds with the needs of load-serving entities in violation of FPA section 217(b)(4).[885] NRECA acknowledges that the Commission explained in Order No. 1920 that the final rule is consistent with FPA section 217(b)(4) and the interpretation of that statute adopted when the D.C. Circuit upheld Order No. 1000 in *South Carolina Public Service Authority v. FERC*.[886] Nonetheless, NRECA claims that Order No. 1920 is different from Order No. 1000, and therefore that decision is not dispositive—particularly as to Order No. 1920's treatment of state-approved integrated resource plans and the expected supply obligations as discretionary.[887] NRECA further argues that the Commission should revisit its conclusion that *South Carolina Public Service Authority v. FERC* remains binding precedent, because the D.C. Circuit upheld Order No. 1000's compliance with section 217(b)(4) using the deferential standard of review in *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*,[888] which was under review by the U.S.

---

factors in Factor Category Three (citation omitted)); *id.* at 1 (stating that East Kentucky "specifically adopts the majority of issues identified by NRECA and incorporates the bases and arguments for rehearing set forth in the NRECA Rehearing Request for those issues").

[885] NRECA Rehearing Request at 39-40 (citing 16 U.S.C. 824q(b)(4)).

[886] *Id.* at 40-41 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 283).

[887] *Id.* at 41.

[888] *Id.* (citing *Chevron U.S.A. Inc. v. Nat. Res. Def. Council, Inc.*, 467 U.S. 837 (1984); *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 54).

Supreme Court at the time NRECA submitted its request for rehearing.[889] NRECA further argues that the Commission's decision in this regard was arbitrary and capricious because Order No. 1920 was not "based on a consideration of the relevant factors" and "entirely failed to consider an important aspect of the problem."[890]

315. SERTP Sponsors request the following clarifications regarding specific categories of factors. With regard to Factor Categories One through Three, SERTP Sponsors request that the Commission expressly clarify that the open and transparent stakeholder process established by transmission providers is not intended to create an opportunity to relitigate or dispute the underlying integrated resource plans, resource projections, or laws and regulations, but instead, simply intends to create a forum in which such inputs can be brought forth to examine the potential impact on Long-Term Transmission Needs.[891] Regarding Factor Category Three, SERTP Sponsors request that the resource planning and procurement processes of non-jurisdictional transmission providers, such as those of the non-jurisdictional SERTP Sponsors, that have been approved by their respective governing authorities should be included in this Factor Category Three as scenario inputs that are to be included without discount.[892] SERTP Sponsors also request

[889] *Id.* (citing *Loper Bright Enters. v. Raimondo*, No. 22-451; *Relentless, Inc. v. Dep't of Commerce*, No. 22-1219 (U.S. argued Jan. 17, 2024)).

[890] *Id.* at 41-42 (quoting *State Farm*, 463 U.S. at 43).

[891] SERTP Sponsors Rehearing Request at 5.

[892] *Id.* at 6.

clarification that "federal, federally-recognized Tribal, state, and local laws and regulations" is intended to encompass only "enacted statutes (i.e., passed by the legislature and signed by the executive) and regulations promulgated by a relevant jurisdiction, whether within a state or at the federal level" as established in Order No. 1000, albeit with the addition of Tribal laws and regulations.[893] Similarly, SERTP Sponsors request clarification that for Factor Category One, such legally binding obligations, incentives (e.g., tax credits), and/or restrictions must be enacted by legislatures or promulgated by the relevant agency or Tribal authority.[894]

316. PIOs request rehearing of the Commission's findings regarding Factor Categories Four and Seven because they assert that the Commission erred when it failed to create specific guardrails to prevent transmission providers from minimizing these two categories of factors.[895] PIOs argue that the Commission must provide specific guardrails for Factor Categories Four and Seven to ensure that transmission needs are accurately assessed.[896] PIOs argue that Order No. 1920 allows "boundless discounting" of these categories, which "creates an opportunity for transmission providers to functionally ignore the Commission's mandate."[897]

---

[893] *Id.* at 14-15 (quoting Order No. 1000, 136 FERC ¶ 61,051 at P 2).

[894] *Id.*

[895] PIOs Rehearing Request at 33-35.

[896] *Id.* at 33.

[897] *Id.*

317. PIOs contend that the evidence in the record does not substantiate the Commission's dismissal of the concern that the additional discretion granted to transmission providers regarding the last four categories of factors could functionally minimize these categories.[898] Regarding Factor Category Four, PIOs urge the Commission to maintain a list of best available data.[899] Regarding Factor Category Seven, PIOs request that the Commission limit the discounting of utility and corporate commitments by creating a presumption that transmission providers' discounting cannot assume greater failure to reach utility and corporate commitments than has occurred in the previous 10 years.[900]

(b) Commission Determination

318. We disagree with NRECA's rehearing arguments and continue to find that, while transmission providers must incorporate into the development of Long-Term Scenarios all factors in Factor Category Three (state-approved integrated resource plans and expected supply obligations for load-serving entities) that the transmission providers determine are likely to affect Long-Term Transmission Needs, transmission providers have the discretion as to whether they must account for a specific factor in Factor Category Three in the development of Long-Term Scenarios by concluding it is likely to

[898] *Id.*

[899] *Id.* at 34.

[900] *Id.* at 35.

affect Long-Term Transmission Needs.[901] We continue to believe that the framework adopted in Order No. 1920 regarding categories of factors strikes the right balance between prescriptive requirements and flexibility.[902] Transmission providers determining whether a particular factor is likely to affect Long-Term Transmission Needs does not allow them to simply pick-and-choose one factor that they may prefer over another factor. Instead, allowing transmission providers to determine whether to account for a specific factor by concluding it is likely to affect Long-Term Transmission Needs is necessary to ensure that transmission providers develop accurate assumptions on which to base their Long-Term Scenarios.[903] Further, Order No. 1920 builds on the foundation of Order No. 890, and specifically the comparability principle, which requires that transmission providers treat similarly situated customers comparably in the transmission planning process.[904]

319. We believe that the vast majority of factors in Factor Category Three, which represent state-approved integrated resource plans and expected supply obligations for load-serving entities, will likely affect Long-Term Transmission Needs. Nevertheless,

---

[901] Order No. 1920, 187 FERC ¶ 61,068 at PP 447, 510.

[902] *Id.* P 417.

[903] *Cf. id.* P 530 (discussing importance of transmission providers being able to develop more accurate assumptions to serve as the basis for their Long-Term Scenarios).

[904] *Id.* P 14 (citing Order No. 890, 118 FERC ¶ 61,119 at PP 418-601); *see also* Order No. 890, 118 FERC ¶ 61,119 at PP 494-495 (discussing the comparability principle).

we cannot foresee every potential factor that may be identified, and we therefore find it appropriate to preserve transmission providers' discretion to conclude that a specific factor (even in Factor Category Three) will have limited or no impact on Long-Term Transmission Needs. We also emphasize, as discussed below,[905] that transmission providers must consult with and consider the positions of the Relevant State Entities as to how to incorporate categories of factors into the development of Long-Term Scenarios in such a way that states will play an important role in ensuring that state-approved integrated resource plans are incorporated in the manner they are expected to be implemented.

320. We also disagree with NRECA's argument that the Commission acted at odds with the needs of load-serving entities in violation of FPA section 217(b)(4) by providing transmission providers with the discretion to not account for factors in Factor Category Three that a transmission provider finds are unlikely to affect Long-Term Transmission Needs. If a factor is unlikely to affect Long-Term Transmission Needs, excluding that factor in the transmission planning process is unlikely to negatively affect the needs of load-serving entities. Contrary to NRECA's claims, FPA section 217(b)(4) does not require the Commission to require transmission providers to account for factors in the development of Long-Term Scenarios that do not affect Long-Term Transmission Needs. We continue to find that Order No. 1920 satisfies the Commission's obligation under FPA section 217(b)(4) because Order No. 1920 facilitates the planning and expansion of

[905] *Infra* Stakeholder Process and Transparency section.

transmission facilities to meet load-serving entities' needs.[906] Long-Term Regional Transmission Planning, as clarified herein, is intended to enhance the transmission planning process for states, load-serving entities, and other interested parties, and, to that end, requires transmission providers to account for factors (including load-serving entities' expected supply obligations) that are likely to affect Long-Term Transmission Needs in the development of Long-Term Scenarios.

321. Further, we disagree with NRECA that the U.S. Supreme Court's decision in *Loper Bright Enterprises v. Raimondo*[907]—in which the Court overruled *Chevron U.S.A. Inc. v. Natural Resources Defense Council*, *Inc.*—requires us to reconsider the D.C. Circuit's holding in *South Carolina Public Service Authority v. FERC* as to the meaning of FPA section 217(b)(4).[908] The D.C. Circuit interpreted section 217(b)(4) and determined that this provision requires the Commission to "facilitate the planning of a reliable grid" by "seek[ing] to ensure that adequate transmission capacity is built to allow load-serving entities to meet their service obligations."[909] Order No. 1920 did not reinterpret FPA section 217(b)(4), but rather applied the interpretation adopted by the

[906] Order No. 1920, 187 FERC ¶ 61,068 PP 283, 420.

[907] 144 S.Ct. 2244 (2024).

[908] NRECA Rehearing Request at 41 (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 54).

[909] *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 90. Moreover, even if the D.C. Circuit had relied on *Chevron* in reaching this conclusion, the Supreme Court confirmed that "mere reliance" on *Chevron* is "not enough to justify overruling a statutory precedent." *Loper Bright*, 144 S.Ct. at 2273.

D.C. Circuit. Moreover, we believe the interpretation set forth by the Commission in Order No. 1000, endorsed by the D.C. Circuit in *South Carolina Public Service Authority v. FERC* and applied in Order No. 1920, remains the most reasonable reading of this statutory provision.[910] Fundamentally, meeting the reasonable needs of load-serving entities to satisfy their service obligations requires that sufficient transmission capacity is available to deliver power when it is needed, and fostering a reliable transmission system is the best way to ensure that such capacity is available. Order No. 1920's requirements are designed to achieve precisely that development of sufficient transmission capacity to ensure reliable and affordable delivery of needed power to meet the reasonable needs of load-serving entities, and therefore we find that it complies with FPA section 217(b)(4).

322. We grant SERTP Sponsors' request for clarification regarding the first three categories of factors and clarify that nothing in Long-Term Regional Transmission Planning is intended to relitigate or dispute the outcomes of the underlying integrated resource plans, resource projections, or laws and regulations that are (or are not) incorporated into the development of Long-Term Scenarios. The open and transparent

[910] *Compare* Order No. 1000, 136 FERC ¶ 61,051 at P 108 ("[T]his Final Rule is consistent with section 217 because it supports the development of needed transmission facilities, which ultimately benefits load-serving entities."), *with S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 90 ("Section 217 (b)(4) requires the Commission to facilitate the planning of a reliable grid, which is exactly what the Commission has done in the challenged orders."); Order No. 1920, 187 FERC ¶ 61,068 at P 283 ("As articulated in *South Carolina Public Service Authority v. FERC*, FPA section 217(b)(4) requires the Commission to 'facilitate the planning of a reliable grid,' and we do so by 'seek[ing] to ensure that adequate transmission capacity is built to allow load-serving entities to meet their service obligations.'" (alteration in original) (citation omitted)).

stakeholder process required in Order No. 1920 is a forum that provides stakeholders, including states, with a meaningful opportunity to propose potential factors and to provide timely input on how to account for specific factors in the development of Long-Term Scenarios.[911] For purposes of identifying Long-Term Transmission Needs, every factor is an input that transmission providers consider when determining the assumptions to use in the development of Long-Term Scenarios. Through the stakeholder process, states, transmission providers and stakeholders will have the opportunity to discuss how a factor would affect assumptions used to develop Long-Term Scenarios, if it does at all, and how the effect varies in different Long-Term Scenarios.

323. In addition, we grant SERTP Sponsors' request for clarification regarding non-jurisdictional entities,[912] in part. We clarify that, where a non-jurisdictional entity is a transmission customer of one or more transmission providers in a transmission planning region, the transmission providers must plan for the non-jurisdictional entity's needs as a transmission customer as it would for the needs of any other transmission customer, including any resource planning and procurement processes that have been approved by the respective governing authorities under Factor Category Three, for purposes of complying with the requirements of Order No. 1920. For example, each Long-Term Scenario must account for and be consistent with these factors once the transmission providers have determined that such a factor is likely to affect Long-Term Transmission

[911] Order No. 1920, 187 FERC ¶ 61,068 at P 528.

[912] SERTP Sponsors Rehearing Request at 6.

Needs.[913] However, we further clarify that transmission providers may *not* plan for the needs of a non-jurisdictional utility transmission provider if that non-jurisdictional transmission provider has not enrolled in the transmission planning region and thereby has not agreed to any cost allocation method applicable to selected Long-Term Regional Transmission Facilities.[914] If the transmission provider were to plan for and consider non-jurisdictional transmission providers' Long-Term Transmission Needs without a way to ensure the non-jurisdictional transmission provider contributes to the costs of the resulting Long-Term Regional Transmission Facilities, the resulting cost allocation could violate the cost causation principle and result in free-ridership.[915]

324. In response to SERTP Sponsors' request for clarification regarding the meaning of "laws and regulations," we clarify that Order No. 1920 adopts the meaning of the terms used in the NOPR, namely "enacted statutes (i.e., passed by the legislature and signed by the executive) and regulations promulgated by a relevant jurisdiction."[916] Order No. 1920 amended the term "statutes" used in the NOPR by adding the duly enacted and

[914] *Cf.* Order No. 1000-A, 139 FERC ¶ 61,132 at P 276 ("[T]he regional transmission planning process is *not required* to plan for the transmission needs of such a non-[jurisdictional] utility transmission provider that has not made the choice to join a transmission planning region." (emphasis added)).

[915] *El Paso Elec. Co. v. FERC*, 76 F.4th at 363-66.

[916] NOPR, 179 FERC ¶ 61,028 at P 104 n.189; *see also* Order No. 1000, 136 FERC ¶ 61,051 at P 2. We clarify here that the definition of "laws and regulations" includes laws and regulations duly enacted by local jurisdictions, even where there are differences in how these jurisdictions enact laws or promulgate regulations.

legally binding obligations of federally-recognized Tribes.[917] We reiterate that Factor Categories One and Two include laws and regulations at the federal, federally-recognized Tribal, state, and local level.[918]

325. We disagree with PIOs' request for rehearing to create more prescriptive requirements for Factor Category Four (trends in fuel costs and in the cost, performance, and availability of generation, electric storage resources, and building and transportation electrification technologies) and Factor Category Seven (utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs).[919] We reiterate that the framework that the Commission adopted in Order No. 1920 regarding the incorporation of categories of factors into the development of Long-Term Scenarios strikes the right balance between prescriptive requirements and flexibility.[920] We believe that the requirements for transmission providers to incorporate (i.e., more than merely consider) categories of factors in the development of Long-Term Scenarios, as well as to develop plausible

[917] Order No. 1920, 187 FERC ¶ 61,068 at P 434.

[918] *Id.* P 409. It is unclear whether SERTP Sponsors intended to argue that failure to grant clarification in this respect would result in Order No. 1920 exceeding the Commission's authority; to the extent they intended to do so, we find this argument has not been raised with the specificity required on rehearing. *See supra* Major Questions Doctrine section.

[919] PIOs Rehearing Request at 33.

[920] Order No. 1920, 187 FERC ¶ 61,068 at P 417.

Long-Term Scenarios with the best available data,[921] are adequate to safeguard against "boundless discounting" and opportunities to "functionally ignore the Commission's mandate."[922]

326. More specifically, we disagree with PIOs' request to require on rehearing that transmission providers incorporate certain factors from a Commission-maintained list of data sources for Factor Category Four. As an initial matter, we find that it is unnecessary to grant PIOs' request because transmission providers' technical expertise and the required open and transparent stakeholder process to identify factors are sufficient to ensure that transmission providers implement the requirements of Long-Term Regional Transmission Planning. In addition to the Commission's concerns regarding regional variation and stifled innovation identified in Order No. 1920,[923] we conclude that there are practical challenges associated with the Commission establishing and maintaining a list of data sources. For example, transmission providers already collect data similar to the data needed for these factors for other applications, and the Commission would be duplicating this data collection effort. We believe that transmission providers working with Relevant State Entities and other stakeholders in their regions are better equipped to

[921] *Id.* PP 413-414.

[922] PIOs Rehearing Request at 33.

[923] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 639 (declining to impose further requirements as to data uniformity because regional variation may make uniformity challenging and because it could stifle innovation that may improve Long-Term Regional Transmission Planning).

understand the unique circumstances of their regions and to compile data and inputs for the required categories of factors.

327. With respect to Factor Category Seven, we decline to limit the discounting of utility and corporate commitments as proposed by PIOs.[924] In this case, we find that transmission providers may face practical challenges in accurately quantifying the historical rate of failure for utility commitments; moreover, the historical rate of failure is not necessarily determinative of future achievement rates for such commitments. In addition, limiting how transmission providers manage the uncertainty associated with utility commitments may have unintended consequences. For example, such a limit would not allow transmission providers to adapt their treatment of utility commitments in response to, for example, industry-wide changes that make it more challenging for utilities to meet prior commitments. We believe that the existing requirements in Order No. 1920[925] are adequate to safeguard against boundless discounting of factors in Factor Category Seven.[926]

[924] The issue of discounting corporate commitments is rendered moot by our decision to set aside the requirement to include these commitments in Factor Category Seven above.

[925] *Id.* PP 413-414.

[926] PIOs Rehearing Request at 33.

iv. Requests for Additional Requirements

(a) Requests for Rehearing

328. Invenergy requests rehearing, asserting that the Commission erred by not requiring transmission providers to include "advanced-stage" merchant high-voltage direct current (HVDC) transmission facilities in the list of factors to be considered when developing Long-Term Scenarios.[927] Invenergy claims this omission is unduly discriminatory against advanced-stage merchant HVDC transmission.[928] Invenergy also asserts that the Commission failed to consider significant evidence in Order No. 1920 because the Commission failed to address AEE's comments, which argued that merchant HVDC transmission facilities must be included in at least one Long-Term Scenario in order to address potential undue discrimination against merchant HVDC transmission facilities. According to Invenergy, AEE asserted that it is important to include merchant HVDC transmission facilities in at least one Long-Term Scenario because merchant HVDC transmission facilities are developed by nonincumbent transmission developers and this inclusion guards against potential undue discrimination.[929] In addition, Invenergy claims that failure to utilize critical and readily available information will result in Long-Term Scenarios that do not accurately reflect the topography of the system, and that this information should be included to guard against potential undue discrimination from

[927] Invenergy Rehearing Request at 2, 6-7.

[928] *Id.* at 10.

[929] Invenergy Rehearing Request at 9 (citing AEE NOPR Reply Comments at 19).

incumbent transmission owners.[930] Invenergy argues that the Commission ignored significant evidence in the record from Invenergy and others on this issue.[931]

(b) Commission Determination

329. In response to Invenergy's request for rehearing, we reiterate that the Commission did not propose specific requirements in the NOPR regarding merchant HVDC transmission facilities under development and was not persuaded by the evidence in the record that it should include advanced-stage HVDC transmission facilities in the minimum set of known determinants of Long-Term Transmission Needs.[932] Invenergy has not clearly articulated how merchant HVDC transmission facilities are essential to identifying, or are known and identifiable drivers of, Long-Term Transmission Needs.

330. In the NOPR, the Commission referenced merchant transmission facilities only once,[933] and that reference was in the context of a larger proposed requirement that the Commission declined to adopt in Order No. 1920.[934] Order No. 1920 addressed specific

[930] *Id.* at 8-9.

[931] *Id.* at 9.

[932] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 493.

[933] NOPR, 179 FERC ¶ 61,028 at P 150 (In the context of the NOPR proposal for the identification of geographic zones, the Commission proposed to include "any merchant or other entity commitments to build . . . transmission facilities" as one of seven mandatory considerations to assess generation developers' commercial interest in developing generation within each designated geographic zone.).

[934] Order No. 1920, 187 FERC ¶ 61,068 at P 665 (stating that "the [identification of geographic zones] NOPR proposal is not warranted at this time").

deficiencies with the Commission's existing regional transmission planning and cost allocation requirements but did not identify issues surrounding merchant transmission as one of those deficiencies.[935]

331. We disagree with Invenergy's claim that the exclusion of proposed but not yet built merchant HVDC transmission facilities from the required factors underlying the Long-Term Scenarios is unjust and unreasonable.[936] In Order No. 1920, the Commission described the seven specific categories of factors required by the Commission as "essential to identifying Long-Term Transmission Needs" and "known and identifiable drivers of Long-Term Transmission Needs."[937] Although Invenergy claimed that one of its merchant HVDC transmission facilities could *address* transmission needs,[938] Invenergy has failed to clearly articulate how proposed but not yet built merchant HVDC

[935] *Id.* P 139 ("[W]e find that the Commission's regional transmission planning and cost allocation requirements fail to require transmission providers to: (1) perform a sufficiently long-term assessment of transmission needs that identifies Long-Term Transmission Needs; (2) adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs; and (3) consider the broader set of benefits of regional transmission facilities planned to meet those Long-Term Transmission Needs. We find that reforms to those requirements are thus necessary to ensure that Commission-jurisdictional rates are just, reasonable, and not unduly discriminatory or preferential.").

[936] Invenergy Rehearing Request at 8.

[937] Order No. 1920, 187 FERC ¶ 61,068 at P 410.

[938] Invenergy Initial NOPR Comments at 7 ("A planned 5,000 MW HVDC line such as Grain Belt's would be a significant system addition, and could itself provide system benefits or even address transmission needs otherwise identified through the planning process . . . .").

transmission facilities are essential to identifying, or are known and identifiable drivers of, Long-Term Transmission Needs. However, as indicated in Order No. 1920, transmission providers may be aware of additional categories of factors beyond those adopted in the final rule that drive Long-Term Transmission Needs and may incorporate additional categories of factors into the development of Long-Term Scenarios.[939] We clarify that, if transmission providers elect to use additional categories of factors beyond the required categories of factors in Order No. 1920 in the development of Long-Term Scenarios, the transparency requirements set forth in Order No. 1920 also apply to the additional categories of factors.[940] Pursuant to this clarification, transmission providers must publish on the public portion of an OASIS or other public website: (1) the list of each additional categories of factors, and the factors in each of the additional categories of factors that they will account for in their Long-Term Scenarios; (2) a description of each additional category of factors and a description of each factor that they will account for in their Long-Term Scenarios; (3) a general statement explaining how they will account for each additional category of factors and each of the additional factors in their Long-Term Scenarios; (4) a description of the extent to which they will discount any factors in each additional category of factors; and (5) a list of the factors that they considered but did not incorporate in each additional category of factors in their Long-Term Scenarios. Consistent with Order No. 1920, we find that this transparency is

[939] Order No. 1920, 187 FERC ¶ 61,068 at P 493.

[940] *See id.* PP 528-533.

necessary to make clear to stakeholders which specific additional categories of factors and factors transmission providers incorporate into Long-Term Scenarios and how they are incorporated. We believe this posting requirement for additional categories of factors will also provide greater transparency into how transmission providers develop Long-Term Scenarios, while still providing transmission providers with flexibility regarding whether, and if so, how they choose to incorporate relevant factors.[941] Accordingly, in transmission planning regions where proposed HVDC transmission facilities may play a role in shaping Long-Term Transmission Needs, transmission providers have the flexibility to consider and incorporate such facilities into their Long-Term Scenarios.

332. We also disagree with Invenergy's argument that the Commission has failed to direct transmission providers to use critical—and readily available—information related to the future electric power system, which renders the resulting Long-Term Scenarios unjust and unreasonable.[942] Order No. 1920 requires transmission providers to develop Long-Term Scenarios with data inputs that are timely, developed using best practices and diverse and expert perspectives, and adopted via a process that satisfies the transmission planning principles of Order Nos. 890 and 1000.[943] In addition, in Order No. 1920, the Commission found that transmission providers must use best available data when determining whether each factor is likely to affect Long-Term Transmission Needs.

---

[941] *Id.* P 534.

[942] Invenergy Rehearing Request at 9.

[943] Order No. 1920, 187 FERC ¶ 61,068 at P 633.

Once transmission providers have determined that a factor is likely to affect Long-Term Transmission Needs, they must use the best available data when they then account for that factor in the development of Long-Term Scenarios.[944]

333. We also disagree with Invenergy's claim that the Commission ignored significant evidence in the record.[945] We remain unpersuaded by the evidence in the record that the Commission should include advanced-stage HVDC transmission facilities in the minimum set of known determinants of Long-Term Transmission Needs.[946] Invenergy's experience with its Grain Belt project in the MISO Long Range Transmission Plan speaks to a separate issue currently before the Commission.[947]

334. Finally, we disagree with Invenergy's argument that the Commission's inclusion of a wide range of factors, including generation interconnections, but exclusion of advanced-stage merchant HVDC facilities is unduly discriminatory and opens such developers to further potential undue discrimination.[948] The Commission found it appropriate to require transmission providers to incorporate Factor Category Six

---

[944] *Id.*

[945] Invenergy Rehearing Request at 9 ("As demonstrated above, multiple commenters, including Invenergy, the Clean Energy Associations, and others placed evidence into the record explaining why merchant HVDC transmission facilities must be included.").

[948] Invenergy Rehearing Request at 10.

(generator interconnection requests and withdrawals) into the development of Long-Term Scenarios because generation interconnection queues provide important information about future generation development over the transmission planning horizon and therefore affect Long-Term Transmission Needs.[949] We cannot make a similar finding for advanced-stage merchant HVDC transmission based on the record in this proceeding, nor do we conclude (and Invenergy has not demonstrated) that the exclusion of advanced-stage merchant HVDC facilities from the required categories of factors opens merchant transmission developers to potential undue discrimination. We also are not persuaded by Invenergy's reference to AEE's comments claiming that being a nonincumbent transmission developer rises to the level of potential undue discrimination that must be remedied by requiring merchant HVDC to be included in Long-Term Scenarios. To the extent that similar potential undue discrimination claims for nonincumbent merchant HVDC transmission developers are pending in other proceedings, the Commission will address those claims based on the evidence in those proceedings. We note that AEE provides no evidence of potential undue discrimination and that AEE itself has not filed a rehearing request on this issue. Finally, we clarify that transmission providers, in addressing interconnection requests and withdrawals under Factor Category Six, must include merchant transmission developer interconnection requests in the development of Long-Term Scenarios, and in a manner comparable to other interconnection requests.

[949] Order No. 1920, 187 FERC ¶ 61,068 at P 472.

c. Stakeholder Process and Transparency

i. Order No. 1920 Requirements

335. In Order No. 1920, the Commission required transmission providers in each transmission planning region to revise the regional transmission planning process in their OATTs to outline an open and transparent process that provides stakeholders, including federally-recognized Tribes and states, with a meaningful opportunity to propose potential factors and to provide timely input on how to account for specific factors in the development of Long-Term Scenarios. The Commission further required transmission providers to publish on the public portion of an OASIS or other public website the following information: (1) the list of the factors in each of the seven required categories of factors that they will account for in their Long-Term Scenarios; (2) a description of each factor that they will account for in their Long-Term Scenarios; (3) a general statement explaining how they will account for each of those factors in their Long-Term Scenarios; (4) a description of the extent to which they will discount any factors in Factor Categories Four through Seven in each Long-Term Scenario; and (5) a list of the factors that they considered but did not incorporate in their Long-Term Scenarios.[950] In addition, the Commission required transmission providers to post this information after stakeholders, including states, have had the meaningful opportunity to propose potential factors and to provide input on how to account for specific factors in the development of

[950] *Id.* P 528.

Long-Term Scenarios.[951] The Commission explained that this requirement will provide greater transparency into how transmission providers develop Long-Term Scenarios, while still providing transmission providers with flexibility regarding whether, and if so, how they choose to incorporate relevant factors,[952] and the Commission explained that this transparency also ensures that transmission providers review stakeholder-proposed factors in a fair and non-discriminatory manner.[953]

336. The Commission also required transmission providers, consistent with Order No. 890's transparency transmission planning principle, to make transparent the methodology, criteria, assumptions, and data used to develop each Long-Term Scenario.[954] Given the importance of a robust stakeholder process to developing more accurate assumptions to serve as the basis for Long-Term Scenarios, Order No. 1920 required transmission providers to give stakeholders a meaningful opportunity to provide timely input on how and what information to incorporate into the development of Long-Term Scenarios, including how to account for a specific factor in terms of how the factor may affect Long-Term Transmission Needs. The Commission explained that this meaningful opportunity includes the opportunity to propose factors, provide information and identify sources of best available data, propose how a factor may affect Long-Term

[951] *Id.* P 533.

[952] *Id.* P 534.

[953] *Id.* P 535.

[954] *Id.* P 305 (citing Order No. 890, 118 FERC ¶ 61,119 at P 471).

Transmission Needs, and explain how that factor could be reflected in the development of Long-Term Scenarios, including the extent to which it is appropriate to discount the effects of certain factors on Long-Term Transmission Needs.[955]

337. The Commission further found in Order No. 1920 that stakeholder input is particularly important for factors in the first three categories of factors, because federal, state, and local government entities, federally-recognized Tribes, and utilities, load-serving entities, and their retail regulators that participate in the stakeholder process are distinctly well-positioned to provide transmission providers with vital information on how the factors over which they have authority or that they govern are likely to influence Long-Term Transmission Needs over the transmission planning horizon.[956] The Commission recognized that different stakeholders may provide information about the same factor that is contradictory and allowed transmission providers to weigh more heavily one source of information over another.[957]

ii. Requests for Rehearing and Clarification

338. NESCOE requests clarification that transmission providers must rely on states in developing Long-Term Scenarios where state laws, regulations, and/or policies are driving Long-Term Transmission Needs. If the Commission does not provide this

[955] *Id.* PP 529-530.

[956] *Id.* P 530.

[957] *Id.* P 531.

clarification, NESCOE requests rehearing.[958] NESCOE explains that state officials have expertise in connection with these matters such that transmission providers should rely on states for input regarding the details of state requirements in Factor Categories One, Two, and Seven. NESCOE claims that, in the absence of this clarification, transmission providers may devote resources to developing Long-Term Scenarios that are less useful to transmission planning regions.[959] Similarly, PJM States request clarification of the degree to which transmission providers should defer to, weigh, or consider the input of states as it relates specifically to state laws and integrated resource plans. PJM States argue that states have a unique role as to these subjects, and that transmission providers should not treat state perspectives the same as those of any other stakeholder.[960]

339. PIOs request rehearing such that the Commission would strengthen the transparency provisions by requiring transmission providers to provide more detailed explanations of the factors to be used and to justify any discounting of factors in Factor Categories Four through Seven. PIOs argue that stronger transparency provisions would foster more meaningful stakeholder processes.[961] Specifically, PIOs contend that, with respect to the information that transmission providers must publish on the public portion of an OASIS or other public website, the Commission should replace the third item, i.e.,

---

[958] NESCOE Rehearing Request at 11.

[959] *Id.* at 20-21.

[960] PJM States Rehearing Request at 4.

[961] PIOs Rehearing Request at 36.

"a general statement explaining how [transmission providers] will account for each of [the factors that they will account for in their Long-Term Scenarios]," with "a detailed description of the reasoning and methodology used to account for each factor, as well as providing the actual data inputs when possible."[962]

340. PIOs criticize the Commission's rationale for declining to include this requirement, i.e., that the burden would not be justified by the benefit of such additional information. PIOs argue that requiring transmission providers to justify their discounting decisions would help hold transmission providers accountable, incentivize more accurate discounting assumptions, and guard against pressure from self-interested stakeholders to excessively discount factors.[963] PIOs contend that Order No. 1920 is arbitrary and capricious because failing to require more detailed explanations of the factors to be used or to justify any discounting of factors in Factor Categories Four through Seven does not flow rationally from Order No. 1920's "more fundamental findings" as to the requirements for transmission providers to provide meaningful opportunity for stakeholder input and to make the development of Long-Term Scenarios transparent.[964]

341. SERTP Sponsors request that the Commission clarify that transmission providers have the discretion to include or to exclude an assumption from the development of a Long-Term Scenario where stakeholders do not provide transmission providers with

---

[962] *Id.*

[963] *Id.* at 37-38.

[964] *Id.* at 38 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 305).

sufficient information as to whether a potential assumption or factor is likely to affect Long-Term Transmission Needs. SERTP Sponsors provide the example of a generator whose point of interconnection is unknown and contend that transmission providers should not be obligated to hypothesize arbitrarily as to that point of interconnection, because doing so likely would yield implausible Long-Term Scenarios and would not result in cost-effective or efficient transmission planning.[965]

342. SERTP Sponsors request that the Commission clarify that transmission providers may rely on stakeholders to identify factors in Factor Categories Four through Seven, and, if stakeholders identify no such factors, that transmission providers may but need not do so. SERTP Sponsors contend that Order No. 1920 implies but does not clearly provide for this requested clarification.[966] SERTP Sponsors also request that the Commission clarify that transmission providers may rely upon stakeholders to identify factors that, unlike factors in Factor Categories One through Three, do not pertain directly to a specific transmission provider in the relevant transmission planning region.[967] If the Commission does not so clarify, SERTP Sponsors request rehearing on the grounds that requiring transmission providers to identify such factors would be unduly burdensome.[968]

---

[965] SERTP Sponsors Rehearing Request at 13-14.

[966] *Id.* at 13 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 516).

[967] *Id.* at 14 & n.33.

[968] *Id.* at 14.

343. Finally, SERTP Sponsors request that the Commission clarify the required timing of when transmission providers must publish on the public portion of an OASIS or other public website the information about factors required by Order No. 1920. SERTP Sponsors contend that Order No. 1920 does not make clear whether this information must be published in conjunction with transmission providers' compliance filings or by the start of the first Long-Term Regional Transmission Planning cycle. SERTP Sponsors argue that the Commission should require transmission providers to post this information after the conclusion of the period during which stakeholders provide input into these matters.[969]

iii. Commission Determination

344. In response to NESCOE's and PJM States' requested clarification that transmission providers must rely on states in developing Long-Term Scenarios where state laws, regulations, and/or policies are driving Long-Term Transmission Needs, we grant the following clarifications. We clarify that states must have a meaningful opportunity to provide timely input on the development of Long-Term Scenarios, including factors and data inputs, and to explain how their own policies and planning affect Long-Term Transmission Needs.[970] Furthermore, we clarify that transmission providers must consult with and consider the positions of the Relevant State Entities and any other entity authorized by a Relevant State Entity as its representative as to how to

[969] *Id.* at 26.

[970] Order No. 1920, 187 FERC ¶ 61,068 at PP 528-537, 560-562, 634.

account for factors related to states' laws, policies, and regulations when determining the assumptions that will be used in the development of Long-Term Scenarios.[971] Specifically, transmission providers shall consult with Relevant State Entities and any other authorized entities as to whether a specific state policy must be accounted for as a factor within each category (i.e., if the specific state policy will likely affect Long-Term Transmission Needs), how to account for the specific state policy in the development of Long-Term Scenarios (e.g., the method and data used to forecast generation resources added because of a specific state policy), and how to adjust the treatment of the specific state policy across Long-Term Scenarios (e.g., assume certain policy-related outcomes materialize in some but not all Long-Term Scenarios).[972]

345. We further clarify that, where transmission providers determine that a factor based on a state's law, regulation, or policy is likely to affect Long-Term Transmission Needs, transmission providers should rely on the state in determining *how* to account for such a state-related factor when developing Long-Term Scenarios. For example, for a state that has required integrated resource planning processes, transmission providers should include one of the state's preferred power system trajectories, including both the supply

[971] A Relevant State Entity may believe that a different state entity would be better situated to advise transmission providers as to how state policy may affect Long-Term Transmission Needs. For example, the state entity responsible for electric utility regulation may believe that the state entity responsible for energy policy is in a better position to advise on state energy policy implementation. In this case, the Relevant State Entity may authorize the other state entity as its representative in discussions with transmission providers.

[972] *See id.* P 417.

and demand side resource trajectory as appropriate, in each of Long-Term Scenarios, or include different state-preferred power system trajectories in different Long-Term Scenarios. As such, transmission providers could include in the development of Long-Term Scenarios the set of resource capacity additions and/or retirements expected by a state based on the incentives or requirements in that state's law. If transmission providers determine, based on input provided by the state or their own judgment, that a factor based on a state's law, regulation, or policy is likely to affect Long-Term Transmission Needs, transmission providers should then determine whether and how to account for that factor in the development of Long-Term Scenarios.

346. We disagree with PIOs that a more detailed explanation of the factors that transmission providers will account for in their Long-Term Scenarios and justification of the factors that they will discount is warranted. Broadly, we affirm that Order No. 1920 strikes the right balance between prescriptive requirements and flexibility with respect to the development of Long-Term Scenarios.[973] We also find that this is true with respect specifically to Order No. 1920's requirements on stakeholder process and transparency. PIOs request that we require "a detailed description of the reasoning and methodology used to account for each factor, as well as providing the actual data inputs when possible" and that we require transmission providers to justify their discounting decisions of factors in Factor Categories Four through Seven. We find that such requirements are not necessary to ensure that stakeholders have a meaningful opportunity to provide input.

[973] *Id.*

We further find that the requirements of Order No. 1920 ensure that the development of Long-Term Scenarios is sufficiently transparent,[974] and that PIOs' requested requirements are not needed to ensure that transmission providers use accurate data.[975]

347. We emphasize that Order No. 1920 sets minimum requirements with which all transmission providers must comply, and we are not convinced that the level of information that PIOs seek is necessary. Further, we clarify that nothing in Order No. 1920 prevents transmission providers from providing more than the minimum amount of information that we require, including the level of detail requested by PIOs. Moreover, we conclude that granting PIOs' request is unnecessary because the existing transparency requirements in Order No. 1920[976] are sufficient to ensure that "the methodology, criteria, assumptions, and data used to develop each Long-Term Scenario" are transparent.[977]

---

[974] *See id.* P 533 (requiring transmission providers to publicly post "(1) the list of the factors in each of the seven required categories of factors that they will account for in their Long-Term Scenarios; (2) a description of each factor that they will account for in their Long-Term Scenarios; (3) a general statement explaining how they will account for each of these factors in their Long-Term Scenarios; (4) a description of the extent to which they will discount any factors in Factor Categories Four through Seven in each Long-Term Scenario; and (5) a list of the factors that they considered but did not incorporate in their Long-Term Scenarios.").

[975] PIOs Rehearing Request at 36-37. *See* Order No. 1920, 187 FERC ¶ 61,068 at P 636 ("We find that a requirement to use the best available data inputs is warranted to ensure that transmission providers are regularly updating data inputs and using timely and accurate data inputs to inform Long-Term Scenarios.").

[976] *Supra* P 346 n.975.

[977] Order No. 1920, 187 FERC ¶ 61,068 at P 305.

348. We decline to provide clarification to SERTP Sponsors with respect to the inclusion or exclusion of factors for which stakeholders provide insufficient information, and we similarly decline to address SERTP Sponsors' hypothetical in the abstract.[978] Generally, transmission providers can rely on stakeholders for input on the development of Long-Term Scenarios, including factors and data inputs, and must consult with and consider the positions of Relevant State Entities and any other entity authorized by a Relevant State Entity as its representative regarding how their policies and planning affect Long-Term Transmission Needs and the assumptions that will be used in the development of Long-Term Scenarios. Transmission providers implementing Long-Term Regional Transmission Planning necessarily will balance competing interests from within the transmission planning region when developing Long-Term Scenarios, and Order No. 1920 provides transmission providers with sufficient flexibility to exercise engineering judgment to ensure the reliable operation of the transmission system and compliance with a variety of regulatory requirements.[979]

349. In response to SERTP Sponsors' request for clarification regarding the identification of factors in Factor Categories Four through Seven, we clarify that transmission providers must identify factors in Factor Categories Four, Five, and Six but

[978] It is unclear whether SERTP Sponsors intended to argue that failure to grant clarification in this respect would result in Order No. 1920 exceeding the Commission's authority; to the extent they intended to do so, we find this argument has not been raised with the specificity required on rehearing. *See supra* Major Questions Doctrine section.

[979] Order No. 1920, 187 FERC ¶ 61,068 at P 1027.

need not independently identify factors in Factor Category Seven – rather, transmission providers may rely on stakeholders, including states, to bring such factors to their attention. We believe that factors in Factor Categories One, Two, Three, and Seven arise from stakeholder decision-making and legal processes that generally are external to the transmission provider and are therefore suitable for identification by the states and other stakeholders that govern or have authority over those processes. Therefore, as with factors in Factor Categories One, Two, and Three, transmission providers may rely on stakeholders to identify factors in Factor Category Seven in the development of Long-Term Scenarios, particularly through the open and transparent stakeholder process required by Order No. 1920.[980] In contrast, we believe that factors in Factor Categories Four, Five, and Six relate to the expertise of transmission providers arising from their day-to-day operations. For example, transmission providers manage processes for processing interconnection requests and withdrawals (Factor Category Six) and determining the impact of resource retirements (Factor Category Five). In managing those processes and the day-to-day operations of the transmission system, transmission providers also gain information about trends in technology and fuel costs within and outside the electricity supply industry (Factor Category Four). Therefore, we clarify that transmission providers have an independent obligation to identify factors in Factor

[980] *Id.* P 508. We note, however, an exception to this general rule. Where the transmission provider is the entity that has made a commitment that affects Long-Term Transmission Needs, the transmission provider may not rely on the identification by stakeholders of this factor or these factors.

Categories Four, Five, and Six regardless of whether any such factors are identified by stakeholders and must, where relevant, consult with and consider the positions of Relevant State Entities and any entities authorized by the Relevant State Entities. In response to SERTP Sponsors' argument that, if transmission providers must independently identify factors in Factor Categories Four through Seven, the Commission would be holding transmission providers to a burdensome unattainable standard, we clarify that the independent obligation to identify factors in Factor Categories Four through Six does not require transmission providers to identify every potentially knowable factor within those categories. Transmission providers can use their prior experience and professional judgement to independently identify factors in Factor Categories Four, Five, and Six.

350. Finally, in response to SERTP Sponsors' request for clarification regarding the timing of transmission providers' publication of information regarding the factors to be incorporated into the development of Long-Term Scenarios on the public portion of an OASIS or other public website, we clarify that transmission providers do not need to include this information with the filings that they submit to comply with Order No. 1920. Rather, we clarify that Order No. 1920 requires transmission providers to post this information as part of each Long-Term Regional Transmission Planning cycle after stakeholders, including states, have had a meaningful opportunity to propose potential factors and to provide input on how to account for specific factors in the development of

Long-Term Scenarios for that planning cycle.[981] We further clarify that publication of information regarding the factors to be incorporated into the development of Long-Term Scenarios must occur before transmission providers finish developing Long-Term Scenarios,[982] and, in any event, well before the transmission provider has identified Long-Term Transmission Needs.

5. Requests for Additional Flexibility Regarding Long-Term Scenarios Requirements

351. This section responds to requests for rehearing or clarification to permit additional flexibility with respect to multiple interrelated Long-Term Scenario requirements, including transmission providers' incorporation of factors from seven categories of factors; the treatment of factors in the first three categories of factors; and the number, type, and plausibility of Long-Term Scenarios.

a. Order No. 1920 Requirements

352. In Order No. 1920, the Commission required transmission providers in each transmission planning region to develop, at least once during the five-year Long-Term Regional Transmission Planning cycle, at least three distinct Long-Term Scenarios that, at a minimum, incorporate the seven categories of factors listed in the Categories of Factors section.[983] The Commission adopted the NOPR proposals to require transmission

[981] *Id.* P 533.

[982] *See id.* P 534 (discussing the value of posting requirement in terms of the transparency into how transmission providers develop Long-Term Scenarios).

[983] *Id.* P 559.

providers in each transmission planning region to publicly disclose information and data inputs used to create each Long-Term Scenario and provide stakeholders an opportunity to provide timely and meaningful input into how Long-Term Scenarios are developed.[984]

353. The Commission required transmission providers in each transmission planning region to develop a plausible and diverse set of at least three Long-Term Scenarios.[985] The Commission also required that each individual Long-Term Scenario be plausible to avoid resting on assumptions about factors and data inputs that do not reasonably capture possible future outcomes. The Commission clarified that the term "diverse" means that the *set* of Long-Term Scenarios must represent a reasonable range of probable future outcomes consistent with the requirement for plausibility, based on assumptions about the factors and data inputs.[986]

354. The Commission also required transmission providers in each transmission planning region to develop at least one sensitivity, applied to each Long-Term Scenario, to account for uncertain operational outcomes that determine the benefits of and/or need for transmission facilities during multiple concurrent and sustained generation and/or transmission outages due to an extreme weather event across a wide area.[987] In Order No. 1920, the Commission provided transmission providers with flexibility to conduct

[984] *Id.* P 560.

[985] *Id.* PP 575-577.

[986] *Id.* P 576.

[987] *Id.* P 593.

this sensitivity either before or after identifying potential regional transmission solutions to the Long-Term Transmission Needs identified using those Long-Term Scenarios.[988] Order No. 1920 did not preclude transmission providers from considering additional sensitivities, and the Commission encouraged transmission providers to assess the need to develop other sensitivities as part of Long-Term Regional Transmission Planning.[989] The Commission found that modeling extreme weather events as sensitivities is appropriate for Long-Term Regional Transmission Planning.[990]

b. Requests for Rehearing and Clarification

355. PJM requests rehearing such that the Commission either would consider requests for flexibility or permit flexibility that PJM contends would be required for PJM to develop Long-Term Scenarios and sensitivities consistent with a draft long-term transmission planning process that PJM has developed.[991] PJM argues that Order

[988] *Id.* P 594.

[989] *Id.* P 597.

[990] *Id.* P 598.

[991] *See* PJM Rehearing Request at 12 ("Granting rehearing and permitting flexibility with respect to the issues identified below would allow PJM to use the PJM Long Term Regional Transmission Planning process as the foundation for a long-term planning process that achieves the objectives of the Final Rule, even though implementation details may differ in some way from those the Final Rule prescribes." (footnote omitted)); *id.* at 14 ("PJM urges the Commission to grant rehearing and confirm that it will consider requests for flexibility to accommodate regional differences."); *id.* at 19 ("[G]iven the diversity among regions, PJM believes it is appropriate to allow transmission planners to work with states and stakeholders within their respective regions to determine the appropriate number of and specific scenarios to be used in the Long-Term Regional Transmission Planning process, as well as giving the transmission provider flexibility to determine how to weigh specific factors used to develop the

No. 1920's requirements with respect to the development of Long-Term Scenarios are overly prescriptive, particularly with respect to the requirements that transmission providers develop three Long-Term Scenarios that each incorporate seven categories of factors and that transmission providers cannot discount factors in Factor Categories One through Three.[992] PJM contends that these requirements would "complicate" PJM's efforts to promote more efficient or cost-effective regional transmission planning and development.[993]

356. PJM explains that, under the draft long-term transmission planning process that PJM developed, PJM would develop three distinct scenarios that would "generally account for the seven factors" required by Order No. 1920: the "Base Reliability Scenario," the "Medium Public Policy Scenario," and the "High Public Policy Scenario."[994] The Base Reliability Scenario would include certain "categories of factors," including: the PJM Load Forecast Report; announced retirements and retirements required by Public Policy Requirements; in-service generation and generation that is not yet in service but with an executed service agreement or State Agreement

---

assumptions upon which Long-Term Scenarios are based."); *id.* ("PJM urges the Commission to grant rehearing and confirm that it will consider requests for flexibility to develop Long-Term Scenarios and conduct sensitivity analyses in such a way as to accommodate regional differences.").

[992] *Id.* at 13 n.59, 16, 18.

[993] *Id.* at 16, 18.

[994] *Id.* at 16-18.

Approach reservation; and replacement generation taken mainly from the PJM Service Request process.[995] The Medium Public Policy Scenario would build on the Base Reliability Scenario by including certain additional Public Policy Requirements that otherwise would be brought to PJM as part of the State Agreement Approach process, such as state renewable portfolio standards.[996] The High Public Policy Scenario would in turn build on the Medium Public Policy Scenario by modeling "Public Policy Objectives," defined as Public Policy Requirements that are not yet in a statute or regulation.[997] PJM argues that this draft process would demonstrate a wide range of possible transmission needs, and would be a prudent way to account for long-term needs without overbuilding the transmission system.[998]

357. PJM States and West Virginia Commission request that the Commission clarify that—or, in the alternative, request rehearing such that—Order No. 1920 does not prohibit the development by transmission providers of a fourth Long-Term Scenario or additional sensitivities that are designed to provide information to states on the factors driving the need for transmission facilities and on their costs and benefits. PJM States and West Virginia Commission explain that Order No. 1920 requires that transmission providers assume that all legally binding obligations are followed, state-approved

[995] *Id.* at 16-17.

[996] *Id.* at 17-18.

[997] *Id.* at 18 & n.80.

[998] *Id.* at 19.

integrated resource plans are followed, and expected supply obligations for load-serving entities are met and not discounted. PJM States and West Virginia therefore express concern that Order No. 1920 places "undue restrictions" on the development of scenarios or sensitivities that can provide the information sought by states, which PJM States contend would be necessary to assist in cost allocation determinations and in siting and safety decisions.[999]

358. Ohio Commission Federal Advocate argues that Order No. 1920 makes it impossible to identify and evaluate transmission facilities that are required due to other states' laws, as well as to "isolate the incremental costs" arising from those laws. Ohio Commission Federal Advocate states that this lack of transparency is not in the public interest, and that the Commission should clarify that counterfactual scenarios that do not reflect compliance with state law are permissible because they provide important insights into the factors driving transmission needs.[1000]

359. Virginia and North Carolina Commissions argue that the Commission should grant rehearing such that Order No. 1920 would require or allow for one or more "baseline" planning scenarios that exclude all or some policy-driven factors. Virginia and North Carolina Commissions explain that Order No. 1920 requires transmission providers to incorporate seven categories of factors in each Long-Term Scenario, and that the

[999] PJM States Rehearing Request at 4-6; West Virginia Commission Rehearing Request at 14-16.

[1000] Ohio Commission Federal Advocate Rehearing Request at 18.

Commission did not allow flexibility for additional scenarios that exclude some or all of these factors. Virginia and North Carolina Commissions contend that, without a "baseline" scenario, Relevant State Entities and other stakeholders will not have adequate transparency regarding the critical drivers of transmission needs or the costs associated with a particular transmission facility, nor will they be able to evaluate whether cost allocation methods comply with the Commission's cost causation principles.[1001]

360. Finally, in PJM's general request for additional flexibility in the development of Long-Term Scenarios, PJM identified the requirement in Order No. 1920 to conduct a specific sensitivity for each Long-Term Scenario as an example of a requirement that it believes to be overly burdensome.[1002] PJM States and West Virginia Commission request that the Commission clarify that—or grant rehearing such that—transmission providers are required, or even permitted, to provide additional sensitivity analyses to the states that best inform them on required transmission facility needs, costs, and benefits based on variations or exclusions of specific factors or categories of factors, including those in the first three categories of factors.[1003]

[1001] Virginia and North Carolina Commissions Rehearing Request at 4-5.

[1002] PJM Rehearing Request at 16.

[1003] PJM States Rehearing Request at 4-5; West Virginia Commission Rehearing Request at 14-16.

c. Commission Determination

361. We disagree with PJM's rehearing arguments and deny its requested clarification with respect to flexibility regarding the development of Long-Term Scenarios. Specifically, we continue to find that transmission providers must develop at least three distinct Long-Term Scenarios as defined in Order No. 1920, and that transmission providers must incorporate the seven categories of factors set forth in Order No. 1920 into each of those Long-Term Scenarios,[1004] as also clarified above.[1005] As the Commission held in Order No. 1920, and as we continue to find here, the Commission's regional transmission planning requirements currently fail to adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs, and the incorporation of the seven categories of factors is necessary because these categories of factors are essential to identifying Long-Term Transmission Needs.[1006] Failing to require that transmission providers incorporate these categories of factors into the development of each Long-Term Scenario would increase the likelihood that transmission providers will continue to underestimate—or omit entirely—certain known

[1004] Order No. 1920, 187 FERC ¶ 61,068 at PP 409, 559.

[1005] *See supra* Long-Term Scenarios Requirements, Stakeholder Process and Transparency section.

[1006] Order No. 1920, 187 FERC ¶ 61,068 at P 410.

determinants of Long-Term Transmission Needs in their regional transmission planning processes.[1007]

362. We also continue to find that transmission providers must assume that legally binding obligations (i.e., federal, federally-recognized Tribal, state, and local laws and regulations) are followed, state-approved integrated resource plans are followed, and expected supply obligations for load-serving entities are fully met.[1008] Each Long-Term Scenario must account for and be consistent with factors in these first three categories of factors, because these categories of factors are part of the primary drivers of Long-Term Transmission Needs.[1009]

363. We disagree with PJM's apparent contention that complying with Order No. 1920 requirements with respect to Long-Term Scenarios will "complicate" PJM's efforts to conduct Long-Term Regional Transmission Planning[1010] as it is set forth in Order No. 1920.[1011] Instead, we reiterate that Order No. 1920's Long-Term Scenarios

---

[1007] *Id.* P 411.

[1008] We continue to find that it is appropriate for transmission providers to assume that legally binding obligations are met, unless and until there is a change in law. *Id.* P 512.

[1009] *Id.* PP 507, 512.

[1010] PJM Rehearing Request at 18-19.

[1011] To the extent that PJM was requesting that the Commission address in this order PJM's proposed long-term transmission planning process, we decline to address such a request here because doing so would be premature and more properly the subject of compliance.

requirements strike a reasonable balance between, on the one hand, ensuring that transmission providers identify Long-Term Transmission Needs and identify, evaluate, and select Long-Term Regional Transmission Facilities that would meet those needs, and, on the other hand, providing sufficient flexibility for transmission providers to develop and use Long-Term Scenarios in a way that reflects the unique characteristics of their respective transmission planning regions.[1012] We continue to find that Order No. 1920's categories of factors requirements strike the right balance between prescriptive requirements and flexibility[1013] and that they are sufficiently detailed to address the need for reform without limiting regional flexibility.[1014] Further, we continue to find that the requirement to develop at least three distinct Long-Term Scenarios that meet Order No. 1920's requirements strikes the appropriate balance between establishing a sufficient number of Long-Term Scenarios and the associated burden of developing and using Long-Term Scenarios in Long-Term Regional Transmission Planning.[1015]

364. In response to the requests for clarification and/or rehearing of various Order No. 1920 requirements related to Long-Term Scenarios and sensitivities submitted by PJM States, Virginia and North Carolina Commissions, Ohio Commission Federal Advocate, and West Virginia Commission, we clarify that Order No. 1920 allows

[1012] Order No. 1920, 187 FERC ¶ 61,068 at P 298.

[1013] *Id.* P 417.

[1014] *Id.* P 421.

[1015] *Id.* P 559.

transmission providers to conduct analyses in addition to those required by Order No. 1920—including additional scenarios or sensitivities[1016]—at the transmission providers' discretion or at the request of the transmission planning region's Relevant State Entities and/or other stakeholders.

365. Specifically, we clarify that transmission providers may develop additional scenarios, beyond the three Long-Term Scenarios that Order No. 1920 requires, to provide Relevant State Entities with information that they can use to inform the application of Long-Term Regional Cost Allocation Method(s) or the development of cost allocation methods through the State Agreement Process(es). We believe that additional analyses may help transmission providers and stakeholders to better understand the potential impact of Long-Term Regional Transmission Facilities on the transmission system, as well as the costs and benefits of Long-Term Regional Transmission Facilities. Particularly, consistent with the flexibility the Commission provided in Order No. 1920 as to cost allocation methods for Long-Term Regional Transmission Facilities (or portfolios of such Facilities), we find that additional analyses may help inform the application of *ex ante* Long-Term Regional Transmission Cost Allocation Methods or the development of cost allocation methods through the State Agreement Process.

[1016] The use of "scenarios" in this context indicates that these analyses are not required to meet Order No. 1920's requirements as to the development of Long-Term Scenarios and therefore are not "Long-Term Scenarios" within the meaning provided in Order No. 1920.

366. We further clarify that, when developing these additional analyses or scenarios used to inform cost allocation, transmission providers have the flexibility to depart from Order No. 1920's requirements related to the development of Long-Term Scenarios. For example, transmission providers may develop scenarios that consider the incremental cost and benefits of Long-Term Regional Transmission Facilities needed to achieve state laws, policies, and regulations beyond the cost and benefits of Long-Term Regional Transmission Facilities needed in the absence of those laws, policies, and regulations. Finally, as discussed below, we clarify that, if the Relevant State Entities wish for the transmission provider to develop a reasonable number of additional scenarios for Long-Term Regional Transmission Planning or Long-Term Regional Cost Allocation, then the transmission providers will develop these scenarios. While transmission providers may conduct such additional analyses, additional analyses that do not meet Order No. 1920's Long-Term Scenario requirements are not considered Long-Term Scenarios as defined in Order No. 1920.[1017] In other words, transmission providers may not use any such additional analyses to identify Long-Term Transmission Needs, identify Long-Term

[1017] Generally, to comply with Order No. 1920, including as clarified herein, transmission providers must develop at least three Long-Term Scenarios and perform at least one sensitivity analysis for each such Long-Term Scenario; identify Long-Term Transmission Needs using those Long-Term Scenarios and sensitivities thereto; identify Long-Term Regional Transmission Facilities (or portfolios of Long-Term Regional Transmission Facilities) that meet the identified Long-Term Transmission Needs; use and measure the seven required benefits of Long-Term Regional Transmission Facilities within those Long-Term Scenarios and sensitivities; otherwise evaluate those Long-Term Regional Transmission Facilities in the manner prescribed by Order No. 1920; and make a selection decision as to the Long-Term Regional Transmission Facilities identified and evaluated by transmission providers.

Regional Transmission Facilities, or to meet the requirement that transmission providers estimate the costs and measure the benefits of Long-Term Regional Transmission Facilities for purposes of selection (i.e., to apply the transmission provider's selection criteria). Transmission providers also may not, consistent with the requirement that transmission providers have the opportunity to select more efficient or cost-effective Long-Term Regional Transmission Facilities to meet Long-Term Transmission Needs, condition the selection of a Long-Term Regional Transmission Facility on the information provided in these additional analyses.

367. Next, we clarify that, when requested by Relevant State Entities in a transmission planning region, transmission providers are required to conduct a reasonable number of additional analyses or scenarios. On compliance, transmission providers may propose processes to determine when Relevant State Entities have requested additional analyses and how to determine what a reasonable number of additional analyses may be.[1018] We reiterate that any cost allocation method—whether an *ex ante* Long-Term Regional Transmission Cost Allocation Method or a cost allocation method developed through the State Agreement Process for a specific Long-Term Regional Transmission Facility or

[1018] For example, in Order No. 890, the Commission required that stakeholders be given the right to request that transmission providers conduct a certain number of economic planning studies, to be determined on a regional basis, and the Commission offered the "merely illustrative" example of five to ten such studies. Order No. 890, 118 FERC ¶ 61,119 at P 547 & n.323.

portfolio thereof— that results from such additional analyses or scenarios must satisfy the cost causation principle.[1019]

368. Finally, in response to the request for rehearing from PJM related to sensitivity analyses required by Order No. 1920 to account for uncertain operational outcomes that determine the benefits of and/or need for transmission facilities during multiple concurrent and sustained generation and/or transmission outages due to an extreme weather event across a wide area, we disagree with the arguments on rehearing and decline to provide clarification. We continue to find that Order No. 1920's requirements in this regard are necessary to ensure just and reasonable Commission-jurisdictional rates. In particular, extreme weather events have occurred more frequently in recent years, represent periods during which regional transmission facilities have particularly high value, and create stressed system conditions that transmission providers can readily compare with non-stressed scenarios to determine the value of specific transmission facilities under these types of conditions.[1020] PJM did not provide adequate information to explain why additional flexibility in developing sensitivities for each Long-Term Scenario is necessary, and we are unconvinced that PJM's regional circumstances justify

[1019] Order No. 1920, 187 FERC ¶ 61,068 at PP 1472, 1477.

[1020] *Id.* P 596. *See also Transmission Sys. Plan. Performance Requirements for Extreme Weather*, Order No. 896, 88 FR 41262 (June 23,2023), 183 FERC ¶ 61,191, at P 2 (2023) (explaining that extreme heat and cold weather events have occurred more frequently in recent years); *One-Time Informational Reps. on Extreme Weather Vulnerability Assessments Climate Change, Extreme Weather, & Elec. Sys. Reliability*, Order No. 897, 88 FR 41477 (June 27, 2023), 183 FERC ¶ 61,192, at P 2 (2023) (same).

flexibility on this issue. To the extent that PJM's regional circumstances require other specific sensitivities, we reiterate that we encourage transmission providers to assess the need to develop other sensitivities as part of Long-Term Regional Transmission Planning.[1021]

C. Evaluation of the Benefits of Regional Transmission Facilities

1. Requirement for Transmission Providers to Use and Measure a Set of Seven Required Benefits

a. Order No. 1920 Requirements

369. In Order No. 1920, the Commission required transmission providers in each transmission planning region to measure a set of seven required benefits (required benefits) for Long-Term Regional Transmission Facilities under each Long-Term Scenario and to use these measured benefits to evaluate Long-Term Regional Transmission Facilities.[1022] The Commission required transmission providers to measure and use the following required benefits in Long-Term Regional Transmission Planning: (1) avoided or deferred reliability transmission facilities and aging infrastructure replacement; (2) a benefit that can be characterized and measured as either reduced loss of load probability or reduced planning reserve margin; (3) production cost savings; (4) reduced transmission energy losses; (5) reduced congestion due to transmission outages;

[1021] Order No. 1920, 187 FERC ¶ 61,068 at P 597.

[1022] Order No. 1920, 187 FERC ¶ 61,068 at P 719.

(6) mitigation of extreme weather events and unexpected system conditions; and

(7) capacity cost benefits from reduced peak energy losses.[1023]

370. The Commission found that the record demonstrated that, in order to ensure just and reasonable Commission-jurisdictional transmission rates, it was necessary to require transmission providers to measure and use in Long-Term Regional Transmission Planning a set of particular benefits so that they may identify, evaluate, and select regional transmission facilities that are more efficient or cost-effective transmission solutions to Long-Term Transmission Needs. Further, the Commission found that the benefits that Long-Term Regional Transmission Facilities generally provide extend beyond the benefits that transmission providers currently consider as part of their regional transmission planning and cost allocation processes, and without consideration of such benefits, Long-Term Regional Transmission Planning could not be reasonably expected to identify, evaluate, and select more efficient or cost-effective regional transmission solutions to address Long-Term Transmission Needs.[1024] The Commission concluded that requiring the measurement and use of the seven required benefits in Long-Term Regional Transmission Planning ensured that transmission providers will consider a sufficiently broad range of benefits when determining whether to select a Long-Term Regional Transmission Facility as a more efficient or cost-effective regional transmission solution to Long-Term Transmission Needs. In contrast, the Commission found that not

[1023] *Id.* P 720.

[1024] *Id.* P 722.

requiring transmission providers to use any specific benefits in Long-Term Regional Transmission Planning, as proposed in the NOPR, would fail to ensure that transmission providers consider the broader set of benefits provided by, and the beneficiaries receiving the benefits of, Long-Term Regional Transmission Facilities, and, thus, may fail to identify the potentially more efficient or cost-effective regional transmission solution(s) to specific Long-Term Transmission Needs.[1025]

371. The requirement that transmission providers measure and use the required benefits in Long-Term Regional Transmission Planning was a change from the NOPR proposal.[1026] In the NOPR, the Commission did not propose to require the use of any specific benefits and instead acknowledged the benefits of regional flexibility, and consistent with Order No. 1000, proposed to consider such matters on review of compliance proposals.[1027] The NOPR included a non-exhaustive list of 12 benefits[1028] that the Commission stated could be considered by transmission providers in Long-Term Regional Transmission Planning and cost allocation processes.[1029] The Commission also sought comment on "whether public utility transmission providers should be required to

[1025] *Id.* P 723.

[1026] *Id.*

[1027] NOPR, 179 FERC ¶ 61,028 at P 183 (citation omitted).

[1028] *Id.* P 185.

[1029] *Id.* P 184.

use some or all of the Long-Term Regional Transmission Benefits as a minimum set of benefits for their Long-Term Regional Transmission Planning process."[1030]

b. Logical Outgrowth

i. Requests for Rehearing and Clarification

372. East Kentucky and NRECA argue that Order No. 1920 violates the APA's notice-and-comment requirements because it mandates that transmission providers use a set of seven benefits for evaluating Long-Term Regional Transmission Facilities, a requirement that East Kentucky and NRECA argue is not a logical outgrowth of the NOPR, which proposed non-mandatory and non-exhaustive examples of benefits that transmission providers could use.[1031] NRECA asserts that the NOPR made clear that the list of potential benefits was neither mandatory nor exhaustive and that transmission providers would have flexibility to determine what benefits they use in their Long-Term Regional Transmission Planning.[1032] NRECA describes the final rule's seven required benefits as "nationwide, mandatory, [and] one-size-fits all" and the "exact opposite" of the proposed rule.[1033]

[1030] *Id.* P 188.

ii. Commission Determination

373. We disagree with the argument that the Commission failed to provide adequate notice and opportunity to comment on Order No. 1920's requirement that transmission providers measure a set of seven required benefits for Long-Term Regional Transmission Facilities under each Long-Term Scenario as part of Long-Term Regional Transmission Planning and use these measured benefits to evaluate Long-Term Regional Transmission Facilities.[1034] As courts have explained, "[n]otice suffices when [an agency] has 'expressly asked for comments on a particular issue or otherwise made clear that the agency was contemplating a particular change.'"[1035] NRECA acknowledges that the NOPR sought comment on whether transmission providers should be required to use some or all of the potential benefits described in the NOPR as a minimum set of benefits for their Long-Term Regional Transmission Planning process.[1036] By requesting comment on whether to make mandatory some or all of the benefits in the NOPR, the Commission sufficiently put parties on notice that the Commission was considering *the exact change* that East Kentucky and NRECA now argue was unanticipated and violated the APA's notice-and-comment requirements. Thus, in adopting the requirement that transmission providers measure and use the set of seven required benefits in Long-Term

[1034] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 719.

[1035] *Brennan v. Dickson*, 45 F.4th 48, 69 (D.C. Cir. 2022) (quoting *CSX Transp., Inc. v. Surface Transp. Bd.*, 584 F.3d 1076, 1081 (D.C. Cir. 2009)).

[1036] *See* NRECA Rehearing Request at 10 (citing NOPR, 179 FERC ¶ 61,028 at P 188).

Regional Transmission Planning, the Commission adhered to the APA's notice-and-comment requirements.

c. Flexibility Regarding Benefits Rather than a Minimum Set

i. Requests for Rehearing and Clarification

374. Dominion requests rehearing and argues that the seven required benefits are not directly tied or correlated to the seven categories of factors establishing Long-Term Transmission Needs.[1037] Dominion contends that the seven required benefits "are generic, almost inherent benefits of all transmission," whereas the seven categories of factors that transmission providers must incorporate in the development of Long-Term Scenarios "are mostly restatements of public policy driven needs for transmission facilities."[1038] Dominion states that it "is not suggesting that Factor Category No. 1 must match Benefit No. 1, etc.; rather, individually, and as a whole, the[] seven Factor Categories do not correlate to any or all of the seven Benefits."[1039] Dominion opines that, because the seven required benefits do not correspond to the seven categories of factors, regardless of the public policy issues driving the need for a transmission facility, Order No. 1920's requirement that transmission providers use the seven required benefits in determining whether to select a transmission facility will likely result in a public policy

[1037] Dominion Rehearing Request at 18.

[1038] *Id.* at 20.

[1039] *Id.* at 19 n.83.

project always being selected.[1040] Further, Dominion opines that, because the seven required benefits do not correspond to the seven categories of factors, the seven required benefits are "secondary or incidental" to the primary purpose of the Long-Term Regional Transmission Facilities. Dominion states that the United States Court of Appeals for the Seventh Circuit "rejected the use of 'incidental' benefits because 'the incidental-benefits tail mustn't be allowed to wag the primary-benefits dog.'"[1041] Dominion contends that Order No. 1920 should have required that Long-Term Transmission Needs and the benefits of Long-Term Regional Transmission Facilities correspond to each other, and failure to impose such a requirement was not reasoned decision making.[1042] Dominion states that the Commission should provide flexibility to transmission providers to allow them to identify the benefits that they will measure in their compliance filings and ensure that those benefits are tied to the underlying needs.[1043]

375. PJM requests rehearing and argues that Order No. 1920 is arbitrary and capricious because the requirement that transmission providers measure and use seven required benefits to evaluate Long-Term Regional Transmission Facilities is an unexplained departure from the NOPR's recognition of the value of allowing regional flexibility with

[1040] *Id.* at 20.

[1041] *Id.* (alteration omitted) (quoting *ICC v. FERC III*, 756 F.3d at 564).

[1042] *Id.*

[1043] *Id.* at 18-19, 21.

respect to benefits.[1044] PJM argues that the Commission should provide flexibility to transmission providers to allow them to identify the benefits that they will measure in their compliance filings (except for Final Rule Benefits 1, 2, and 3, which PJM agrees should be required).[1045] PJM asserts that Final Rule Benefits 4 and 5 are additional benefits that RTOs could add as they gain experience and determine to be quantitatively important. PJM also argues that Final Rule Benefit 6 has three different subcomponents and could be very cumbersome to measure if each one of them must be quantified.[1046]

376. Designated Retail Regulators and Undersigned States request rehearing and assert that the benefit metrics used to evaluate Long-Term Regional Transmission Facilities should be developed as part of RTO stakeholder processes, not mandated by the Commission.[1047] NRECA alleges that by prescribing the required benefits that transmission providers must use for evaluation and selection of Long-Term Regional Transmission Facilities, the final rule will likely change the results of the evaluation and selection processes in unanticipated ways.[1048]

[1044] PJM Rehearing Request at 5, 26-27 & n.106.

[1045] *Id.* at 26-29, 42.

[1046] *Id.* at 29.

[1047] Designated Retail Regulators Rehearing Request at 29; Undersigned States Rehearing Request at 29.

[1048] NRECA Rehearing Request at 11-12.

ii. Commission Determination

377. We are not persuaded by arguments raised on rehearing that the Commission should not require transmission providers to use and measure the seven required benefits. We continue to find that allowing transmission providers to determine which benefits they will use and measure, rather than requiring the measurement and use of a minimum set of benefits, may result in transmission providers not measuring important potential benefits of Long-Term Regional Transmission Facilities.[1049] This, in turn, would not resolve the deficiencies that the Commission identified in the final rule, such as transmission providers failing to adequately consider the benefits of regional transmission facilities and thereby not selecting the more efficient or cost-effective solutions, leading to unjust and unreasonable Commission-jurisdictional rates.[1050] Additionally, as the Commission noted in Order No. 1920, requiring transmission providers to measure and

[1049] Order No. 1920, 187 FERC ¶ 61,068 at PP 723-724.

[1050] *See id.* P 123 ("Failing to adequately identify and consider the benefits of [Long-Term Regional Transmission Facilities] may lead to relatively inefficient or less cost-effective transmission development. In particular, the cost-benefit analyses that transmission providers often use as part of the evaluation process may fail to identify more efficient or cost-effective regional transmission facilities for selection because they provide an inaccurate portrayal of the comparative benefits of different transmission facilities. Thus, the failure to adequately consider the benefits of regional transmission facilities results in, among other things, transmission customers forgoing benefits that may significantly outweigh their costs, which results in less efficient or cost-effective transmission investments and, in turn, contributes to Commission-jurisdictional rates that are unjust and unreasonable."); *id.* P 723.

use a required set of benefits will help improve interregional transmission coordination among different transmission planning regions.[1051]

378. We disagree with Dominion's argument that Order No. 1920 does not constitute reasoned decision making or is arbitrary and capricious because the seven required benefits are not tied or correlated to the seven categories of factors that Order No. 1920 requires transmission providers to incorporate into the development of Long-Term Scenarios. We understand Dominion's argument to be that, even though Long-Term Regional Transmission Facilities address Long-Term Transmission Needs that are driven primarily by the incorporation of certain categories of factors that Dominion considers to be "public policy issues," the required benefits, which Dominion contends are designed to measure a broader range of benefits of transmission facilities unrelated to public policy-related factors, will likely result in a public policy project always being selected. We disagree with this argument. We first note that Dominion provides only speculation that such a result will occur. As the Commission found in Order No. 1920, while state policies make up some of the drivers of Long-Term Transmission Needs, they do not comprise the entirety of those drivers.[1052] Accordingly, Long-Term Transmission Needs will be driven by factors (e.g., resource retirements and trends in fuel costs) in addition to

[1051] *Id.* P 729 (citations omitted).

[1052] *Id.* P 1478. The Commission recognized that state policy goals do not necessarily need to be given the same weight as state laws and regulations when determining the assumptions that will be used in the development of Long-Term Scenarios because government entities have an interest and ability to ensure that the requirements of state laws and regulations are fully achieved. *Id*. PP 512, 516.

and unrelated to "public policy issues," and Long-Term Transmission Facilities will likely be designed to address multiple Long-Term Transmission Needs. In any case, Order No. 1920 does not require that transmission providers select any particular Long-Term Regional Transmission Facility, even where it meets the transmission provider's selection criteria,[1053] which this order maintains on rehearing.[1054]

379. We disagree with Dominion's assertion that the seven required benefits are "secondary or incidental" to Long-Term Transmission Needs. As the Commission explained in Order No. 1920, the drivers of transmission needs are diverse and include, but are not limited to, grid reliability, changes in the resource mix, and increased demand for electricity.[1055] As discussed in the Requirement for Transmission Providers To Use the Seven Required Benefits To Help To Inform Their Identification of Long-Term Transmission Needs section above, we clarify in this order that Long-Term Transmission Needs as defined in Order No. 1920 are driven by both reliability and economic considerations and, as such, both reliability and economic considerations must inform transmission providers' identification of Long-Term Transmission Needs. The seven required benefits measure distinct, well-understood benefits of potential Long-Term

[1053] *Id.* P 1026 (citations omitted).

[1054] *See infra* No Selection Requirement section.

[1055] Order No. 1920, 187 FERC ¶ 61,068 at P 299. *See also id.* PP 39, 299 (defining Long-Term Transmission Needs as "transmission needs identified through Long-Term Regional Transmission Planning by, among other things . . . running scenarios and considering the enumerated categories of factors").

Regional Transmission Facilities and are well supported in the record.[1056] Because the seven required benefits reflect many of the reliability and economic benefits that Long-Term Regional Transmission Facilities can provide, we disagree with Dominion that such benefits are secondary or incidental to Long-Term Transmission Needs. Further, the Commission noted in Order No. 1920 that, "[w]e find that the benefits that Long-Term Regional Transmission Facilities generally provide extend beyond the benefits that transmission providers currently consider as part of their regional transmission planning and cost allocation processes, and without consideration of such benefits, Long-Term Regional Transmission Planning cannot be reasonably expected to identify, evaluate, and select more efficient or cost-effective regional transmission solutions to address Long-Term Transmission Needs."[1057] The Commission also stated that "[b]y requiring the measurement and use of the seven enumerated benefits in Long-Term Regional Transmission Planning, we ensure that transmission providers will consider a sufficiently broad range of benefits when determining whether to select a Long-Term Regional

[1056] *Id.* P 724 (noting that the seven required benefits "have a proven track record"); *id.* P 746 (Final Rule Benefit 1), PP 749-750 (Final Rule Benefit 2), P 761 (Final Rule Benefit 3), P 782 (Final Rule Benefit 4), P 784 (Final Rule Benefit 5), P 791 (Final Rule Benefit 6), P 812 (Final Rule Benefit 7); *see also id.* P 731 ("[A]ll seven required benefits have either been approved for use in regional transmission planning in at least one non-RTO/ISO transmission planning region or may be implemented by building upon the modeling or techniques used to measure benefits in RTO/ISO or non-RTO/ISO regions, or both."); *id.* P 732 (explaining that the Commission has accepted the use of several of the seven benefits to evaluate transmission facilities and projects).

[1057] *Id.* P 722.

Transmission Facility as a more efficient or cost-effective regional transmission solution to Long-Term Transmission Needs."[1058]

380. Finally, the Commission found in Order No. 1920, and we continue to find here, that transmission providers must measure, at a minimum, this set of seven required benefits and then use them to evaluate Long-Term Regional Transmission Facilities in order to ensure just and reasonable rates.[1059] The Commission noted:

> The record in this proceeding shows that, in order to ensure just and reasonable Commission-jurisdictional transmission rates, it is necessary to require transmission providers to measure and use in Long-Term Regional Transmission Planning a set of particular benefits so that they may identify, evaluate, and select regional transmission facilities that are more efficient or cost-effective transmission solutions to Long-Term Transmission Needs. We find that the benefits that Long-Term Regional Transmission Facilities generally provide extend beyond the benefits that transmission providers currently consider as part of their regional transmission planning and cost allocation processes, and without consideration of such benefits, Long-Term Regional Transmission Planning cannot be reasonably expected to identify, evaluate, and select more efficient or cost-effective regional transmission solutions to address Long-Term Transmission Needs.[1060]

[1058] *Id.* P 723.

[1059] *Id.* P 721.

[1060] *Id.* P 722.

381. Indeed, as Dominion concedes, the seven benefits that Order No. 1920 requires transmission providers to use and measure when evaluating Long-Term Regional Transmission Facilities are "inherent benefits of all transmission."[1061]

382. In addition, we disagree with PJM's assertion that Order No. 1920 is arbitrary and capricious because the requirement that transmission providers measure and use seven required benefits to evaluate Long-Term Regional Transmission Facilities is an unexplained departure from the NOPR's recognition of the value of allowing regional flexibility with respect to benefits. We continue to find that the requirement for transmission providers to measure and use the minimum set of seven required benefits in Long-Term Regional Transmission Planning is necessary to ensure that Commission-jurisdictional rates are just and reasonable.[1062] Specifically, absent a requirement that transmission providers measure and use a sufficiently broad range of the benefits of Long-Term Regional Transmission Facilities when evaluating them for potential selection, transmission providers may not identify, evaluate, and select more efficient or cost-effective regional transmission solutions to Long-Term Transmission Needs, which may lead to relatively inefficient or less cost-effective transmission development. Therefore, we find that allowing the regional flexibility that PJM suggests would fail to remedy the deficiencies in existing regional transmission planning and cost allocation processes – namely, the failure to require transmission providers to adequately consider

[1061] Dominion Rehearing Request at 20.

[1062] Order No. 1920, 187 FERC ¶ 61,068 at P 727.

the broader set of benefits of regional transmission facilities planned to meet Long-Term Transmission Needs[1063] – that the Commission identified in the final rule.[1064] We also note that PJM itself previously recognized that certain benefits should be required; in its comments on the NOPR, PJM called for the adoption of a nationwide consideration of

[1063] *Id.* P 122.

[1064] Contrary to PJM's assertion, in Order No. 1920 the Commission explained its reasons for not adopting the more flexible approach proposed in the NOPR. The Commission found:

> [A]dopting the more flexible approach proposed in the NOPR would not address the identified deficiencies in existing regional transmission planning and cost allocation processes because such an approach would fail to ensure that transmission providers consider the broader set of benefits provided by, and the beneficiaries receiving the benefits of, Long-Term Regional Transmission Facilities, and thus, may fail to identify the potentially more efficient or cost-effective regional transmission solution. We find that failing to use the set of benefits that we require in this final rule to evaluate Long-Term Regional Transmission Facilities for potential selection could render resulting Commission-jurisdictional rates unjust and unreasonable. We find that not requiring transmission providers to use certain benefits to evaluate Long-Term Regional Transmission Facilities would be expected to lead to relatively inefficient and less cost-effective transmission development, as Long-Term Regional Transmission Facilities that provide significant net benefits may not be selected.

Id. P 723; *see also id.* P 728 ("We conclude that it would be inappropriate to provide flexibility not to consider this required set of benefits in Long-Term Regional Transmission Planning because . . . requiring the measurement and use of these benefits ensures that transmission providers are able to identify, evaluate, and select regional transmission solutions to more efficiently or cost-effectively address Long-Term Transmission Needs, and thereby ensures just and reasonable rates.").

benefits that are similar to certain benefits that the Commission adopted in Order No. 1920 as part of the set of seven required benefits that transmission providers must measure and use in Long-Term Regional Transmission Planning.[1065]

383. In response to Designated Retail Regulators' and Undersigned States' requests for flexibility to establish the benefits for transmission providers to measure through RTO/ISO stakeholder processes, we reiterate that the measurement and use of certain benefits in Long-Term Regional Transmission Planning is essential to ensuring just and reasonable Commission-jurisdictional rates.[1066] As such, we find that it is necessary for the Commission to mandate the measurement and use of these benefits – the required benefits – in Long-Term Regional Transmission Planning rather than deferring to RTO/ISO stakeholder processes.[1067]

384. We also are not persuaded by NRECA's assertion that, by prescribing the required benefits that transmission providers must use for evaluation and selection of Long-Term Regional Transmission Facilities, the final rule will likely change the results of the evaluation and selection processes in unanticipated ways. NRECA does not explain what

[1065] PJM NOPR Initial Comments at 96 ("[T]he following benefit categories should be considered on a nationwide basis: (i) Enhanced Reliability; (ii) Avoided or Deferred Reliability Transmission Projects and Aging Infrastructure Replacement; (iii) Deferred Capacity Investment; and (iv) Production Cost Savings.").

[1066] *See* Order No. 1920, 187 FERC ¶ 61,068 at PP 722-723, 725, 727-728.

[1067] *Id.* PP 723, 728.

unanticipated consequences it foresees arising, and we find this assertion speculative and unsupported.

d. Overlap and Double-Counting

i. Order No. 1920 Requirements

385. In Order No. 1920, the Commission noted that, "rather than requiring transmission providers to measure and use all 12 benefits enumerated in the NOPR, we only require transmission providers to measure and use seven specific benefits that have a proven track record, can be discretely measured, and are unlikely to cause duplication."[1068] In response to concerns raised by commenters regarding the potential for overlap and double-counting, the Commission further noted:

> We believe that the seven benefits that we include in the required set of benefits that transmission providers must measure and use in Long-Term Regional Transmission Planning are distinct enough that they will not overlap in a way that results in double-counting. Nonetheless, to the extent that transmission providers are concerned that any possibility of double-counting remains, we provide transmission providers with flexibility on the measurement of such benefits and expect that transmission providers can use such flexibility to develop methods for measuring each required benefit that address those concerns.[1069]

386. With respect to Final Rule Benefit 3, Production Cost Savings, the Commission in Order No. 1920 explained why it did not believe that this benefit would result in double-counting of benefits merely because such benefits may also be considered in state

[1068] *Id.* P 724.

[1069] *Id.* P 735.

resource planning.[1070] Specifically, the Commission found that while integrated resource planning processes, where they exist, may consider similar benefits compared to those required by Order No. 1920, the consideration of benefits in a state-jurisdictional process does not result in the double-counting of benefits within any Commission-jurisdictional transmission planning process.[1071]

387. The Commission in Order No. 1920 also offered guidance regarding the manner of measurement of certain aspects of Final Rule Benefit 6, mitigation of extreme weather events and unexpected system conditions, to avoid double-counting. The Commission noted, for example, that "to avoid double-counting of similar circumstances, transmission providers must account for extreme weather events and unexpected system conditions that are separate and distinct such that the benefits of mitigating each system condition can be combined into a single benefit measure."[1072]

ii. Requests for Rehearing and Clarification

388. Designated Retail Regulators and Undersigned States request rehearing and assert that Order No. 1920's requirements to use seven required factors and seven required benefits will result in unjust and unreasonable rates. They argue that the seven required factors and seven required benefits overlap and will double-count or exaggerate the

[1070] *Id.* P 770.

[1071] *Id.*

[1072] *Id.* P 804.

potential benefits of Long-Term Regional Transmission Facilities, with Undersigned States adding that this renders the rule arbitrary and capricious.[1073]

389. Designated Retail Regulators and Undersigned States assert that with respect to the seven required benefits, it is unclear whether these metrics will result in double-counting of potential benefits.[1074]

iii. Commission Determination

390. We disagree with Designated Retail Regulators and Undersigned States that the seven required benefits will overlap and will double-count or exaggerate the potential benefits of Long-Term Regional Transmission Facilities. As an initial matter, the Commission found in Order No. 1920, and we continue to find here, that "the seven benefits that we include in the required set of benefits that transmission providers must measure and use in Long-Term Regional Transmission Planning are distinct enough that they will not overlap in a way that results in double-counting."[1075] Designated Retail Regulators and Undersigned States fail to provide evidence in support of their arguments

[1073] Designated Retail Regulators Rehearing Request at 8 (citation omitted); Undersigned States Rehearing Request at 8 (citation omitted).

[1074] Designated Retail Regulators Rehearing Request at 29; Undersigned States Rehearing Request at 29.

[1075] Order No. 1920, 187 FERC ¶ 61,068 at P 735. As noted above, the Commission also addressed arguments relating to double-counting and/or overlap between Final Rule Benefit 3 and integrated resource planning processes and provided guidance regarding the manner of measurement of certain aspects of Final Rule Benefit 6, mitigation of extreme weather events and unexpected system conditions, to avoid double-counting.

to the contrary, and they do not provide any specific examples of the alleged overlap. Given the descriptions of the required benefits adopted in Order No. 1920,[1076] we conclude that each of these required benefits captures a different type of benefit that Long-Term Regional Transmission Facilities may provide. However, we reiterate, as the Commission stated in the final rule, that Order No. 1920 provides transmission providers with flexibility on the measurement of the required benefits, and we expect that transmission providers can use such flexibility to develop methods for measuring each required benefit that address any concerns about the possibility of double-counting benefits.[1077]

391. Moreover, the Commission explained in Order No. 1920 that transmission providers' evaluation of Long-Term Regional Transmission Facilities must culminate in a determination that is sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility (or portfolio of Long-Term Regional Transmission Facilities) was selected or not selected.[1078] The Commission also explained that this determination must include the estimated costs and measured benefits of each alternative Long-Term Regional Transmission Facility (or portfolio of Long-Term Regional Transmission Facilities) that transmission providers evaluated in the Long-Term Regional Transmission Planning process, regardless of whether or not the Long-

[1076] *Id.* PP 745, 756, 758, 767, 781, 788, 800, 817.

[1077] *Id.* P 735.

[1078] *Id.* P 954.

Term Regional Transmission Facility (or portfolio of such Facilities) is selected.[1079] We find that these requirements will further safeguard against potential overlap and double-counting of benefits.

392. With respect to Undersigned States' and Designated Retail Regulators' concerns regarding the relationship between benefits and factors, we address this issue in the Requirement for Transmission Providers to Use the Seven Required Benefits to Help to Inform Their Identification of Long-Term Transmission Needs section above. As noted there, we are setting aside Order No. 1920's requirement for transmission providers to use the set of seven required benefits to help to inform their identification of Long-Term Transmission Needs. As such, we find that there is no overlap between the categories of factors that transmission providers must incorporate into the development of Long-Term Scenarios, which are developed prior to the identification of Long-Term Transmission Needs and Long-Term Regional Transmission Facilities to address those needs, and the required benefits, which are subsequently used to evaluate the identified Long-Term Regional Transmission Facilities.

393. With respect to Designated Retail Regulators' and Undersigned States' concerns about potential overlaps between the seven required benefits and other benefits that transmission providers may use and measure, we find that Order No. 1920 provides for sufficient transparency to prevent any such overlap. Specifically, Order No. 1920 requires transmission providers to describe how they will measure the seven required

[1079] *Id.* PP 954, 966.

benefits in OATT filings.[1080] Additionally, it requires transmission providers to measure and use any additional benefits beyond those included in the required set of benefits, including on a transmission facility or plan-specific basis, in a manner that is consistent with their obligations under Order No. 890 and Order No. 1000 transmission planning principles to be open and transparent as to their transmission planning processes.[1081] As such, stakeholders will have the information necessary to identify any potential double-counting of the required benefits and any other benefits that transmission providers choose to measure and use in Long-Term Regional Transmission Planning.

e. Conflicts with State Authority

i. Requests for Rehearing and Clarification

394. Designated Retail Regulators assert that the seven required benefits conflict with the state authority reflected in both the transmission planning principles adopted by OMS that project metrics should be quantifiable, subject to accurate measurement, verifiable, non-duplicative, and forward looking and the Entergy Regional State Committee's adoption of "even more stringent requirements to ensure that any metrics adopted reflected actual, not hypothetical, value that would justify major transmission investment."[1082] For instance, Designated Retail Regulators state that the Entergy

[1080] *Id.* P 837.

[1081] *Id.* P 822.

[1082] Designated Retail Regulators Rehearing Request at 31-33 (citing Organization of MISO States, Inc., *Organization of MISO States Statement of Principles: Cost Allocation for Long Range Transmission Planning Projects*, https://www.misostates.org/images/PositionStatements/OMS_Position_Statement_of_Pri

Regional State Committee (E-RSC) adopted stringent requirements to ensure that any metrics adopted reflected actual, not hypothetical, value that would justify major transmission investment:

> The cost-benefit and other analyses that are used to inform the business case and cost allocation for Tranche 3 shall be based only on accurate, objective, measurable, quantifiable, non-duplicative, forward-looking, and replicable metrics that are supported by data;
>
> Tranche 3 costs shall be allocated using an exclusive list of benefit metrics identified by the E-RSC, with advice from MISO and MISO South Stakeholders, that meet the criteria identified in Paragraph 3 above. These metrics shall be memorialized after being approved by the E-RSC;
>
> Each Tranche 3 project must individually satisfy the cost-benefit analysis used for the business case and cost allocation on a stand-alone basis. Where two or more transmission facility upgrades combine to address a specific transmission issue, they may be evaluated as a single project for the purpose of analysis and cost allocation.[1083]

395. NESCOE requests that the Commission grant rehearing to require transmission providers to defer to states in the identification of benefits that Long-Term Regional Transmission Facilities may provide when the driver of the Long-Term Transmission Need is related to satisfying state laws, regulations, or policies.[1084]

---

nciples_Cost_Allocation_for_LRTPs.pdf).

[1083] Designated Retail Regulators Rehearing Request at 32-33 (quoting Entergy Regional State Committee, *Resolution of the Entergy Regional State Committee*, 3 (adopted June 30, 2023), https://cdn.misoenergy.org/20230630%20-%20ERSC%20Resolution%20re%20MISO%20South%20Cost%20Allocation%20for%20Tranche%203629421.pdf).

[1084] NESCOE Rehearing Request at 11 (citation omitted).

ii. Commission Determination

396. We are not persuaded by requests for rehearing that argue that the Commission's establishment of a set of required benefits in Order No. 1920 impermissibly or improperly intrudes upon state authority. We continue to find that, while the Long-Term Regional Transmission Planning required in Order No. 1920 may be more comprehensive than the status quo, as a matter of the Commission's jurisdiction, it is fundamentally no different than the regional transmission planning already required by the Commission and upheld by the appellate courts.[1085] Using the required benefits to evaluate Long-Term Regional Transmission Facilities is an incremental improvement to the Commission's Order No. 890 and Order No. 1000 reforms requiring processes for evaluating the merits of proposed transmission solutions offered by potential developers.[1086] The D.C. Circuit upheld the Commission's Order No. 1000 regional transmission planning reforms against challenges rooted in similar misunderstandings of the Commission's jurisdiction as those advanced by the rehearing parties.[1087]

[1085] Order No. 1920, 187 FERC ¶ 61,068 at P 277 (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 68-69).

[1086] *See* Order No. 1000, 136 FERC ¶ 61,051 at P 315 (citing Order No. 890, 118 FERC ¶ 61,119 at P 494; Order No. 890-A, 121 FERC ¶ 61,297 at PP 215-216).

[1087] *See S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 63 ("Taken together, these points support the Commission's assertion of authority over transmission planning matters in the challenged orders, notwithstanding petitioners' contention that the orders intrude on the States' authority.").

397. Further, we reiterate the Commission's finding in Order No. 1920 that some benefits are so essential to Long-Term Regional Transmission Planning that they must be required and not left to the discretion of stakeholders, whether RTOs/ISOs or state committees.[1088] Order No. 1920, for example, found that requiring the measurement and use of Final Rule Benefit 1, Avoided or Deferred Reliability Transmission Facilities and Aging Transmission Infrastructure Replacement, as described, is necessary because Long-Term Regional Transmission Facilities may obviate or delay the need for reliability transmission facilities identified in the near term, or the need for later replacements of aging transmission infrastructure.[1089] Moreover, as discussed in the Flexibility Regarding Benefits Rather than a Minimum Set section above, the Commission found in Order No. 1920 that the requirement for transmission providers to measure and use the seven required benefits in Long-Term Regional Transmission Planning is necessary to ensure that Commission-jurisdictional rates are just and reasonable.[1090] We sustain this finding and, as a result, continue to find that the measurement and use of these minimum set of required benefits in Long-Term Regional Transmission Planning cannot be left to the discretion of transmission providers or stakeholders.

398. We also question the degree of intrusion cited by certain rehearing parties. We note, for example, that many of the OMS and Entergy Regional State Committee

[1088] *See* Order No. 1920, 187 FERC ¶ 61,068 at PP 722-723, 725, 728.

[1089] *Id.* P 745.

[1090] *Id.* P 727.

transmission planning principles cited by Designated Retail Regulators are similar to provisions governing the measurement and use of the required benefits in Order No. 1920. For example, Order No. 1920's findings and requirements with respect to the seven required benefits are consistent with the second of OMS's transmission planning principles[1091] that benefit metrics be quantifiable,[1092] capable of replication,[1093] non-duplicative,[1094] and forward-looking.[1095]

399. With respect to Designated Retail Regulators' assertions regarding the Entergy Regional State Committee requirements, we note that many of the metrics for analysis

[1091] Organization of MISO States, Inc., *Organization of MISO States Statement of Principles: Cost Allocation for Long Range Transmission Planning Projects*, https://www.misostates.org/images/PositionStatements/OMS_Position_Statement_of_Principles_Cost_Allocation_for_LRTPs.pdf.

[1092] Order No. 1920, 187 FERC ¶ 61,068 at P 724 ("[W]e only require transmission providers to measure and use seven specific benefits that . . . can be discretely measured.").

[1093] *Id.* P 837 ("[We] require transmission providers in each transmission planning region to include in their OATTs a general description of how they will measure each of the seven benefits included in the required set of benefits . . . .").

[1094] *Id.* P 735 ("We believe that the seven benefits that we include in the required set of benefits that transmission providers must measure and use in Long-Term Regional Transmission Planning are distinct enough that they will not overlap in a way that results in double-counting.").

[1095] *Id.* P 859 ("[We] require transmission providers in each transmission planning region, as part of Long-Term Regional Transmission Planning, to calculate the benefits of Long-Term Regional Transmission Facilities over a time horizon that covers, at a minimum, 20 years starting from the estimated in-service date of the transmission facilities . . . .").

raised by the first cited requirement[1096] are similar to those required by the final rule and by OMS. With respect to the second requirement ("Tranche 3 costs shall be allocated using an exclusive list of benefit metrics identified by the E-RSC"), we note that transmission providers are free to measure and use additional benefits in Long-Term Regional Transmission Planning so long as they also measure and use the required benefits and measure and use any other benefits in a manner that is consistent with their obligations under Order No. 890 and Order No. 1000 transmission planning principles to be open and transparent as to their transmission planning processes.[1097] With respect to the third requirement,[1098] the final rule noted the potential to use cost-benefit metrics as a means for evaluating and selecting Long-Term Regional Transmission Facilities.[1099]

[1096] Entergy Regional State Committee, *Resolution of the Entergy Regional State Committee*, at 3 (adopted June 30, 2023), https://cdn.misoenergy.org/20230630%20-%20ERSC%20Resolution%20re%20MISO%20South%20Cost%20Allocation%20for%20Tranche%203629421.pdf ("The cost-benefit and other analyses that are used to inform the business case and cost allocation for Tranche 3 shall be based only on accurate, objective, measurable, quantifiable, non-duplicative, forward-looking, and replicable metrics that are supported by data.").

[1099] Order No. 1920, 187 FERC ¶ 61,068 at P 966 (noting that transmission provider evaluation processes must result in determinations that "include the estimated costs and measured benefits of each alternative Long-Term Regional Transmission Facility (or portfolio of such Facilities) evaluated by the transmission providers, whether or not the Long-Term Regional Transmission Facility (or portfolio of such Facilities) is

400. We are also unpersuaded by NESCOE's request that we defer to state preferences regarding benefits when the driver of the Long-Term Transmission Need is related to satisfying state laws, regulations, or policies. As noted above, the measurement and use of the required benefits in Long-Term Regional Transmission Planning is essential to ensuring just and reasonable Commission-jurisdictional rates such that the Commission cannot defer to states on this point. However, we note that Order No. 1920 requires consultation with the states regarding aspects of Long-Term Regional Transmission Planning, including a requirement that transmission providers consult with and seek the support of Relevant State Entities regarding the evaluation process, including selection criteria, that transmission providers propose to use to identify and evaluate Long-Term Regional Transmission Facilities and that provide transmission providers with the opportunity to select Long-Term Regional Transmission Facilities to address Long-Term Transmission Needs, including those related to satisfying state laws, regulations, or policies.[1100] Further, as clarified in this order in the Stakeholder Process and Transparency section above, transmission providers must provide states with a meaningful opportunity to provide timely input on the development of Long-Term Scenarios, including factors and data inputs, and an opportunity to explain how their own policies and planning affect Long-Term Transmission Needs.[1101]

---

selected").

[1100] *See id.* PP 914, 994.

[1101] Further, as discussed in the General Benefits Requirements Related to Cost Allocation section below, transmission providers can consider additional benefits for cost

f. Individual Benefits

i. Final Rule Benefit 2(a): Reduced Loss of Load Probability; or Final Rule Benefit 2(b): Reduced Planning Reserve Margin

(a) Order No. 1920 Requirements

401. With respect to Final Rule Benefit 2, the Commission stated that this benefit can be characterized and measured as Final Rule Benefit 2(a), Reduced Loss of Load Probability, or as Final Rule Benefit 2(b), Reduced Planning Reserve Margin, two different methods for measuring the same underlying benefit. The Commission found that because there is an overlap between the reduced loss of load probability benefits and reduced planning reserve margin benefits, for purposes of Long-Term Regional Transmission Planning, transmission providers must either measure reduced loss of load events by holding the planning reserve margin constant *or* measure the reduction in planning reserve margins by holding loss of load events constant but may not measure both simultaneously for purposes of using and measuring Final Rule Benefit 2(a) or 2(b).[1102]

(b) Requests for Rehearing and Clarification

402. SERTP Sponsors argue that the Commission should clarify that it does not intend to require transmission providers to establish a planning reserve margin other than the

---

allocation purposes, including, but not limited to, those agreed to by Relevant State Entities and described elsewhere in Order No. 1920, provided that costs are allocated in a way that is at least roughly commensurate with estimated benefits.

[1102] Order No. 1920, 187 FERC ¶ 61,068 at P 755.

planning reserve margin established by the resource planners and load-serving entities on that transmission provider's system. SERTP Sponsors also assert that the Commission should clarify that any analysis under Final Rule Benefit 2 should not be used as a basis to challenge the planning reserve margin of a resource planner or load-serving entity established through state resource planning processes, and that the use of such an analysis is only intended for the purpose of evaluating potential Long-Term Regional Transmission Facilities that may under certain planning scenarios suggest a potential benefit.[1103]

(c) Commission Determination

403. We clarify that Order No. 1920 does not require transmission providers to establish a different planning reserve margin than the one established by resource planners or load-serving entities in a particular transmission provider's system, including in measuring Final Rule Benefit 2. We underscore here that any calculation of this benefit will only serve to support the benefits assessment of potential Long-Term Regional Transmission Facilities during the Long-Term Regional Transmission Planning process. While the Commission described examples of how transmission providers could measure certain benefits, the Commission did not require a specific measurement method for any of the required benefits.[1104] Further, the Commission noted that Final Rule Benefit 2 can be measured in one of two ways: (a) using reduced loss of load probability

[1103] SERTP Sponsors Rehearing Request at 18.

[1104] Order No. 1920, 187 FERC ¶ 61,068 at P 727.

or (b) reduced planning reserve margin.[1105] In light of this clarification, we need not reach SERTP Sponsors' alternative argument that, absent this clarification, Order No. 1920 would raise concerns that the Commission has exceeded its jurisdiction.[1106]

404. In response to SERTP Sponsors' request to clarify that any analysis under Final Rule Benefit 2 should not be used as the basis for challenging a resource planner's or load-serving entity's planning reserve margin established through state resource planning processes, we clarify that any state resource planning process is a separate process subject to state jurisdiction and is beyond the scope of Order No. 1920.

ii. Final Rule Benefit 3: Production Cost Savings

(a) Order No. 1920 Requirements

405. In Order No. 1920, the Commission required transmission providers in each transmission planning region to measure and use Final Rule Benefit 3 in Long-Term Regional Transmission Planning. The Commission described this benefit as savings in fuel and other variable operating costs of power generation that are realized when transmission facilities allow for displacement of higher-cost supplies through the increased dispatch of suppliers that have lower incremental costs of production, as well as a reduction in market prices as lower-cost suppliers set market clearing prices.[1107]

[1105] *Id.* P 748.

[1106] *See* SERTP Sponsors Rehearing Request at 18 n.46, 43 (Issue Statement 15) (citations omitted).

[1107] Order No. 1920, 187 FERC ¶ 61,068 at P 767.

406. In Order No. 1920, the Commission disagreed with the assertion made in comments that production cost savings may not always be applicable, such as where financial transmission rights fully hedge the cost of congestion. The Commission stated that financial transmission rights are required in RTO/ISO markets and allow the market participant that owns the right to mitigate the congestion charge along an existing transmission path for the capacity of that path. The Commission further stated that a new transmission facility could reduce congestion and allow that market participant to purchase more electricity, exceeding the capacity of the transmission path for the financial transmission right, at a lower price. The Commission observed that this reduced congestion allows load to access lower cost resources and results in more efficient dispatch of resources and, thus, provides avoided production cost benefits that are distinct from the avoided congestion charges associated with financial transmission rights.[1108]

(b) Requests for Rehearing and Clarification

407. SERTP Sponsors argue that the Commission should clarify that production cost analysis from state-approved integrated resource plans may be used to the extent feasible to satisfy the requirement to consider Final Rule Benefit 3. SERTP Sponsors further argue that, in the event of conflict, state-regulated integrated-resource-plan planning must control in accordance with FPA section 201.[1109]

[1108] *Id.* P 773 (citations omitted).

[1109] SERTP Sponsors Rehearing Request at 19.

408. Designated Retail Regulators assert that the Commission was mistaken in stating that a load-serving entity may benefit from reduced production costs associated with transmission construction even when its congestion costs are fully hedged. Designated Retail Regulators argue that as congestion is eliminated by transmission construction, the value of the load-serving entity's financial transmission rights decreases, and the load-serving entity incurs additional transmission charges associated with the new transmission facilities. Designated Retail Regulators assert that any benefit based on adjusted production cost must therefore consider congestion to determine if a load-serving entity receives any benefit or harm from transmission construction.[1110]

(c) Commission Determination

409. In response to SERTP Sponsors, we note that Order No. 1920 does not require a specific measurement method for any of the seven required benefits. We clarify that if transmission providers in a transmission planning region believe they can use production cost savings from one or more state integrated resource plans as an appropriate method to measure the value of Final Rule Benefit 3, they may propose to do so on compliance. As a general matter, we agree that states have authority over generation resource adequacy, which may include evaluation of production cost savings in state-regulated integrated resource plans. Order No. 1920, however, addresses transmission planning practices directly affecting Commission-jurisdictional rates, including by requiring that transmission providers consider the broader set of benefits (such as Final Rule Benefit 3)

[1110] Designated Retail Regulators Rehearing Request at 30-31.

associated with Long-Term Regional Transmission Facilities. We therefore decline SERTP Sponsors' request to clarify that transmission providers must, in all circumstances, rely on such state evaluations of production cost savings in assessing the benefits associated with such facilities.[1111]

410. We decline Designated Retail Regulators' request for clarification regarding Final Rule Benefit 3 with respect to financial transmission rights. We continue to find that financial transmission rights allow the market participant that owns the right to mitigate the congestion charge along an existing path for the capacity of that path and note that a new transmission facility could reduce congestion and allow that market participant to purchase more electricity, exceeding the capacity of the transmission path for the financial transmission right, at a lower price. While the extent of production cost savings from any Long-Term Regional Transmission Facility or portfolio of such Facilities may vary among representative transmission providers, and transmission providers may propose on compliance to consider the effects of financial transmission rights on Final Rule Benefit 3, we decline to prospectively determine how any load-serving entity may or may not benefit from a reduction in regional production costs, including whether the

[1111] In light of this clarification, we continue to conclude that Order No. 1920 is a lawful exercise of the Commission's statutory authority and does not intrude into areas of reserved state jurisdiction. *See supra* Statutory Authority section; SERTP Sponsors Rehearing Request at 18-19 nn.46 & 48, 43 (Issue Statement 15) (citations omitted). To the extent that transmission providers propose a different evaluation of production cost savings than reflected in state-regulated integrated resource plans, they will be doing so in the context of Order No. 1920's regulation of Commission-jurisdictional transmission planning processes.

degree to which a particular load-serving entity may have hedged against congestion would affect such benefits.

2. Measurement and Use of Other Benefits

a. Order No. 1920 Requirements

411. In Order No. 1920, the Commission declined to require transmission providers to measure and use the remaining five benefits described in the NOPR in Long-Term Regional Transmission Planning (i.e., mitigation of weather and load uncertainty, generation capacity investments, access to lower-cost generation, increased competition, and increased market liquidity), but permitted transmission providers to measure and use additional benefits beyond the set of seven required benefits (other benefits), including on a transmission facility or plan-specific basis, subject to the requirement that they do so in a manner that is consistent with their obligations under Order No. 890 and Order No. 1000 transmission planning principles to be open and transparent as to their transmission planning processes.[1112] The Commission stated that, in particular, the evaluation process must result in a determination that is sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility (or portfolio of such Facilities) was selected or not selected to address Long-Term Transmission Needs, which necessarily means that stakeholders must understand which benefits transmission providers considered in the evaluation process, including any

[1112] Order No. 1920, 187 FERC ¶ 61,068 at PP 821-822.

beyond the seven benefits that the Commission required transmission providers to include in their OATTs.[1113]

b. Requests for Rehearing and Clarification

412. PIOs assert that the Commission erred by not requiring transmission providers to measure and use the five additional benefits identified in the NOPR.[1114] PIOs assert that the Commission ignores its own evidence in the NOPR that the five additional proposed benefits have a proven track record, can be discretely measured, and are unlikely to cause duplication.[1115]

413. TAPS asserts that Order No. 1920's lack of a requirement for transmission providers to fully explain and justify additional benefits used to evaluate Long-Term Regional Transmission Facilities is an unjustified departure from the NOPR and inconsistent with the final rule's directive requiring transmission providers to describe how they will measure each of the seven required benefits on compliance. TAPS states that the final rule invites transmission providers to supplement Order No. 1920's required benefits, seemingly abandoning concerns about double-counting. TAPS further argues that the flexibility regarding additional benefits also provides an opportunity to selectively apply additional benefits on a transmission facility or plant-specific basis,

[1113] *Id.* P 737.

[1114] PIOs Rehearing Request at 26-27.

[1115] *Id.* at 27 (citing NOPR, 179 FERC ¶ 61,028 at PP 208-209, 213-225).

inviting discrimination.[1116] TAPS also asserts that it is unclear whether the final rule's requirements for transmission providers to be "open and transparent" applies to the process of deciding whether to use and how to measure additional benefits or to the implementation of the additional benefits for specific projects. TAPS contends that it should apply to both.[1117]

c. Commission Determination

414. We are not persuaded by PIOs' rehearing request concerning the Commission's decision in Order No. 1920 to not require the measurement and use of benefits other than the seven required benefits, such as the five additional benefits identified by the Commission in the NOPR. The Commission determined that measurement and use of the set of seven required benefits constituted the just and reasonable replacement rate. Furthermore, the Commission explained its reasoning in Order No. 1920 for only requiring the measurement and use of seven required benefits and not other benefits, including recognizing commenters' concerns about duplication of certain benefits and the difficulty of measuring certain benefits.[1118] The Commission also explained that the list of seven required benefits only requires transmission providers to measure and use seven

[1116] TAPS Rehearing Request at 12-13.

[1117] *Id.* at 11.

[1118] Order No. 1920, 187 FERC ¶ 61,068 at P 724.

specific benefits that have a proven track record, can be discretely measured, and are unlikely to cause duplication.[1119]

415. With respect to TAPS' concerns regarding a lack of a requirement for transmission providers to explain and justify other benefits on compliance, we believe that the approach in the final rule is reasonable because it provides transmission providers with greater flexibility to consider potential additional benefits of Long-Term Regional Transmission Facilities beyond the seven required benefits. We further find that, by providing transparency, the requirements of the final rule are sufficient to avoid undue discrimination. Specifically, Order No. 1920 requires transmission providers that measure and use any other benefits beyond the set of seven required benefits to do so in a manner that is consistent with their obligations under Order No. 890 and Order No. 1000 transmission planning principles to be open and transparent as to their transmission planning processes.[1120] Moreover, the Commission stated that the evaluation process must result in a determination that is sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility (or portfolio of such Facilities) was selected or not selected to address Long-Term Transmission Needs, which necessarily means that stakeholders must understand which benefits transmission providers considered in the evaluation process, including any beyond the seven benefits

[1119] *Id.* P 724.

[1120] *Id.* PP 821-822.

that the Commission required transmission providers to include in their OATTs.[1121] Such transparency will limit the opportunities for transmission providers to measure and use in Long-Term Regional Transmission Planning any benefits in addition to the required benefits in an unduly discriminatory manner.

416. We therefore grant TAPS' request for clarification that the final rule's requirements for transmission providers to be "open and transparent" applies to the process of deciding whether to use and how to measure other benefits in addition to the required benefits as well as to the implementation of other benefits for specific Long-Term Regional Transmission Facilities, as discussed above.

3. Identification, Measurement, and Evaluation of Benefits

a. Order No. 1920 Requirements

417. In Order No. 1920, the Commission required transmission providers in each transmission planning region to include in their OATTs a general description of how they will measure each of the set of seven required benefits, sufficient only to enable stakeholders to understand the manner by which transmission providers will measure these benefits.[1122] Order No. 1920 provided flexibility to transmission planners to specify the method for measuring each of the seven required benefits,[1123] as well as discretion to measure and use additional benefits that go beyond the set of seven required benefits,

[1121] *Id.* P 737.

[1122] *Id.* PP 837, 840.

[1123] *Id.* P 839.

subject to the requirement that they do so in a manner that is consistent with their obligations under Order No. 890 and Order No. 1000 transmission planning principles to be open and transparent as to their transmission planning processes.[1124]

b. Requests for Rehearing and Clarification

418. SERTP Sponsors request that the Commission clarify that it did not intend for transmission providers to engage in generation or resource planning as part of the Long-Term Regional Transmission Planning process, as doing so would violate FPA section 201 because it would intrude upon state-jurisdictional resource decisions. SERTP Sponsors also request clarification that it is reasonable for transmission providers to establish protocols by which they can rely, to the extent available, on resource planners and load-serving entities for data in support of generation-based benefits.[1125]

c. Commission Determination

419. In response to SERTP Sponsors' request, we clarify that Order No. 1920 does not require transmission providers to engage in generation or resource planning as part of Long-Term Regional Transmission Planning. The requirement for transmission providers to measure and use the set of seven required benefits in Long-Term Regional Transmission Planning is necessary for transmission providers to consider a sufficiently broad range of benefits when evaluating and determining whether to select a Long-Term Regional Transmission Facility as the more efficient or cost-effective regional

[1124] *Id.* P 822.

[1125] SERTP Sponsors Rehearing Request at 17-18.

transmission solution to Long-Term Transmission Needs and for purposes of conducting Long-Term Regional Transmission Planning, and not as a basis to cause transmission providers to engage in resource planning.[1126]

420. Further, as requested by SERTP Sponsors, we clarify that Order No. 1920 does not prohibit transmission providers from proposing to establish protocols by which they can rely, to the extent available, on resource planners and load-serving entities for generation-based data and information in satisfying the requirement to measure the benefits of Long-Term Regional Transmission Facilities. In Order No. 1920, the Commission provided flexibility to transmission providers to specify the method for measuring each of the seven required benefits and did not mandate any specific method for measuring those seven benefits. Order No. 1920 also provided the flexibility for transmission providers to establish protocols to obtain data, to the extent available, from resource planners and load-serving entities to measure the benefits of specific Long-Term Regional Transmission Facilities. However, we re-emphasize that, whether the transmission providers themselves measure the benefits of Long-Term Regional Transmission Facilities, or instead establish protocols by which they can rely on resource planners or load-serving entities for generation-based data and information to measure the benefits, the general description in the OATT of the method that the transmission provider uses to

[1126] In light of this clarification, we need not reach SERTP Sponsors' alternative argument that, absent this clarification, Order No. 1920 would raise concerns that the Commission has exceeded its jurisdiction. *See id.* at 19 n.48, 43 (Issue Statement 15) (citations omitted).

measure each of the required benefits must be sufficient to enable stakeholders to understand the manner by which transmission providers will measure those benefits, as noted in Order No. 1920.[1127]

4. Benefits Horizon

a. Order No. 1920 Requirements

421. In Order No. 1920, the Commission required transmission providers in each transmission planning region, as part of Long-Term Regional Transmission Planning, to calculate the benefits of Long-Term Regional Transmission Facilities over a time horizon that covers, at a minimum, 20 years starting from the estimated in-service date of the transmission facilities, and the Commission stated that this minimum 20-year benefit horizon must be used both for the evaluation and selection of Long-Term Regional Transmission Facilities.[1128] In addition, in Order No. 1920, the Commission stated that, while transmission providers may discount the benefits calculated for purposes of determining a present value of those benefits, they may not further discount those benefits to reflect uncertainty over the minimum 20-year time horizon for calculating benefits.[1129]

422. In prohibiting transmission providers from discounting benefits to reflect uncertainty over the 20-year benefits horizon, the Commission stated that Order No. 1920

[1127] Order No. 1920, 187 FERC ¶ 61,068 at P 840.

[1128] *Id.* P 859.

[1129] *Id.* P 865.

affords transmission providers with considerable flexibility in how to address uncertainty in Long-Term Regional Transmission Planning through the process to develop Long-Term Scenarios.[1130] In addition, the Commission noted that transmission providers have the flexibility to evaluate Long-Term Regional Transmission Facilities and their measured benefits across the different Long-Term Scenarios and sensitivities in a manner that addresses the inherent uncertainty in Long-Term Regional Transmission Planning, for example, through the use of a least-regrets or a weighted-benefits approach.[1131] As a result, the Commission determined that transmission providers have considerable flexibility in how to address uncertainty in Long-Term Regional Transmission Planning, including the calculation of benefits under different future scenarios, and that transmission providers did not need additional flexibility that would be realized by discounting benefits over time specifically due to future uncertainty.[1132]

b. Requests for Rehearing and Clarification

423. SERTP Sponsors request rehearing of the Commission's determination in Order No. 1920 to prohibit discounting of the measured benefits of Long-Term Regional Transmission Facilities based on uncertainty over the minimum 20-year benefit horizon. According to SERTP Sponsors, by requiring a 20-year benefits estimation without permitting discounting to reflect uncertainty, while also allowing a weighted-benefits

[1130] *Id.* PP 861, 865.

[1131] *Id.* P 862.

[1132] *Id.* PP 862, 865.

approach to account for uncertainty, Order No. 1920's requirement and authorization are unclear and contradictory, and therefore arbitrary and capricious.[1133] Similarly, Dominion states that the Commission must provide transmission providers with the flexibility to discount the measured benefits to reflect uncertainty over the minimum 20-year horizon for purposes of selection and evaluation of projects.[1134]

c. Commission Determination

424. We sustain the finding in Order No. 1920 that, while transmission providers may discount the value of the benefits calculated for purposes of determining the present value of those benefits, they may not further reduce the estimates of those benefits to reflect uncertainty over the minimum 20-year time horizon for calculating benefits. We disagree with SERTP Sponsors that Order No. 1920 is contradictory in allowing the use of a weighted-benefits approach for evaluating Long-Term Regional Transmission Facilities while also prohibiting the reduction in estimates of measured benefits based on uncertainty over the minimum 20-year horizon. These two techniques are not the same, and allowing one but prohibiting the other is not contradictory. Permitting transmission providers to use a weighted-benefits approach for Long-Term Regional Transmission Facilities allows transmission providers to measure the estimated total benefits that a

[1133] SERTP Sponsors Rehearing Request at 19-20, 43 (Issue Statement 16) (citations omitted); *see also id.* at 43 (Issue Statement 15) (citations omitted) (asserting that failure to grant clarification of the issues in Section II.C.3 of SERTP Sponsors' argument would result in the Commission intruding on state-jurisdictional resource decisions).

[1134] Dominion Rehearing Request at 21-25.

particular Long-Term Regional Transmission Facility may provide across a range of Long-Term Scenarios, each with a different probability of occurrence.[1135] This method can help account for uncertainty in the total benefits that a Long-Term Regional Transmission Facility may provide and help to balance an over-reliance on any particular Long-Term Scenario. While we understand that applying a probability to a Long-Term Scenario, and its resulting benefits, may reduce the benefits measured for that particular Long-Term Scenario, when aggregated, the probability-weighted benefits measured across all Long-Term Scenarios results in a representative estimate of the total benefits of the Long-Term Regional Transmission Facility as a whole while also accounting for uncertainty regarding the likelihood of different Long-Term Scenarios being realized.

425. On the other hand, we continue to find that allowing transmission providers to reduce the estimates of certain benefits based only on the relative certainty over the 20-year benefits horizon is unnecessary given other flexibilities provided to transmission providers to manage uncertainty in planning over a minimum of 20 years, for the reasons discussed in Order No. 1920.[1136] For example, in addition to the use of a weighted-

[1135] Under a weighted-benefits approach, transmission providers that use three Long-Term Scenarios with expected likelihoods of, for example, 30%, 30%, and 40%, would attribute these expected likelihoods to the benefits that the transmission provider measures under each Long-Term Scenario. The total estimated benefits of the Long-Term Regional Transmission Facility would then be calculated by summing the probability-adjusted benefits across these three Long-Term Scenarios (i.e., the sum of the measured benefits in the first Long-Term Scenario multiplied by its 30% probability, plus the second Long-Term Scenario's benefits multiplied by 30%, plus the third Long-Term Scenario's benefits multiplied by 40%).

[1136] Order No. 1920, 187 FERC ¶ 61,068 at P 865.

benefits approach, transmission providers have flexibility in how they account for the factors that go into Long-Term Scenario development once, as discussed elsewhere in this rule, transmission providers consult with Relevant State Entities and their authorized representatives as to how to account for factors related to state policy when determining the assumptions that will be used in the development of Long-Term Scenarios, as well as in determining *how* to account for such a state-related factor when developing Long-Term Scenarios when such state input is available.[1137].

426. As a result, we continue to believe that prohibiting the discounting of benefits based on relative certainty over the 20-year benefits horizon is reasonable and strikes an appropriate balance between preventing an excessive undercounting of benefits and allowing transmission providers to account for uncertainty in measuring benefits of Long-Term Regional Transmission Facilities across Long-Term Scenarios. For these reasons, we also disagree with Dominion that transmission providers must be afforded the flexibility to discount benefits based on the uncertainty in planning over a minimum 20-year horizon.

427. SERTP Sponsors do not explain how, in the absence of their requested clarification regarding discounting the benefits of Long-Term Regional Transmission Facilities, Order No. 1920 would "intrude[ ] upon state-jurisdictional resource decisions."[1138] Regardless, we would be unpersuaded by this argument on its merits

[1137] *See supra* Long-Term Scenarios Requirements, Stakeholder Process and Transparency section.

[1138] SERTP Sponsors Rehearing Request at 43 (Issue Statement 15) (citations

because, as described above, Order No. 1920 falls comfortably within the Commission's jurisdiction to regulate practices directly affecting Commission-jurisdictional rates.[1139] The manner in which benefits of Long-Term Regional Transmission Facilities are assessed is such a Commission-jurisdictional practice.

5. Evaluation of the Benefits of Portfolios of Transmission Facilities

a. Order No. 1920 Requirements

428. In Order No. 1920, the Commission allowed, but not did not require, transmission providers in each transmission planning region to use a portfolio approach when evaluating the benefits of Long-Term Regional Transmission Facilities. Further, the Commission required transmission providers that propose to use a portfolio approach when evaluating the benefits of Long-Term Regional Transmission Facilities to include provisions in their OATTs regarding their use of the portfolio approach.[1140]

b. Requests for Rehearing and Clarification

429. PIOs request rehearing of the Commission's decision in Order No. 1920 to not require transmission providers to use a portfolio approach when evaluating the benefits of Long-Term Regional Transmission Facilities.[1141] PIOs state that the record in this docket

---

omitted); *id.* at 37-41 (generic argument that failure to grant certain clarifications intrudes on state jurisdiction or may implicate the major questions doctrine, without discussion of discounting benefits).

[1139] *See supra* Statutory Authority section.

[1140] Order No. 1920, 187 FERC ¶ 61,068 at P 889.

[1141] PIOs Rehearing Request at 47 (citations omitted).

includes widespread commenter support and substantial evidence, ranging from expert reports to examples of existing processes, demonstrating the benefits of using a portfolio approach when evaluating the benefits of Long-Term Regional Transmission Facilities.[1142] PIOs argue that by allowing transmission providers to continue to evaluate the benefits of Long-Term Regional Transmission Facilities on a facility-by-facility basis, the Commission undermines Order No. 1920's central purpose of requiring planning for system-wide transmission needs on a comprehensive and regional basis and leaves in place unjust and unreasonable rates.[1143] PIOs state that the Commission could provide transmission providers with flexibility while meeting the goals of Order No. 1920 by establishing a rebuttable presumption that Long-Term Regional Transmission Facilities be assessed on a portfolio basis, which transmission providers could overcome by demonstrating that the portfolio approach is inapplicable in a particular instance.[1144]

430. Undersigned States[1145] and Designated Retail Regulators request rehearing of Order No. 1920's decision to allow transmission providers to use a portfolio approach when evaluating the benefits of Long-Term Regional Transmission Facilities.[1146]

[1142] *Id.* at 44-46.

[1143] *Id.* at 47.

[1144] *Id.* 47-48 (citing US DOE NOPR Initial Comments at 34-35).

[1145] Undersigned States note that the state of North Dakota does not join in the portion of Undersigned States' request for rehearing that addresses the final rule's determinations concerning the portfolio approach. Undersigned States Rehearing Request at 29 n.19.

[1146] Designated Retail Regulators Rehearing Request at 33-34; Undersigned States

Designated Retail Regulators and Undersigned States opine that the Commission should prohibit transmission providers from using the portfolio approach because, by allowing the bundling of economic and uneconomic facilities such that all facilities in a portfolio appear economic on a collective basis, the portfolio approach spreads uneconomic project costs to non-beneficiaries.[1147] Designated Retail Regulators and Undersigned States further argue that the portfolio approach results in the unjust and unreasonable recovery of costs exceeding benefits and that every facility approved for construction should be economic and meet the required benefits-to-cost ratio on a stand-alone basis.[1148]

c. Commission Determination

431. We are unpersuaded by PIOs', Undersigned States', and Designated Retail Regulators' requests for rehearing of the Commission's decision to allow, but not require, transmission providers in each transmission planning region to use a portfolio approach when evaluating the benefits of Long-Term Regional Transmission Facilities. We disagree with PIOs' arguments that the Commission's decision not to require transmission providers to use a portfolio approach undermines the goals or purpose of Order No. 1920 or leaves unjust and unreasonable rates in place.[1149] We continue to find

---

Rehearing Request at 29-30.

[1147] Designated Retail Regulators Rehearing Request at 34; Undersigned States Rehearing Request at 30.

[1148] Designated Retail Regulators Rehearing Request at 34; Undersigned States Rehearing Request at 30.

[1149] *See* PIOs Rehearing Request at 47.

that the advantages of a portfolio approach to evaluating benefits must be balanced against other considerations and that it is appropriate to provide transmission providers in each transmission planning region with flexibility as to whether to use a portfolio approach, subject to the requirement that transmission providers that propose to use a portfolio approach include provisions in their OATTs regarding their use of the portfolio approach.[1150]

432. Specifically, we find that the advantages of a portfolio approach to evaluating benefits—including administrative efficiencies related to economies of scale and a more stable or even distribution of benefits, which is likely to facilitate agreement on regional cost allocation—must be weighed against the fact that a portfolio approach may not be appropriate in all instances. For example, a facility-by-facility approach may be more appropriate if Long-Term Scenarios reveal the same or nearly identical constraints in discrete and isolated areas of the transmission system where system upgrades would be beneficial. We find that transmission providers are in the best position to determine in any given circumstance whether a portfolio or facility-by-facility approach to evaluate the benefits of Long-Term Regional Transmission Facilities is more appropriate.

[1150] Order No. 1920, 187 FERC ¶ 61,068 at PP 889-890. Order No. 1920 requires transmission providers that propose to use a portfolio approach to indicate in their proposed OATTs that they will use a portfolio approach. However, Order No. 1920 does not require transmission providers to indicate whether they will use a portfolio approach for all Long-Term Regional Transmission Facilities or only in certain specified instances, nor to describe how they will analyze the benefits of Long-Term Regional Transmission Facilities under a portfolio approach, as such requirements could impede transmission provider consideration and development of portfolio approaches. *Id.* P 889.

Therefore, we sustain the determination in Order No. 1920 to provide transmission providers in each transmission planning region with flexibility as to whether to use a portfolio approach, subject to the requirement that transmission providers that propose to use a portfolio approach when evaluating the benefits of Long-Term Regional Transmission Facilities include provisions in their OATTs regarding their use of the portfolio approach.

433. We are also unpersuaded by Designated Retail Regulators' and Undersigned States' requests that the Commission prohibit transmission providers from using a portfolio approach to evaluate the benefits of Long-Term Regional Transmission Facilities. We note that the Commission has previously accepted the use of the portfolio approach to the evaluation of transmission facilities.[1151] In response to Undersigned States' claim that the portfolio approach allocates uneconomic project costs to non-beneficiaries, we note that the measurement and use of the benefits of Long-Term Regional Transmission Facilities, whether on a portfolio or facility-by-facility basis, is a requirement for the evaluation of Long-Term Regional Transmission Facilities for the purposes of potential selection. Order No. 1920 provides transmission providers with flexibility as to the consideration of benefits in their cost allocation methods for Long-Term Regional Transmission Facilities, subject to the requirement that transmission

[1151] *Midwest Indep. Transmission Sys. Operator, Inc.*, 133 FERC ¶ 61,221, at PP 221-222 (2010), *order on reh'g and compliance filing*, 137 FERC ¶ 61,074 (2011), *aff'd in part, dismissed in part and remanded in part sub nom. Ill. Com. Comm'n v. FERC*, 721 F.3d 764, 780 (7th Cir. 2013).

providers demonstrate that such cost allocation methods allocate costs in a manner that is at least roughly commensurate with estimated benefits.[1152] Thus, Designated Retail Regulators' and Undersigned States' arguments that the portfolio approach to evaluation of benefits will result in the allocation of costs for uneconomic facilities are unfounded.

D. Evaluation and Selection of Long-Term Regional Transmission Facilities

1. Minimum Requirements

a. Order No. 1920 Requirements

434. In Order No. 1920, the Commission required transmission providers in each transmission planning region to include in their OATTs an evaluation process, including selection criteria, that they will use to identify and evaluate Long-Term Regional Transmission Facilities for potential selection to address Long-Term Transmission Needs.[1153] The Commission further held that the transmission developer of a selected Long-Term Regional Transmission Facility will be eligible to use the applicable cost allocation method for that Long-Term Regional Transmission Facility.

435. The Commission provided flexibility to transmission providers to propose, after consultation with Relevant State Entities and other stakeholders, evaluation processes, including selection criteria,[1154] provided that they (1) are transparent and not unduly

---

[1152] *See* Order No. 1920, 187 FERC ¶ 61,068 at PP 1478, 1506 (citing *ICC v. FERC I*, 576 F.3d at 477; *ICC v. FERC III*, 756 F.3d at 564).

[1153] Order No. 1920, 187 FERC ¶ 61,068 at P 911.

[1154] *Id.* P 924.

discriminatory;[1155] (2) aim to ensure that more efficient or cost-effective Long-Term Regional Transmission Facilities are selected to address Long-Term Transmission Needs;[1156] and (3) seek to maximize benefits accounting for costs over time without over-building transmission facilities.[1157]

436. As to the requirement that transmission providers' evaluation processes, including selection criteria, are transparent and not unduly discriminatory, the Commission explained that transmission providers' evaluation of Long-Term Regional Transmission Facilities must culminate in a determination that is sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility (or portfolio of Long-Term Regional Transmission Facilities) was selected or not selected.[1158] The Commission also explained that this determination must include the estimated costs and measured benefits of each Long-Term Regional Transmission Facility (or portfolio of Long-Term Regional Transmission Facilities) that transmission providers evaluated in the Long-Term Regional Transmission Planning process, regardless of whether the Long-Term Regional Transmission Facility (or portfolio of such Facilities) is selected.[1159] The Commission further explained that, where transmission providers employ a portfolio

[1155] *Id.* P 954.

[1156] *Id.* P 955.

[1157] *Id.* P 964.

[1158] *Id.* P 954

[1159] *Id.* PP 954, 966.

approach to evaluating and selecting Long-Term Regional Transmission Facilities, transmission providers may provide the measured benefits included in this determination on an aggregate basis.[1160]

437. As to the requirement that transmission providers' evaluation processes, including selection criteria, must aim to ensure that more efficient or cost-effective Long-Term Regional Transmission Facilities are selected to address Long-Term Transmission Needs, the Commission explained that evaluation processes must: (1) identify one or more Long-Term Regional Transmission Facilities (or portfolio of Long-Term Regional Transmission Facilities) that address the Long-Term Transmission Needs that transmission providers identify in Long-Term Regional Transmission Planning; (2) estimate the costs and measure the benefits of Long-Term Regional Transmission Facilities that are identified or proposed for potential selection; (3) designate a point in the evaluation process that is no later than three years following the beginning of the Long-Term Regional Transmission Planning cycle at which transmission providers will determine to select or not to select identified or proposed Long-Term Regional Transmission Facilities; and (4) culminate in determinations that are sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility (or portfolio of Long-Term Regional Transmission Facilities) was selected or not selected.[1161] The Commission also provided transmission providers with flexibility to

[1160] *Id.* P 966 n.2121.

[1161] *Id.* P 955. As to the identification of Long-Term Regional Transmission Facilities, Order No. 1920 requires, consistent with Order Nos. 890 and 1000, that

determine how they will evaluate whether Long-Term Regional Transmission Facilities more efficiently or cost-effectively address Long-Term Transmission Needs, including by using benefit-cost ratios, assessing their net benefits, and/or using some other method. Consistent with cost allocation principle (3), however, the Commission prohibited transmission providers from imposing as a selection criterion a minimum benefit-cost ratio that is higher than 1.25-to-1.00.[1162]

438. Finally, as to the requirement that transmission providers' evaluation processes, including selection criteria, must seek to maximize benefits accounting for costs over time without over-building transmission facilities, the Commission stated that transmission providers could adopt evaluation processes and selection criteria that would allow transmission providers to make selection decisions while addressing the uncertainty inherent in Long-Term Regional Transmission Planning. For example, transmission providers could include features that minimize the future risk of developing a previously selected Long-Term Regional Transmission Facility that is not the more efficient or cost-effective regional transmission solution to Long-Term Transmission Needs, such as by using a least-regrets or weighted-benefits approaches.[1163] The Commission explained

---

nonincumbent transmission developers be able to propose transmission facilities in Long-Term Regional Transmission Planning, and that therefore transmission providers make clear in their OATTs the point in the Long-Term Regional Transmission Planning evaluation process at which they will accept Long-Term Regional Transmission Facility proposals from stakeholders, including nonincumbent transmission developers. *Id.*

[1162] *Id.* P 958 (citation omitted).

[1163] *Id.* P 967. The Commission explained that, under a least-regrets approach, transmission providers would select Long-Term Regional Transmission Facilities if those

that, consistent with this requirement, transmission providers may not disregard benefits that they are required to use and measure, and may not do so even where those benefits only are measured under certain transmission system conditions.[1164] The Commission further explained that transmission providers may not adopt an approach under which a Long-Term Regional Transmission Facility would be required to meet the selection criteria in every Long-Term Scenario and sensitivity.[1165]

b. Requests for Rehearing and Clarification

439. NRECA argues that the Commission violated the APA's notice-and-comment requirements because the NOPR did not propose the "prescriptive" requirements set forth in Order No. 1920 related to the evaluation of Long-Term Regional Transmission Facilities.[1166] These include the requirement that transmission providers identify Long-Term Regional Transmission Facilities that address Long-Term Transmission Needs, estimate the costs and measure the benefits of such facilities, and designate a point in the evaluation process, no later than three years from the date when the Long-Term Regional

---

facilities are net beneficial in more than one Long-Term Scenario and sensitivity analysis even if other transmission facilities have a higher benefit-cost ratio or provide more net benefits in a single Long-Term Scenario or particular sensitivity. Under a weighted-benefits approach, transmission providers would select a Long-Term Regional Transmission Facility based on its probability-weighted average benefits, where probabilities have been assigned to each Long-Term Scenario or sensitivity thereof that is studied. *Id.*

[1164] *Id.* P 965.

[1165] *Id.* P 968.

[1166] NRECA Rehearing Request at 14.

Transmission Planning cycle begins, at which time the transmission provider will determine whether to select or not select those identified Long-Term Regional Transmission Facilities.[1167]

440. NRECA also requests that the Commission grant rehearing and require that transmission providers' selection criteria ensure the selection of Long-Term Regional Transmission Facilities that meet the reasonable needs of load-serving entities, which NRECA argues that they must do under FPA section 217(b)(4). Further, NRECA contends that FPA section 217(b)(4) requires that selection criteria enable load-serving entities to secure firm transmission rights (or equivalent tradable or financial rights) on a long-term basis for long-term power supply arrangements made, or planned, to meet such needs.[1168]

441. PIOs request rehearing of the Commission's determination to allow transmission providers to adopt benefit-cost ratios as high as 1.25-to-1.00 and request that the Commission require benefit-cost ratios no higher than 1.00-to-1.00. PIOs contend that a 1.25-to-1.00 benefit-cost ratio does not work in the context of scenario-based planning using a portfolio approach because some Long-Term Regional Transmission Facilities

[1167] NRECA Rehearing Request at 14-15 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 381, 955).

[1168] *See* NRECA Rehearing Request at 39-43. As with its arguments related to the discretion provided under Order No. 1920 for transmission providers to determine that factors in Factor Category Three may not affect Long-Term Transmission Needs, NRECA also argues with respect to selection criteria that the Commission should revisit its conclusion that *South Carolina Public Service Authority v. FERC* remains good law on the meaning of FPA section 217(b)(4). *Id.* at 40-41.

may, in isolation, be below 1.25-to-1.00 despite raising the value of a portfolio of Long-Term Regional Transmission Facilities above such a threshold.[1169] PIOs also argue that the measured benefits of certain Long-Term Regional Transmission Facilities may depend on the Long-Term Scenario or sensitivity within which benefits are measured, and that it does not make sense to apply a benefit-cost ratio threshold to Long-Term Regional Transmission Facilities whose benefits are not fixed.[1170]

442. ITC requests rehearing of the Commission's decision to allow, but not to require, transmission providers to adopt least-regrets approaches to selecting Long-Term Regional Transmission Facilities. ITC argues that, given other requirements in Order No. 1920, a least-regrets approach would hedge against the inherent uncertainty of Long-Term Regional Transmission Planning by ensuring that selected Long-Term Regional Transmission Facilities provide robust benefits over a wide variety of future system conditions.[1171]

443. Dominion states that Order No. 1920 is clear that transmission providers "*can* compare calculated benefits [of Long-Term Regional Transmission Facilities] to costs for purposes of project evaluation and selection."[1172] Dominion requests that the

---

[1169] PIOs Rehearing Request at 48-49 (citing PIOs NOPR Initial Comments, ex. A at 12-17).

[1170] *Id.* at 48-49.

[1171] ITC Rehearing Request at 11-12.

[1172] Dominion Rehearing Request at 25 (emphasis added) (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 955, 964-965).

Commission clarify that transmission providers may weigh measured benefits against "other factors" and that transmission providers may propose "what factors will be considered," provided that transmission providers' selection criteria are "sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility was selected or not selected."[1173] Dominion further requests that the Commission clarify what different "costs" transmission providers can consider and weigh against measured benefits beyond the direct costs of the construction and operation of the specific Long-Term Regional Transmission Facility. By way of example, Dominion explains that some Long-Term Regional Transmission Facilities may allow for the delivery of more generation to an area of high load demand, while also creating reliability issues on another transmission facility. If upgrades to that transmission facility are made in response to those reliability issues, Dominion requests clarification that transmission providers can consider the costs of those upgrades to be a "cost" of the Long-Term Regional Transmission Facility.[1174]

444. Finally, TAPS requests rehearing of the Commission's decision not to require that transmission providers calculate and provide to the transmission planning region's stakeholders TAPS's proposed "affordability metrics." TAPS explains that this proposed requirement would include the projected incremental transmission rate impact that each

[1173] *Id.* at 25-26 (punctuation omitted) (quoting Order No. 1920, 187 FERC ¶ 61,068 at P 737).

[1174] *Id.*

Long-Term Regional Transmission Facility would provide, if selected, and the projected total transmission rate that transmission customers would pay if all selected Long-Term Regional Transmission Facilities are placed in service. TAPS explains that transmission providers should make these calculations on the basis of the default *ex ante* Long-Term Regional Transmission Cost Allocation Method (in the absence of any state agreement), covering a period extending at least 20 years after the Long-Term Regional Transmission Facility is expected to be in commercial operation, and would be required to share their assumptions and calculations. TAPS explains that transmission providers should also provide a process for stakeholders to submit questions and verify information. TAPS argues that the Commission's rejection of affordability metrics was "conclusory" and did not satisfy the Commission's obligation to engage with comments.[1175]

c. Commission Determination

445. We disagree with the rehearing arguments submitted by NRECA. First, the Commission did not violate the APA's notice-and-comment requirements when it modified the NOPR proposal to be more "prescriptive"[1176] by requiring that the evaluation and selection processes that transmission providers propose must: (1) identify Long-Term Regional Transmission Facilities that address the Long-Term Transmission

[1175] TAPS Rehearing Request at 20-22 ("[T]he 'Commission cannot satisfy its mandate to engage with parties' comments by relying on conclusory statements that dismissed a party's concerns without providing reasoned analysis.'" (internal quotation and alteration omitted) (quoting *Cal. Pub. Utils. Comm'n v. FERC*, 20 F.4th 795, 804 (D.C. Cir. 2021)).

[1176] NRECA Rehearing Request at 14.

Needs they have identified;(2) estimate the costs and measure the benefits of such facilities; and (3) designate a point in the evaluation process when the transmission provider will determine whether to select or not select those facilities. Agency final rules need not be identical to proposed rules, and notice is sufficient if the final rule represents a "logical outgrowth" of the proposed rule.[1177]

446. The final rule is a logical outgrowth of the NOPR in this regard. The Commission described Long-Term Regional Transmission Planning in the NOPR as regional transmission planning that: (1) identifies transmission needs driven by changes in the resource mix and demand; (2) evaluates transmission facilities that meet such needs; and (3) identifies and evaluates such transmission facilities for potential selection to meet those needs.[1178] The NOPR also proposed to require that transmission providers' selection criteria "aim to ensure that more efficient or cost-effective transmission facilities are selected in the regional transmission plan for purposes of cost allocation to address transmission needs driven by changes in the resource mix and demand."[1179] In

[1177] *Long Island Care at Home, Ltd. v. Coke*, 551 U.S. 158, 174-75 (2007) (*Long Island Care*). *See also Am. Paper Inst. v. EPA*, 660 F.2d 954, 959 n.13 (4th Cir. 1981) ("An agency may make *even substantial changes* in its original proposed rule without a further comment period if the changes are in character with the original proposal and are a logical outgrowth of the notice and comments already given.") (emphasis added).

[1178] *See* NOPR, 179 FERC ¶ 61,028 at P 68. Order No. 1920 adopted a definition of Long-Term Transmission Needs that includes transmission needs driven by changes in the resource mix and demand. *See* Order No. 1920, 187 FERC ¶ 61,068 at P 299 (describing the drivers of Long-Term Transmission Needs as including changes in the resource mix and changes in demand).

[1179] NOPR, 179 FERC ¶ 61,028 at P 245.

Order No. 1920, the Commission modified the NOPR proposal "to provide additional clarity as to how transmission providers' evaluation processes must aim to ensure the selection of more efficient or cost-effective Long-Term Regional Transmission Facilities to address Long-Term Transmission Needs."[1180] The Commission then set forth procedural requirements that require transmission providers to meet the NOPR definition of Long-Term Regional Transmission Planning by: (1) identifying Long-Term Regional Transmission Facilities that address Long-Term Transmission Needs; (2) estimating the costs and measuring the benefits of such facilities as part of the evaluation process; and (3) designating a point when transmission providers will make a decision to select or not select such facilities.[1181] These additional procedural clarifications satisfy the logical outgrowth test because the requirements in Order No. 1920 achieve the same ends using very similar means to those proposed in the NOPR. Accordingly, we find that the evaluation requirements follow logically from the NOPR and that the NOPR adequately framed the subjects for discussion such that a reasonable member of the regulated class would anticipate the general aspects of the final rule.[1182]

447. Second, we disagree with NRECA's rehearing argument that, in order to satisfy FPA section 217(b)(4), the Commission must impose a specific requirement that

[1180] Order No. 1920, 187 FERC ¶ 61,068 at P 955.

[1181] *Id.*

[1182] *Conn. Light & Power Co. v. Nuclear Regul. Comm'n*, 673 F.2d 525, 533 (D.C. Cir. 1982); *Telesat Canada v. FCC*, 999 F.3d 707, 713-14 (D.C. Cir. 2021).

transmission providers' selection criteria ensure the selection of Long-Term Regional Transmission Facilities that meet the reasonable needs of load-serving entities and enable load-serving entities to secure firm transmission rights (or equivalent tradable or financial rights) on a long-term basis for long-term power supply arrangements made, or planned, to meet such needs. Fulfilling the requirements of FPA section 217(b)(4) does not require that the Commission impose the selection criterion that NRECA prefers, and we find that the criteria that the Commission required represent a superior and, in any case, just and reasonable and not unduly discriminatory or preferential approach to this issue. Moreover, the Commission explained in Order No. 1920 that, "[t]hrough the requirements of this final rule, we seek to ensure that adequate transmission capacity is built to allow load-serving entities to meet their service obligations and facilitate the planning of a reliable grid, consistent with FPA section 217(b)(4)."[1183]

448. We further disagree with the rehearing arguments submitted by PIOs, and we sustain the Commission's holding that, consistent with Order No. 1000 regional cost allocation principle (3), transmission providers may not impose as a selection criterion a minimum benefit-cost ratio that is higher than 1.25-to-1.00.[1184] We do not agree with

[1183] Order No. 1920, 187 FERC ¶ 61,068 at P 1001. *See also id.* PP 283, 447 (discussing Commission's obligations under FPA section 217(b)(4) and its application to Order No. 1920). We also reject NRECA's argument that the Commission should revisit its conclusion that *South Carolina Public Service Authority v. FERC* remains good law for the same reasons provided in the Other Specific Required Categories of Factors section above.

[1184] *Id.* P 958.

PIOs that this holding is inconsistent with the use of a portfolio approach to selecting Long-Term Regional Transmission Facilities. While PIOs are correct that the benefits of Long-Term Regional Transmission Facilities may depend on the Long-Term Scenario or sensitivity in which they are measured, Order No. 1920 does not require transmission providers to apply benefit-cost ratios within specific Long-Term Scenarios or sensitivities.[1185] Further, the fact that the measured benefits of Long-Term Regional Transmission Facilities may differ among the Long-Term Scenarios or sensitivities studied does not render the use of benefit-cost ratios incompatible with Long-Term Regional Transmission Planning. In fact, the least-regrets and weighted-benefits approaches to selecting Long-Term Regional Transmission Facilities described in Order No. 1920 are examples of how transmission providers may make selection decisions notwithstanding the fact that the measured benefits of Long-Term Regional Transmission Facilities may differ depending on the Long-Term Scenario or sensitivity in which they are measured.[1186]

449. We also disagree with the rehearing arguments advanced by ITC. While we agree with ITC that a least-regrets approach to selecting Long-Term Regional Transmission

[1185] *See id.* P 956 (requiring transmission providers to make transparent the methods that they used to analyze each individual Long-Term Scenario and the sensitivity or sensitivities applied to each scenario to determine the Long-Term Transmission Needs that exist in the transmission planning region, the Long-Term Regional Transmission Facilities that would resolve those needs, and the benefits of those Long-Term Regional Transmission Facilities for purposes of selection).

[1186] *Id.* P 967. *See infra* Benefits Horizon section.

Facilities may allow transmission providers to address the inherent uncertainty of Long-Term Regional Transmission Planning, we disagree that this is the only such approach,[1187] and therefore we sustain the Commission's holding that transmission providers are not required to use this approach.[1188] Generally, the Commission attempted in Order No. 1920 to ensure that transmission providers have the flexibility that they need to develop evaluation processes, including selection criteria, that meet the minimum requirements set forth in Order No. 1920, and we are not persuaded by PIOs or ITC to limit that flexibility here, either by reducing the maximum benefit-cost ratio that transmission providers may propose to use as a selection criterion in Long-Term Regional Transmission Planning or by requiring a particular selection approach.

450. We grant clarification, in part, to Dominion. As an initial matter, we clarify that transmission providers' evaluation processes must—not can—compare the measured benefits of Long-Term Regional Transmission Facilities against their estimated costs.[1189]

[1187] *See id.* P 967 (describing least-regrets *and* weighted-benefits approaches to selecting Long-Term Regional Transmission Facilities as potential methods to manage uncertainty).

[1188] *Id.* P 968.

[1189] *See id.* P 955 ("Second, transmission providers' evaluation processes must estimate the costs and measure the benefits of the Long-Term Regional Transmission Facilities (or portfolio of such Facilities) that are identified or proposed for potential selection, *in addition* to evaluating the identified Long-Term Regional Transmission Facilities (or portfolio of such Facilities) using any qualitative or other quantitative selection criteria that the transmission providers in a transmission planning region propose to apply." (emphasis added)); *id.* P 964 (requiring transmission providers to propose evaluation processes, including selection criteria, that seek to *maximize benefits accounting for costs* over time without over-building transmission facilities) (emphasis

The purpose of such a comparison is for transmission providers to determine the benefits of Long-Term Regional Transmission Facilities for purposes of applying the transmission provider's selection criteria.[1190] We further clarify that, once a transmission provider makes a selection decision, i.e., for each selected Long-Term Regional Transmission Facility (or portfolio of such Facilities), and, if a State Agreement Process is used, once a cost allocation method is agreed upon, transmission providers must make available, on a password-protected portion of OASIS or other password-protected website, a breakdown of how those estimated costs will be allocated, by zone (i.e., by transmission provider retail distribution service territory/footprint or RTO/ISO transmission pricing zone), and a quantification of those estimated benefits as imputed to each zone, as such benefits can be reasonably estimated. The increase in transparency from this posting requirement ensures that transmission providers make available information that is sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility was selected or not selected. As to Dominion's request that the Commission clarify what—aside from project costs—transmission providers may compare to measured benefits, we reiterate here that transmission providers may propose qualitative measures in their evaluation processes or qualitative selection criteria,[1191]

---

added).

[1190] *See id.* P 956 (holding that transmission providers must make clear the methods they used to analyze the benefits of Long-Term Regional Transmission Facilities for purposes of selection).

[1191] *Id.* P 961.

provided that they meet the minimum requirements set forth in Order No. 1920 with which transmission providers' evaluation processes, including selection criteria, must comply.[1192] We further clarify that, contrary to Dominion's understanding,[1193] transmission providers' evaluation processes must culminate in a *determination*—not selection criteria—that is sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility (or portfolio of such Facilities) was selected or not selected.[1194] Finally, we clarify that the Commission generally provides transmission providers with the discretion to use engineering judgment in designing and conducting transmission planning studies, and we therefore decline to address Dominion's hypothetical in the abstract.

451. Finally, we are not persuaded by the arguments raised on rehearing by TAPS regarding its proposed "affordability metrics." We find that the potential benefits of requiring that transmission providers make these metrics available are outweighed by the potential burden on transmission providers, who would need to determine on a customer-by-customer basis the effect on incremental rates of a wide variety of rate design and cost recovery factors in order to produce a meaningful analysis. Therefore, we decline to

[1192] *See id.* PP 954-971.

[1193] *See* Dominion Rehearing Request at 26 ("Dominion Energy understands that the Final Rule gives Transmission Providers an opportunity to propose what factors will be considered so long as the *selection criteria* is 'sufficiently detailed to understand why a particular Long-Term Regional Transmission Facility . . . was selected or not selected.") (quoting Order No. 1920, 187 FERC ¶ 61,068 at P 737) (emphasis added).

[1194] Order No. 1920, 187 FERC ¶ 61,068 at PP 737, 954-955, 966, 1214.

adopt any requirement to calculate and make available the "affordability metrics" as described by TAPS. However, even though we do not require transmission providers to calculate rate impacts, as discussed above, we do require transparency regarding the allocation of costs after Long-Term Transmission Facilities are selected.

2. Role of Relevant State Entities

a. Order No. 1920 Requirements

452. In Order No. 1920, the Commission required transmission providers in each transmission planning region to consult with and seek support from Relevant State Entities regarding the evaluation process, including selection criteria, that transmission providers propose to use to identify and evaluate Long-Term Regional Transmission Facilities for selection.[1195] The Commission declined to adopt the NOPR proposal to require that transmission providers include in their OATTs a process to coordinate with the transmission planning region's Relevant State Entities in developing selection criteria.[1196] Instead, the Commission required transmission providers to demonstrate on compliance that they made good faith efforts to consult with and seek support from Relevant State Entities in their transmission planning region's footprint when developing the evaluation processes and selection criteria that they propose to include in their OATTs.[1197] The Commission did not require transmission providers to obtain the support

[1195] *Id.* P 994.

[1196] *Id.* P 995.

[1197] *Id.* P 994.

of Relevant State Entities before proposing evaluation processes and selection criteria on compliance.[1198]

b. Requests for Rehearing and Clarification

453. Several parties request rehearing or clarification of Order No. 1920's requirements related to the role that Relevant State Entities will play in developing the evaluation processes, including selection criteria, that transmission providers will propose.[1199]

454. Designated Retail Regulators claim that the Commission violated the APA's notice-and-comment requirements because the NOPR required that states approve the selection criteria that transmission providers will propose to use in Long-Term Regional Transmission Planning, whereas the Commission did not require transmission providers to obtain their support in Order No. 1920. As such, Designated Retail Regulators conclude that Order No. 1920 is not a logical outgrowth of the NOPR proposal because it is "surprisingly distant" from the NOPR.[1200] Similarly, NRECA argues that Order No. 1920 is not a logical outgrowth of the NOPR because the Commission declined to adopt the NOPR proposal that transmission providers include a formal tariff process for

[1198] *Id.* P 996.

[1199] Arizona Commission Rehearing Request at 16; Designated Retail Regulators Rehearing Request at 48-50; NARUC Rehearing Request at 17-21; NESCOE Rehearing Request at 12; NRECA Rehearing Request at 6, 17-19.

[1200] Designated Retail Regulators Rehearing Request at 48-50 (quoting *Int'l Union, United Mine Workers of Am. v. Mine Safety & Health Admin.*, 407 F.3d 1250, 1260 (D.C. Cir. 2005)).

coordinating with Relevant State Entities regarding transmission providers' selection criteria.[1201]

455. Arizona Commission argues that the Commission erred in not requiring transmission providers to obtain the agreement of the State of Arizona as to the evaluation processes, including selection criteria, that transmission providers will propose, and requests rehearing because the Commission did not offer any legitimate legal reason or sufficient justification for not requiring such state approval. Arizona Commission asserts that states alone have the inherent police power to regulate the utilities within their states and that the final rule improperly eliminates the State of Arizona's role with respect to selection criteria.[1202] NARUC requests that the Commission grant rehearing such that transmission providers would be required to include in their compliance filings any selection criteria that are "promulgated and supported" by Relevant State Entities.[1203]

456. Finally, NESCOE requests that the Commission clarify Order No. 1920 to provide guidance as to what constitutes "good faith efforts" on the part of transmission providers as they consult with and seek support from Relevant State Entities. NESCOE requests further clarification that the requirement that transmission providers "consult with" Relevant State Entities means that there is an "unambiguous pathway" for states'

[1201] NRECA Rehearing Request at 6, 17-19.

[1202] *See* Arizona Commission Rehearing Request at 16.

[1203] NARUC Rehearing Request at 17.

feedback to be heard and taken into account. Further, NESCOE observes that "consult with" can mean a range of things, from an offer of a one-hour meeting to preview potential selection criteria to interactive and substantive discussions, and it requests that the Commission confirm that the obligation to consult with Relevant State Entities means something more consequential than the former.[1204]

c. Commission Determination

457. We disagree with the arguments raised on rehearing by Designated Retail Regulators and NRECA that Order No. 1920 is not a logical outgrowth of the NOPR proposal. In particular, we disagree with Designated Retail Regulators that the NOPR proposed to require that states approve transmission providers' selection criteria.[1205] Instead, the NOPR proposed to require that transmission providers "coordinate" with Relevant State Entities in developing selection criteria, and the Commission explained that this would mean that transmission providers "must consult with and seek support from" Relevant State Entities.[1206] Neither statement can be construed as imposing a requirement that states approve the selection criteria to be proposed by transmission providers on compliance. In any event, the Commission adopted the exact proposal from the NOPR, namely, that transmission providers must consult with and seek support from

[1204] NESCOE Rehearing Request at 12.

[1205] Designated Retail Regulators Rehearing Request at 48-49.

[1206] *See* NOPR, 179 FERC ¶ 61,028 at PP 241, 244.

Relevant State Entities, which was subject to a notice and comment period, as required under the APA.

458. Further, while NRECA is correct that in Order No. 1920, the Commission declined to adopt the NOPR proposal for transmission providers to propose on compliance OATT provisions providing for a "process" to coordinate with Relevant State Entities in developing selection criteria,[1207] this does not mean that Order No. 1920 is not a logical outgrowth of the NOPR proposal in this regard. As the D.C. Circuit has explained, "[o]ne logical outgrowth of a proposal is surely . . . to refrain from taking the proposed step."[1208] The same is true here. Further, the Commission required that transmission providers demonstrate good faith efforts as they consult with and seek support from Relevant State Entities.[1209] We continue to believe that these requirements are sufficient to ensure that transmission providers benefit from Relevant State Entities' views. Nevertheless, we note that Order No. 1920 does not prohibit transmission providers from adopting additional approaches for coordinating with Relevant State

[1207] NRECA Rehearing Request at 17-18.

[1208] *N.Y. v. EPA*, 413 F.3d 3, 44 (D.C. Cir. 2005) (per curiam) (quoting *Am. Iron & Steel Inst. v. EPA*, 886 F.2d 390, 400 (D.C. Cir. 1989)). *See also Long Island Care*, 551 U.S. at 175 (stating, in the context of rejecting claims that an agency provided legally defective notice because it did not finalize a proposed rule, "[w]e do not understand why such a possibility was not reasonably foreseeable"); *Vanda Pharms., Inc. v. Ctrs. for Medicare & Medicaid Servs.*, 98 F.4th 483, 498 (4th Cir. 2024) (*Vanda Pharms*) (The APA's "notice-and-comment procedure is designed so that an agency can float a potential rule to the public without committing itself to enacting the proposed rule's content").

[1209] Order No. 1920, 187 FERC ¶ 61,068 at P 994.

Entities regarding selection criteria and/or consulting with Relevant State Entities in the selection of particular Long-Term Regional Transmission Facilities, and we encourage transmission providers to do so.[1210]

459. We also disagree with the rehearing arguments of Arizona Commission and NARUC. Arizona Commission incorrectly claims that the Commission did not offer any "legitimate legal or sufficient justification" for not requiring state approval of evaluation processes.[1211] As the Commission explained, it is transmission providers who must propose on compliance an evaluation process and selection criteria that comply with the requirements of Order No. 1920, because Long-Term Regional Transmission Planning is the tariff obligation of each transmission provider.[1212] As the Commission further explained, achieving consensus may not be possible in every instance, and transmission providers nevertheless must submit compliance filings consistent with Order No. 1920

[1210] *Id.* PP 994, 996. We reiterate, however, that transmission providers may not include in their evaluation process or selection criteria any prohibition on the selection of a Long-Term Regional Transmission Facility based on the transmission providers' anticipated response of a state public utility commission or consumer advocates to particular Long-Term Regional Transmission Facilities. *Id.* P 962. Doing so would deny transmission providers the opportunity to select more efficient or cost-effective Long-Term Regional Transmission Facilities to meet Long-Term Transmission Needs, and therefore may lead to failing to address the deficiencies in the Commission's existing regional transmission planning requirements identified in Order No. 1920. *Id.* P 914.

[1211] *See* Arizona Commission Rehearing Request at 16.

[1212] Order No. 1920, 187 FERC ¶ 61,068 at P 996 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 153 ("[T]he ultimate responsibility for transmission planning remains with . . . transmission providers.")).

and the compliance timelines set forth therein.[1213] We deny NARUC's request to require transmission providers to include in their compliance filings any selection criteria that are "promulgated and supported" by Relevant State Entities. That said, we continue to believe that Long-Term Regional Transmission Planning is more likely to be successful where transmission providers, Relevant State Entities, and other stakeholders collaborate to develop an evaluation process and selection criteria.[1214] As such, we strongly encourage transmission providers to consider any selection criteria supported by Relevant State Entities.

460. Finally, we grant in part NESCOE's requests for clarification. We believe that "good faith efforts" is a reasonably well-understood standard that parties use in their contractual dealings with one another.[1215] We further believe that the good faith efforts standard is similar to a "reasonable efforts" standard, which can be defined as "one or more actions rationally calculated to achieve a usually stated objective, but not

[1213] *Id.* P 996.

[1214] *Id.* P 996.

[1215] *See Zady Natey, Inc. v. United Food & Comm. Workers Int'l Union, Loc. No. 27*, 995 F.2d 496, 499-500 (4th Cir. 1993) (determining whether contractual counterparty made good faith efforts to perform obligation on the basis of facts developed in adjudicating contractual dispute); *Creative Mktg. Assocs., Inc. v. AT&T*, 476 F.3d 536, 538-39 (8th Cir. 2007) (same); *Zinn v. Parrish*, 644 F.2d 360, 366 (7th Cir. 1981) (same); *Taco Bell Corp. v. necessarily with the expectation that all possibilities are to be exhausted."[1216] We expect that transmission providers can determine how to apply the "good faith efforts" standard as they consult with and seek support from Relevant State Entities as to the evaluation processes and selection criteria they will use in Long-Term Regional Transmission Planning. Therefore, we find that Order No. 1920 requires transmission providers to provide opportunities for Relevant State Entities to provide input on those proposed processes and to consider that feedback.[1217] We otherwise deny clarification and decline to address NESCOE's hypothetical interpretation of the standard.

3. Voluntary Funding

a. Order No. 1920 Requirements

461. In Order No. 1920, the Commission required transmission providers in each transmission planning region to include in their OATTs a process to provide Relevant State Entities and interconnection customers with the opportunity to voluntarily fund the cost of, or a portion of the cost of, a Long-Term Regional Transmission Facility that otherwise would not meet transmission providers' selection criteria.[1218]

[1216] *Reasonable Efforts*, Black's Law Dictionary (12th ed. 2024).

[1217] As the Commission explained in Order No. 1920, however, the transmission provider's failure to obtain Relevant State Entities' support is not necessarily evidence that transmission providers did not exercise good faith efforts to seek their support. Order No. 1920, 187 FERC ¶ 61,068 at P 997.

[1218] *Id.* P 1012.

462. The Commission provided transmission providers with flexibility to propose certain features of such a voluntary funding process in their compliance filings, provided that: (1) the process is transparent and not unduly discriminatory or preferential; and (2) they consult with and seek support from Relevant State Entities when developing such processes.[1219]

463. The Commission further required that transmission providers' proposed OATT provisions must describe: (1) the process by which transmission providers will make voluntary funding opportunities available to Relevant State Entities and interconnection customers, which must ensure that they receive timely notice and a meaningful opportunity; (2) the period during which Relevant State Entities and interconnection customers may exercise the voluntary funding option; (3) the method that transmission providers will use to determine the amount of voluntary funding required to ensure that the Long-Term Regional Transmission Facility meets the transmission providers' selection criteria; and (4) the mechanism through which transmission providers and Relevant State Entities or interconnection customers will memorialize any voluntary funding agreement.[1220] Finally, the Commission explained that, for any portion of the costs of a selected Long-Term Regional Transmission Facility that is not voluntarily funded, such remaining costs must be allocated according to either the applicable Long-

[1219] *Id.*

[1220] *Id.* P 1013.

Term Regional Transmission Cost Allocation Method or a cost allocation method resulting from a State Agreement Process.[1221]

b. Requests for Rehearing and Clarification

464. SERTP Sponsors request that the Commission clarify that the requirement in Order No. 1920 that transmission providers include in their OATTs a process to provide Relevant State Entities and interconnection customers with voluntary funding opportunities does not imply that the Commission otherwise is prohibiting voluntary funding in other circumstances.[1222]

c. Commission Determination

465. In response to SERTP Sponsors' request for clarification, we reiterate that Order No. 1920 does not prohibit voluntary funding approaches that are not described therein.[1223] Transmission providers may seek to demonstrate on compliance that other voluntary funding approaches are consistent with or superior to Order No. 1920's requirements, or they may submit a filing under FPA section 205 to propose such approaches.[1224]

[1221] *Id.*

[1222] SERTP Sponsors Rehearing Request at 8. SERTP Sponsors further contend that, if the Commission fails to clarify that Order No. 1920 does not prohibit voluntary funding in other circumstances, Order No. 1920 would be arbitrary and capricious and exceed the Commission's authority. *Id.*

[1223] Order No. 1920, 187 FERC ¶ 61,068 at P 1017.

[1224] *Id.* It is unclear whether SERTP Sponsors intended to argue that failure to grant clarification in this respect would result in Order No. 1920 exceeding the Commission's authority; to the extent they intended to do so, we find this argument has

4. No Selection Requirement

a. Order No. 1920 Requirements

466. In Order No. 1920, the Commission stated that it would not require transmission providers to select any particular Long-Term Regional Transmission Facility, even where it meets the transmission provider's selection criteria.[1225] The Commission also prohibited transmission providers from adopting an approach under which they would not select a Long-Term Regional Transmission Facility unless it meets their selection criteria in every Long-Term Scenario and sensitivity.[1226]

b. Requests for Rehearing and Clarification

467. SERTP Sponsors request clarification that the Commission's statement, i.e., that "transmission providers may not adopt an approach under which they would not select a Long-Term Regional Transmission Facility unless it meets their selection criteria in every Long-Term Scenario and sensitivity," does not undercut the Commission's determination that Order No. 1920 does not require a transmission provider to select any Long-Term Regional Transmission Facility, even where it meets the transmission provider's selection criteria.[1227] PJM also requests that the Commission clarify that PJM

---

not been raised with the specificity required on rehearing. *See supra* Major Questions Doctrine section.

[1225] Order No. 1920, 187 FERC ¶ 61,068 at P 1026 (citations omitted).

[1226] *Id.* P 968.

[1227] SERTP Sponsors Rehearing Request at 9-10 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 968, 1026).

is not required to select Long-Term Regional Transmission Facilities under any of the Long-Term Scenarios that it develops.[1228]

c. Commission Determination

468. In response to SERTP Sponsors' and PJM's requests for clarification, we clarify that Order No. 1920 does not require transmission providers to select any Long-Term Regional Transmission Facility, even where it meets the transmission providers' selection criteria.[1229]

5. Reevaluation

a. NOPR Proposal

469. The Commission proposed in the NOPR that, consistent with Order No. 1000, the developer of a transmission facility selected through Long-Term Regional Transmission Planning to address transmission needs driven by changes in the resource mix and demand would be eligible to use the applicable cost allocation method for the Long-Term Regional Transmission Facility. The Commission proposed that the existing transmission developer requirements would apply, including that the developer of the selected regional transmission facility must submit a development schedule that indicates the required steps, such as the granting of state approvals necessary to develop and construct the transmission facility such that it meets the transmission needs of the

[1228] PJM Rehearing Request at 19.

[1229] Order No. 1920, 187 FERC ¶ 61,068 at P 1026.

transmission planning region.[1230] The Commission proposed that, to the extent the Relevant State Entities in a transmission planning region agree to a State Agreement Process, the development schedule should also include relevant steps related to that process.[1231]

470. The Commission noted that, given the longer-term nature of transmission needs driven by changes in the resource mix and demand, the required development schedule for a transmission facility selected may make it unnecessary for the developer to take actions or incur expenses in the near-term if the transmission facility will not need to be in service in the near-term. The Commission also noted that a transmission provider may make that Long-Term Regional Transmission Facility's selection status subject to the outcomes of subsequent Long-Term Regional Transmission Planning cycles, such that the previously selected transmission facility is no longer needed. The Commission proposed that transmission providers include in their selection criteria how they will

[1230] NOPR, 179 FERC ¶ 61,028 at P 247 (citing Order No. 1000-A, 139 FERC ¶ 61,132 at P 442). The Commission also stated in Order No. 1000-A that, as part of the ongoing monitoring of the progress of a transmission facility once it is selected, the transmission providers in a transmission planning region must establish a date by which state approvals to construct must have been achieved that is tied to when construction must begin to timely meet the need that the facility is selected to address. The Commission stated that if such critical steps have not been achieved by that date, then the transmission providers in a transmission planning region may "remove the transmission project from the selected category and proceed with reevaluating the regional transmission plan to seek an alternative solution." Order No. 1000-A, 139 FERC ¶ 61,132 at P 442.

[1231] NOPR, 179 FERC ¶ 61,028 at P 247.

address the selection status of a previously selected transmission facility based on the outcomes of subsequent Long-Term Regional Transmission Planning cycles.1232

b. Order No. 1920 Requirements

471. In Order No. 1920, the Commission required transmission providers to include in their OATTs provisions that require them to reevaluate previously selected Long-Term Regional Transmission Facilities in three situations, where: (1) delays in the development of a previously selected Long-Term Regional Transmission Facility would jeopardize a transmission provider's ability to meet its reliability needs or reliability-related service obligations; (2) the actual or projected costs of a previously selected Long-Term Regional Transmission Facility significantly exceed cost estimates used in that Long-Term Regional Transmission Facility's selection; or (3) significant changes in federal, federally-recognized Tribal, state, or local laws or regulations cause reasonable concern that a previously selected Long-Term Regional Transmission Facility may no longer meet the transmission provider's selection criteria.[1233] The Commission further required transmission providers to include in these reevaluation provisions the specific criteria they will use to determine when one of these situations occurs.[1234]

472. With respect to reevaluation on the basis of development delays, the Commission explained that Order No. 1920's requirement is the same requirement as that set forth by

[1232] *Id.* P 248.

[1233] Order No. 1920, 187 FERC ¶ 61,068 at PP 1048-1049.

[1234] *Id.* P 1050.

the Commission in Order No. 1000.[1235] The Commission explained that, as is required for regional transmission planning processes under Order No. 1000, transmission providers must have the ability to take action when delays in developing a Long-Term Regional Transmission Facility risk jeopardizing a transmission provider's ability to meet its reliability needs or reliability-related service obligations.[1236]

473. The Commission provided transmission providers with the flexibility to develop these reevaluation criteria1237 provided that, with respect to reevaluation on the basis of significant changes in federal, federally-recognized Tribal, state, or local laws or regulations, transmission providers may not reevaluate a previously selected Long-Term Regional Transmission Facility unless its targeted in-service date was in the latter half of the 20-year transmission planning horizon when it was selected.[1238] The Commission also required that the reevaluation criteria seek to maximize benefits accounting for costs over time without over-building transmission facilities. The Commission further explained that it expected transmission providers to balance the need to provide

[1235] *Id.* P 1049 n.2250. *See id.* P 1033 & n.2224 (explaining that the Commission proposed in the NOPR that existing transmission developer requirements would apply to Long-Term Regional Transmission Planning and that, if a transmission facility's developer did not achieve development milestones, transmission providers may remove that facility from the regional transmission plan and reevaluate the regional transmission plan to seek an alternative solution).

[1236] *Id.* P 1056.

[1237] *Id.*

[1238] *Id.* P 1051.

transmission developers with adequate investment certainty, absent which more efficient or cost-effective Long-Term Regional Transmission Facilities will not be developed, against the risk that, due to significant changes in circumstances, failing to reevaluate a selected Long-Term Regional Transmission Facility may result in the over-building of transmission.[1239] The Commission also required transmission providers to designate a point after which all selected Long-Term Regional Transmission Facilities will no longer be subject to reevaluation—e.g., when the facility's transmission developer has secured all relevant permits and authorizations—such that the transmission developer of the selected Long-Term Regional Transmission Facility has adequate certainty to make investment decisions.[1240]

474. The Commission further required transmission providers to include in their OATTs provisions detailing the process and procedures they will use to reevaluate a previously selected Long-Term Regional Transmission Facility, including the potential outcomes of reevaluation (e.g., taking no action, imposing a mitigation plan, reassigning the Long-Term Regional Transmission Facility to a different transmission developer, modifying the Long-Term Regional Transmission Facility, or removing the Long-Term Regional Transmission Facility from the regional transmission plan), and in particular the

[1239] *Id.* P 1050.

[1240] *Id.*

conditions under which they would remove a previously selected Long-Term Regional Transmission Facility from the regional transmission plan.[1241]

475. The Commission otherwise allowed flexibility as to the design of the reevaluation processes and procedures, subject to three requirements.[1242] First, the Commission stated that any reevaluation on the basis of cost increases or of significant changes in federal, federally-recognized Tribal, state, or local laws or regulations must occur in a subsequent Long-Term Regional Transmission Planning cycle and must take into account not only the updated costs but also the updated benefits of the Long-Term Regional Transmission Facility.[1243] The Commission stated that, when performing these reevaluations, it expected that transmission providers will use the updated Long-Term Scenarios and associated transmission system models that are developed for the Long-Term Regional Transmission Planning cycle in which the transmission provider reevaluates the selected Long-Term Regional Transmission Facility.[1244] Second, the Commission required

[1241] *Id.* P 1052 (citing MISO, FERC Electric Tariff, MISO OATT, attach. FF (Transmission Expansion Planning Protocol) (90.0.0), § IX.E, which sets forth potential outcomes of MISO's variance analysis procedures).

[1242] *Id.*

[1243] *Id.*; *see also id.* P 1059 (explaining that the requirement that the reevaluation processes and procedures update not only actual and projected costs but also their calculation of the benefits of the selected Long-Term Regional Transmission Facility will ensure that transmission providers compare the updated costs and benefits when determining whether the Long-Term Regional Transmission Facility continues to be a more efficient or cost-effective regional transmission solution to Long-Term Transmission Needs).

[1244] *Id.* P 1052 n.2254.

transmission providers to include in the reevaluation processes and procedures mechanisms for tracking the costs of Long-Term Regional Transmission Facilities.[1245] Third, the Commission required that the reevaluation processes and procedures seek to maximize benefits accounting for costs over time without over-building transmission facilities.1246

c. Requests for Rehearing and Clarification

i. Logical Outgrowth

476. Several parties argue that the Commission did not provide sufficient notice of, and opportunity to comment on, Order No. 1920's reevaluation requirements.1247 For example, EEI claims that the Commission cannot require transmission providers to adopt OATT provisions that require them to reevaluate previously selected Long-Term Regional Transmission Facilities without providing notice of and an opportunity to comment on these requirements.1248 EEI argues that Order No. 1920's reevaluation requirements are not within the scope of the NOPR's reevaluation proposal and therefore were not "reasonably foreseeable" by interested parties and that these requirements

[1245] *Id.* P 1052.

[1246] *Id.*

[1247] East Kentucky Rehearing Request at 1-2; EEI Rehearing Request at 4-11; ITC Rehearing Request at 16; MISO TOs Rehearing Request at 8, 19-22; NRECA Rehearing Request at 13-15, 22; WIRES Rehearing Request at 2-4, 6-16.

[1248] EEI Rehearing Request at 5.

cannot stand because they are not a logical outgrowth of the NOPR proposal.[1249] EEI notes that the Commission stated in Order No. 1920 that a number of parties expressed support for the reevaluation requirements in their NOPR comments but contends that applicable precedent makes clear that comments on the proposed rule are not a substitute for the Commission itself providing notice of its intention to impose these requirements.[1250] EEI further notes that the Commission has invited consideration of the reevaluation of previously selected transmission facilities in a different proceeding and states that it would have been more appropriate for the Commission to have acted in that proceeding rather than in Order No. 1920 because the NOPR lacked any description of the range of reevaluation alternatives.[1251] EEI states that it does not oppose "reasonable mechanisms" to protect consumers from over-building Long-Term Regional Transmission Facilities and from the possibility of building transmission facilities that may not be cost-effective, but asserts that the appropriate remedy in this instance is to return to the NOPR proposal.[1252]

477. NRECA argues that Order No. 1920 departs from the NOPR proposal by adopting "completely new" requirements for the reevaluation of previously selected Long-Term

[1249] *Id.* at 6-7 (citing *Brennan v. Dickson*, 45 F.4th at 69-70).

[1250] *Id.* (citing *Small Refiner Lead Phase-Down Task Force v. EPA*, 705 F.2d 506, 549 (D.C. Cir. 1983)).

[1251] *Id.* at 10 (citing Notice Inviting Post-Technical Conference Comments, *Transmission Planning and Cost Mgmt.*, Docket No. AD22-8-000, et al. (Dec. 23, 2022)).

[1252] *Id.* at 10-11.

Regional Transmission Facilities.[1253] NRECA contends that the reevaluation requirements result in an "inflexible, final selection of Long-Term Regional Transmission Facilities for purposes of regional cost allocation in the first three years of each Long-Term Regional Transmission Planning cycle."[1254] NRECA recommends that, to ensure compliance with the APA's notice-and-comment requirements, the Commission withdraw the final rule and issue a supplemental NOPR.[1255]

478. WIRES asserts that the NOPR did not provide notice to interested parties of Order No. 1920's "detailed and prescriptive" reevaluation requirements and that these requirements represent major changes from the NOPR proposal.[1256] WIRES asserts that the reevaluation requirements are significant because they could lead to modifying Long-Term Regional Transmission Facilities or removing them from the regional transmission plan, and, as such, the Commission should have clearly and unambiguously set forth a proposal in the NOPR before adopting Order No. 1920's reevaluation requirements.[1257] WIRES alleges that instead, the Commission adopted "almost word-for-word" a proposal

[1256] WIRES Rehearing Request at 3-5.

[1257] *Id.* at 2-4.

submitted in comments by Large Public Power without first providing notice of and an opportunity to comment on this proposal.[1258]

479. Several rehearing parties contend that, while the NOPR proposed a structure that would permit but not require transmission providers to reevaluate previously selected Long-Term Regional Transmission Facilities, Order No. 1920 requires that transmission providers do so and includes a number of prescriptive requirements that were not included in the NOPR.[1259] MISO TOs argue that Order No. 1920 states that it adopted with modification the NOPR proposal, despite the fact that the NOPR proposed a "flexible and open-ended opportunity" in accordance with which transmission providers could have tailored their compliance proposals, whereas Order No. 1920's reevaluation requirements are "a wholly new and tightly prescriptive process with new triggering events and new requirements for reassessing facilities."[1260] WIRES notes that the NOPR did not use the term "reevaluate," that it proposed to provide flexibility for transmission providers to propose their own processes, and did not include any relevant details or requirements other than to propose that transmission providers "should include in their selection criteria how they will address the selection status of a previously

[1258] *Id.* at 10.

[1259] *See, e.g.*, EEI Rehearing Request at 7-8; WIRES Rehearing Request at 7-8.

[1260] MISO TOs Rehearing Request at 21-22 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1048).

selected transmission facility based on the outcomes of subsequent Long-Term Regional Transmission Planning cycles."[1261]

480. Several parties acknowledge that, in setting forth Order No. 1920's reevaluation requirements, the Commission cited the NOPR proposal that would have allowed transmission providers to make the selection status of previously selected Long-Term Regional Transmission Facilities subject to the outcome of subsequent Long-Term Regional Transmission Planning cycles,[1262] but contend nonetheless that that notice was inadequate. EEI states that the NOPR proposal contained none of the detail or the rationale regarding specific elements of Order No. 1920's reevaluation requirements, such as the specific situations in which reevaluation would be required or the requirement for transmission providers to include in their OATTs the potential outcomes of reevaluation.[1263] EEI further argues that, whereas the NOPR proposal focused on how the outcome of subsequent Long-Term Regional Transmission Planning cycles could give rise to the need to reevaluate, the three situations in which Order No. 1920 requires reevaluation do not depend on the results of or actions in a subsequent Long-Term Regional Transmission Planning cycle.[1264]

[1262] *See* NOPR, 179 FERC ¶ 61,028 at P 248.

[1263] EEI Rehearing Request at 5-6.

[1264] *Id.* at 8-9.

481. NRECA states that it did not oppose the Commission's NOPR proposal to require transmission providers to participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning—and particularly, the requirements that transmission providers use a 20-year transmission planning horizon and measure the benefits of transmission facilities over 20 years—because of the NOPR proposal to allow transmission providers to subject the selection status of Long-Term Regional Transmission Facilities to the outcome of subsequent Long-Term Regional Transmission Planning cycles.[1265] NRECA states that it interpreted the NOPR as allowing transmission providers to develop selection criteria under which transmission providers could conditionally select a Long-Term Regional Transmission Facility but delay selecting that Facility for purposes of cost allocation until later.[1266] NRECA states that the Commission did not adopt the NOPR proposal and instead adopted "completely different, prescriptive [reevaluation] requirements."[1267]

482. MISO TOs and ITC each argue that the Commission did not provide adequate notice of or an opportunity to comment on the requirement that transmission providers update their measurement of the benefits of Long-Term Regional Transmission Facilities. MISO TOs state that the NOPR proposed "the option of a routine review" and did not

[1265] NRECA Rehearing Request at 13 (citing NOPR, 179 FERC ¶ 61,028 at P 248).

[1266] *Id.* at 24.

[1267] *Id.* at 25 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1055 & n.2257).

include any requirement for a "general reevaluation of benefits of the facilities," and that this deprived regulated parties of the fair notice required by the APA.1268 ITC contends that Order No. 1920's reevaluation requirements depart substantially from the original reevaluation proposal, and that the Commission has not provided commenters a meaningful opportunity to comment on the requirement "to perform a full update of the calculation of the benefits" resulting in a factual record that does not address the relative merits of this approach.1269

483. MISO TOs and WIRES each argue that, had the Commission provided notice of and an opportunity to comment, Order No. 1920's reevaluation requirements would ultimately have been improved. MISO TOs argue that Order No. 1920 is not as clear or as workable as it might have been if MISO TOs and other commenters had fair notice, and that the Commission instead could have adopted "a more nuanced and workable requirement."1270 WIRES claims that the Commission did not have the benefit of sufficient input from regulated parties. WIRES contends that, while the Commission stated that it set forth Order No. 1920's reevaluation requirements having "carefully reviewed the record developed here and weighed commenters' countervailing

[1269] ITC Rehearing Request at 16.

[1270] MISO TOs Rehearing Request at 19, 22.

arguments," the comments submitted were specific to the NOPR proposal that was not adopted—not Order No. 1920's reevaluation requirements.1271

ii. Other Issues

484. Several parties sought rehearing or clarification of the requirement to update the measurement of benefits when reevaluating a previously selected Long-Term Regional Transmission Facility or Facilities.[1272] MISO TOs argued that the requirement for transmission providers to update their measurement of the benefits of Long-Term Regional Transmission Facilities risks significant disruption to the use of portfolio approaches to selecting such facilities. MISO TOs argued that the Commission had not provided substantial evidence to support requiring transmission providers to update their measurement of the benefits of Long-Term Regional Transmission Facilities during reevaluations, as the Commission acknowledged that updating the measurement of benefits is "not as straightforward as tracking costs," reassessing benefits is different than reassessing costs, and reevaluation could create "unnecessary disruptions and potentially impede the efficient conduct" of Long-Term Regional Transmission Planning.[1273] MISO TOs requested that, on rehearing, the Commission modify Order No. 1920's requirement

[1271] WIRES Rehearing Request at 14-16 (quoting Order No. 1920, 187 FERC ¶ 61,068 at P 1053).

[1272] MISO TOs Rehearing Request at 4; ITC Rehearing Request at 17; WIRES at 11-12.

[1273] MISO TOs Rehearing Request at 17-19 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1059).

such that transmission providers would "consider benefits and the broader needs of the region in the reevaluation process and choose an outcome based on that assessment."[1274]

485. ITC argued that, while reevaluating a previously selected Long-Term Regional Transmission Facility on the basis of cost increases is reasonable, Order No. 1920's requirement for transmission providers to update their measurement of the benefits of Long-Term Regional Transmission Facilities will burden transmission providers and deter investment in such facilities. ITC therefore requested that the Commission eliminate the requirement to update the measurement of the benefits or, in the alternative, clarify that transmission providers may adopt a more qualitative assessment that takes into account the benefits and costs of a Long-Term Regional Transmission Facility in the context of the transmission planning region's Long-Term Transmission Needs, and also that transmission providers may adopt flexible remedial measures such as those available under MISO's variance analysis process.[1275] Similarly, WIRES requested clarification as to whether Order No. 1920 would allow transmission providers flexibility to determine how they will update their measurement of the benefits of Long-Term Regional Transmission Facilities, and argued that transmission providers should have the flexibility to address the concerns raised by the Commission in developing their reevaluation criteria in a manner compatible with their transmission planning process.[1276]

[1274] *Id.* at 13.

[1275] ITC Rehearing Request at 15-19.

[1276] WIRES Rehearing Request at 14.

486. NRECA requested that the Commission eliminate the requirement for transmission providers to designate a point after which all previously selected Long-Term Regional Transmission Facilities will no longer be subject to reevaluation, i.e., a pencils-down point, such that the transmission developer of the selected facility would have adequate certainty to make investment decisions.[1277]

487. Large Public Power and NRECA requested that the Commission require on rehearing that transmission providers reevaluate previously selected Long-Term Regional Transmission Facilities not only when there is a significant increase in costs, but also when there is a significant decrease in the benefits of a particular facility.[1278] Large Public Power further requested that the Commission clarify that Order No. 1920 requires transmission providers to track both the costs and the benefits of previously selected Long-Term Regional Transmission Facilities.[1279] In addition to reevaluation on the basis of cost increases, NRECA argued that transmission providers should be required to

[1277] NRECA Rehearing Request at 33 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1050); *see also* East Kentucky Rehearing Request at 2 (arguing that Order No. 1920 permits arbitrary and unreasonable deadlines on reevaluations).

[1278] Large Public Power Rehearing Request at 17-19; NRECA Rehearing Request at 29-30; *see also* East Kentucky Rehearing Request at 2 (arguing that the Order No. 1920 requirement related to reevaluation on the basis of cost increases is "too narrowly drawn" and inconsistent with other aspects of Order No. 1920).

[1279] Large Public Power Rehearing Request at 17-18 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 1054, 1059).

reevaluate previously selected Long-Term Regional Transmission Facilities when the transmission planning region's Long-Term Transmission Needs have changed.[1280]

488. ITC, Large Public Power, and NRECA argued that the Commission should grant rehearing and eliminate Order No. 1920's requirements to reevaluate on the basis of significant changes in federal, federally-recognized Tribal, state, or local laws or regulations, because these requirements are either too narrow or too broad.[1281]

489. ITC stated that Order No. 1920 encourages the use of portfolio approaches to select Long-Term Regional Transmission Facilities, as they generate considerable interdependency among the various Long-Term Regional Transmission Facilities selected in a particular Long-Term Regional Transmission Planning cycle. ITC therefore recommended that the Commission require periodic project portfolio reporting modeled after MISO's Multi-Value Project Triennial Reporting framework, which ITC contended provides a regular check to ensure transmission customers receive the benefits they are promised and allows for regional transmission planning process improvement.1282 If the Commission did not grant rehearing and eliminate reevaluations on the basis of significant changes in law or regulations, ITC requested that the Commission allow such

[1280] NRECA Rehearing Request at 30-32.

[1281] ITC Rehearing Request at 4-5; Large Public Power Rehearing Request at 19-20; NRECA Rehearing Request at 36; *see also* East Kentucky Rehearing Request at 2 (stating that Order No. 1920 "arbitrarily [and] unreasonably prohibits some reevaluations due to changes in laws or regulations").

[1282] ITC Rehearing Request at 13-14.

reevaluation only for Long-Term Regional Transmission Facilities whose targeted in-service date is more than 10 years from the point at which the transmission provider conducts the reevaluation.

490. In contrast, Large Public Power argued that the "blanket ten-year moratorium" is arbitrary and capricious.[1283] NRECA argued that the Commission provided no rationale for this limitation, which it characterized as "so implausible that it could not be ascribed to a difference in view or the product of agency expertise."[1284]

491. Several parties requested that the Commission provide transmission providers with more flexibility to reevaluate previously selected Long-Term Regional Transmission Facilities in other situations. Dominion sought rehearing or, as applicable, clarification of the Commission's reevaluation process to allow transmission providers to reevaluate a previously selected Long-Term Regional Transmission Facility in situations other than those identified in Order No. 1920.1285 Similarly, SERTP Sponsors requested that the Commission clarify that the three situations described in Order No. 1920 in which reevaluation of previously selected Long-Term Regional Transmission Facilities is required are illustrative, arguing that Order No. 1920 grants transmission providers

[1283] Large Public Power Rehearing Request at 19-20.

[1285] Dominion Rehearing Request at 17.

inadequate flexibility in developing OATT provisions regarding the reevaluation of previously selected Long-Term Regional Transmission Facilities.[1286]

d. Commission Determination

i. Logical Outgrowth

492. We disagree with the argument that the Commission failed to provide adequate notice of and opportunity to comment on Order No. 1920's requirement that transmission providers include provisions in their OATTs that require them to reevaluate previously selected Long-Term Regional Transmission Facilities in certain circumstances. As the D.C. Circuit explained recently, "the very premise of agencies' duty to solicit, consider, and respond appropriately to comments is that rules evolve from conception to completion."1287 Indeed, notice is sufficient if the final rule represents a "logical outgrowth" of the proposed rule.[1288] Order No. 1920's reevaluation requirements are closely related to and fully in character with the NOPR proposal, and represent the kind of reasonable evolution of an initial proposal in response to comments that rehearing parties could have reasonably anticipated.

[1286] SERTP Sponsors Rehearing Request at 20-21.

[1287] *Brennan v. Dickson*, 45 F.4th at 69.

[1288] *Long Island Care*, 551 U.S. at 174-75. *See also Am. Paper Inst. v. EPA*, 660 F.2d at 959 n.13 ("An agency may make *even substantial changes* in its original proposed rule without a further comment period if the changes are in character with the original proposal and are a logical outgrowth of the notice and comments already given.") (emphasis added).

493. As an initial matter, we note that the NOPR proposed to require the reevaluation of previously selected transmission facilities in certain circumstances. Because Long-Term Regional Transmission Planning is a form of regional transmission planning,[1289] the Commission's regional transmission planning requirements apply. This includes a requirement that transmission providers describe in their OATTs the circumstances in which and the procedures under which transmission providers will conduct a reevaluation. This reevaluation is necessary to determine how a transmission provider will respond if development delays affecting a previously selected regional transmission facility jeopardize incumbent transmission owners' ability to meet their reliability needs or service obligations.1290 The Commission made this explicit in the NOPR when it proposed that Order No. 1000's transmission developer requirements would apply to Long-Term Regional Transmission Planning[1291] and noted that in the event of development delays, transmission providers may "remove the transmission facility from the selected category and proceed with reevaluating the regional transmission plan to seek an alternative solution."[1292]

[1289] NOPR, 179 FERC ¶ 61,028 at P 68; Order No. 1920, 187 FERC ¶ 61,068 at P 224.

[1290] Order No. 1000, 136 FERC ¶ 61,051 at P 329.

[1291] NOPR, 179 FERC ¶ 61,028 at P 247.

[1292] *Id.* P 247 n.395 (citing Order No. 1000-A, 139 FERC ¶ 61,132 at P 442).

494. The Commission further proposed in the NOPR to allow transmission providers to make the selection status of a previously selected Long-Term Regional Transmission Facility "subject to the outcomes of subsequent Long-Term Regional Transmission Planning cycles," such that it "is no longer needed" and proposed that transmission providers "should include in their selection criteria how they will address the selection status of a previously selected transmission facility based on the outcomes of subsequent Long-Term Regional Transmission Planning cycles."[1293] The Commission suggested that this proposal was warranted because the development schedule for a Long-Term Regional Transmission Facility may not require its developer to undertake actions or incur expenses in the near-term,[1294] and it explained that the NOPR's proposed reforms were intended to be responsive to "commenters' concerns about over-building [transmission facilities] due to uncertainties of future transmission system conditions."[1295] Therefore, although the Commission used other language, the Commission effectively proposed in the NOPR that transmission providers could reevaluate certain Long-Term Regional Transmission Facilities (i.e., those for which near-term development activities are not necessary) in light of changed circumstances apparent in the subsequent Long-

[1293] *Id.* P 248.

[1294] *Id.*

[1295] NOPR, 179 FERC ¶ 61,028 at P 245.

Term Regional Transmission Planning cycle to determine whether to continue developing that facility or find that it was no longer needed.1296

495. In other words, the NOPR provided adequate notice of and an opportunity to comment on proposals to require reevaluation of previously selected Long-Term Regional Transmission Facilities due to development delays and to permit reevaluation of previously selected Long-Term Regional Transmission Facilities due to changed circumstances from one Long-Term Regional Transmission Planning cycle to the next.

496. Commenters objected to the NOPR proposal on the grounds that providing open-ended allowance for reevaluation of previously selected Long-Term Regional Transmission Facilities would undermine selection as a "reasonably final" step and create too much uncertainty for transmission developers, which would impede the development of the relevant transmission facilities and ultimately could raise concerns about reliability impacts or other consequences.[1297] Upon consideration of the record before it and these comments in particular, the Commission modified the NOPR proposal to allow for the reevaluation of previously selected Long-Term Regional Transmission Facilities due to changed circumstances from one transmission planning cycle to the next. Specifically, Order No. 1920 required the reevaluation of Long-Term Regional Transmission Facilities only in certain circumstances that could affect the need for the facility—i.e., where the costs of the transmission facility significantly exceed estimates or where significant

[1296] *Id.* P 248.

[1297] Order No. 1920, 187 FERC ¶ 61,068 at P 1055 & n.2256.

changes in federal, federally-recognized Tribal, state, or local laws or regulations cause reasonable concern that the facility no longer meets selection criteria.[1298] Further, consistent with the Commission's reasoning in the NOPR that reevaluation may be appropriate where near-term development actions or expenditures are not needed in order to meet the targeted in-service date, the Commission limited the availability of reevaluation due to significant changes in laws or regulations to only those facilities that are not needed to be in-service within 10 years (i.e., unless its targeted in-service date was in the latter half of the 20-year transmission planning horizon during the Long-Term Regional Transmission Planning cycle in which it was selected) and required a "pencils-down" point in the development of a facility at which reevaluation would no longer be permitted.[1299] The Commission's modifications are not "surprisingly distant" from the proposal so as to be wholly unexpected;[1300] instead, the changes merely refine the proposals included in the NOPR and are thus precisely the kind of tailoring and fine-tuning of a proposed rule in response to comments that is the *raison d'être* for APA notice-and-comment requirements.[1301]

[1298] *Id.* PP 1048-1055.

[1299] *Id.* PP 1050-1051.

[1300] *Brennan v. Dickson*, 45 F.4th at 69.

[1301] We note that, while the reevaluation requirements are one tool to manage the inherent uncertainties of Long-Term Regional Transmission Planning and to limit the risk of over-building transmission in response to speculative transmission needs, we believe that other requirements in Order No. 1920 also address these concerns. The inability to include reevaluation requirements would not have prevented the Commission from

ii. Other Issues

497. We also disagree with rehearing parties' substantive objections to the reevaluation requirements. While certain parties object to the reevaluation requirements as too lax,1302 and other parties object to them as too stringent,1303 we conclude that they strike a reasonable balance between providing adequate certainty to transmission developers to support capital investment, such that more efficient or cost-effective Long-Term Transmission Facilities actually may be developed, and mitigating the inherent uncertainty involved in Long-Term Regional Transmission Planning, given that continued selection of Long-Term Regional Transmission Facilities that no longer meet selection criteria could be costly to consumers.1304 Specifically, though several rehearing parties object that reevaluation should be required in additional circumstances, such as whenever there is a reduction in benefits,[1305] whenever there is a change in transmission needs,1306 or at points of time beyond the "pencils-down" date,[1307] and

---

issuing Order No. 1920.

[1302] *See e.g.*, East Kentucky Rehearing Request at 2; NRECA Rehearing Request at 33.

[1305] Large Public Power Rehearing Request at 17-19; NRECA Rehearing Request at 29-30.

[1306] NRECA Rehearing Request at 30-32.

[1307] *Id.* at 33.

others argue that the transmission provider should have more discretion to determine when to reevaluate previously selected Long-Term Regional Transmission Facilities,[1308] we continue to find that such open-ended allowance for reevaluation would fail to account for the degree of certainty that is needed to support capital investment, and would therefore fail to adequately ensure development of more efficient or cost-effective Long-Term Regional Transmission Facilities.1309

498. On the other hand, we also reject requests to eliminate the requirement to reevaluate facilities where significant changes in laws or regulations cause reasonable concern that a previously selected Long-Term Regional Transmission Facility may no longer meet the transmission provider's selection criteria.1310 We remain concerned that, absent an opportunity to determine whether selection of such a facility remains warranted in light of a significant change in laws or regulations, transmission providers may be reluctant to select certain Long-Term Regional Transmission Facilities,[1311] and we find that requiring reevaluation in such a circumstance helps to mitigate the inherent uncertainty of Long-Term Regional Transmission Planning and the risk of over-building transmission facilities. With the limitations we impose—i.e., that such reevaluation only

[1308] Dominion Rehearing Request at 17; SERTP Sponsors Rehearing Request at 20-21.

[1309] Order No. 1920, 187 FERC ¶ 61,068 at P 1053.

[1310] ITC Rehearing Request at 4-5.

[1311] Order No. 1920, 187 FERC ¶ 61,068 at P 1056.

occur for facilities with a targeted in-service date that is in the latter half of the Long-Term Regional Transmission Planning cycle in which it is selected and that reevaluation may only occur up to the "pencils-down" point in the facility's development—we are not persuaded that reevaluation under these circumstances will create such uncertainty for transmission developers as to significantly impede the development of more efficient of cost-effective Long-Term Regional Transmission Facilities.

499. While we appreciate rehearing parties' concerns that assessing a change in a transmission facility's benefits is more complex than assessing a change in its costs, we decline requests to set aside the requirement to account for updated benefits when transmission providers reevaluate a Long-Term Regional Transmission Facility based on a significant increase in the facility's estimated costs.1312 We continue to find that such a requirement will help to ensure there is an opportunity to select more efficient or cost-effective Long-Term Regional Transmission Facilities, because otherwise the transmission provider would compare the facility's currently determined costs with its previously determined benefits.[1313]

500. We further find that rehearing parties' concerns about the burdens of accounting for updated benefits are misplaced, as Order No. 1920 provided significant flexibility to transmission providers as to how to account for changes in benefits. While Order No. 1920 requires that such reevaluations must only occur during a subsequent Long-Term

[1312] MISO TOs Rehearing Request at 17-19; ITC Rehearing Request at 15-19.

[1313] Order No. 1920, 187 FERC ¶ 61,068 at P 1059.

Regional Transmission Planning cycle (i.e., rather than in between such cycles) because doing so during such a cycle enables transmission providers to make use of updated assumptions, inputs, and the Long-Term Scenarios that must be developed in any event during the subsequent cycle, Order No. 1920 does not prescribe any particular method for assessing updated benefits.[1314] We note that, because Order No. 1920 provides transmission providers the flexibility to propose qualitative measures in their evaluation processes and qualitative selection criteria, transmission providers will need flexibility to develop a process for determining if a previously selected Long-Term Regional Transmission Facility continues to meet those selection criteria.

501. We are also not persuaded by rehearing parties' arguments that the reevaluation requirements will undermine the ability of transmission providers to use a portfolio approach to evaluating benefits or selecting Long-Term Regional Transmission Facilities.[1315] As described above, transmission providers have significant flexibility to determine how to update benefits, and they may propose to use a method that accommodates Order No. 1920's reevaluation requirements in the context of portfolio approaches to selecting Long-Term Regional Transmission Facilities. Likewise, provided the process seeks to maximize benefits accounting for costs over time without over-building transmission facilities, transmission providers have significant flexibility to

[1314] This clarification resolves WIRES's request for clarification regarding the flexibility allowed transmission providers to determine how to account for updated benefits. *See* WIRES Rehearing Request at 14.

[1315] ITC Rehearing Request at 6-9; MISO TOs Rehearing Request at 17-19.

determine the appropriate outcomes that may result from reevaluation, including the potential mitigation measures that may be regionally appropriate.1316 Thus, transmission providers have scope to tailor both how reevaluation is conducted and the outcomes of the reevaluation process to the portfolio approach.

E. Implementation of Long-Term Regional Transmission Planning

1. Order No. 1920 Requirements

502. In Order No. 1920, the Commission required transmission providers to explain on compliance how the initial timing sequence for Long-Term Regional Transmission Planning interacts with existing regional transmission planning processes. The Commission required transmission providers to provide in their explanations any information necessary to ensure that stakeholders understand this interaction, including at least the following two components. First, the Commission required transmission providers to address the possible interaction between the transmission planning cycles for Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes. The Commission recognized that there may be overlap in the time horizon for Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes and that these processes will likely inform each other.[1317] Second, the Commission required transmission providers to address the possible displacement of regional transmission facilities from the existing

[1316] Order No. 1920, 187 FERC ¶ 61,068 at P 1052.

[1317] *Id.* P 1071.

regional transmission planning processes. The Commission recognized that it is possible that, in some cases, Long-Term Regional Transmission Facilities selected to address Long-Term Transmission Needs may provide near-term reliability or economic benefits, and thus could displace regional transmission facilities that are under consideration as part of existing regional transmission planning processes.[1318]

503. The Commission found that transmission providers should have the flexibility to integrate the existing regional transmission planning processes with Long-Term Regional Transmission Planning in a manner that mitigates the potential for disruption of the existing regional transmission planning processes. However, the Commission expressed concern that too much flexibility for transmission providers with respect to the date by which they must begin the first Long-Term Regional Transmission Planning cycle could lead to unnecessary delay in realizing these beneficial reforms for customers. Thus, the Commission required transmission providers in each transmission planning region to propose on compliance a date, no later than one year from the date on which initial filings to comply with the final rule are due, on which they will commence the first Long-Term Regional Transmission Planning cycle. The Commission stated that transmission providers in a transmission planning region may propose to start the first Long-Term Regional Transmission Planning cycle on a date later than one year from the initial compliance filing due date, only to the extent needed to align the Long-Term Regional

[1318] *Id.*

Transmission Planning cycle with existing transmission planning cycles.[1319] While the Commission encouraged transmission providers to align transmission planning cycles if useful, to ensure that there is no inappropriate delay to starting Long-Term Regional Transmission Planning, the Commission stated that transmission providers in a transmission planning region that propose a commencement date of later than one year from the compliance due date must include adequate support explaining how the proposed date to begin the first Long-Term Regional Transmission Planning cycle is necessary and appropriately tailored for their transmission planning region.[1320]

504. The Commission encouraged transmission providers to address in their explanations how their proposed Long-Term Regional Transmission Planning would facilitate moving beyond piecemeal transmission expansion to address relatively near-term transmission needs and toward a more robust, well-planned transmission system.[1321]

2. Requests for Rehearing and Clarification

505. PJM states that it recognizes that the long-term transmission planning horizon can and will inform Order No. 1000 processes but argues that it is imperative that these two processes function effectively together so that PJM can respond to short-term needs quickly and nimbly.[1322] Accordingly, PJM requests flexibility in designing its Long-

[1319] *Id.* P 1072.

[1320] *Id.*

[1321] *Id.* P 1073.

[1322] PJM Rehearing Request at 41.

Term Regional Transmission Planning process in a way that would minimize harmful interaction from the overlap between Order No. 1000 and Order No. 1920 regional transmission planning processes and would allow for the efficient use of PJM's resources.[1323]

506. TAPS asserts that Order No. 1920 does not adequately clarify how the Order No. 1000 economic and reliability processes and the Long-Term Regional Transmission Planning process will interact after the initial implementation phase.[1324] TAPS argues that Order No. 1920 does not address whether, or the circumstances under which, transmission projects may be moved from an Order No. 1000 reliability or economic planning process to the Long-Term Regional Transmission Planning process, or vice versa.[1325] As a result, TAPS requests that the Commission recognize that these regional transmission planning processes will continue to interact after the initial implementation of Long-Term Regional Transmission Planning and require that transmission providers demonstrate how these processes will interact on an ongoing basis, including how and when transmission projects may be moved between the two processes.[1326]

3. Commission Determination

507. As an initial matter, upon further consideration, we set aside, in part, Order No. 1920's requirement that transmission providers in each transmission planning region must propose on compliance a date, no later than one year from the date on which initial filings to comply with the final rule are due, on which they will commence the first Long-Term Regional Transmission Planning cycle.[1327] Instead, we require that transmission providers must propose on compliance a date, no later than *two* years from the date on which initial filings to comply with Order No. 1920 are due, on which they will commence the first Long-Term Regional Transmission Planning cycle. We find that this modification balances the need to ensure that transmission providers timely implement Order No. 1920's requirements to avoid unnecessary delay in realizing these beneficial reforms for customers, as explained in Order No. 1920,[1328] with the need to provide transmission providers with sufficient time to implement Long-Term Regional Transmission Planning and align the Long-Term Regional Transmission Planning cycle with existing transmission planning cycles, which may be longer than a single year.

508. Moreover, we modify Order No. 1920's requirement that transmission providers that propose a commencement date of later than one year from the compliance due date must include adequate support explaining how the proposed date to begin the first Long-Term Regional Transmission Planning cycle is necessary and appropriately tailored for

[1327] Order No. 1920, 187 FERC ¶ 61,068 at P 1072.

[1328] *See id.*

their transmission planning region.[1329] Instead, we require that regardless of the date that transmission providers propose on compliance, they must explain in their compliance filing why the proposed date on which they will commence the first Long-Term Regional Transmission Planning cycle is necessary and appropriately tailored for their transmission planning region. We find that this modification will allow the Commission to ensure that the proposed date will not unnecessarily delay the realization of Order No. 1920's beneficial reforms for customers.

509. We sustain the requirement that transmission providers must explain on compliance how the initial timing sequence for Long-Term Regional Transmission Planning will interact with the existing regional transmission planning processes under Order No. 1000. As the Commission recognized in Order No. 1920, there may be overlap in the time horizons for these processes, and transmission providers should have the flexibility to integrate the existing regional transmission planning processes with Long-Term Regional Transmission Planning in a manner that mitigates the potential for disruption of the existing regional transmission planning processes.[1330] While Long-Term Regional Transmission Planning processes must still meet all requirements set forth in Order No. 1920, we believe that this flexibility extends to and addresses concerns raised by PJM, including its request for flexibility to design its Long-Term Regional

[1329] *See id.*

[1330] *Id.*

Transmission Planning process in a way that minimizes potential harmful impacts to existing regional transmission planning processes.

510. In response to TAPS' request for rehearing, we recognize that Long-Term Regional Transmission Planning and existing Order No. 1000 economic and reliability transmission planning processes may continue to interact after the initial implementation of Long-Term Regional Transmission Planning. However, while this interaction is possible, we believe that, after the first Long-Term Regional Transmission Planning cycle concludes, the overlap between the existing Order No. 1000 regional transmission planning processes and Long-Term Regional Transmission Planning will likely diminish. As the Commission found in Order No. 1920, existing regional transmission planning processes that plan for reliability and economic transmission needs may in the future come to address only residual needs not already addressed through Long-Term Regional Transmission Planning.[1331] As a result, the potential for overlap between Long-Term Regional Transmission Planning and the existing Order No. 1000 regional transmission planning process should decrease. Further, we do not believe that it is necessary to require transmission providers to explain how a transmission facility selected in one regional transmission process may "move" to another regional transmission planning process. Nevertheless, as the Commission stated in Order No. 1920, we encourage transmission providers to address in their explanation on compliance how their proposed Long-Term Regional Transmission Planning process will facilitate moving beyond

[1331] *Id.* P 245.

piecemeal transmission expansion to address relatively near-term transmission needs and toward a more robust, well-planned transmission system.[1332]

VI. Coordination of Regional Transmission Planning and Generator Interconnection Processes

A. Need for Reform and Overall Requirement

1. Order No. 1920 Requirements

511. In Order No. 1920, the Commission found that there is substantial evidence to support the conclusion that the Commission's existing regional transmission planning requirements are unjust, unreasonable, and unduly discriminatory or preferential because they do not adequately consider certain interconnection-related transmission needs that the transmission provider has identified multiple times in the generator interconnection process but that have never been resolved due to the withdrawal of the underlying interconnection request(s).1333 The Commission made this finding in response to (among other things) evidence in the record that the level of spending on interconnection-related network upgrades has dramatically increased in recent years and evidence that this trend leads to more interconnection requests withdrawing in the face of significant costs associated with interconnection-related network upgrades.1334 The Commission stated that, while interconnection customers may choose to withdraw from the interconnection queue for a number of reasons, in recent years, the deciding factor has increasingly

[1332] *Id.* P 1073.

[1333] Order No. 1920, 187 FERC ¶ 61,068 at P 1100.

[1334] *Id.* P 1101.

become the interconnection customer's sticker shock at its cost responsibility for interconnection-related network upgrades.[1335] The Commission also based its finding on evidence that in many cases when an interconnection-related transmission need is not addressed via development of interconnection-related network upgrades in one interconnection queue cycle, the same interconnection-related transmission need—and oftentimes the same or a substantially similar interconnection-related network upgrade—will appear in subsequent interconnection queue cycles.[1336]

512. Consequently, the Commission adopted requirements for transmission providers in each transmission planning region to revise their regional transmission planning processes in their OATTs to evaluate for selection regional transmission facilities that address certain interconnection-related transmission needs associated with specific interconnection-related network upgrades originally identified through the generator interconnection process. In particular, the Commission adopted four qualifying criteria for when transmission providers must evaluate interconnection-related transmission needs in the regional transmission planning process. The Commission found that this requirement will ensure that more efficient or cost-effective transmission expansion can be effectuated through regional transmission planning processes and will eliminate a potential barrier to entry for new generation resources, thereby enhancing competition in wholesale electricity markets and facilitating access to lower-cost generation. The

[1335] *Id.*

[1336] *Id.* P 1102.

Commission stated that, as a result, this reform will ensure just and reasonable and not unduly discriminatory or preferential Commission-jurisdictional rates.[1337]

2. Requests for Rehearing

513. SERTP Sponsors, Large Public Power, and Industrial Customers argue that this reform is premature in light of Order No. 2023, which is intended to, among other things, reduce speculative interconnection requests and withdrawals.[1338] SERTP Sponsors argue that the Commission should grant rehearing and revisit this reform after experience is gained to determine whether interconnection withdrawals could "reasonably be expected to be indicative of a need for new regional transmission facilities that have 'a voltage of at least 200 kV and an estimated cost of at least $30 million.'"[1339] SERTP Sponsors argue that accordingly, the Commission has not established a rational basis supported by substantial evidence for this requirement.[1340]

514. PJM argues that the Commission failed to provide substantial evidence for its conclusion that, nationwide, the deciding factor for interconnection customers'

[1337] *Id.* PP 1106, 1145.

[1338] SERTP Sponsors Rehearing Request at 22; Large Public Power Rehearing Request at 23; Industrial Customers Rehearing Request at 46-47.

[1339] SERTP Sponsors Rehearing Request at 22 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1145).

[1340] *Id.* at 22-23 (citing *Samaritan Health Serv. v. Bowen*, 811 F.2d 1524, 1528 (D.C. Cir. 1987) (finding that agency's classification of costs had "no rational basis" and was, therefore, arbitrary and capricious)).

withdrawals is sticker shock at their assigned network upgrade costs.[1341] PJM argues that the Commission ignored its analysis of more than 700 interconnection requests in one transmission zone over a six-year period that demonstrated that only 14 requests or 2% would have likely met the voltage and cost thresholds in Order No. 1920 and that nine of the 14 withdrew before a feasibility study was issued. Additionally, PJM argues that, of the remaining five, two were ultimately responsible for network upgrades of less than $30 million, thus leaving only three interconnection requests potentially withdrawing due to the cost of network upgrades.[1342] PJM argues that this data suggesting a withdrawal rate of less than one half percent in a large sample indicates insignificant correlation between network upgrade costs, voltage level, and business decisions to withdraw.[1343]

515. PJM further argues that, on the other hand, over the past six years, several dozen generation projects that executed interconnection agreements had associated network upgrades of less than $5 million but nonetheless terminated their interconnection agreements. Thus, PJM argues that factors other than sticker shock are common reasons for delay or failure to advance.[1344] PJM argues that the Commission disregarded this evidence and relied on studies in MISO and SPP to justify a one-size-fits-all approach,

[1341] PJM Rehearing Request at 31.

[1342] *Id.*

[1343] *Id.*

[1344] PJM Rehearing Request at 32.

and it argues that this decision was arbitrary and capricious.[1345] NRECA argues that if the Commission believes that its existing generator interconnection polices are unjust and unreasonable and impose barriers to generation development, it should develop the appropriate evidentiary record, make the required findings, and direct a just and reasonable replacement policy.[1346]

3. Commission Determination

516. We continue to find that this reform will ensure just and reasonable and not unduly discriminatory or preferential Commission-jurisdictional rates.[1347] While SERTP Sponsors, Large Public Power, and Industrial Customers argue that this reform is premature in light of Order No. 2023, we find that the scope of the Order No. 1920 coordination reform operates independently of, and is more limited than, the Order No. 2023 reforms. Order No. 2023 adopts reforms to the generator interconnection process through changes to the *pro forma* generation interconnection procedures and agreements. By comparison, Order No. 1920 adopts no changes to the generator interconnection process and instead implements the coordination reform through changes to the transmission planning process and the *pro forma* OATT.

[1345] *Id.* at 32 (citing 5 U.S.C. 706(2); 16 U.S.C. § 825l(b); *S.C. Pub. Serv. Auth.*, 762 F.3d at 66-67; *TAPS*, 225 F.3d at 687; *Env't Def. Fund*, 2 F.4th 953).

[1346] NRECA Rehearing Request at 48-49.

[1347] Order No. 1920, 187 FERC ¶ 61,068 at P 1106.

517. Additionally, the purpose of the coordination reform in Order No. 1920 is to address a specific problem—insufficient coordination between the existing generator interconnection processes and regional transmission planning and cost allocation processes regarding interconnection-related transmission needs that are repeatedly identified in the generator interconnection process.[1348] Order No. 1920 recognizes the generator interconnection process is unlikely to result in the construction of transmission facilities that resolve such interconnection-related transmission needs because of the rate of withdrawal from the interconnection queue, due at least in part to interconnection customers' cost responsibility for expensive interconnection-related network upgrades.[1349] While Order No. 2023 aims to fix inefficiencies in the generator interconnection process, it does not direct any reforms regarding specific interconnection-related network upgrades that are unlikely to be developed.

518. The Commission reasonably concluded that reforms regarding these types of network upgrades are better addressed through improvement of coordination between the generator interconnection and regional transmission planning processes. The purpose of the Order No. 1920 coordination reform is to (1) require evaluation of regional transmission facilities that address certain (i.e., that qualify under the criteria established in Order No. 1920) interconnection-related transmission needs associated with specific interconnection-related network upgrades in existing Order No. 1000 regional

[1348] *Id.* P 1100.

[1349] *See id.* P 1108.

transmission planning and cost allocation processes to determine whether to select such facilities in the regional transmission plan for purposes of cost allocation, and (2) determine whether such facilities may address other regional transmission needs more efficiently or cost-effectively. For a limited set of interconnection-related transmission needs, this reform will allow transmission providers to identify, evaluate, and select the more efficient or cost-effective regional transmission solution independent of the success or failure of a particular interconnection request in the generator interconnection process. Additionally, if this requirement is triggered (i.e., because interconnection-related network upgrades meet all of the established qualifying criteria), that is an indication of the continued existence of the concerns described in Order No. 1920, namely a barrier to entry in locations that, absent sticker shock, are "otherwise desirable for generators to locate."[1350] Moreover, it may be that eventually, as a result of Order No. 2023, fewer withdrawals from the generator interconnection queue occur and that this provision is triggered less often. Further, there may be fewer instances of this requirement as the Order No. 1920 Long-Term Regional Transmission Planning process proactively addresses transmission needs related to generation additions on a forward-looking basis. These developments would not, however, address the present concerns that necessitate this coordination requirement. Given the low administrative burden associated with this reform,[1351] we conclude that its potential benefits outweigh the costs.

[1350] *Id.* P 1103.

[1351] *See id.* P 1113.

519. We disagree with PJM's claim that the Commission does not provide substantial evidence to demonstrate that existing Order No. 1000 regional transmission planning and cost allocation processes do not adequately address interconnection-related transmission needs associated with withdrawn interconnection requests. PJM's claim is unpersuasive because, as explained above, the Commission has sufficiently demonstrated the need for reform.

520. The Commission in Order No. 1920 also explained why it is appropriate to establish the coordination requirement in existing Order No. 1000 regional transmission planning and cost allocation processes, stating that:

> Evaluation of interconnection-related transmission needs in the existing Order No. 1000 regional transmission planning and cost allocation processes is most appropriate because such evaluation would occur at shorter intervals and would likely result in more expeditious development of regional transmission facilities to address the nearer-term interconnection-related transmission needs identified through the generator interconnection process.[1352]

521. Further, courts have recognized the Commission can rely on general findings of systemic conditions to impose an industry-wide remedy under FPA section 206.[1353] The Commission found that there was substantial evidence to conclude that the Commission's existing regional transmission planning requirements are unjust, unreasonable, and unduly discriminatory or preferential because they do not adequately consider certain

[1352] *Id.* P 1126.

[1353] *See TAPS*, 225 F.3d at 687-88 *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 67 (citing *Interstate Nat. Gas Ass'n of Am. v. FERC*, 285 F.3d at 37).

interconnection-related transmission needs that the transmission provider has identified multiple times in the generator interconnection process but that have never been resolved due to the withdrawal of the underlying interconnection request(s).[1354]

522. We also are not persuaded by the evidence that PJM presented in this proceeding, which it argues demonstrates that only a small fraction of network upgrades that are the subject of its analysis would meet the voltage and cost thresholds established by Order No. 1920. We do not reach the same conclusions as PJM for multiple reasons. To begin, PJM's evidence pertains only to the Dominion zone in PJM from 2014 to 2020 and is not necessarily reflective of circumstances across the region, or nationwide, or over different time periods. Further, in Order No. 1920, the Commission cited to evidence from the record to support the conclusion that, in recent years, sticker shock over an interconnection customer's assigned network upgrade costs is often the deciding factor that leads to that interconnection customer's withdrawal of its interconnection request.[1355] For instance, the Commission cited analysis from a report showing that between January 2016 and July 2020, 245 generation projects in advanced stages in the MISO generator interconnection process withdrew from the queue, with the project developers citing high

[1354] *Id.* PP 1100-05.

[1355] *See*, *e.g.*, *id.* P 1101 (citing *See* ACORE ANOPR Comments at 12; DC and Maryland Office of People's Counsel Initial Comments at 16; Invenergy Reply Comments at 14; Northwest and Intermountain Initial Comments at 14; *see also Improvements to Generator Interconnection Procs. & Agreements,* Order No. 2023, 88 FR 61014 (Sept. 6, 2023), 184 FERC ¶ 61,054, at 41, *order on reh'g,* Order No. 2023-A, 89 FR 27006 (Apr. 16, 2024), 186 FERC ¶ 61,199, at P 14 (2024).

interconnection-related network upgrade costs as the primary reason for their withdrawal.[1356]

523. We also disagree with PJM's interpretation of its data, namely the claim that there is no need for reform because the data shows that the number of withdrawals due to sticker shock is small. PJM's reasoning suggests that the Commission found that sticker shock is only ever a deciding factor for an interconnection request's withdrawal if the withdrawn interconnection request was allocated interconnection-related network upgrade costs of $30 million or more or has a voltage of at least 200 kV (i.e., the cost and voltage thresholds established by Order No. 1920 to limit the applicability of this new requirement). However, the Commission did not suggest that interconnection-related network upgrades below this cost threshold or below the 200 kV voltage threshold do not cause sticker shock. Instead, the established qualifying criteria are intended to strike a reasonable balance between precision and workability.[1357] To accomplish this workability, the Commission adopted requirements that do not require evaluation in the existing Order No. 1000 regional transmission planning and cost allocation processes of all interconnection-related transmission needs that were not addressed because the corresponding interconnection request withdrew in part or entirely due to sticker shock.

[1356] *Id.* (citing Jay Caspary et al., ACEG, Disconnected: The Need for a New Generator Interconnection Policy, 14 (2021)), https://cleanenergygrid.org/wp-content/uploads/2021/01/Disconnected-The-Need-for-aNew-Generator-Interconnection-Policy-1.pdf (ACEG 2021 Interconnection Report) at 17.

[1357] *See id.* P 1147.

Instead, as the Commission stated in Order No. 1920, the established criteria are necessary to limit the scope of the requirement to interconnection-related transmission needs associated with high-cost interconnection-related network upgrades "that are likely to persist, . . . not unique to a single interconnection request, and . . . that have the potential to provide more widespread benefits to transmission customers."[1358] We again find that this targeted approach and criteria are "broad enough to capture interconnection-related network upgrades that are likely to produce benefits beyond the interconnection customer" while retaining flexibility for transmission providers.[1359]

524. In response to NRECA, we note that the focus of Order No. 1920 is to remedy deficiencies in the regional transmission planning and cost allocation requirements and not the generator interconnection process. Nonetheless, we reiterate the findings in Order No. 1920 that the repeated identification of interconnection-related network upgrades in the generator interconnection process is indicative of a "barrier to accessing the transmission system and [establishes] a known interconnection-related transmission need … [that] can hinder the timely development of new generation, thereby stifling competition in wholesale electricity markets and limiting access to lower-cost generation" and that by "failing to consider such interconnection-related transmission

[1358] *Id.* P 1148.

[1359] *Id.* P 1149.

needs, the regional transmission planning process is unable to identify the more efficient or cost-effective regional transmission solutions."[1360]

B. Qualifying Criteria

1. Order No. 1920 Requirements

525. In Order No. 1920, the Commission required transmission providers to evaluate for selection in their existing Order No 1000 regional transmission planning processes regional transmission facilities to address interconnection-related transmission needs that have been identified in the generator interconnection process by meeting four qualifying criteria. Specifically, the Commission required transmission providers to evaluate interconnection-related network upgrades where: (1) the transmission provider has identified interconnection-related network upgrades in interconnection studies to address those interconnection-related transmission needs in at least two interconnection queue cycles during the preceding five years (looking back from the effective date of the Commission-accepted tariff provisions proposed to comply with this reform, and the later-in-time withdrawn interconnection request occurring after the effective date of the Commission-accepted tariff provisions); (2) an interconnection-related network upgrade identified to meet those interconnection-related transmission needs has a voltage of at least 200 kV *and* an estimated cost of at least $30 million; (3) such interconnection-related network upgrade(s) have not been developed and are not currently planned to be developed because the interconnection request(s) driving the need for the network

[1360] *Id.* P 1103.

upgrade(s) has been withdrawn; and (4) the transmission provider has not identified an interconnection-related network upgrade to address the relevant interconnection-related transmission need in an executed generator interconnection agreement or in a generator interconnection agreement that the interconnection customer requested that the transmission provider file unexecuted with the Commission.[1361]

526. The Commission found it necessary to establish these criteria to limit the scope of the requirement to those interconnection-related transmission needs that are likely to persist, are not unique to a single interconnection request, and might be addressed by regional transmission facilities that have the potential to provide more widespread benefits to transmission customers.[1362] The Commission found that these criteria strike a reasonable balance between precision and workability, and that each of the four criteria is necessary to identify the appropriate set of interconnection-related transmission needs.[1363] The Commission further found that the purpose of the criteria established in Order No. 1920 is to limit the number of interconnection-related transmission needs that transmission providers must evaluate to those that merit consideration in the existing Order No. 1000 regional transmission planning and cost allocation processes.[1364]

[1361] *Id.* P 1145.

[1362] *Id.* P 1146.

[1363] *Id.* PP 1146-1147.

[1364] *Id.* P 1150.

527. As relevant here, the Commission proposed in the NOPR that part of the criteria regarding interconnection-related transmission needs is met where an interconnection-related network upgrade identified to meet interconnection-related transmission needs in the generator interconnection process has a voltage of at least 200 kV and/or an estimated cost of at least $30 million.[1365] In Order No. 1920, the Commission found it necessary and just and reasonable to modify the NOPR proposal such that any interconnection-related network upgrade identified to meet that interconnection-related transmission need must have a voltage of at least 200 kV *and* an estimated cost of at least $30 million (the cost-and-voltage criterion).[1366] The Commission found it necessary to establish a cost threshold that is stringent enough to capture those interconnection-related network upgrades that are likely to have caused the underlying interconnection requests to withdraw and a voltage threshold that is high enough that any regional transmission facility evaluated to address the underlying interconnection-related transmission need(s) is likely to produce benefits that extend beyond the interconnection customer.[1367] The Commission provided additional support for the voltage threshold in stating that the Commission has also previously found, and the record demonstrates, that higher-voltage

[1365] *Id.* P 1130.

[1366] *Id.* PP 1145, 1150-1151.

[1367] *Id.* P 1151.

transmission facilities are more likely to provide widespread benefits to transmission customers.[1368]

528. The Commission stated that requiring an interconnection-related network upgrade identified to meet an interconnection-related transmission need to satisfy both the cost and voltage criteria will prevent transmission providers from evaluating interconnection-related transmission needs associated with interconnection-related network upgrades that are less likely to provide more widespread benefits to transmission customers.[1369] The Commission found that requiring both the cost threshold and the voltage threshold be met better limits the scope of the reform compared to the NOPR proposal and thus the reform is more likely to produce a smaller and more practicable set of interconnection-related needs that transmission providers must evaluate in their existing Order No. 1000 regional transmission planning processes.[1370] The Commission also stated that the change to require that both the cost threshold and the voltage threshold be met addresses commenters' concerns that relying on only one threshold would identify interconnection-related network upgrades that are less likely to provide more widespread benefits to transmission customers.[1371]

[1368] *Id.* P 1146, n. 2433.

[1369] *Id.* P 1152.

[1370] *Id.* P 1146; *id.* P 1151; *id.* P 1153.

[1371] *Id.* P 1153 (citing Pine Gate Initial Comments at 32; SEIA Initial Comments at 15; US DOE Initial Comments at 28.).

529. In Order No. 1920, the Commission also established as another qualifying criterion that transmission providers must have identified interconnection-related network upgrades in interconnection studies to address the same interconnection-related transmission need in at least two interconnection queue cycles during the preceding five years (repeat identification criterion).[1372] Like for the cost-and-voltage criterion, the Commission stated that the repeat identification criterion provides an important limit on the extent to which evaluation of regional transmission facilities to address interconnection-related transmission needs is required.[1373] The Commission further explained that repeat identification indicates that the constraint that the interconnection-related network upgrades were identified to address is not unique to a single interconnection request at a single point in time and that the interconnection-related transmission need is likely to persist.[1374] The Commission explained that, if it did not limit the requirements in this way, the burden of evaluation would be greater because transmission providers could have to evaluate more interconnection-related transmission needs.[1375]

530. The Commission also clarified the timing of the requirement that transmission providers have identified interconnection-related network upgrades in interconnection

[1372] *Id.* P 1145.

[1373] *Id.* P 1150.

[1374] *Id.* PP 1150, 1158.

[1375] *Id.* P 1150.

studies to address those interconnection-related transmission needs in at least two interconnection queue cycles during the preceding five years.[1376] The Commission explained that this five-year period means looking back from the effective date of the Commission-accepted tariff provisions proposed to comply with this reform and the later-in-time withdrawn interconnection request occurring after the effective date of the Commission-accepted tariff provisions.[1377] Separately, the Commission explained that transmission providers must evaluate an interconnection-related transmission need that has been previously identified multiple times within the five years prior to the effective date of the Commission-accepted tariff provisions but never been resolved due to the withdrawal of the underlying interconnection request(s).[1378] The Commission also clarified that if there are no "queue cycles" in the preceding five-year period because the transmission provider uses a first-come, first-served serial interconnection process, then this criterion will be met if the interconnection-related transmission need is identified in at least two individual interconnection studies during the preceding five-year period for interconnection customers that subsequently withdrew from the interconnection queue.[1379] Finally, the Commission stated that evaluation for selection of regional

[1376] *Id.* PP 1145, 1158-1160.

[1377] *Id.* P 1145.

[1378] *Id.* P 1159.

[1379] We note that this accommodation will eventually become moot because transmission provides that do not already do so must transition to a cluster study rather than a serial process pursuant to the requirements of Order No. 2023. *See* Order No.

transmission facilities that address certain (i.e., that qualify under the criteria established in Order No. 1920) identified interconnection-related transmission needs must occur in the first Order No. 1000 regional transmission planning and cost allocation processes cycle that commences after the later-in-time withdrawn interconnection request occurring after the effective date of the accepted tariff provisions.[1380]

531. For both the cost-and-voltage criterion and the repeat identification criterion, the Commission disagreed with commenters that argued for the adoption of different criteria or for the elimination of one or both criteria and found that requiring both criteria is just and reasonable.[1381]

2. Requests for Rehearing and Clarification

532. Clean Energy Associations contend that the Commission acted arbitrarily and capriciously and failed to engage in reasoned decision-making by adopting the cost-and-voltage criterion and repeat identification criterion.[1382] Clean Energy Associations ask that the Commission, at a minimum, only require either a voltage criterion *or* cost criterion, such that the eligibility threshold is met if an interconnection-related network upgrade has a voltage of at least 200 kV *or* an estimated cost of at least $30 million.[1383]

2023, 184 FERC ¶ 61,054 at P 223.

[1380] Order No. 1920, 187 FERC ¶ 61,068 at P 1159.

[1381] *Id.* P 1150 (citations omitted).

[1382] Clean Energy Associations Rehearing Request at 13-22.

[1383] *Id.* at 21-22.

Clean Energy Associations also request that the Commission grant rehearing to change the repeat identification criterion, such that the criterion is met if an interconnection-related network upgrade was identified in at least one interconnection queue cycle.[1384] Separately, Clean Energy Associations ask the Commission to clarify that the time period transmission providers must use to identify interconnection-related network upgrades for inclusion in the initial regional transmission planning cycle exceeds five years, or alternatively, grant rehearing to require so.[1385]

533. As to the cost-and-voltage criterion, Clean Energy Associations contend that the Commission acted arbitrarily and capriciously because it failed to explain how interconnection-related network upgrades that satisfy both the voltage threshold and cost threshold (as required in Order No. 1920) are more likely to provide widespread benefits to customers compared to interconnection-related network upgrades that meet only the voltage threshold or only the cost threshold (as proposed in the NOPR).[1386] Clean Energy Associations claim that the Commission ignored record evidence and adopted eligibility criteria that arbitrarily exclude lower voltage facilities that cost more than $30 million from consideration in regional transmission planning processes regardless of the degree to which those interconnection-related network upgrades benefit transmission

[1384] *Id.*

[1385] *Id.* at 22-26.

[1386] *Id.* at 13-14.

customers.[1387] Clean Energy Associations assert that the Commission ignored evidence that requiring both the cost threshold and the voltage threshold to be met is even more harmful in certain parts of the country.[1388]

534. Clean Energy Associations also claim that the Commission mischaracterized certain comments opposing the imposition of a requirement to meet both the cost threshold and the voltage threshold as comments favoring "elimination of one or both criteria" when many of such comments actually support what Clean Energy Associations refer to as the "flexibility" in the NOPR that only required an interconnection-related network upgrade to satisfy one of the thresholds to be eligible for evaluation.[1389] Clean Energy Associations further argue that the record shows that the NOPR's "flexibility" is more likely to identify interconnection-related transmission needs that warrant evaluation compared to the requirements in Order No. 1920, because Order No. 1920's requirement to meet both the cost threshold and the voltage threshold unduly limits the universe of transmission solutions in a manner that jeopardizes transmission providers' ability to evaluate transmission solutions that might be more efficient or cost-effective than other

[1387] *Id.* at 15 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1137 (referencing comments of Pattern Energy, Pine Gate, and Shell)).

[1388] *Id.* (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1140 (referencing comments of PJM)).

options.[1390] Clean Energy Associations claim that the Commission did not directly address the record evidence and arguments on this issue, which renders this aspect of the Order No. 1920 arbitrary and capricious.[1391]

535. On the repeat identification criterion, Clean Energy Associations contend that this criterion is arbitrary and inconsistent with Order No. 1920's goal of removing barriers to entry, increasing competition, and promoting more efficient or cost-effective solutions to interconnection-related transmission needs.[1392] Clean Energy Associations believe that the repeat identification criterion will render Order No. 1920's reforms to coordinate the regional transmission planning and generator interconnection processes ineffective for several reasons that the Commission failed to address, including the Commission's shift to cluster-based studies, the self-defeating nature of the repeat identification criterion, and the adverse effects of the repeat identification criterion in conjunction with the cost-and-voltage criterion.[1393] Clean Energy Associations claim that the Commission also ignored substantial record evidence and arguments relevant to the eligibility criteria and that the Commission's stated rationale for adopting its unduly restrictive criteria "does not hold water."[1394]

[1390] *Id.* at 16-17.

[1391] *Id.* at 17.

[1392] *Id.* at 18.

[1393] *Id.* at 18-21.

[1394] *Id.* at 20-21 (quoting *e.g.*, Interwest Initial Comments at 11 ("the NOPR imposes so many procedural hurdles that . . . it could not be expected to produce results .

536. Clean Energy Associations also request clarification on two issues related to the time period for the repeat identification criterion. First, Clean Energy Associations request that the Commission clarify that, for each transmission provider's initial regional transmission planning cycle under an Order No. 1920-compliant tariff, the review window for identifying interconnection-related network upgrades that are required to be considered as interconnection-related transmission needs may span more than five years in duration.[1395] As an example, Clean Energy Associations state that:

> if a transmission provider's Order No. 1920-compliant tariff takes effect on August 1, 2025, [and] the first regional transmission planning cycle in which interconnection-related transmission needs must be considered commences on August 1, 2027, and the date on which the transmission provider will identify the transmission solutions to be evaluated in that planning cycle is April 1, 2028, then the transmission provider must include for evaluation any network upgrades that were identified in interconnection cycles between August 1, 2020 (i.e., five years before the effective date) and April 1, 2028 (i.e., the date on which transmission solutions are identified for inclusion in the transmission planning process) and that meet the eligibility criteria. In that hypothetical example, the total time-period over which network upgrades could be identified for evaluation as interconnection-related transmission needs is seven years and nine months.[1396]

537. Second, noting the requirement in Order No. 1920, Clean Energy Associations request that the Commission clarify that any eligible interconnection-related network

---

. . requiring that the same interconnection upgrades be identified twice . . . is simply impractical")).

[1395] *Id.* at 23-24.

[1396] *Id.* at 24.

upgrade that is identified in any two interconnection cycles within the review window—even if both occurrences took place in the five years prior to the effective date—must be evaluated in the transmission providers' initial Order No. 1000 regional transmission planning cycle following the effective date of its Order No. 1920 compliance filing.[1397] Clean Energy Associations argue that there is no reason why the "later in time withdrawn interconnection request" must occur after the "effective date of the Commission-accepted tariff provisions" rather than at any point during the relevant lookback period. Clean Energy Associations claim that, absent the requested clarification, the Commission acted arbitrarily and capriciously and failed to engage in reasoned decision-making by failing to clearly identify the time period at which transmission providers must look to implement this reform.[1398]

3. Commission Determination

538. We disagree with Clean Energy Associations' requests for rehearing and decline to revise the cost-and-voltage criterion and the repeat identification criterion. We continue to find that it is necessary to limit the scope of the requirement to those interconnection-related transmission needs that are likely to persist, are not unique to a single interconnection request, and might be addressed by regional transmission facilities

[1397] *Id.* at 25 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1145 (establishing the requirement that the time period is "the preceding five years (looking back from the effective date of the Commission-accepted tariff provisions proposed to comply with this reform, and the later-in-time withdrawn interconnection request occurring after the effective date of the Commission-accepted tariff provisions)")).

[1398] *Id.* at 3, 25.

that have the potential to provide more widespread benefits to transmission customers.[1399] We reiterate the Commission's stated purpose of this reform, which is to address the narrow issue of interconnection-related transmission needs being repeatedly identified yet continuing to go unresolved through the generator interconnection process, even though more efficient or cost-effective regional transmission solutions could be achieved if such needs were evaluated through the regional transmission planning and cost allocation process.[1400]

539. We disagree with Clean Energy Associations' argument that the Commission acted arbitrarily and capriciously in adopting the requirement to meet both the cost threshold and the voltage threshold. In Order No. 1920, the Commission explained how the cost threshold is intended to capture interconnection-related network upgrades that cause underlying interconnection requests to withdraw (i.e., are likely to persist), and the voltage threshold is intended to capture interconnection-related transmission needs that are likely to produce more widespread benefits.[1401] These explanations for requiring that previously identified interconnection-related network upgrades meet both of these thresholds for an interconnection-related transmission need to satisfy the cost-and-voltage criterion are consistent with the Commission's stated purpose and the necessary scope of this reform. Namely, the cost threshold identifies interconnection-related transmission

[1399] Order No. 1920, 187 FERC ¶ 61,068 at P 1146.

[1400] *Id.* P 1112.

[1401] *Id.* P 1151.

needs associated with prohibitive interconnection-related network upgrade costs that contribute to a barrier to accessing the transmission system, and the voltage threshold identifies interconnection-related transmission needs with the potential for transmission benefits that extend beyond the interconnection customer.[1402] We also disagree with Clean Energy Associations' claim that the Commission ignored record evidence on this issue.[1403] As stated above, the Commission adopted this reform and the associated qualifying criteria to address a narrow issue with limited scope, not to address an expansive set of interconnection-related transmission needs as requested by some commenters in response to the NOPR.

540. We disagree with Clean Energy Associations that providing for the "flexibility" of meeting either the cost threshold or the voltage threshold is more consistent with Order No. 1920's objectives. Allowing such flexibility places Clean Energy Associations' preferred policy outcome in place of the need for reform articulated by the Commission.[1404] The Commission in Order No. 1920 explained that the coordination reform is not intended to create an expansive set of interconnection-related transmission needs that transmission providers must evaluate in the regional transmission planning and cost allocation processes. Instead, this reform is intended to identify a limited set of

[1402] *Id.* PP 1103-1104.

[1403] Clean Energy Associations Rehearing Request at 15 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1137 (referencing comments of Pattern Energy, Pine Gate, and Shell); Order No. 1920, 187 FERC ¶ 61,068 at P 1140 (referencing comments of PJM)).

[1404] Order No. 1920, 187 FERC ¶ 61,068 at PP 1106-1121.

interconnection-related transmission needs that are likely to persist, are not unique to a single interconnection request, and might be addressed by regional transmission facilities that have the potential to provide more widespread benefits to transmission customers. We believe that requiring transmission providers to consider a more limited set of interconnection-related transmission needs through their existing regional transmission planning and cost allocation processes is warranted because a more expansive set could include transmission needs associated with expensive but relatively low voltage interconnection-related network upgrades (which are less likely to provide widespread benefits to transmission customers compared to higher voltage transmission facilities) and transmission needs associated with high voltage but relatively inexpensive network upgrades (which are less likely to remain unbuilt by interconnection customers).

541. As explained in Order No. 1920, in the context of the repeat identification criterion, we are also concerned that relaxing the qualifying criteria would create greater burdens on transmission providers by increasing the number of interconnection-related transmission needs that transmission providers must evaluate in their Order No. 1000 regional transmission planning and cost allocation processes without widespread benefits to transmission customers.[1405] Additionally, the repeat identification criterion is meant to refine the evaluation to apply to more actionable and valuable interconnection-related transmission needs that may be better suited for evaluation and development in the existing Order No. 1000 regional transmission planning and cost allocation processes.

[1405] *Id.* P 1150.

542. We disagree with Clean Energy Associations' claim that the requirement to meet both the cost threshold and the voltage threshold unduly limits the universe of transmission solutions in a manner that jeopardizes transmission providers' ability to evaluate transmission solutions that might be more efficient or cost-effective than other options. Clean Energy Associations conflate transmission needs and transmission solutions to address those needs. The purpose of the qualifying criteria adopted in Order No. 1920 is to limit the number of interconnection-related transmission needs that transmission providers must evaluate to those that merit consideration.[1406] Contrary to Clean Energy Associations' claim, the qualifying criteria in Order No. 1920 do not limit the transmission solutions that transmission providers may evaluate to address the identified interconnection-related transmission needs. Instead, the qualifying criteria in Order No. 1920 limit the set of interconnection-related transmission needs that transmission providers must evaluate. We believe requiring transmission providers to evaluate this subset of transmission needs is justified because interconnection-related transmission needs that satisfy both the cost threshold and the voltage threshold can be solved with transmission facilities that are more likely to provide widespread benefits to the transmission system and be selected in the regional transmission for purposes of cost allocation as the more efficient and cost-effective transmission solution, compared to interconnection-related transmission needs that satisfy only the cost threshold, or only the voltage threshold.

[1406] *Id.*

543. We also disagree with Clean Energy Associations' claim that the Commission's decision to adopt the repeat identification criterion is arbitrary and inconsistent with the goals of Order No 1920. Clean Energy Associations' request for rehearing effectively asks the Commission to eliminate the repeat identification criterion to require the evaluation of more interconnection-related transmission needs in regional transmission planning processes, an argument that some commenters made in response to the NOPR and with which the Commission disagreed in Order No. 1920.[1407] The Commission explained in Order No. 1920 that the purpose of this criterion is to indicate that an interconnection-related transmission need is likely to persist and to limit the extent to which evaluation of regional transmission facilities to address interconnection-related transmission needs is required.[1408]

544. In response to Clean Energy Associations' request to clarify the timing requirements, and as more fully described below, we clarify that the time period that transmission providers use to identify interconnection-related transmission needs for potential consideration during any Order No. 1000 regional transmission planning and cost allocation process cycle will be longer than five calendar years. Additionally, we modify the requirements adopted in Order No. 1920 to resolve ambiguity about timing. We find that these modifications are necessary for transmission providers to determine precisely when the coordination requirements are triggered. Specifically, we modify

[1407] *Id.*

[1408] *Id.* PP 1150, 1158.

criterion (1), the repeat identification criterion, and criterion (3), which specifies the maximum time period between withdrawals of interconnection requests associated with the same interconnection-related transmission need (the double withdrawal criterion). We also adopt a new criterion (5), which specifies the timing for identifying withdrawn interconnection requests associated with the same interconnection-related transmission need in the initial and successive Order No. 1000 regional transmission planning and cost allocation cycles (the withdrawal window criterion). The withdrawal window criterion clarifies the intent of the repeat identification criterion in Order No. 1920.[1409]

545. In particular, we modify the repeat identification criterion to read (with additions in bold and italicized and deletions struck through):

> (1) Transmission Providers in the transmission planning region have identified the relevant interconnection-related transmission need in interconnection studies in at least two interconnection queue cycles ***(or in at least two individual interconnection studies for Transmission Providers that use a first-come, first-served serial generator interconnection process)***~~during the preceding five years (looking back from the effective date of the accepted tariff provisions proposed to comply with this reform in Order No. 1920, and the later-in-time withdrawn interconnection request occurring after the effective date of the accepted tariff provisions)~~;

We also modify the double withdrawal criterion in Attachment K to read (with additions in bold and italicized and deletions struck through):

> (3) ~~the interconnection-related Network Upgrade identified through the generator interconnection process to meet the~~

[1409] We also make a minor modification to criterion (4) to account for the fact that we are adopting an additional qualifying criterion. All the revisions detailed below are reflected in the Attachment K Appendix to this order.

> ~~relevant interconnection-related transmission need is not currently planned to be developed because~~ the interconnection request~~(s)~~ that led to the identification of the interconnection-related transmission need ***in two or more interconnection queue cycles (or two individual interconnection studies if the Transmission Provider uses a first-come, first-served serial generator interconnection process) have*** ~~has~~ been withdrawn ***and no more than five calendar years have passed between the date of an earlier interconnection request withdrawal and the date of a later interconnection request withdrawal***; ~~and~~

We make a slight modification to criterion (4) so that it reads (with additions in bold and italicized and deletions struck through):

> the Transmission Providers have not identified a different interconnection-related Network Upgrade to meet the relevant interconnection-related transmission need in an executed Generator Interconnection Agreement or in a Generator Interconnection Agreement that the interconnection customer requested that the Transmission Provider file unexecuted with the Commission~~.~~***; and***

We also add a new criterion (5), the withdrawal window criterion, as follows (with additions in bold and italicized):

> ***(5) The interconnection request withdrawals associated with the repeatedly identified interconnection-related transmission need occurred no earlier than seven calendar years prior to the commencement date of the Order No. 1000 regional transmission planning and cost allocation cycle. The initial evaluation should occur in the first Order No. 1000 regional transmission planning and cost allocation cycle to occur after the effective date of the tariff revisions implementing this reform. The transmission provider need not evaluate an interconnection-related transmission need that has been evaluated in a previous Order No. 1000 regional transmission planning and cost allocation cycle.***

546. We make these modifications to resolve confusion about the timing requirements for this reform. The Commission's *pro forma* generator interconnection procedures require an annual cluster request window for interconnection customers to submit interconnection requests.[1410] Over the span of the interconnection cycle, the transmission provider studies the interconnection requests and provides more refined interconnection study results.[1411] The requirements of this reform provide an opportunity for transmission providers to evaluate interconnection-related transmission needs associated with repeatedly identified interconnection-related network upgrades that are not developed through the generator interconnection process because the interconnection requests associated with interconnection-related network upgrade withdraw from the interconnection queue.[1412]

[1410] *See pro forma* LGIP § 3.4.1. As Order No. 1920 recognizes, however, for a transmission provider that operates a serial process and studies interconnection requests on a first-come, first served basis, the criterion will be met if the interconnection-related transmission need is identified in at least two individual interconnection studies during the preceding five-year period for interconnection customers that subsequently withdrew from the interconnection queue. Order No. 1920, 187 FERC ¶ 61,068 at P 1160. As noted above, however, this intricacy will be rendered moot as transmission providers with serial queues come into compliance with Order No. 2023, which requires them to transition to a cluster study process. *Supra* P 530 n.1380; *see* Order No. 2023, 184 FERC ¶ 61,054 at P 223.

[1411] *See*, *e.g.*, *pro forma* §§ LGIP 3.1.1 (Study Deposits), 7 (Cluster Study), 8 (Interconnection Facilities Study), 9 (Affected Systems Study), 10 (Option Interconnection Study).

[1412] Order No. 1920, 187 FERC ¶ 61,068 at P 1108 (because "the high cost of interconnection is increasing the rate at which generators withdraw from the interconnection queue. . . . interconnection customers are unlikely to resolve these interconnection-related transmission needs through the generator interconnection

547. The modifications that we make here clarify that a transmission provider need not evaluate an interconnection-related transmission need if more than five calendar years separate the withdrawal of the earlier and later interconnection requests associated with an interconnection-related transmission need (the double withdrawal criterion). Additionally, the withdrawal window criterion makes clear that a transmission provider need only evaluate an interconnection-related transmission need in its Order No. 1000 regional transmission planning and cost allocation cycle if the withdrawal of the interconnection requests associated with the repeatedly identified interconnection-related transmission need occurred within the seven calendar years prior to the commencement date of the Order No. 1000 regional transmission planning and cost allocation cycle.

548. We find that seven years is an appropriate period because it accounts for the time between withdrawn interconnection requests associated with otherwise eligible interconnection-related transmission needs (at most five years, as specified in the double withdrawal criterion) and accounts for the fact that the timing of generator interconnection queue cluster cycles likely does not coincide with the Order No. 1000 regional transmission planning and cost allocation cycle. Additionally, this seven-year period also accounts for the potential lag between the effective date of the Commission-approved tariff revisions and the initial Order No. 1000 regional transmission planning and cost allocation cycle (for the initial Order No. 1000 cycle) or the time between Order No. 1000 cycles (for subsequent Order No. 1000 cycles). Consequently, by establishing

---

process.")

a seven-year withdrawal window period, we avoid the possibility of otherwise qualifying interconnection-related transmission needs being ineligible for evaluation in an Order No. 1000 regional transmission planning and cost allocation cycle due to an inadequate withdrawal window period that does not account for lags between processes.

549. We also believe this seven-year period for the withdrawal window is simpler to calculate than the language that the Commission previously adopted for the repeat identification criterion in Order No. 1920 (before the modifications described here). The reason is that transmission providers will only need to look back seven calendar years from a single date (the commencement date of the Order No. 1000 regional transmission planning and cost allocation cycle). Without the modifications adopted here, the first qualifying criterion of the repeat identification criterion in Order No. 1920 established several look-back periods in reference to multiple dates.[1413]

550. As a result of the modifications above, there is no need to distinguish between the initial Order No. 1000 regional transmission planning and cost allocation cycle and subsequent No. 1000 regional transmission planning and cost allocation cycles. Thus, for the initial implementation of this reform, the transmission provider need only determine if the qualifying criteria are satisfied for the period beginning seven calendar years before

[1413] *Id.* P 1145 ("(1) the transmission provider has identified interconnection-related network upgrades in interconnection studies to address those interconnection-related transmission needs in at least two interconnection queue cycles during the preceding five years (looking back from the effective date of the Commission-accepted tariff provisions proposed to comply with this reform, and the later-in-time withdrawn interconnection request occurring after the effective date of the Commission-accepted tariff provisions)").

the initial Order No. 1000 regional transmission planning and cost allocation cycle commencement date. We acknowledge that, in implementation, this start date is likely to be earlier than the start date established in Order No. 1920.[1414] As a result, transmission providers may need to consider one or two additional years of withdrawn interconnection requests during the initial Order No. 1000 regional transmission planning and cost allocation cycle. However, we believe this departure from Order No. 1920 is necessary to resolve the ambiguity raised on rehearing and to establish clear qualifying criteria for transmission providers to implement going forward.

551. In addition, the withdrawal window criterion makes clear that a transmission provider need not evaluate an interconnection-related need that meets all the qualifying criteria if it has already evaluated that interconnection-related transmission need in an Order No. 1000 regional transmission planning and cost allocation cycle. This modification is necessary to prevent transmission providers from having to evaluate an interconnection-related transmission need in more than one Order No. 1000 regional transmission planning and cost allocation cycle.

552. Consistent with the adoption of the withdrawal window criterion, we clarify for Clean Energy Associations that the time period that transmission providers use to identify interconnection withdrawals is longer than five calendar years. In particular, the withdrawal window criterion requires the transmission provider to determine if the interconnection request withdrawals associated with the repeatedly identified

[1414] *Id.* P 1159.

interconnection-related transmission need occur within seven calendar years prior to the commencement of the relevant Order No. 1000 regional transmission planning and cost allocation cycle.

553. To explain how this would work, consider the following hypothetical and assume that the voltage-and-cost threshold criterion is satisfied:

- Transmission provider identifies interconnection-related transmission need A as necessary to interconnect interconnection request A in interconnection cluster cycle 1.
- Interconnection request A withdraws from interconnection cluster cycle 1 on August 1, 2035.
- In interconnection cluster cycle 2, transmission provider identifies interconnection-related transmission need A as necessary to interconnect interconnection request B.
- Interconnection request B withdraws from interconnection cluster cycle 2 on or before August 1, 2040.
- The first Order No. 1000 regional transmission planning and cost allocation cycle following the withdrawal of interconnection request B commences on January 1, 2042.

In this example, the repeat identification criterion would be satisfied because the same interconnection-related transmission need was identified for interconnection request A and interconnection request B in interconnection cluster cycle 1 and interconnection cluster cycle 2, respectively. The double withdrawal criterion would be satisfied because

no more than five calendar years have passed between the withdrawal of interconnection request A and interconnection request B. The withdrawal window criterion would be satisfied because the withdrawals of interconnection request A and interconnection request B occurred within seven calendar years prior to the commencement date of the Order No. 1000 regional transmission planning and cost allocation cycle. Consequently, the transmission provider would be required to evaluate interconnection-related transmission need A in the Order No. 1000 regional transmission planning and cost allocation cycle that commences on January 1, 2042.

554. We turn now back to Clean Energy Associations' first clarification request and explain these requirements using the dates provided in Clean Energy Associations' example, where the relevant tariff revisions would become effective August 1, 2025, the initial Order No. 1000 regional transmission planning and cost allocation cycle would commence on August 1, 2027, and the transmission solutions to be evaluated will be identified on April 1, 2028.

555. We clarify that the April 1, 2028 date would not be relevant for determining whether a transmission provider must evaluate an interconnection-related transmission need. The relevant dates are the interconnection request withdrawal dates and the commencement date of the Order No. 1000 regional transmission planning and cost allocation cycle. In Clean Energy Associations' example, the transmission provider would identify interconnection request withdrawals between August 1, 2020 (seven calendar years prior to the commencement date of the Order No. 1000 regional transmission planning and cost allocation cycle provided in this example) and August 1,

2027 (the commencement date of the Order No. 1000 regional transmission planning and cost allocation cycle provided in this example). Of those withdrawals, the repeat identification criterion will be satisfied if no more than five calendar years elapsed between the earlier and later interconnection request withdrawal dates for interconnection requests associated with the same repeatedly identified interconnection-related transmission need. Thus, withdrawals of interconnection requests with the earlier occurring on August 1, 2020 and the later occurring August 1, 2025 would satisfy the double withdrawal criterion. The same is true for withdrawals of interconnection requests with the earlier occurring on August 1, 2022 and the later occurring August 1, 2027. The double withdrawal criterion would not be satisfied, however, if the first withdrawal occurred on August 1, 2020 and the later occurred on August 2, 2025 because more than five calendar years occur between the earlier and later interconnection request withdrawals.

556. Additionally, in response to Clean Energy Associations' second request for clarification, we note that the modifications to the repeat identification criterion adopted here delete the Attachment K language adopted in Order No. 1920 that created confusion.[1415] Consistent with the modifications adopted here, we clarify that the double withdrawal criterion requires that no more than five calendar years occur between the earlier and later interconnection request withdrawals and that the withdrawal window criterion makes clear that transmission providers need not evaluate an interconnection-

[1415] *See id.* P 1145.

related transmission need if the relevant interconnection request withdrawals do not occur within the seven calendar years prior to the commencement date of the Order No. 1000 regional transmission planning and cost allocation cycle.

C. Cost Allocation

1. Order No. 1920 Requirements

557. In Order No. 1920, the Commission adopted new coordination requirements to require that transmission providers evaluate regional transmission facilities that address certain interconnection-related transmission needs identified by this reform in the existing Order No. 1000 regional transmission planning and cost allocation processes.[1416] The Commission also stated that requests to modify existing cost allocation criteria were outside the scope of the proceeding.[1417] Additionally, the Commission stated that transmission providers will still have to evaluate and select any regional transmission facilities that address the interconnection-related transmission needs as the more efficient or cost-effective regional transmission solution as part of the regional transmission planning process in order for any regional cost allocation method to apply. Further, Order No. 1920 did not alter the existing cost allocation methods in either the generator interconnection or existing Order No. 1000 regional transmission planning process.[1418] The Commission went on to explain that, to the extent that transmission providers wish to

[1416] *Id.* P 1111.

[1417] *Id.* P 1112.

[1418] *Id.* P 1117.

propose changes to their Order No. 1000 regional cost allocation method(s) because of this new requirement, they would need to do so in separate FPA section 205 filings rather than on compliance with Order No. 1920.[1419]

2. Requests for Rehearing and Clarification

558. Retail Regulators, Ohio Consumers, NRECA, Undersigned States, and West Virginia Commission argue that Order No. 1920's coordination reform shifts the costs of generator interconnection to load.[1420] In particular, Retail Regulators and Undersigned States argue that this requirement is another means to transfer network upgrade costs necessitated by generator interconnection to load and they contend, along with West Virginia Commission, that shifting these costs is not just and reasonable.[1421] Undersigned States further argue that this shift violates the FPA, and that Order No. 1920's failure to account for these effects is arbitrary and capricious.1422 Relatedly, PJM argues that this reform is arbitrary and capricious because it reopens accepted cost allocation methods in Order Nos. 1000 and 2023 that were built on the premise that the cost causer pays for the interconnection costs.[1423]

[1419] *Id.* P 1118.

[1420] Retail Regulators Rehearing Request at 43-44; Ohio Consumers Rehearing Request at 8; NRECA Rehearing Request at 45; Undersigned States Rehearing Request at 37; West Virginia Commission Rehearing Request at 16.

[1421] Retail Regulators Rehearing Request at 43-44; Undersigned States Rehearing Request at 37; West Virginia Commission Rehearing Request at 16.

[1422] Undersigned States at 37.

[1423] PJM Rehearing Request at 36 (citing *Midwest ISO Transmission Owners*, 373

559. NRECA states that the Commission has failed to consider that its policies governing interconnection-related network upgrades—particularly allowing participant funding in RTOs/ISOs—are intended to result in a just and reasonable allocation of the costs of interconnection-related network upgrades.[1424] Industrial Customers argue that Order No. 1920 abruptly abandons participant funding, which it characterizes as a "longstanding" model that sends proper pricing signals for generation developers to select projects close to load while also protecting existing transmission customers from subsidizing interconnection of new generation.[1425] East Kentucky argues that the Commission:

> has not provided a reasonable explanation of how this requirement does not result in unjust, unreasonable, and unduly discriminatory transmission rates in violation of Section 206 of the Federal Power Act, 16 U.S.C. § 824e, and does not alter, without adequate explanation or evidence, the Commission's existing interconnection pricing and participant funding polices.[1426]

560. Industrial Customers state that the Commission ignored arguments that the Commission must rationally explain its decision to depart from the existing just and reasonable "but for" policy of Order No. 2003.[1427] Industrial Customers argue that the

---

F.3d at 1368 (citing 5 U.S.C. § 706(2)(A)); *State Farm*, 463 U.S. at 43; *Wis. Gas Co. v. FERC*, 770 F.2d at 1156; *see also* Industrial Consumers Rehearing Request at 48.

[1424] NRECA Rehearing Request at 48.

[1425] Industrial Customers Rehearing Request at 41.

[1426] East Kentucky Rehearing Request at 3.

[1427] Industrial Customer Rehearing Request at 41.

Commission should not justify its "cost allocation techniques by arguing that interconnection costs for renewable energy resources are too high and should be socialized across all transmission customers."[1428] Industrial Customers further argue that Order No. 1920 changes prior Commission policies without setting forth a reasonable and adequate explanation for resulting shifting of costs.[1429]

561. Ohio Consumers argue that Order No. 1920 is inconsistent with Order No. 2003 incentives because it shifts network upgrade costs that would have incentivized generation developers to locate in "the right area."[1430] NRECA argues that requiring evaluation and selection of unbuilt interconnection-related network upgrades in the existing Order No. 1000 regional transmission planning and cost allocation processes gives an undue preferential treatment to generation developers, a group that would ordinarily fund the network upgrades in the first instance.[1431] Further, NRECA states that the Commission has made no finding that the Commission's policies allowing participant funding in RTOs/ISOs for interconnection-related network upgrades have become unjust and unreasonable and should be replaced.[1432]

3. Commission Determination

562. We sustain Order No. 1920 and find that the coordination requirements in Order No. 1920 do not require changes to existing cost allocation methods that transmission providers have adopted in either the generator interconnection or existing Order No. 1000 regional transmission planning and cost allocation processes. Therefore, those existing cost allocation methods adopted by transmission providers remain intact.

563. To this point, in response to Retail Regulators, Ohio Consumers, NRECA, Undersigned States, West Virginia Commission, and PJM, we first note that the coordination reform does not alter existing cost allocation methods or create a new cost allocation method for generator interconnection processes. Rather, the purpose of the coordination reform is to require transmission providers to *evaluate*, in the existing Order No. 1000 regional transmission planning and cost allocation processes, certain (i.e., that qualify under the criteria established in Order No. 1920) interconnection-related transmission needs that were not addressed through the generator interconnection process because the identified interconnection-related network upgrades were never constructed pursuant to that process. If an interconnection customer enters into a generator interconnection agreement, the transmission provider will construct the identified interconnection-related network upgrades and allocate their costs in accordance with the transmission provider's Commission-accepted cost allocation approach for such interconnection-related network upgrades. If an interconnection customer does not enter into a generator interconnection agreement for its interconnection request, however, the identified interconnection-related network upgrades will not be constructed pursuant to

the generator interconnection process; thus, the generator interconnection cost allocation approach would not apply.

564. Moreover, in response to NRECA and PJM, the coordination reform does not create a new regional cost allocation method for the existing Order No. 1000 regional transmission planning and cost allocation processes. Instead, transmission providers must now, pursuant to this reform, *evaluate* certain interconnection-related transmission needs pursuant to their existing Order No. 1000 regional transmission planning and cost allocation processes. The transmission provider may adopt the evaluation method and selection criteria from any of its existing Order No. 1000 regional transmission planning and cost allocation processes (e.g., economic or reliability process) to evaluate and potentially select transmission facilities that address these transmission needs. To the extent that such a transmission facility is selected, it will have met the selection criteria for the applicable Order No. 1000 regional transmission planning process and be eligible for cost allocation pursuant to a regional cost allocation method that has been found to allocate costs of transmission facilities selected through that process in a manner that is at least roughly commensurate with benefits.

565. We reiterate, however, that there is no obligation for transmission providers to select a transmission facility that addresses the interconnection-related transmission need that must be evaluated pursuant to this reform.[1433] As the Commission stated in Order No. 1920, in order for the transmission facility associated with the relevant

[1433] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 1156.

interconnection-related transmission need to be eligible for cost allocation pursuant to transmission providers' existing Order No. 1000 regional cost allocation method, the transmission provider "will still have to evaluate and select any regional transmission facilities that address the interconnection-related transmission needs as the more efficient or cost-effective regional transmission solution."[1434] The Commission also stated that "if a regional transmission facility that addresses identified interconnection-related transmission needs is not selected as part of the regional transmission planning process, then the associated regional cost allocation method would not apply."[1435] The Commission explained that, to the extent that the coordination reform results in transmission providers selecting a transmission facility that, among other things, addresses an interconnection-related transmission need in the existing Order No. 1000 regional transmission planning and cost allocation processes, they would have done so because the selected transmission facility was evaluated and determined by the transmission provider to be eligible for selection in the regional transmission plan for purposes of cost allocation and is the more efficient or cost-effective regional transmission solution. Moreover, we reiterate that the reform adopted here does not compel transmission providers to adopt a new cost allocation method for transmission facilities that address interconnection-related transmission needs.

[1434] *Id.* P 1117.

[1435] *Id.*

D. Gaming

1. Order No. 1920 Requirements

566. In Order No. 1920 the Commission did not adopt revisions to the proposed coordination reform in response to assertions that the reform would lead to "gaming," resulting in spurious interconnection requests. The Commission explained that interconnection requests require significant financial commitments from interconnection customers, which the Commission made more stringent in Order No. 2023. Consequently, the Commission considered it unlikely that an interconnection customer would submit multiple interconnection requests in multiple interconnection queue cycles to trigger the requirement for transmission providers to evaluate, as part of their existing Order No. 1000 regional transmission planning and cost allocation processes, regional transmission facilities that may address certain interconnection-related transmission needs. The Commission noted that an interconnection customer would face various risks pursuing such a strategy, including the risk that the regional transmission solution for the interconnection-related transmission need is not selected, and the risk that the newly created interconnection or transmission capacity is allocated to a different transmission or interconnection customer.[1436]

2. Requests for Rehearing and Clarification

567. PJM and NRECA argue that Order No. 1920 is arbitrary and capricious because it creates perverse incentives for generation developers to game the interconnection process

[1436] *Id.* P 1119.

and shift interconnection-related network upgrade costs in an unduly discriminatory manner onto transmission customers.[1437] PJM and NRECA argue that the evidence does not support the Commission's reasoning that the stringent financial commitments required in the interconnection process will prevent gaming.[1438]

568. PJM states that, in its generator interconnection process, an interconnection customer's initial readiness deposit is only at risk prior to the interconnection customer learning its assigned network upgrade cost responsibility.[1439] PJM further states that, for a hypothetical 300 MW project that would trigger the $30 million dollar threshold in the final rule,[1440] the interconnection customer would only risk its readiness deposit of $1.2 million prior to withdrawing and having to post an additional deposit.[1441] PJM asserts that a sophisticated developer can leverage that low risk and enhance its chances of selection for PJM's Regional Transmission Expansion Plan (RTEP) by submitting well-formed and strategically positioned, but specious, interconnection requests.[1442] PJM asserts that, as a result, such developers can flood the PJM interconnection process with speculative and larger than necessary interconnection requests and withdraw shortly after

---

[1437] PJM Rehearing Request at 33; NRECA Rehearing Request at 44, 46-47.

[1438] PJM Rehearing Request at 33; NRECA Rehearing Request at 46.

[1439] PJM Rehearing Request at 34.

[1440] Order No. 1920, 187 FERC ¶ 61,068 at P 1155.

[1441] PJM Rehearing Request at 35.

[1442] *Id.* at 36.

the required network upgrade costs are identified.[1443] PJM asserts that this would force it to reconsider RTEP upgrades that would incorporate the needed network upgrades and assign cost responsibility to load rather than to the generation developers.[1444]

569. PJM asserts that the final rule discounts these concerns despite PJM's demonstration that the risk-to-benefit ratio heavily favors the submission of speculative interconnection requests for a relatively low at-risk deposit. PJM argues that this risk-to-benefit ratio justifies the potential risk of non-selection in RTEP that a developer may face.[1445]

3. Commission Determination

570. We do not find persuasive arguments raised on rehearing and continue to find that no revisions to Order No. 1920's coordination requirement are necessary to address the speculative gaming concerns raised in this proceeding.[1446] With respect to PJM's specific generator interconnection process, we disagree with PJM that the risk an interconnection customer faces of losing only its readiness deposit if it withdraws is too low a risk to mitigate gaming concerns. Specifically, PJM's own hypothetical example demonstrates that an interconnection customer would risk losing $1.2 million for a single interconnection request, a risk that that we do not consider inconsequential. Moreover,

[1443] *Id.* at 35.

[1444] *Id.*

[1445] PJM Rehearing Request at 36.

[1446] Order No. 1920, 187 FERC ¶ 61,068 at P 1119.

for a single interconnection customer to attempt this gaming strategy, it would have to put its study and readiness deposits at risk in at least two interconnection queue cycles, and therefore would put at risk $2.4 million ($1.2 million per cycle) for the underlying interconnection-related transmission need to trigger the repeat identification criterion to qualify for evaluation in the Order No.1000 regional transmission planning and cost allocation processes.[1447] Therefore, the risk is higher than what PJM asserts.

571. Additionally, we continue to find it unlikely that an interconnection customer would submit multiple interconnection requests (in multiple interconnection queue cycles) to trigger this requirement because the interconnection customer would face additional uncertainty in that transmission providers may not select a transmission facility that addresses the interconnection-related network upgrade in a regional transmission plan for purposes of cost allocation. We also reiterate that pursuing such a strategy would entail other risks, including the risk that any of the five qualifying criteria will not be met and the possibility that the newly created interconnection or transmission capacity will not benefit the interconnection customer that submitted, and withdrew, the interconnection requests in multiple interconnection queue cycles because the entity that withdrew the interconnection requests has no preferential claim to that capacity.[1448] For these reasons, we believe the financial risks and process-related restrictions make it unlikely that a generation developer would risk time and resources to "game" this process

[1447] *Id.* PP 1119, 1145.

[1448] *See id.* P 1119.

in the hope of benefiting from an uncertain process, which is highly unlikely to produce the generation developer's preferred result.

E. Transmission Planning Process Evaluation

1. Order No. 1920 Requirements

572. In Order No. 1920, the Commission required transmission providers in each transmission planning region to evaluate regional transmission facilities that address certain interconnection-related transmission needs in their existing Order No. 1000 regional transmission planning and cost allocation processes instead of in Long-Term Regional Transmission Planning, as was proposed in the NOPR. The Commission explained that by requiring transmission providers to evaluate identified interconnection-related transmission needs in existing Order No. 1000 regional transmission planning and cost allocation processes, such needs will be addressed within a timeframe that is relevant for identifying more efficient or cost-effective near-term regional transmission solutions.[1449]

573. The Commission agreed with commenters that future interconnection-related transmission needs will be considered as part of Long-Term Regional Transmission Planning and incorporated in the development of Long-Term Scenarios. The Commission disagreed with commenters that asserted that the Commission's coordination proposal is unnecessary because well-executed Long-Term Regional Transmission Planning will identify the transmission needed to support generator

[1449] *Id.* P 1126.

interconnections. The Commission anticipated that as transmission providers gain experience with Long-Term Regional Transmission Planning they will identify fewer interconnection-related transmission needs associated with certain interconnection-related network upgrades originally identified through the generator interconnection process because transmission providers will plan to address Long-Term Transmission Needs, including those driven by Factor Category One: federal, federally-recognized Tribal, state, and local laws and regulations that affect the future resource mix and demand; Factor Category Two: federal, federally-recognized Tribal, state, and local laws and regulations on decarbonization and electrification; Factor Category Six: generator interconnection requests and withdrawals, and Factory Category Seven: utility and corporate commitments and federal, federally-recognized Tribal, state, and local policy goals that affect Long-Term Transmission Needs, through Long-Term Regional Transmission Planning.[1450]

2. Requests for Rehearing and Clarification

574. NRECA and East Kentucky argue that the Commission did not provide sufficient notice and opportunity to comment on the final rule's requirement to evaluate for selection transmission facilities to address identified interconnection-related transmission needs in existing Order No. 1000 regional transmission planning and cost allocation

[1450] *Id.* P 1127.

processes rather than in Long Term-Regional Transmission Planning process, as the NOPR proposed.[1451]

575. Clean Energy Associations claim that the Commission failed to engage in reasoned decision-making by not requiring transmission providers to evaluate network upgrades that address interconnection-related transmission needs in Long-Term Regional Transmission Planning.[1452] Clean Energy Associations argue that if one assumes that the Order No. 1920 rationale is true, i.e., that the existing Order No. 1000 regional transmission planning and cost allocation processes are a faster and more effective means of getting these facilities built, then such rationale does not justify the Commission's failure to also require evaluation of those upgrades in Long-Term Regional Transmission Planning.[1453] Clean Energy Associations allege that Order No. 1920, by limiting the mandatory consideration of interconnection-related network upgrades to the existing Order No. 1000 regional transmission planning and cost allocation processes, will necessarily fail to require transmission providers to evaluate benefits of transmission facilities that would result from their selection. Clean Energy Associations allege that any transmission upgrade, including interconnection-related network upgrades, is more likely to be selected in the "more robust" Long-Term Regional Transmission Planning,

[1451] East Kentucky Rehearing Request at 1-2; NRECA Rehearing Request at 15-16.

[1452] Clean Energy Associations Rehearing Request at 4-6.

[1453] *Id.* at 6.

which they believe is consistent with the Commission's justifications of the reform and supported by the record.[1454]

576. Clean Energy Associations assert that the Commission's expectation that fewer interconnection-related network upgrades would be identified over time, in part due to transmission providers' consideration of Factor Category Six (Generator Interconnection Requests and Withdrawals), is no grounds to deny a parallel path for transmission providers to evaluate interconnection-related transmission needs through Long-Term Regional Transmission Planning because the categories of factors apply to identifying Long-Term Transmission Needs, rather than evaluating specific facilities for possible selection.[1455] Clean Energy Associations claim that the Commission's requirement to evaluate interconnection-related transmission needs is more analogous to the evaluation requirements than to the Long-Term Scenarios requirements of Long-Term Regional Transmission Planning. Clean Energy Associations argue, therefore, that it is not just and reasonable, nor is it comparable, to assume that Factor Category Six is duplicative of evaluating interconnection-related network upgrades in Long-Term Regional Transmission Planning.

577. Clean Energy Associations further argue that evaluating interconnection-related transmission needs in Long-Term Regional Transmission Planning may serve as a needed fail-safe for addressing current interconnection-related transmission needs if a particular

[1454] *Id.* at 7.

[1455] *Id.* at 7-8.

transmission provider's existing Order No. 1000 regional transmission planning and cost allocation processes prove to be ineffective for that purpose.[1456] Clean Energy Associations assert that to maximize the chances that more efficient or cost-effective projects will be successfully developed, the Commission should require transmission providers to evaluate qualifying interconnection-related network upgrades in both Long-Term Regional Transmission Planning and the existing Order No. 1000 regional transmission planning and cost allocation processes.[1457]

578. Clean Energy Associations claim that the record demonstrates that interconnection-related network upgrades provide transmission benefits beyond the interconnection customers triggering them, and it is therefore reasonable to require their evaluation with comparable high-voltage, high-cost facilities in Long-Term Regional Transmission Planning.[1458] Clean Energy Associations also state that evaluation of interconnection-related network upgrades in Long-Term Regional Transmission Planning is the logical precedent for the voluntary funding option for interconnection customers because it will provide potential funders of the transmission facilities with a comparable way to evaluate the benefits of that facility.[1459]

[1456] *Id.* at 8.

[1457] *Id.* at 9.

[1458] *Id.* at 10-11.

[1459] *Id.* at 11-12.

579. Finally, Clean Energy Associations request that, at a minimum, the Commission clarify that Order No. 1920 does not prohibit transmission providers from evaluating interconnection-related transmission needs in Long-Term Regional Transmission Planning.[1460]

580. Large Public Power argues that by specifying that interconnection applications and withdrawals are the sole criterion for project selection in existing Order No. 1000 regional transmission planning and cost allocation processes, Order No. 1920 will dramatically skew the Order No. 1000 processes and is fundamentally at odds with the Commission's objective of not disrupting planning for reliability and economic needs put in place under Order No. 1000.[1461] Large Public Power also argues that specifying that interconnection applications and withdrawals are the sole criterion for project selection in existing Order No. 1000 regional transmission planning and cost allocation processes is inconsistent with the approach to developing Long-Term Scenarios, which "call[s] for a holistic analysis which enables system planners to make informed, balanced decisions to address the unique Long-Term Transmission Needs of each planning region."[1462] Large Public Power asserts that the Commission failed to explain why generation interconnection application withdrawals should be the only consideration to determine

[1460] *Id.* at 12-13.

[1461] Large Public Power Rehearing Request at 21.

[1462] *Id.* at 21-22.

transmission needs under existing Order No. 1000 regional transmission planning and cost allocation processes.[1463]

581. PJM claims that the withdrawn and speculative interconnection requests, as potential drivers of regional transmission needs, would insert an unjustified level of uncertainty into its existing Order No. 1000 regional transmission planning and cost allocation processes.[1464] PJM also asserts that the final rule is arbitrary and capricious because it requires consideration of withdrawn interconnection requests in its near-term RTEP and provides them undue preference over interconnection requests that have taken all required steps to obtain site control, permits, and regulatory approvals and have paid deposits.[1465] PJM contends that under the final rule, the output of the RTEP process, which is used in the generator interconnection process, "would be inflated by the addition of questionable transmission upgrades."[1466] Thus, PJM claims, the RTEP and generator interconnection processes, which are meant to work in tandem, would become unnecessarily separated and infused with dubious inputs and drivers.[1467]

[1463] Large Public Power Rehearing Request at 22.

[1464] PJM Rehearing Request at 37-38.

[1465] *Id.*

[1466] *Id.* at 38.

[1467] *Id*.

3. Commission Determination

582. We disagree with NRECA and East Kentucky that the Commission failed to provide adequate notice of and opportunity to comment on Order No. 1920's requirement that transmission providers in each transmission planning region evaluate for selection regional transmission facilities that address certain interconnection-related transmission needs in their existing Order No. 1000 regional transmission planning and cost allocation processes instead of in Long-Term Regional Transmission Planning.[1468]

583. A final rule is a logical outgrowth of a proposed rule where "a reasonable member of the regulated class" could "anticipate the general aspects of the [final] rule."[1469] Order No. 1920 satisfies this standard because the NOPR explicitly requested comment on how the proposed reform "should interact with existing regional transmission planning processes and the Long-Term Regional Transmission Planning proposed herein,"[1470] which put parties on notice that the Commission was contemplating the change that

---

[1468] East Kentucky Rehearing Request at 1-2; NRECA Rehearing Request at 15-16.

[1469] *Telesat Canada v. FCC*, 999 F.3d at 713-14 (quotations omitted). We note that, while requiring transmission providers to evaluate identified interconnection-related transmission needs in existing Order No. 1000 regional transmission planning and cost allocation processes will allow such needs to be addressed within a timeframe that is relevant for identifying more efficient or cost-effective near-term regional transmission solutions, we believe that evaluating interconnection-related transmission needs in Long-Term Regional Transmission Planning would also be appropriate. The inability to require that transmission providers consider regional transmission facilities to address interconnection-related transmission needs in Order No. 1000 processes would not have prevented the Commission from issuing Order No. 1920.

[1470] NOPR, 179 FERC ¶ 61,028 at P 174.

NRECA and East Kentucky now argue is not a logical outgrowth of the NOPR. Courts have explained that "[n]otice suffices when [an agency] has 'expressly asked for comments on a particular issue or otherwise made clear that the agency was contemplating a particular change.'"[1471] Here, by requesting comment on the issue, the Commission put parties on notice that it was continuing to contemplate how the proposed reform should interact with both proposed Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes.

584. Agency final rules need not be identical to proposed rules, and notice is sufficient if the final rule represents a "logical outgrowth" of the proposed rule.[1472] The final rule is a logical outgrowth of the NOPR in this regard. In the NOPR, the Commission proposed to require that transmission providers evaluate for selection in the regional transmission plan for purposes of cost allocation regional transmission facilities to address certain interconnection-related needs that meet specific qualifying criteria established by the Commission.[1473] Order No. 1920 adopted this requirement and mandated that such consideration occur in existing Order No. 1000 regional transmission planning and cost

[1471] *Brennan v. Dickson*, 45 F.4th at 69 (quoting *CSX Transp., Inc. v. Surface Transp. Bd.*, 584 F.3d at 1081).

[1472] *Long Island Care*, 551 U.S. at 174-75; *see also Am. Paper Inst. v. EPA*, 660 F.2d at 959 n.13 ("An agency may make *even substantial changes* in its original proposed rule without a further comment period if the changes are in character with the original proposal and are a logical outgrowth of the notice and comments already given." (emphasis added)).

[1473] NOPR, 179 FERC ¶ 61,028 at P 166.

allocation processes,[1474] rather than in Long-Term Regional Transmission Planning, as the NOPR proposed.[1475] The Commission explained that this change will allow interconnection-related transmission needs to be addressed within a timeframe that is relevant for identifying more efficient or cost-effective near-term regional transmission solutions. We find that this change satisfies the logical outgrowth test because while the Commission modified the type of regional transmission planning and cost allocation processes that would be subject to coordination with interconnection-related transmission needs, it retained the underlying requirement that such coordination occur. Thus, Order No. 1920's requirement "follow[s] logically from" the NOPR because the NOPR "adequately frame[d] the subjects for discussion."[1476]

585. We are unpersuaded by Clean Energy Associations' assertion that the Commission failed to engage in reasoned decision-making by not requiring transmission providers to evaluate network upgrades that address interconnection-related transmission needs in Long-Term Regional Transmission Planning. We continue to find that evaluating interconnection-related transmission needs associated with this coordination requirement is more appropriate in the existing Order No. 1000 regional transmission planning and cost allocation processes than in Long-Term Regional Transmission Planning because such evaluation would occur at shorter intervals and would be more likely to result in

[1474] Order No. 1920, 187 FERC ¶ 61,068 at P 1126.

[1475] NOPR, 179 FERC ¶ 61,028 at P 167.

[1476] *Conn. Light & Power Co. v. Nuclear Regulatory Comm'n*, 673 F.2d at 533.

expeditious development of regional transmission facilities to address the nearer-term interconnection-related transmission needs identified through the generator interconnection process.[1477] We find that it is unnecessary to require transmission providers to also evaluate interconnection-related transmission needs associated with this coordination requirement in Long-Term Regional Transmission Planning because the coordination requirement in Order No. 1920 is just and reasonable and sufficient to address the need for reform.

586. In addition, we reiterate that transmission providers must consider future interconnection-related transmission needs as a driver of Long-Term Transmission Needs in Long-Term Regional Transmission Planning through the development of Long-Term Scenarios, which must incorporate generator interconnection withdrawals in Factor Category Six (Generator Interconnection Requests and Withdrawals).[1478] Factor Category Six allows transmission providers to consider a broader range of potential interconnection-related transmission needs compared to the interconnection-related transmission needs that meet the coordination requirement's qualifying criteria. Moreover, to the extent that an interconnection-related transmission need is not addressed according to this coordination requirement, transmission providers may choose to consider similar interconnection-related transmission needs as Long-Term Transmission Needs and evaluate Long-Term Regional Transmission Facilities to address those needs

[1477] Order No. 1920, 187 FERC ¶ 61,068 at P 1126.

[1478] *Id.* PP 1127-1128.

in Long-Term Regional Transmission Planning. Therefore, we believe that requiring transmission providers to evaluate interconnection-related transmission needs identified by this coordination requirement in Long-Term Regional Transmission Planning would be redundant to existing Order No. 1920 requirements and could inappropriately limit the scope of the interconnection-related transmission needs that transmission providers consider in Long-Term Regional Transmission Planning.

587. On this point, we disagree with Clean Energy Associations' claim that it is not just and reasonable, nor is it comparable, to assume Factor Category Six is duplicative of evaluating interconnection-related network upgrades in Long-Term Regional Transmission Planning, and that this coordination requirement is more analogous to the Long-Term Regional Transmission Planning evaluation requirements. Both the qualifying criteria of the coordination requirement and the categories of factors of the Long-Term Scenarios requirements (in Long-Term Regional Transmission Planning) establish how transmission providers identify transmission needs. We recognize that the coordination requirement mandates the evaluation of regional transmission facilities to address interconnection-related transmission needs associated with this coordination requirement, albeit allowing for flexibility in how transmission providers evaluate such facilities for selection, but Long-Term Regional Transmission Planning does not mandate evaluation of a specific type of transmission facility.[1479] However, the requirement to evaluate regional transmission facilities associated with the coordination requirement is

[1479] *Id.* P 1111.

similar to the Long-Term Regional Transmission Planning requirement for transmission providers to establish a process, including selection criteria, that they will use to identify and evaluate Long-Term Regional Transmission Facilities for potential selection to address Long-Term Transmission Needs (which, as discussed above, will include future interconnection-related transmission needs). This explanation addresses Clean Energy Associations' concern that Order No. 1920 will necessarily fail to require transmission providers to evaluate benefits of transmission facilities to address interconnection-related transmission needs through Long-Term Regional Transmission Planning.

588. In response to Clean Energy Associations' request for clarification that Order No. 1920 does not prohibit transmission providers from evaluating interconnection-related transmission needs in Long-Term Regional Transmission Planning, we reiterate that future interconnection-related transmission needs must be considered as part of Long-Term Regional Transmission Planning and incorporated in the development of Long-Term Scenarios.[1480] We clarify that Order No. 1920 does not prohibit transmission providers from proposing on compliance how they will identify and evaluate future interconnection-related transmission needs in Long-Term Regional Transmission Planning. However, we will not prejudge Clean Energy Associations' proposal for a "parallel path" for identifying and evaluating interconnection-related transmission needs in Long-Term Regional Transmission Planning using the coordination requirement's

[1480] *Id.* P 1127.

qualification criteria.[1481] If any transmission provider chooses to develop additional processes to address interconnection-related transmission needs in Long-Term Regional Transmission Planning, they must demonstrate that the proposal is consistent with or superior to Order No. 1920's requirements.

589. We are not persuaded by Large Public Power's argument that, in Order No. 1920, the Commission is specifying that interconnection applications and withdrawals are the sole criterion for project selection in existing Order No. 1000 regional transmission planning and cost allocation processes. To this point, we first note that Order No. 1920 adopts not one, but five, criteria for interconnection-related transmission needs to be evaluated through existing Order No. 1000 regional transmission planning and cost allocation processes. That is, evaluation is only required when the interconnection-related network upgrades driving interconnection-related transmission needs meets the five qualification criteria established in Order No. 1920.[1482]

590. Furthermore, the evaluation requirement only requires transmission providers to *evaluate* interconnection-related transmission needs in the Order No. 1000 regional transmission planning process. It does not require that transmission providers use interconnection-related transmission needs as a criterion to decide whether to select a regional transmission facility in the Order No. 1000 regional transmission planning process nor does it require that the interconnection-related transmission need be resolved.

[1481] *Id.* P 1145.

[1482] *Id.*

As the Commission explained, these requirements provide flexibility in how transmission providers evaluate transmission facilities for selection by allowing them to adopt the evaluation method and selection criteria from any of their existing Order No. 1000 regional transmission planning and cost allocation processes (e.g., economic or reliability processes) to evaluate and potentially select these types of transmission facilities. The Commission thus permitted transmission providers to propose the best method to incorporate this new requirement for their transmission planning region and encouraged transmission providers to consider, as part of the evaluation process, whether regional transmission facilities that address certain identified interconnection-related transmission needs may also address other regional transmission needs more efficiently or cost-effectively.[1483]

591. We also disagree with PJM's assertions that the Order No. 1920 requirement is arbitrary and capricious because the requirement would insert an unjustified level of uncertainty into its existing Order No. 1000 regional transmission planning and cost allocation processes by requiring consideration of withdrawn interconnection requests in its near-term RTEP. As explained here and in Order No. 1920, we are not requiring that transmission providers develop transmission facilities through the Order No. 1000 regional transmission planning and cost allocation processes as transmission solutions to address interconnection-related transmission needs. The coordination reform simply creates an avenue for evaluation of qualifying interconnection-related transmission needs

[1483] *Id.* P 1111.

in the existing Order No. 1000 regional transmission planning and cost allocation processes. Further, Order No. 1920 gives transmission providers flexibility to "adopt the evaluation method and selection criteria from any of their existing Order No. 1000 regional transmission planning and cost allocation processes (e.g., economic or reliability processes) to evaluate and potentially select these types of transmission facilities"[1484]

592. Additionally, we disagree with PJM that the Order No. 1920 requirement gives undue preference to withdrawn interconnection requests. Instead, the requirement addresses a barrier to entry for new generation resources, where repeated interconnection requests are increasingly withdrawn due to sticker shock from the estimated costs of the required interconnection-related network upgrades. The qualifying requirements, however, disqualify from these requirements interconnection-related transmission needs memorialized in generator interconnection agreements (i.e., that are ready to move forward with project development in the generator interconnection process). Consequently, pursuant to the coordination reformation requirements, no interconnection customer would benefit from having the upgrade costs that it would otherwise pay allocated instead through transmission rates. Rather, in the circumstance that Order No. 1920 addresses, no interconnection customer is willing to pay the estimated costs of the interconnection-related network upgrades. Therefore, there would be no undue preference because if the qualifying criteria are met, there is no longer an interconnection

[1484] *Id.*

request or interconnection customer associated with the qualifying interconnection-related transmission need.

593. Moreover, in response to PJM's assertion that the output of the RTEP process, which is used in its generator interconnection process, "would be inflated by the addition of questionable transmission upgrades," we again note that the Order No. 1920 requirement does not require that transmission providers resolve interconnection-related transmission needs, including resolving them through selection of transmission facilities; that is, Order No. 1920 neither requires nor guarantees a specific outcome. Rather, transmission providers must consider the interconnection-related transmission needs in their existing Order No. 1000 regional transmission planning and cost allocation processes and determine whether there is a more efficient or cost-effective transmission solution, under the existing evaluation and selection criteria in the existing Order No. 1000 regional transmission planning and cost allocation processes.

VII. Consideration of Dynamic Line Ratings and Advanced Power Flow Control Devices

A. Order No. 1920 Requirements

594. In Order No. 1920, the Commission required transmission providers in each transmission planning region to consider, in Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes, the following enumerated alternative transmission technologies for each identified transmission need: (1) dynamic line ratings; (2) advanced power flow control devices; (3) advanced

conductors; and (4) transmission switching.[1485] This list of enumerated alternative transmission technologies that the Commission required transmission providers in each transmission planning region to consider expanded on the Commission's proposed list of alternative transmission technologies, which only proposed to require the consideration of dynamic line ratings and advanced power flow control devices.[1486] The Commission further required that transmission providers consider each of these enumerated technologies when evaluating new regional transmission facilities, as well as upgrades to existing transmission facilities. Thus, the Commission required that for each identified transmission need, when evaluating regional transmission facilities for potential selection, transmission providers must consider whether regional transmission facilities that incorporate, or solely consist of, any of the enumerated list of alternative transmission technologies would be more efficient or cost-effective than selecting new regional transmission facilities or upgrades to existing transmission facilities that do not incorporate these technologies.[1487]

[1485] Order No. 1920, 187 FERC ¶ 61,068 at P 1198. In Order No. 1920, the Commission defined advanced transmission technologies as "a range of permissible present and future technologies, and is defined relative to conventional aluminum conductor steel reinforced conductors." *Id.* P 1243. The Commission further clarified that "advanced conductors include, but are not limited to, superconducting cables, advanced composite conductors, advanced steel cores, high temperature low-sag conductors, fiber optic temperature sensing conductors, and advanced overhead conductors." *Id.*

[1486] NOPR, 179 FERC ¶ 61,028 at P 272.

[1487] Order No. 1920, 187 FERC ¶ 61,068 at P 1198.

595. The Commission further required that transmission providers' evaluation of the enumerated alternative transmission technologies must be consistent with the requirements in their OATTs for other transmission solutions.[1488] In response to requests for additional transparency, the Commission adopted the NOPR proposal to expand the existing requirement established in Order No. 1000 for transmission providers' evaluation processes to culminate in a determination that is sufficiently detailed for stakeholders to understand why a particular transmission facility was selected or not selected. Specifically, the Commission required that the determination include an explanation that is sufficiently detailed for stakeholders to understand why dynamic line ratings, advanced power flow control devices, advanced conductors, and/or transmission switching were or were not incorporated into selected regional transmission facilities.[1489]

B. Requests for Rehearing and Clarification

1. General Requests for Rehearing and Clarification

a. Requests for Rehearing and Clarification

596. Large Public Power requests clarification that transmission providers may use engineering judgment in considering which transmission elements should be analyzed as candidates for alternative transmission technologies. Specifically, Large Public Power explains that, while it does not challenge the Commission's general approach to alternative transmission technologies, requiring transmission providers to conduct

[1488] *Id.* P 1199.

[1489] *Id.* P 1214.

resource intensive and detailed production cost simulations for each technology for each existing transmission element would be burdensome and expensive. Large Public Power asks the Commission to clarify that planning engineers may exercise informed discretion regarding the planning horizon within which alternative transmission technologies are of value. Finally, Large Public Power states that it understands that all relevant judgments must be supported and subject to examination and review.[1490]

597. On rehearing, NESCOE argues that the Commission should require transmission providers to prioritize alternative transmission technologies to serve as the starting point for addressing identified transmission needs.[1491] NESCOE states that, absent such prioritization of alternative transmission technologies, rates remain at risk of being unjust and unreasonable.[1492] NESCOE asks the Commission to direct transmission providers to incorporate tariff procedures establishing a rebuttable presumption that the incorporation of alternative transmission technologies as a solution to an identified Long-Term Transmission Need or existing Order No. 1000 transmission need would result in a more efficient or cost-effective transmission solution. NESCOE asserts that such a directive would both maintain the flexibility envisioned by Order No. 1920 and place the burden on transmission providers to demonstrate why alternative transmission technologies are

[1490] Large Public Power Request for Rehearing at 13-16.

[1491] NESCOE Request for Rehearing at 6, 22-25, 34.

[1492] *Id.* at 25.

not, either alone or as a solution component, a more efficient or cost-effective solution.[1493]

b. Commission Determination

598. We grant, in part, Large Public Power's request for clarification regarding "engineering judgment" in analyzing transmission elements for alternative transmission technologies.[1494] In particular, we do not require detailed production cost simulations to demonstrate costs and benefits of each alternative transmission technology for each existing transmission element, and we clarify that transmission providers have flexibility to apply good engineering judgment to identify the specific transmission elements that are likely candidates for specific enumerated alternative transmission technologies. We recognize that a transmission provider's consideration of alternative transmission technologies will likely depend on the particulars of the transmission provider's transmission system. In that context, transmission providers may be able to rapidly determine if a certain alternative transmission technology is inappropriate for further study on a specific transmission element.[1495]

599. We reiterate, however, that transmission providers in each transmission planning region must consider, as discussed above, dynamic line ratings, advanced power flow

[1493] *Id.* at 24-25.

[1494] Large Public Power Request for Rehearing at 13-16.

[1495] We note that this is consistent with the Commission's findings in Order No. 2023. *See, e.g.*, Order No. 2023, 187 FERC ¶ 61,068 at P 1590.

control devices, advanced conductors, and transmission switching for each identified transmission need during Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes. We further reiterate that transmission providers must consider each of those alternative transmission technologies when evaluating new regional transmission facilities, as well as upgrades to existing transmission facilities.[1496] Such consideration of the enumerated alternative transmission technologies must be consistent with the requirements in their OATTs for other transmission solutions and with the Commission's requirements established in Order No. 1920.[1497] Finally, consistent with Large Public Power's understanding,[1498] nothing in this clarification obviates the requirement for transmission providers to support their determinations,[1499] the Commission's transparency requirements, or the potential to challenge a transmission provider's consideration of the enumerated alternative transmission technologies.[1500]

[1496] Order No. 1920, 187 FERC ¶ 61,068 at P 1198.

[1497] *Id.* P 1199.

[1498] Large Public Power Request for Rehearing at 16.

[1499] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 1214.

[1500] *See, e.g.*, *id.* P 224. The Order No. 890 transmission planning principles include transparency and obligate transmission providers to disclose to all customers and other stakeholders the basic criteria, assumptions, and data that underlie their transmission system plans. *See* Order No. 890, 118 FERC ¶ 61,119 at PP 435, 471. In Order No. 890, the transparency transmission planning principle also requires transmission providers to reduce to writing and make available the basic methodology, criteria, and processes they use to develop their transmission plans, including how they treat retail native loads, in order to ensure that standards are consistently applied. Order

600. We deny NESCOE's request that the Commission establish a rebuttable presumption in favor of alternative transmission technologies.[1501] Rather, it is the Commission's longstanding policy to remain fuel and technology neutral.[1502] As such, and consistent with the Commission's finding in Order No. 2023,[1503] we decline to create a presumption in favor of substituting alternative transmission technologies in either Long-Term Regional Transmission Planning or the existing Order No. 1000 regional transmission planning processes. There is insufficient evidence in the record to presume that an alternative transmission technology would be the more efficient or cost-effective solution as a replacement for a traditional wires-based solution or that the addition of an alternative transmission technology to a potential transmission solution would necessarily result in a more efficient or cost-effective solution in all instances. Consequently, Order No. 1920 mandates a process for the consideration of alternative transmission technologies, not specific outcomes.[1504]

[1503] Order No. 2023, 184 FERC ¶ 61,054 at P 1582 ("This final rule does not create a presumption in favor of substituting alternative transmission technologies for necessary traditional network upgrades, either categorically or in specific cases.").

[1504] *See id.*

2. Technology Specific Requests for Rehearing and Clarification

a. Requests for Rehearing and Clarification

601. Clean Energy Associations and PIOs assert that the Commission failed to engage in reasoned decision-making by not requiring transmission providers to evaluate storage resources that perform a transmission function as alternative transmission technologies.[1505] Clean Energy Associations and PIOs disagree that the Commission's finding that "whether an electric storage resource performs a transmission function requires a case-by-case analysis" justifies its exclusion from the list of enumerated alternative transmission technologies because, they argue, all transmission solutions are studied on a case-by-case basis.[1506] Clean Energy Associations further argue that whether a particular storage resource is performing a transmission function is completely separate and distinct from the issue of whether a storage resource that *has* been determined on a case-specific basis to be providing a transmission function should be included in the list of enumerated alternative transmission technologies.[1507] Clean Energy Associations argue that the proper approach is to require storage resources that would be providing a

[1505] Clean Energy Associations Rehearing Request at 26-30; PIOs Rehearing Request at 7, 38-43 (citations omitted).

[1506] Clean Energy Associations Rehearing Request at 26 (quoting Order No. 1920, 187 FERC ¶ 61,068 at P 1245); PIOs Rehearing Request at 40.

[1507] Clean Energy Associations Rehearing Request at 26.

transmission function be included in the enumerated list of alternative transmission technologies.[1508]

602. Clean Energy Associations assert that the Commission's decision to exclude storage providing a transmission function is not supported by substantial evidence and is unduly discriminatory.[1509] Clean Energy Associations argue that the record evidence demonstrates that storage can provide efficient or cost-effective solutions and that the Commission did not cite evidence that considering storage in transmission planning is potentially detrimental or lacks stakeholder support.[1510] Clean Energy Associations further argue that the Commission failed to distinguish storage resources providing a transmission function from advanced conductors and transmission switching technologies, which were added to the advanced technologies enumerated in the final rule. Clean Energy Associations assert that there is no rational basis to exclude storage resources from the list and that it is unduly discriminatory to exclude storage.[1511] Clean Energy Associations state that the Commission should grant rehearing and require

[1508] *Id.* at 27.

[1509] *Id.* at 26-30.

[1510] *Id.* at 27-28 (citing *Emera Me.*, 854 F.3d at 22).

[1511] *Id.* at 29-30 (citing *FPL Energy Marcus Hook, L.P. v. FERC*, 430 F.3d 441, 449 (D.C. Cir. 2005); *Emera Me.*, 854 F.3d at 22).

transmission providers to consider storage as a transmission asset in Long-Term Regional Transmission Planning.[1512]

603. PIOs assert that the Commission's omission of storage as a transmission asset from the list of alternative transmission technologies that transmission providers must consider in Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes was arbitrary and capricious because the Commission did not meaningfully engage with commenters or provide a reasoned basis for its decision.[1513] PIOs urge the Commission to grant rehearing to require transmission providers to evaluate storage as a part of Long-Term Regional Transmission Planning.[1514]

604. PIOs observe that the Commission has identified considerations that, together, ensure that a selected storage resource will serve a transmission function; nevertheless, they argue the Commission failed to explain why it did not simply note that the use of storage as a transmission asset will ultimately need to comply with these considerations, rather than omitting it as an alternative transmission technology.[1515] PIOs state that under the Commission's approach in Order No. 1920, in which it explained that "transmission providers are the appropriate entity to identify, evaluate, and select specific solutions to

[1512] *Id.* at 30.

[1513] PIOs Rehearing Request at 38, 42-43 (citations omitted).

[1514] *Id.* at 43.

[1515] *Id.* at 41-42 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1245, n.2671; *Sw. Power Pool, Inc*., 183 FERC ¶ 61,153, at P 29 (2023)).

specific transmission needs," it need not dictate how transmission providers evaluate storage as transmission.[1516]

605. CTC Global states that the Commission's definition of advanced conductors allows for the consideration of advanced conductors that are not representative of the capabilities represented by the Commission.[1517] CTC Global states that this may allow transmission providers to avoid consideration of the types of advanced conductors that Congress intended to be reviewed in the Energy Policy Act of 2005 and that the US DOE has described in reports.[1518] For this reason, CTC Global requests clarification, or in the alternative rehearing, that the definition of advanced conductors will ensure that sufficiently advanced conductors—which at a given voltage increase power flow capabilities by at least 1.5 times, decrease losses by 20% or more, and improve conductor sag performance—are included in regional transmission planning processes. CTC Global states that such a clarification is needed to ensure that the conditions that the Commission identified as leading to unjust and unreasonable rates are addressed and argues that failure to do so will continue to result in project identification that may not be more efficient or cost-effective than alternatives.[1519]

[1516] *Id.* at 41 (quoting Order No. 1920, 187 FERC ¶ 61,068 at P 1210).

[1517] CTC Global Rehearing Request at 2-3.

[1518] *Id.* (citing Energy Policy Act of 2005, Pub. L. No. 109-58, § 1223, 119 Stat. 594, 953-954 (2005)).

[1519] *Id.* at 2-5, 10-17.

606. Invenergy argues that the Commission should clarify that HVDC is an alternative transmission technology that may be considered in long-term and nearer-term regional transmission planning processes.[1520] Invenergy explains that the Commission did not specifically address the use of HVDC, despite PIOs arguing for its consideration as an alternative transmission technology. Invenergy agrees with PIOs' comments and states that PIOs clearly demonstrated in their comments how HVDC can be beneficial.[1521] In light of this demonstration, Invenergy asks the Commission to grant clarification that transmission providers are not precluded from considering HVDC like other alternative transmission technologies or other potential solutions that may be considered in long-term and nearer-term regional transmission planning processes.[1522]

b. Commission Determination

607. We sustain the Commission's decision in Order No. 1920 to not include storage as a transmission asset in the enumerated list of alternative transmission technologies that transmission providers must consider.[1523] We continue to find that the evaluation of whether an electric storage resource performs a transmission function requires a case-by-case analysis of how a particular electric storage resource would be operated as well as any requirements set forth in an OATT governing selection of such electric storage

[1520] Invenergy Rehearing Request at 10-13.

[1521] *Id.* at 11-12 (citing PIOs NOPR Initial Comments at 22, Ex. A at PP 20, 22,).

[1522] *Id.* at 13.

[1523] Order No. 1920, 187 FERC ¶ 61,068 at P 1245.

resources as transmission solutions.[1524] Therefore, we continue to find that it is inappropriate to require the consideration of storage that performs a transmission function on a generic basis. While Clean Energy Associations and PIOs argue that any transmission solution requires a case-by-case analysis, electric storage resources require an *additional* case-by-case analysis that distinguishes them from other transmission solutions and from the enumerated list of alternative transmission technologies.[1525] Namely, that type of analysis would require the transmission provider to determine, among other considerations: (1) that the electric storage resource would strictly act as a transmission asset, connected to the transmission system as a transmission facility solely to support that transmission provider's transmission system; (2) the electric storage resource's cost recovery, by ensuring that the electric storage resource's participation in markets is limited to only charging from, and discharging to, the transmission provider's transmission system as necessary to provide the services for which it was selected based on the cost of the maximum capacity needed to address the identified transmission issue; and (3) that the electric storage resource's construction would not impact the generator interconnection queue.[1526] We reiterate, however, that Order No. 1920 does not preclude

[1524] *Id.* In Order No. 2023, the Commission pointed to the process in SPP, which takes into account five considerations that, together, ensure that a selected electric storage resource will serve a transmission function. Order No. 2023, 184 FERC ¶ 61,054 at P 1599 (citing *Sw. Power Pool, Inc.*, 183 FERC ¶ 61,153, at P 29 (2023)).

[1525] Order No. 2023, 184 FERC ¶ 61,054 at P 1599; Order No. 2023-A, 186 FERC ¶ 61,199 at P 640.

[1526] *Sw. Power Pool, Inc.*, 183 FERC ¶ 61,153, at P 29 (2023).

transmission providers from considering other alternative transmission technologies that were not included in the enumerated list of alternative transmission technologies, including storage as a transmission asset, in their Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes.[1527]

608. In response to CTC Global, we clarify that the requirement to consider alternative transmission technologies necessitates that transmission providers consider the types of advanced conductors that Congress intended to be reviewed in the Energy Policy Act of 2005 and that the US DOE has described in its reports.[1528] However, we decline to alter the definition of an advanced conductor.[1529] We continue to find that advanced conductors include present and future transmission line technologies whose power flow capacities exceed the power flow capacities of conventional aluminum conductor steel

[1527] Order No. 1920, 187 FERC ¶ 61,068 at P 1247.

[1528] *See, e.g.*, U.S. Dep't of Energy, *Advanced Transmission Technologies* 25-28 (Dec. 2020), https://www.energy.gov/sites/prod/files/2021/02/f82/Advanced%20Transmission%20Technologies%20Report%20-%20final%20as%20of%2012.3%20-%20FOR%20PUBLIC.pdf; *see also* U.S. Dep't of Energy, *Pathways to Commercial Liftoff: Innovative Grid Deployment* 77 (2024), https://liftoff.energy.gov/wp-content/uploads/2024/05/Liftoff_Innovative-Grid-Deployment_Final_5.2-1.pdf; *see also* 42 U.S.C. § 16422(b) (directing the Commission to "encourage, as appropriate, the deployment of advanced transmission technologies"); *id.* § 16422(a) (defining "advanced transmission technology" as "a technology that increases the capacity, efficiency, or reliability of an existing or new transmission facility").

[1529] *See* CTC Global Rehearing Request at 4-5 (setting forth proposed modified definition).

reinforced conductors,[1530] and that advanced conductors include, but are not limited to, superconducting cables, advanced composite conductors, advanced steel cores, high temperature low-sag conductors, fiber optic temperature sensing conductors, and advanced overhead conductors.[1531] However, we clarify that transmission providers, rather than considering just one of the six advanced conductor examples listed, must instead consider each of the six advanced conductor examples listed, and, as they determine appropriate, any additional advanced conductor which that transmission provider determines might be more efficient or cost-effective. In doing so, transmission providers must consider a range of advanced conductor options with a variety of performance and cost attributes, including those with the performance capabilities described by CTC Global.[1532] We deny CTC Global's request to add performance metrics to the definition of an advanced conductor because it would limit the scope of advanced conductors required to be considered and thereby eliminate from required consideration certain advanced conductors that may be more efficient or cost-effective in specific circumstances.

[1530] Order No. 1920, 187 FERC ¶ 61,068 at P 1198 n.2553.

[1531] *Id.* P 1243.

[1532] CTC Global Rehearing Request at 2-5 (requesting that the Commission clarify that advanced conductors are those that have power flow capabilities that exceed those of conventional aluminum conductor steel reinforced conductors at a given voltage by a factor of at least 1.5 times while decreasing electrical losses by 20% or more, and improve conductor sag performance, at the same or reduced weight per foot).

609. In response to Invenergy,[1533] we clarify that transmission providers are not precluded from considering HVDC facilities in Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes. In Order No. 1920, the Commission clarified that transmission providers are not precluded from considering other alternative transmission technologies that are not included in the enumerated list of alternative transmission technologies or other potential solutions in their Long-Term Regional Transmission Planning and existing Order No. 1000 regional transmission planning processes.[1534] That clarification applies to the consideration of HVDC technologies.

VIII. Regional Transmission Cost Allocation

A. Obligation to File an *Ex Ante* Long-Term Regional Transmission Cost Allocation Method and Its Use as a Backstop

1. Logical Outgrowth

a. NOPR Proposals

610. In the NOPR, the Commission proposed to require transmission providers in each transmission planning region to revise their OATTs to include one of the following: (1) a Long-Term Regional Transmission Cost Allocation Method to allocate the costs of Long-Term Regional Transmission Facilities; (2) a State Agreement Process by which one or

[1533] Invenergy Rehearing Request at 10-13.

[1534] Order No. 1920, 187 FERC ¶ 61,068 at P 1247.

more Relevant State Entities may voluntarily agree to a cost allocation method; or (3) a combination thereof.[1535]

611. The Commission noted that if states agree to a State Agreement Process instead of a Long-Term Regional Transmission Cost Allocation Method, certain Long-Term Regional Transmission Facilities selected in the regional transmission plan for purposes of cost allocation would lack a clear *ex ante* cost allocation method,[1536] and sought comment on whether the Commission should require transmission providers to include a Long-Term Regional Transmission Cost Allocation Method in their OATTs, in lieu of the proposed reform.[1537] The Commission requested comment on the appropriate outcome when Relevant State Entities fail to agree on a cost allocation method for all or a portion of Long-Term Regional Transmission Facilities, including whether in such circumstances the transmission providers should be required to establish a Long-Term Regional Transmission Cost Allocation Method.[1538]

[1535] NOPR, 179 FERC ¶ 61,028 at P 302. The Commission explained that, for example, a "combination" approach may entail (i) providing a Long-Term Regional Transmission Cost Allocation Method for certain types of Long-Term Regional Transmission Facilities and providing a State Agreement Process for others; or (ii) providing for cost allocation for a Long-Term Regional Transmission Facility, portfolio, or type of such facilities partially based on a Long-Term Regional Transmission Cost Allocation Method and partially based on funding contributions in accordance with a State Agreement Process. *Id.* P 302 n.510.

[1536] *Id.* P 315.

[1537] *Id.* P 318.

[1538] *Id.* P 310.

b. Order No. 1920 Requirements

612. In Order No. 1920, the Commission required transmission providers in each transmission planning region to revise their OATTs to include one or more Long-Term Regional Transmission Cost Allocation Methods[1539] for Long-Term Regional Transmission Facilities that are selected and permitted transmission providers to additionally revise their OATTs to include a State Agreement Process, if Relevant State Entities indicate that they have agreed to such a process. The Commission required that a State Agreement Process cannot be the sole method filed for cost allocation for Long-Term Regional Transmission Facilities, and that if a State Agreement Process fails to result in a cost allocation method agreed to by Relevant State Entities and any other authorized entities, or if the Commission ultimately finds that the cost allocation method that results from a State Agreement Process is unjust, unreasonable, or unduly discriminatory or preferential, then the relevant Long-Term Regional Transmission Cost Allocation Method on file would apply as a backstop.[1540]

613. In Order No. 1920, the Commission stated that it was not imposing any obligation on transmission providers to file a cost allocation method for Long-Term Regional Transmission Facilities with which they disagree, even if such a method were proposed to

[1539] The Commission defined Long-Term Regional Transmission Cost Allocation Method as an *ex ante* regional cost allocation method for one or more Long-Term Regional Transmission Facilities (or a portfolio of such Facilities) that are selected in the regional transmission plan for purposes of cost allocation. Order No. 1920, 187 FERC ¶ 61,068 at P 1291.

[1540] *Id.* PP 1291-1292.

the transmission providers pursuant to a Commission-approved State Agreement Process, unless the transmission providers have clearly indicated their assent to do so as part of a Commission-approved State Agreement Process in their OATTs.[1541]

c. Requests for Rehearing and Clarification

614. Several commenters argue that Order No. 1920 substantially departs from and is not a logical outgrowth of the NOPR because Order No. 1920 does not require transmission providers to adopt a State Agreement Process, consequently denying Relevant State Entities any meaningful opportunity to determine regional cost allocation.[1542] Arizona Commission asserts that, contrary to the NOPR, Order No. 1920 "effectively eliminates the use of a voluntary State Agreement Process, such as the one that has been used by PJM since Order No. 1000," which it asserts is "directly contrary to comments filed by state regulators."[1543] Idaho Commission argues that "[i]n a substantial departure from the NOPR, Order No. 1920 allows, but does not require, transmission providers in each transmission planning region to adopt a State Agreement Process for allocating the costs of all, or a subset of, Long-Term Regional Transmission Facilities."[1544] Designated Retail Regulators similarly contend that Order No. 1920

[1541] *Id.* P 1429.

[1542] Arizona Commission Rehearing Request at 19; Idaho Commission Rehearing Request at 2, 5-6.

[1543] Arizona Commission Rehearing Request at 19.

[1544] Idaho Commission Rehearing Request at 5 (quotation marks omitted).

"drastically depart[s] from the NOPR" because it gives transmission providers complete discretion to decide whether to file a State Agreement Process or Long-Term Regional Transmission Cost Allocation method in its OATT, even if agreed to by the Relevant State Entities, which would relegate states to a transmission planning role akin to any other stakeholder.[1545]

615. Designated Retail Regulators and Arizona Commission also contend that Order No. 1920 violates the APA's notice-and-comment requirements because it requires transmission providers to set an *ex ante* cost allocation method that would apply as a backstop in certain circumstances, reducing states' bargaining power and setting up a mechanism to impose a regional cost allocation for preferential policy and corporate-driven projects when states do not consent.[1546]

d. Commission Determination

616. We find that the Commission's decision in Order No. 1920 not to require that transmission providers adopt a State Agreement Process is a logical outgrowth of the NOPR, and we thus disagree with arguments to the contrary. The NOPR did not propose to require a State Agreement Process but rather proposed to require transmission providers to include in their OATTs *either* a Long-Term Regional Transmission Cost

[1545] Designated Retail Regulators Rehearing Request at 47-50.

[1546] Arizona Commission Rehearing Request at 18; Designated Retail Regulators Rehearing Request at 47, 49-50.

Allocation Method, *or* a State Agreement Process, *or* a combination thereof.[1547] Furthermore, contrary to Arizona Commission's arguments, Order No. 1920 did not eliminate the State Agreement Process and instead permits transmission providers to revise their OATTs to include a State Agreement Process, if Relevant State Entities indicate that they have agreed to such a process.[1548]

617. We also disagree with Arizona Commission's and Designated Retail Regulators' argument that Order No. 1920's requirement for transmission providers to revise their OATTs to include at least one *ex ante* Long-Term Regional Transmission Cost Allocation Method is not a logical outgrowth of the NOPR proposal to allow transmission providers to choose to include either an *ex ante* regional cost allocation method, or a State Agreement Process, or a combination of both. Although the Commission in the NOPR proposed to allow transmission providers to choose between filing an *ex ante* Long-Term Regional Transmission Cost Allocation Method, a State Agreement Process, or some combination of both, the Commission also sought comment on "whether the Commission should require, instead of the reforms proposed in this section of the NOPR, public utility transmission providers to include a Long-Term Regional Transmission Cost Allocation Method in their OATTs."[1549] As courts have explained, notice is sufficient when an agency has "expressly asked for comments on a

[1547] NOPR, 179 FERC ¶ 61,028 at P 302.

[1548] Order No. 1920, 187 FERC ¶ 61,068 at PP 1291-1292.

[1549] NOPR, 179 FERC ¶ 61,028 at P 318.

particular issue or otherwise made clear that the agency was contemplating a particular change."[1550] By requesting comment on whether the Commission should require inclusion of an *ex ante* Long-Term Regional Transmission Cost Allocation Method, the Commission put parties on notice that the Commission was considering *the exact change* that it ultimately adopted in Order No. 1920. Therefore, in adopting the requirement that transmission providers file at least one *ex ante* Long-Term Regional Transmission Cost Allocation Method, the Commission adhered to the APA's notice-and-comment requirements.[1551] To the extent Arizona Commission's and Designated Retail Regulators' argument was based on concerns about the states' role more broadly in Long-Term Regional Transmission Planning and cost allocation processes, we note that we

[1550] *Brennan v. Dickson*, 45 F.4th at 69 (quoting *CSX Transp., Inc. v. Surface Transp. Bd.*, 584 F.3d at 1081).

[1551] Further, Order No. 1920's requirement that transmission providers revise their OATTs to include at least one *ex ante* Long-Term Regional Transmission Cost Allocation Method separately and independently satisfies the APA's notice-and-comment requirements because courts have indicated that a final rule is a logical outgrowth of a proposal where, as here, an agency adopts only part of a proposal such that "the final rule [is] not wholly unrelated or surprisingly distant" from what the agency initially suggested. *Ariz. Pub. Serv. Co. v. EPA*, 211 F.3d 1280, 1297-1300 (D.C. Cir. 2000) (finding sufficient notice where agency first proposed that Indian tribes be required to meet the "same requirements" as states with respect to judicial review of permits issued pursuant to the Clean Air Act, but then adopted a final rule that exempted tribes from some, though not all, such requirements). Order No. 1920 is a logical outgrowth of the NOPR in this respect because the Commission adopted one of three proposed methods for complying with the requirement—i.e., part of the NOPR proposal—and the challenged provision therefore hews closely to the NOPR proposal such that it is "not wholly unrelated or surprisingly distant" from the NOPR proposal. *Id.*

adopt a number of modifications and clarifications herein to strengthen the states' role in those processes.[1552]

2. Substantive Issues

a. Order No. 1920 Requirements

618. In Order No. 1920, the Commission required transmission providers in each transmission planning region to revise their OATTs to include one or more *ex ante* cost allocation methods that apply to Long-Term Regional Transmission Facilities that are selected in the regional transmission plan for purposes of cost allocation (Long-Term Regional Transmission Cost Allocation Method).[1553]

619. In addition to the required Long-Term Regional Transmission Cost Allocation Method, Order No. 1920 permits transmission providers to revise their OATTs to include a State Agreement Process. However, the Commission found in Order No. 1920 that any State Agreement Process that transmission providers voluntarily propose to include in their OATTs would not comply with the requirements of Order No. 1920 unless Relevant State Entities indicate to the transmission provider that Relevant State Entities have agreed to that process during the Engagement Period.[1554] The Commission also found in Order No. 1920 that a State Agreement Process cannot be the sole method filed for cost

---

[1552] *See supra* Stakeholder Process and Transparency section; Requests for Additional Flexibility Regarding Long-Term Scenarios Requirements section; *infra* Consultation with Relevant State Entities After the Engagement Period section.

[1553] Order No. 1920, 187 FERC ¶ 61,068 at P 1291.

[1554] *Id.*; *see also id.* PP 1292, 1403.

allocation for Long-Term Regional Transmission Facilities.[1555] The Commission explained in Order No. 1920 that, if a State Agreement Process that transmission providers voluntarily include in their OATTs fails to result in a cost allocation method agreed to by Relevant State Entities and any other authorized entities, or if the Commission ultimately finds the cost allocation method that results from a State Agreement Process is unjust, unreasonable, or unduly discriminatory or preferential, then the relevant Long-Term Regional Transmission Cost Allocation Method on file would apply as a backstop.[1556]

620. Order No. 1920 does not require transmission providers to obtain state agreement to a cost allocation method for any Long-Term Regional Transmission Facilities and states that the ultimate decision as to which Long-Term Regional Transmission Cost Allocation Method(s) to file on compliance, and whether to file a State Agreement Process to which Relevant State Entities have agreed, lies with transmission providers.[1557]

b. Requests for Rehearing and Clarification

621. On rehearing, a number of parties argue that the Commission's decision in Order No. 1920 to require transmission providers to file an *ex ante* cost allocation method for Long-Term Regional Transmission Facilities will undermine Relevant State Entities' efforts to determine an alternative cost allocation method through a State Agreement

[1555] *Id.* PP 1292, 1361, 1404.

[1556] *Id.* PP 1291-1292.

[1557] *Id.* PP 1359, 1429; *see also id.* PP 1296, 1363.

Process.[1558] NARUC requests that the Commission adopt the NOPR proposal of mandatory agreement on filed method(s) and/or a State Agreement Process and eliminate the backstop *ex ante* method.[1559] NARUC argues that Order No. 1920's requirement that transmission providers have a backstop Long-Term Regional Transmission Cost Allocation Method in their OATTs undermines Relevant State Entities' negotiation of an alternative cost allocation method and turns such negotiations into a "check the box" exercise.[1560] NARUC asserts that allowing transmission providers to ignore or not even report on state input is the definition of an arbitrary and capricious action, and constitutes unreasonable decision making.[1561]

622. Ohio Commission Federal Advocate states that Order No. 1920 arbitrarily and capriciously requires an Engagement Period for states to participate in reaching a cost allocation agreement for Long-Term Regional Transmission Facilities while providing no assurance that it will amount to anything since the final rule allows the transmission provider to have the final say.[1562] Ohio Commission Federal Advocate argues that,

---

[1558] Designated Retail Regulators Rehearing Request at 35-36; Idaho Commission Rehearing Request at 5-6; NARUC Rehearing Request at 12-17; Ohio Commission Federal Advocate Rehearing Request at 8; Undersigned States Rehearing Request at 31-32; Wyoming Commission Rehearing Request at 2-4.

[1559] NARUC Rehearing Request at 12-17.

[1560] *Id.* at 16.

[1561] *Id.* at 15.

[1562] Ohio Commission Federal Advocate Rehearing Request at 7-8.

because of this, states ultimately have no authority on cost allocation for Long-Term Regional Transmission Facilities.[1563]

623. Designated Retail Regulators and Undersigned States state that Order No. 1920's requirement that transmission providers file one or more *ex ante* cost allocation methods that apply to selected Long-Term Regional Transmission Facilities eliminates the effectiveness of the State Agreement Process, as states are unlikely to agree to a negotiated cost allocation proposal under the State Agreement Process if the default *ex ante* cost allocation results in lower costs for those states.[1564] Designated Retail Regulators and Undersigned States argue that if states jointly agree on a cost allocation process, the rules should require the transmission provider to accept those cost allocation processes, subject to Commission approval.[1565]

624. Wyoming Commission states that the Commission's decision to remove the voluntary state agreement without a backstop reform in the final rule was a significant change from the NOPR, as the NOPR proposal would have allowed states to represent their public policy interests and, in the event of a conflict, prevent other states from exporting their policy decisions and an unreasonable share of related costs to nonconsenting neighbors. Wyoming Commission argues, however, that as a result of

[1563] *Id.* at 8.

[1564] Designated Retail Regulators Rehearing Request at 35-36; Undersigned States Rehearing Request at 31-32.

[1565] Designated Retail Regulators Rehearing Request at 35; Undersigned States Rehearing Request at 31.

reducing states' roles to mere stakeholders in the final rule, the Commission has forced states into agreeing to unjust and unreasonable cost allocations by defaulting to an *ex ante* cost allocation in lieu of requiring a voluntary agreement of the states as a prerequisite.[1566] Wyoming Commission asserts that a voluntary state agreement process is essential to avoid interfering with states' rights with respect to transmission planning and selection, and to prevent nonconsenting states from being "swept up" in their neighbors' identified public policy transmission projects.[1567]

625. Idaho Commission argues that by permitting, but not requiring, transmission providers to adopt a State Agreement Process in compliance with Order No. 1920, the states lack a meaningful opportunity to determine a reasonable cost allocation.[1568] Idaho Commission claims that the Commission's reasoning in not requiring a State Agreement Process is unsupported in the record and ignores that Relevant State Entities have statutory duties to ensure fair, just, and reasonable rates for customers.[1569] Idaho Commission further contends that requiring state agreement for cost allocation for Long-Term Regional Transmission Facilities, as the Commission proposed in the NOPR, would have allowed states to represent public policy interests and prevent other states from forcing policy decisions on nonconsenting neighbors. However, Idaho Commission

[1566] Wyoming Commission Rehearing Request at 2-3.

[1567] *Id.* at 3.

[1568] Idaho Commission Rehearing Request at 5-6.

[1569] *Id.*

asserts that as a result of Order No. 1920, states now have no meaningful opportunity to determine reasonable cost allocation and will be faced with cost allocation that violates the cost causation principle.[1570]

c. Commission Determination

626. While we sustain the determination in Order No. 1920 that transmission providers in each transmission planning region must file one or more *ex ante* cost allocation methods that apply to selected Long-Term Regional Transmission Facilities, we believe that certain modifications adopted in this order help address, at least in part, concerns raised on rehearing by ensuring that the Commission may consider any Long-Term Regional Transmission Cost Allocation Methods supported by Relevant State Entities.[1571] We believe the balance struck in this order will assist the Commission, with the input of Relevant State Entities, in establishing just and reasonable Long-Term Regional Transmission Cost Allocation Methods that meet the requirements of Order No. 1920.

627. In Order No. 1920, the Commission required that, if a State Agreement Process fails to result in a cost allocation method agreed to by Relevant State Entities and any other entities authorized by Relevant State Entities to participate in a State Agreement Process,[1572] a transmission provider chooses not to file an agreed upon cost allocation

---

[1570] *Id.*

[1571] *See infra* Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section.

[1572] Order No. 1920, 187 FERC ¶ 61,068 at P 1402 (noting that Relevant State Entities have the option to include the participation of other entities in a State Agreement

method, or if the Commission ultimately finds the cost allocation method that results from a State Agreement Process is unjust, unreasonable, or unduly discriminatory or preferential, then the relevant Long-Term Regional Transmission Cost Allocation Method on file would apply as a backstop. While we sustain the requirement to have a backstop Long-Term Regional Transmission Cost Allocation Method on file, we revise the portion of this requirement related to the transmission providers' choice as to whether to file Long-Term Regional Transmission Cost Allocation Methods and/or State Agreement Processes agreed to by Relevant State Entities, as discussed in further detail below.[1573]

628. Turning to the rehearing requests challenging the requirement to have an *ex ante* cost allocation method on file, we disagree with Wyoming Commission and Idaho Commission that this requirement forces states into agreeing to unjust and unreasonable cost allocations that allow states to foist the cost of their policy decisions on nonconsenting neighbors.[1574] Under the NOPR proposal, the Commission proposed that transmission providers in each transmission planning region file OATTs to include either (1) a Long-Term Regional Transmission Cost Allocation Method to allocate the costs of Long-Term Regional Transmission Facilities, or (2) a State Agreement Process by which

---

Process).

[1573] *See infra* Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section.

[1574] *See* Idaho Commission Rehearing Request at 5-6; Wyoming Commission Rehearing Request at 3.

one or more relevant state entities may voluntarily agree to a cost allocation method, or (3) a combination thereof.[1575] Pursuant to the FPA, the Commission may accept only proposed rates, terms, and conditions that are just and reasonable. Therefore, the Commission could not accept a cost allocation method that would force states into agreeing to unjust and unreasonable cost allocations, and any just and reasonable cost allocation method must ensure that the costs of Long-Term Regional Transmission Facilities are allocated in a manner that is at least roughly commensurate with the estimated benefits.[1576]

629. We also disagree with arguments that the State Agreement Process will ultimately be a "check the box" exercise or that requiring an *ex ante* Long-Term Regional Transmission Cost Allocation Method otherwise limits the effectiveness of a State Agreement Process.[1577] Order No. 1920 places an affirmative obligation on transmission

[1575] NOPR, 179 FERC ¶ 61,028 at P 302.

FERC I*, 576 F.3d at 476 ("To the extent that a utility benefits from the costs of new facilities, it may be said to have 'caused' a part of those costs to be incurred, as without the expectation of its contributions the facilities might not have been built, or might have been delayed."); Order No. 1000, 136 FERC ¶ 61,051 at P 690 ("If a regional transmission plan determines that a transmission facility serves several functions, as many commenters point out it may, the regional cost allocation method must take the benefits of these functions of the transmission facility into account in allocating costs roughly commensurate with benefits.").

[1577] NARUC Rehearing Request at 16; Ohio Commission Federal Advocate Rehearing Request at 7-8; Designated Retail Regulators Rehearing Request at 35-36; Undersigned States Rehearing Request at 31-32.

providers to supply a forum for states to negotiate cost allocation,[1578] providing ample room for states to allocate costs in a manner that they agree to,[1579] and, as discussed below, in this order we require transmission providers to include in the transmittal or as an attachment to their compliance filing any Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process that Relevant State Entities agree upon.[1580] Relevant State Entities may structure the processes used to determine those cost allocation methods in a manner that would require a level of agreement of their choosing, including, as one potential option, unanimity.[1581] In this order, we also establish a requirement that transmission providers shall consult with Relevant State Entities (1) prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process(es), or (2) if Relevant State Entities seek, consistent with their chosen method to reach agreement, for the transmission provider to amend that method or process.[1582] And as we have already discussed, transmission

[1579] *Id.* PP 1415-1416.

[1580] *See infra* Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section.

[1581] Order No. 1920, 187 FERC ¶ 61,068 at P 1418 ("We will not specify the level of agreement among Relevant State Entities or other entities that is necessary before a transmission provider files a cost allocation method derived from a State Agreement Process. As a state-led process, we believe that Relevant State Entities should have the ability to determine this important facet of their State Agreement Process.").

[1582] *See infra* Consultation with Relevant States Entities After the Engagement Period section.

providers shall develop a reasonable number of additional scenarios, when requested by Relevant State Entities, for the purposes of informing the application of Long-Term Regional Transmission Cost Allocation Method(s) or the development of cost allocation methods through the State Agreement Process(es).[1583]

630. To the extent that Wyoming Commission argues that requiring an *ex ante* cost allocation method for Long-Term Regional Transmission Facilities intrudes on states' rights with respect to transmission planning and selection, we disagree. We note that the D.C. Circuit held that requiring *ex ante* cost allocation methods under Order No. 1000 regional transmission planning does not intrude on state authority.[1584] We continue to find that Long-Term Regional Transmission Planning is a subset of regional transmission planning that closes specific gaps of the existing Order No. 1000 framework without otherwise disturbing the regional transmission planning structure required by Order No. 1000, which was fully affirmed on appeal.[1585]

[1583] *See supra* Requests for Additional Flexibility Regarding Long-Term Scenarios Requirements section.

[1584] *See S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 55-59, 62-64, 82-89; *id.* at 64 ((“[W]e hold that [Order No. 1000] does not interfere with the traditional state authority that is preserved by [FPA] Section 201 . . . .”).

[1585] Order No. 1920, 187 FERC ¶ 61,068 at P 256 (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 55-64 (rejecting arguments that the requirement to engage in regional transmission planning, as prescribed in Order No. 1000, exceeded the Commission's jurisdiction under FPA section 206, interfered with traditional state authority reserved under FPA section 201, or improperly interpreted and applied FPA section 202(a))).

631. With respect to the assertion that states are unlikely to agree to a negotiated cost allocation proposal under the State Agreement Process if the default *ex ante* cost allocation results in lower costs for those states, we note that Order No. 1920 provides Relevant State Entities with the opportunity to negotiate *ex ante* cost allocation methods in the first instance, and we take steps in this order to further enable states to do so.[1586] Further, states are likely to have an incentive to negotiate with other states in order to ensure timely and efficient development of Long-Term Regional Transmission Facilities that benefit their ratepayers, but would not be developed without the support of other states. We find that the opportunity for Relevant State Entities to negotiate *ex ante* cost allocation methods in the first instance and agree to a State Agreement Process, coupled with the benefits of certainty provided by a backstop *ex ante* cost allocation method, strike a reasonable balance, and we otherwise sustain, as explained in greater detail below, the Commission's finding in Order No. 1920 that requiring transmission providers to include a Long-Term Regional Transmission Cost Allocation Method in their OATTs is necessary to ensure that Commission-jurisdictional rates are just and reasonable.[1587]

632. We disagree with Idaho Commission's contention that Order No. 1920 denies Relevant State Entities any meaningful opportunity to determine reasonable cost

[1586] *See infra* Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section; Duration of the Engagement Period section.

[1587] Order No. 1920, 187 FERC ¶ 61,068 at P 1293.

allocation methods.[1588] We recognize the critical role that states play in regional transmission planning and that Relevant State Entities have their own statutory obligations. As discussed in Order No. 1920, and expanded upon here,[1589] we are placing an affirmative obligation on transmission providers to provide a meaningful opportunity for Relevant State Entities to share their views on cost allocation during the Engagement Period, during subsequent implementation of a State Agreement Process to which the Relevant State Entities have agreed that has been filed by a transmission provider and accepted by the Commission,[1590] and, as described herein, before future cost allocation amendments.[1591] Relevant State Entities therefore have a meaningful opportunity to participate in cost allocation decisions related to Long-Term Regional Transmission Facilities.

633. We continue to find that if transmission providers were to rely solely on a State Agreement Process to determine the cost allocation for Long-Term Regional Transmission Facilities and that process did not result in agreement on a cost allocation method, there would be no cost allocation method for Long-Term Regional Transmission Facilities selected as the more efficient or cost-effective solutions to Long-Term

[1588] Idaho Commission Rehearing Request at 5-6.

[1589] *See infra* Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section; Duration of the Engagement Period section.

[1590] Order No. 1920, 187 FERC ¶ 61,068 at P 1296.

[1591] *See infra* Consultation with Relevant State Entities After the Engagement Period section.

Transmission Needs.[1592] As a result, these selected Long-Term Regional Transmission Facilities would be less likely to be developed, and the benefits that these facilities would provide would not be realized.[1593] Furthermore, we continue to find that, if these selected Long-Term Regional Transmission Facilities were not ultimately built, transmission providers would likely rely on relatively inefficient or less cost-effective transmission facilities to address the identified Long-Term Transmission Needs, or they may not even address these needs at all, leading to unjust and unreasonable Commission-jurisdictional rates.[1594]

634. In addition, we are concerned that a state-agreement requirement could lead to a situation in which a transmission project was planned based on benefits that it provides to customers in several states, and that, if one or more of those states declined to voluntarily agree to a cost allocation method, it would raise free-ridership concerns.[1595] For that reason, sole reliance on a State Agreement Process has the potential to suffer from the

[1592] Order No. 1920, 187 FERC ¶ 61,068 at P 1293.

[1593] *Id.*

[1594] *Id.*

[1595] *See El Paso Elec. Co. v. FERC*, 76 F.4th at 361-63 ("No amount of emphasizing other competing interests permits FERC to sacrifice the foundational principle of cost-causation by refusing to allocate costs to those who cause the costs to be incurred and who reap the resulting benefits." (citations omitted)); Order No. 1000, 136 FERC ¶ 61,051 at P 535 ("[If] the Commission could not address free rider problems associated with new transmission investment, [] it could not ensure that rates, terms and conditions of jurisdictional service are just and reasonable and not unduly discriminatory.").

same flaws that led the Commission to require *ex ante* cost allocation for selected regional transmission facilities in Order No. 1000, as the allocation of transmission costs can be contentious and prone to litigation in multi-state transmission planning regions.[1596] The level of certainty for transmissions providers in having a Long-Term Regional Transmission Cost Allocation Method on file, even when a State Agreement Process is used, remains critical to the development of needed Long-Term Regional Transmission Facilities.[1597]

B. Requirements Concerning Relevant State Entities

1. Requested Requirement to Obtain the Agreement of Relevant State Entities

a. Order No. 1920 Requirements

635. In Order No. 1920, the Commission declined to adopt the NOPR proposal to require transmission providers to seek the agreement of Relevant State Entities within the transmission planning region regarding the relevant cost allocation method to be applied to Long-Term Regional Transmission Facilities. Instead, the Commission modified the NOPR proposal to establish a six-month time period (Engagement Period), during which transmission providers must, among other requirements, provide a forum for negotiation of a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process that enables meaningful participation by Relevant State Entities.[1598]

[1596] Order No. 1920, 187 FERC ¶ 61,068 at P 1293 (citation omitted).

[1597] *Id.*

[1598] *Id.* P 1354.

b. Requests for Rehearing and Clarification

636. Undersigned States and Designated Retail Regulators argue that the Engagement Period is not a "fair replacement of a requirement for regulator consent" because Order No. 1920 does not require transmission providers to propose on compliance a Long-Term Regional Transmission Cost Allocation Method agreed to by the states.[1599] Undersigned States and Designated Retail Regulators further argue that Order No. 1920's lack of a requirement for transmission providers to obtain the consent of retail regulators on the cost allocation method(s) that apply to Long-Term Regional Transmission Facilities usurps state authority because it enables the ratepayers of non-consenting states to be assessed the costs of the public policy projects of other states and speculative investment based on conjecture about future resource trends.[1600] Designated Retail Regulators argue that existing regulator organizations such as OMS "may not be the best forums to confect state agreements" because the "authority to reach agreement on cost allocation rests in each State" and cannot be delegated to such organizations in order to reach general consensus on issues.[1601]

[1599] Designated Retail Regulators Rehearing Request at 36; Undersigned States Rehearing Request at 32.

[1600] Designated Retail Regulators Rehearing Request at 36-39; Undersigned States Rehearing Request at 32-35.

[1601] Designated Retail Regulators Rehearing Request at 38.

c. Commission Determination

637. While we sustain our decision not to adopt the NOPR proposal and instead establish the Engagement Period for cost allocation negotiations, we believe that certain modifications in this order help address, at least in part, the concerns raised by Designated Retail Regulators and Undersigned States by providing additional opportunities for Relevant State Entities to help establish just and reasonable cost allocation methods for Long-Term Regional Transmission Facilities.[1602]

638. Turning to Designated Retail Regulators' and Undersigned States' arguments, the Commission did not propose in the NOPR to require transmission providers to obtain the consent of Relevant State Entities within the transmission planning region regarding the relevant cost allocation method to be applied to Long-Term Regional Transmission Facilities. Rather, the Commission proposed to require transmission providers to seek the agreement of Relevant States Entities within the transmission planning region regarding the relevant cost allocation method to be applied to Long-Term Regional Transmission Facilities.[1603] In Order No. 1920, the Commission did not adopt the requirement for

[1602] *See infra* Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section; Duration of the Engagement Period section; Consultation with Relevant State Entities After the Engagement Period section.

[1603] Order No. 1920, 187 FERC ¶ 61,068 at P 1354 ("We decline to adopt the NOPR proposal to require transmission providers to *seek the agreement* of Relevant State Entities within the transmission planning region regarding the relevant cost allocation method to be applied to Long-Term Regional Transmission Facilities." (emphasis added)). We address arguments concerning the Commission's decision not to require transmission providers to seek the agreement of Relevant State Entities in the Requests Arguing the Engagement Period is Inferior to a Requirement that Transmission Providers

transmission providers to seek the agreement of Relevant State Entities (while affording transmission providers flexibility in the process by which they seek agreement from the Relevant State Entities) and instead adopted a requirement for transmission providers to provide a forum for states to meaningfully participate in negotiating cost allocation methods.[1604]

639. With respect to requests that we *require* agreement of state regulators for any cost allocation method for Long-Term Regional Transmission Facilities, we continue to find that the views of state regulators regarding the appropriate cost allocation approach are important, but ultimately the transmission provider is the public utility that must respond and comply with Order No. 1920.[1605] Furthermore, the Commission has a statutory responsibility to review the compliance filings from transmission providers to ensure that any proposed cost allocation is just and reasonable and not unduly discriminatory or preferential, and Order No. 1920 recognizes these statutory roles.[1606] Nonetheless, we reiterate that robust state engagement can valuably inform a cost allocation approach and, as discussed further below, we take steps in this order to further that engagement.

640. In response to Designated Retail Regulators' and Undersigned States' argument that Order No. 1920's lack of a requirement for transmission providers to obtain the

---

Seek the Agreement of Relevant State Entities section below.

[1604] *See id.* PP 1354, 1357.

[1605] *Id.* P 1363.

[1606] *Id.*

consent of states on the cost allocation method(s) that apply to Long-Term Regional Transmission Facilities enables the ratepayers of non-consenting states to be assessed the costs of other states' public policies and speculative investment,[1607] in addition to the steps to further state engagement taken herein, we note that all cost allocation methods for Long-Term Regional Transmission Facilities, including Long-Term Regional Transmission Cost Allocation Methods and cost allocation methods resulting from State Agreement Processes, must allocate the costs of Long-Term Regional Transmission Facilities in a manner that is at least roughly commensurate with the estimated benefits, consistent with legal precedent.[1608] We find that this requirement addresses Designated Retail Regulators' and Undersigned States' concern that Order No. 1920's requirements will result in non-consenting states paying for costs they did not cause.

641. In response to Designated Retail Regulators' assertion that the "authority to reach agreement on cost allocation rests in each State" and that this authority cannot be "delegated to organizations that States participate in to attempt to reach general consensus on issues,"[1609] we note that Order No. 1920 did not require transmission providers to use existing mechanisms for state involvement in regional transmission planning and cost allocation processes, such as the SPP Regional State Committee and

[1607] Designated Retail Regulators Rehearing Request at 37-38; Undersigned States Rehearing Request at 33.

[1608] *See supra* P 628 n.1577.

[1609] *See* Designated Retail Regulators Rehearing Request at 38.

OMS, as a forum for negotiation of a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process.[1610] In fact, Order No. 1920 specified that it is Relevant State Entities – and not transmission providers – who may choose to use such an existing mechanism to negotiate a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process.[1611] Similarly, the Commission left to the Relevant State Entities participating in the Engagement Period matters including what constitutes agreement among Relevant State Entities, how such agreement is reached, and which Relevant State Entities must reach such agreement.[1612]

2. Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods

a. Order No. 1920 Requirements

642. In Order No. 1920, the Commission found that, if the Relevant State Entities participating in an Engagement Period agree on a Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and provide that Method(s) and/or State Agreement Process to the transmission providers no later than the deadline for communicating agreement, the transmission providers may file the agreed-to Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process on compliance. The Commission noted, however, that the ultimate decision as to

[1610] Order No. 1920, 187 FERC ¶ 61,068 at P 1357.

[1611] *Id.*

[1612] *Id.* P 1360.

whether to file a Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process to which Relevant State Entities have agreed will continue to lie with the transmission providers.[1613] In addition, the Commission found that its directives in Order No. 1920 regarding the development of a State Agreement Process and any cost allocation methods to which the Relevant State Entities agree pursuant to that process do not alter existing FPA section 205 filing rights that would govern subsequent filings regarding the cost allocation for Long-Term Regional Transmission Facilities.[1614] The Commission did not impose any obligation on transmission providers to file a cost allocation method for Long-Term Regional Transmission Facilities with which they disagree, even if such a method were proposed to the transmission providers pursuant to a Commission-approved State Agreement Process, unless the transmission providers have clearly indicated their assent to do so as part of a Commission-approved State Agreement Process in their OATT.[1615]

b. Requests for Rehearing and Clarification

643. NARUC, PJM States, Designated Retail Regulators, Undersigned States, and West Virginia Commission request rehearing of Order No. 1920's decision not to require

[1613] *Id.* PP 1359, 1363.

[1614] *Id.* P 1430 ("We further clarify that unless voluntarily waived, a transmission provider retains its FPA section 205 filing rights to submit an *ex ante* cost allocation method for Long-Term Regional Transmission Facilities at any time, consistent with any limitations a transmission provider may have agreed to, for example, as part of its membership in an RTO/ISO.") (citation omitted).

[1615] *Id.* PP 1359, 1429.

transmission providers to adopt any cost allocation method that Relevant State Entities agree upon during the Engagement Period.[1616] NARUC argues that Order No. 1920 "arbitrarily and without adequate explanation removes protections proposed in the NOPR for states and their ratepayers by not requiring [t]ransmission [providers] to incorporate state consensus to cost allocation methods for filing as part of the OATT."[1617] PJM States argue that, absent such a requirement, state engagement in the development of cost allocation methods for Long-Term Regional Transmission Facilities is not likely to materialize. PJM States argue that, by contrast, incenting state agreement (and the filing of that agreement) makes it more likely that Order No. 1920's goals are met, as a state-agreed upon cost allocation method has a lower burden of proof than a transmission provider filing without state agreement.[1618] West Virginia Commission agrees with PJM States and argues that the Commission should either require transmission providers to adopt any cost allocation method that Relevant State Entities agree upon during the Engagement Period or "grant the States 205 filing rights as it pertains to State-agreed cost allocation methods."[1619]

[1619] West Virginia Commission Rehearing Request at 13-14.

644. PIOs, PJM States, and NARUC request clarification that, where a particular cost allocation method garnered state support during the Engagement Period and the transmission provider elects not to adopt that method in its compliance filing, the transmission provider must include the states' preferred cost allocation method in its compliance filing and explain why that method was not used.[1620] West Virginia Commission requests the same clarification in the alternative to its request that the Commission require transmission providers to adopt any cost allocation method that Relevant State Entities agree upon during the Engagement Period.[1621] West Virginia Commission requests that the Commission require transmission providers to include the states' preferred cost allocation method "for informational purposes."[1622] NARUC further requests that the Commission clarify that transmission providers' compliance filings must also include a general description of the discussions during the Engagement Period, including transmission providers' outreach to Relevant State Entities.[1623] Similarly, NARUC, PJM States, and Virginia and North Carolina Commissions request that the Commission clarify that transmission providers must disclose the extent to which states agreed or disagreed with the filed cost allocation method.[1624] PIOs also request that

[1620] NARUC Rehearing Request at 17-18; PIOs Rehearing Request at 55-57; PJM States Rehearing Request at 7-8.

[1621] West Virginia Commission Rehearing Request at 9.

[1622] *Id.*

[1623] NARUC Rehearing Request at 17-18.

[1624] *Id.* at 17; PJM States Rehearing Request at 7; Virginia and North Carolina

the Commission clarify that: (1) transmission providers must "clearly disclose and explain the outcome" of the Engagement Period; (2) the Commission will carefully evaluate the existence of a state agreement regarding cost allocation and any departure from that agreement in reviewing cost allocation methods proposed by transmission providers on compliance; and (3) transmission providers must explain how their chosen cost allocation methods are just and reasonable and not unduly discriminatory or preferential. PIOs contend that their requested clarifications would offer states additional confidence that participation in the Engagement Period will be meaningful.[1625]

645. NESCOE requests rehearing of Order No. 1920's decision to not require transmission providers to file states' preferred cost allocation method along with transmission providers' own preferred cost allocation method. NESCOE argues that because states are not public utilities, absent language in the transmission providers' organizational documents or OATTs, states are unable to file cost allocation methods themselves. NESCOE argues that "[r]elegating states to commenting on a transmission provider's cost allocation filing does not enable the states to put before the Commission their preferred cost allocation method; rather, it shifts the burden to states to show that the transmission provider's FPA section 205 filing is not just and reasonable."[1626] NESCOE contends that Order No. 1920 envisions that the only path for states to have their

---

Commissions Rehearing Request at 10.

[1625] PIOs Rehearing Request at 54-57.

[1626] NESCOE Rehearing Request at 14-15.

preferred cost allocation method approved would be through a complaint proceeding in which states would bear the burden of first proving that a transmission provider's Commission-approved cost allocation method is unjust and unreasonable.[1627] NESCOE argues that requiring each transmission provider to file states' preferred cost allocation method alongside its own would comport with precedent holding that the Commission may not require transmission providers "'to cede rights expressly given to them' in FPA section 205."[1628] In the alternative, NESCOE requests that the Commission strongly encourage transmission providers to "voluntarily codify existing or new approaches on compliance" that would facilitate transmission providers' filing of alternative region-wide state agreement on cost allocation, such as the approaches used in the NYISO and SPP regions.[1629] NESCOE opines that "[i]ncluding the state-agreed upon cost allocation method in a transmission provider's section 205 filing is a lawful and rational means to effectuate in a concrete way the respect for the state role the Commission articulates."[1630]

[1627] *Id.* Vermont Commission states that it supports the NESCOE Rehearing Request, including strengthening the state role in all phases of Long-Term Regional Transmission Planning, and specifically cost allocation. Vermont Commission Rehearing Request at 1-2.

[1630] *Id.* at 16.

646. Harvard ELI requests that the Commission grant rehearing by requiring transmission providers to revise their OATTs to include a process for filing all regional cost allocation methods approved by Relevant State Entities.[1631] Harvard ELI contends that, by not requiring transmission providers to file all cost allocation methods agreed to by Relevant State Entities, Order No. 1920 fails to remedy unjust and unreasonable cost allocation processes.[1632] Harvard ELI argues that such a requirement would not violate the D.C. Circuit's holding in *Atlantic City* because it would neither "deny utilities their right to unilaterally file rate and term changes" nor "force public utilities to file particular rates."[1633] Harvard ELI argues that, because the Commission "has authority to approve utility filing rights arrangements under FPA section 205," it also has the authority under FPA section 206 to order changes to filing processes and may do so here to require transmission providers to file all cost allocation methods approved by the Relevant State Entities.[1634] In the alternative, Harvard ELI requests that the Commission clarify that it did not intend to imply that it lacks authority under FPA section 206 to amend the *pro*

forma OATT to include a process for filing all regional cost allocation methods approved by Relevant State Entities.[1635]

647. NARUC requests that the Commission provide a mechanism to ensure that transmission providers "remain in compliance with the requirement to include [R]elevant [S]tate [E]ntities in cost allocation for Long-Term Regional Transmission Facilities."[1636] NARUC asserts that the Commission should either require transmission providers to periodically open new Engagement Periods or require transmission providers to file a modification to their OATTs if states reach the requisite agreement on a different cost allocation method than that reflected in the transmission providers' OATTs.[1637]

648. PIOs request clarification that transmission providers may, in their compliance filings, voluntarily commit to a process that will ensure that, where a state agreement on cost allocation exists, the agreed-upon cost allocation method will be put before the Commission for approval.[1638]

[1635] *Id.* at 1, 8-9.

[1636] NARUC Rehearing Request at 21-22.

[1637] *Id.* In the Consultation with Relevant State Entities After the Engagement Period section below, we discuss NARUC's request that the Commission require transmission providers to periodically open a new negotiation period with Relevant State Entities concerning cost allocation for Long-Term Regional Transmission Facilities.

[1638] PIOs Rehearing Request at 55-56.

c. Commission Determination

649. As the Commission recognized in Order No. 1920, and we reiterate in this order, it is critical to the success of the Long-Term Regional Transmission Planning reforms that states have an opportunity to have a significant role in the establishment of just and reasonable Long-Term Regional Transmission Cost Allocation Methods and State Agreement Processes.[1639] At the same time, the Commission has an independent responsibility to ensure that those cost allocation methods conform to the cost causation principle and are otherwise just and reasonable and not unduly discriminatory or preferential.

650. To address these considerations and the concerns raised on rehearing, we simultaneously (1) expand Relevant State Entities' opportunities to inform and provide alternatives to the transmission providers' proposed Long-Term Regional Transmission Cost Allocation Method, and (2) sustain Order No. 1920's determination that transmission providers retain the right to determine which cost allocation methods for Long-Term Regional Transmission Facilities they will propose on compliance. Accordingly, while we decline rehearing parties' requests that the Commission require transmission providers to adopt any cost allocation method that Relevant State Entities agree upon during the Engagement Period, we take steps to ensure that the Commission may consider the Relevant State Entities' preferred Long-Term Regional Transmission

[1639] *See, e.g.*, Order No. 1920, 187 FERC ¶ 61,068 at P 1415.

Cost Allocation Method(s) and/or State Agreement Process, to the extent those differ from the Method(s) filed by transmission providers on compliance.

651. To that end, we set aside Order No. 1920, in part, and require that when Relevant State Entities notify transmission providers by the deadline for communicating agreement[1640] that they agree on a Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process resulting from the Engagement Period, the transmission providers must include that method or process in the transmittal or as an attachment to their compliance filing, even if the transmission providers propose a different Long-Term Regional Transmission Cost Allocation Method or do not propose to adopt a State Agreement Process. We further direct transmission providers to include in the transmittal or as an attachment to their compliance filings any information that Relevant State Entities provide to them regarding the state negotiations during the Engagement Period. We also set aside Order No. 1920, in part, to require that, upon the request of Relevant State Entities, transmission providers must facilitate and participate in a cost allocation discussion during the Engagement Period with Relevant State Entities.

[1640] Order No. 1920 requires that transmission providers in each transmission planning region provide notice, such as on its OASIS page or public website, of the deadline for Relevant State Entities to communicate their agreement on a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process, and this deadline must be no earlier than the end date of the Engagement Period. *Id.* P 1356.

652. At the outset, in response to arguments concerning the Commission's authority to impose the various cost allocation requirements proposed by parties on rehearing,[1641] we reiterate that the Commission in Order No. 1920 determined that the Commission's existing regional transmission planning and cost allocation requirements are unjust, unreasonable, and unduly discriminatory or preferential under FPA section 206.[1642] The Commission thus had both the authority and responsibility to "determine the just and reasonable . . . practice . . . to be thereafter observed and in force,"[1643] consistent with Order No. 1920's findings. Pursuant to its authority under FPA section 206, the Commission required transmission providers to submit on compliance an *ex ante* cost allocation method. This compliance filing submitted pursuant to FPA section 206 is not an FPA section 205 filing,[1644] and is thus distinct from any FPA section 205 filing that a transmission provider might file in the future following compliance to propose a change to its cost allocation method(s) for Long-Term Regional Transmission Facilities.[1645]

[1641] *E.g.*, Harvard ELI Rehearing Request at 4; NESCOE Rehearing Request at 15.

[1642] Order No. 1920, 187 FERC ¶ 61,068 at PP 113-114; *supra* The Overall Need for Reform section.

[1643] 16 U.S.C. 824e(a).

[1645] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 1430. As discussed below in the

653. We believe the balance struck herein should address, at least in part, the concerns driving the rehearing requests of NARUC, PJM States, Designated Retail Regulators, Undersigned States, and West Virginia Commission, who request that the Commission require transmission providers to adopt any cost allocation method that Relevant State Entities agree upon during the Engagement Period, and NESCOE, which argues that the Commission should require transmission providers to propose on compliance Relevant State Entities' preferred cost allocation method along with transmission providers' preferred cost allocation method.[1646] While we continue to find that robust state engagement is valuable to informing cost allocation,[1647] we also recognize transmission providers, subject to Commission oversight, remain ultimately responsible for transmission planning,[1648] which we find is fundamentally linked with cost allocation.[1649]

Consultation with Relevant State Entities After the Engagement Period section, we adopt, as part of this rule, a requirement that transmission providers revise their OATTs to add a requirement that they consult with Relevant State Entities (1) prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process(es), or (2) if Relevant State Entities seek, consistent with their chosen method to reach agreement, for the transmission provider to amend that method or process.

[1646] NARUC Rehearing Request at 12; NESCOE Rehearing Request at 14-15; PJM States Rehearing Request at 2-3; Designated Retail Regulators Rehearing Request at 35; Undersigned States Rehearing Request at 31; West Virginia Commission Rehearing Request at 13-14.

[1647] Order No. 1920, 187 FERC ¶ 61,068 at P 1363.

[1648] *Id. See also* Order No. 1000, 136 FERC ¶ 61,051 at P 153; Order No. 890, 118 FERC ¶ 61,119 at P 454.

[1649] Order No. 1000, 136 FERC ¶ 61,051 at P 559 ("[T]here is a fundamental link between cost allocation and planning, as it is through the planning process that benefits,

Consistent with this responsibility, while reiterating the balance the Commission seeks to strike in this order regarding the role of Relevant State Entities, we decline to require transmission providers, on compliance, to propose to adopt a State Agreement Process or Long-Term Regional Transmission Cost Allocation Method to which Relevant State Entities agreed, particularly if transmission providers prefer an alternative approach to cost allocation.

654. However, we are persuaded by PIOs', PJM States', and NARUC's arguments that the Commission should consider any Long-Term Regional Transmission Cost Allocation Method and/or State Agreement process to which the Relevant State Entities agree. We agree that the Commission should require transmission providers to include in the transmittal of their compliance filings any Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process to which the Relevant State Entities agreed but that transmission providers elect not to propose to comply with Order No. 1920.[1650] Therefore, we set aside Order No. 1920, in part, and require that, when Relevant State Entities communicate to transmission providers by the deadline for communicating agreement that they agree on a Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process resulting from the Engagement Period, the transmission providers must include that method or process in the transmittal

---

which are central to cost allocation, can be assessed.").

[1650] *See* NARUC Rehearing Request at 17-18; PIOs Rehearing Request at 55-57; PJM States Rehearing Request at 7-8.

or as an attachment to their compliance filings, even if the transmission providers propose to adopt a different Long-Term Regional Transmission Cost Allocation Method or do not propose to revise their tariffs to include a State Agreement Process.[1651] We continue to decline to define what constitutes agreement among Relevant State Entities,[1652] but we note that, at the choosing of the Relevant State Entities in a transmission planning region, existing relevant state committee processes may guide Relevant State Entities in defining what constitutes agreement, such as the processes of OMS and NESCOE.

655. We are also persuaded by NARUC's, PIOs', PJM States', and Virginia and North Carolina Commissions' arguments that the Commission should require transmission providers to provide additional information related to Relevant State Entities' participation in the Engagement Period even when transmission providers propose on compliance a separate cost allocation method and/or decline to propose a State Agreement Process,[1653] and we therefore further direct transmission providers to include

[1651] We clarify that, under this approach, the transmission providers decide what to submit as their actual Order No. 1920 compliance proposal, including relevant tariff language and supporting evidence or arguments, whether they decide to propose the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process or a different Long-Term Regional Transmission Cost Allocation Method. The requirement to include Relevant State Entities' Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process as an addition to the compliance filing does not constitute a "proposal" from the transmission provider.

[1652] Order No. 1920, 187 FERC ¶ 61,068 at P 1360.

[1653] NARUC Rehearing Request at 17; PIOs Rehearing Request at 54-57; PJM States Rehearing Request at 7; Virginia and North Carolina Commission Rehearing Request at 10.

in the transmittal or as an attachment to their compliance filings any information that any Relevant State Entities provide to them regarding the state negotiations during the Engagement Period. As part of this requirement, we clarify that transmission providers must include any and all supporting evidence and/or justification related to Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process that Relevant State Entities request that transmission providers include in their compliance filing. We expect that the information that Relevant State Entities provide to transmission providers could include, for example, a description of the discussions that took place at the Engagement Period forum for negotiation and whether each Relevant State Entity agreed or disagreed with the cost allocation method proposed on compliance. However, we decline to require transmission providers to independently characterize this information. For example, we do not require transmission providers to separately characterize Relevant State Entities' agreement or independently justify Relevant State Entities' preferred Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process. We find that a requirement for transmission providers to include in the transmittal or as an attachment to their compliance filings the information received from any Relevant State Entities during the Engagement Period will sufficiently capture the results of the Engagement Period.

656. Furthermore, upon review of the requests for rehearing and clarification about the Engagement Period, we also believe that Relevant State Entities would benefit from the assistance of transmission providers in some cases, as transmission providers may have more experience with the transmission providers' OATTs and with the Commission's

processes and precedent. Therefore, we set aside Order No. 1920, in part, and now include a requirement that upon the request of Relevant State Entities, transmission providers must facilitate and participate in a cost allocation discussion during the Engagement Period with Relevant State Entities.

657. We find that these additional requirements will allow the Commission to better evaluate whether transmission providers have complied with Order No. 1920's requirement to provide a forum for negotiation that enables meaningful participation by Relevant State Entities during the Engagement Period.[1654] Furthermore, given that we direct these facilitation and informational requirements on compliance pursuant to the Commission's authority under FPA section 206, we find that these requirements do not implicate or infringe upon transmission providers' filing rights under FPA section 205.

658. When acting under FPA section 206, the Commission's statutory burden is to establish *a* just and reasonable and not unduly discriminatory replacement rate that is supported by substantial evidence.[1655] The statute does not necessarily require the Commission to adopt the transmission provider's proposal on compliance, even if that proposal complies with the final rule's requirements. Rather, the Commission need only select a replacement rate that complies with the final rule and that is adequately supported in the record, and then intelligibly explain the reasons for its choice.[1656]

[1654] Order No. 1920, 187 FERC ¶ 61,068 at P 1357.

[1655] 16 U.S.C. 824e; 16 U.S.C 825*l*(b).

[1656] *See Entergy Ark., LLC v. FERC*, 40 F.4th 689, 701–02 (D.C. Cir. 2022) (noting that the Commission "is not required to choose the best solution, only a

659. We recognize that the Commission generally does not consider alternate compliance proposals other than those filed by the relevant public utility (here, the transmission provider).[1657] Nevertheless, as the Commission explained in Order No. 1920, and as we reiterate on rehearing, there are "good reasons" for considering such alternatives here with respect to cost allocation under Order No. 1920.[1658] States play a unique role in Long-Term Regional Transmission Planning, as their laws, regulations, and policies drive the need for Long-Term Regional Transmission Facilities,[1659] and they typically will have responsibility to consider and approve the siting, permitting, and construction of Long-Term Regional Transmission Facilities selected in a regional transmission plan. As such, states affect whether Long-Term Regional Transmission Facilities are timely, efficiently, and cost-effectively developed such that customers actually receive the benefits associated with the selection of more efficient or cost-effective transmission solutions.[1660] We further find that, given the inherent uncertainty

reasonable one") (first quoting *Petal Gas Storage, LLC v. FERC*, 496 F.3d 695, 703 (D.C. Cir. 2007); and then quoting *EPSA*, 577 U.S. at 295).

[1659] *Supra* Categories of Factors section.

[1660] Order No. 1920, 187 FERC ¶ 61,068 at PP 124, 126, 268, 1293, 1362-1364, 1404, 1407, 1410-1411, 1415, 1477, 1515.

involved in planning to meet Long-Term Transmission Needs,[1661] state-developed cost allocation methods and State Agreement Process take on heightened importance. This means that the Commission will consider the entire record – including the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process and the transmission provider's proposal – when setting the replacement rate. Specifically, when the Commission reviews transmission providers' compliance filings, the Commission is not required to accept a cost allocation proposal from a transmission provider simply because it may comply with Order No. 1920. Instead, the Commission may adopt any cost allocation method proposed by the Relevant State Entities and submitted on compliance so long as it complies with Order No. 1920.[1662]

660. We believe Order No. 1920, as modified here on rehearing, strikes a reasonable balance between, on the one hand, recognizing the rights and responsibilities of the Commission and transmission providers over regional transmission planning and, on the other, the states' critical interests in the resulting Long-Term Regional Transmission Facilities and how the costs associated with those facilities will be allocated. We also believe that this balance, including the requirement that transmission providers consult

[1661] *Id.* P 227.

[1662] We believe that these findings address NESCOE's arguments that Order No. 1920's cost allocation requirements "[r]elegat[ed] states to commenting on a transmission provider's cost allocation filing," or that the "only path the Commission envision[ed] for approval of the states' cost allocation method would be through the vehicle of a complaint." NESCOE Rehearing Request at 14.

with Relevant State Entities (1) prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process(es), or (2) if Relevant State Entities seek, consistent with their chosen method to reach agreement, for the transmission provider to amend that method or process,[1663] addresses, at least in part, concerns underlying arguments by Harvard ELI and NARUC that the Commission should establish a prospective mechanism through which transmission providers would be required to file for Commission approval any cost allocation methods approved by Relevant State Entities[1664] or if states reach the requisite agreement on a different cost allocation method than that reflected in the OATT then on file.[1665]

661. Nonetheless, consistent with our findings above with respect to requests that the Commission require transmission providers to adopt any cost allocation method that Relevant State Entities agree upon during the Engagement Period, we decline to adopt Harvard ELI's and NARUC's proposals. Transmission planning is the tariff obligation of each transmission provider and transmission providers retain, subject to Commission oversight, responsibility for regional transmission planning, including Long-Term

[1663] *See infra* Consultation with Relevant State Entities After the Engagement Period section.

[1664] Harvard ELI Rehearing Request at 1-3. Because we are unpersuaded by Harvard ELI's request for rehearing in this respect, we find it unnecessary to address Harvard ELI's request for clarification in the alternative that FPA section 206 provides the Commission the authority to amend the *pro forma* OATT to include a process for filing all cost allocation methods approved by Relevant State Entities. *Id.* at 8.

[1665] NARUC Rehearing Request at 21-22.

Regional Transmission Planning, as well as complying with the obligations of Order No. 1920.[1666] We disagree with Harvard ELI's contention that Order No. 1920's cost allocation requirements fail to remedy unjust and unreasonable cost allocation processes because Order No. 1920 does not require transmission providers to file all cost allocation methods approved by Relevant State Entities.[1667] As discussed below,[1668] we find that the Engagement Period established in Order No. 1920 provides the "dedicated process through which states have an opportunity to participate in the development of regional cost allocation methods"[1669] that the Commission recognized was absent from existing cost allocation requirements. We further find that, combined with existing opportunities for state engagement in the development of regional cost allocation methods along with those established herein,[1670] Order No. 1920's cost allocation requirements remedy the

[1666] *See* Order No. 1920, 187 FERC ¶ 61,068 at PP 996 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 153), 1363; *see also* Order No. 890, 118 FERC ¶ 61,119 at P 454 ("[T]ransmission planning is the tariff obligation of each transmission provider."). To the extent that West Virginia Commission, in stating that the Commission should "grant the States 205 filing rights as it pertains to State-agreed cost allocations," is requesting that the Commission confer filing rights to states under FPA section 205, West Virginia Commission does not explain the authority or legal theory upon which it believes the Commission could do so. West Virginia Commission Rehearing Request at 14.

[1667] Harvard ELI Rehearing Request at 6-7.

a. NOPR Proposals

663. To implement the NOPR proposal to require transmission providers to include in their OATTs either a Long-Term Regional Transmission Cost Allocation Method or a State Agreement Process, or a combination thereof, the Commission proposed to require transmission providers to "seek the agreement" of relevant state entities regarding the cost allocation method or methods that will apply to transmission facilities selected in the regional transmission plan for purposes of cost allocation through Long-Term Regional Transmission Planning and to revise their OATTs to include the method or methods.[1675] The Commission additionally proposed to afford transmission providers flexibility in the process by which they seek agreement from the Relevant State Entities.[1676] The Commission stated that the proposed reforms would enable Relevant State Entities who

[1674] *See Infra* Consultation with Relevant State Entities After the Engagement Period section.

[1675] NOPR, 179 FERC ¶ 61,028 at PP 278, 303, 305, 308.

[1676] *Id.* P 306.

seek greater involvement in cost allocation for Long-Term Regional Transmission Facilities an opportunity to do so.[1677]

664. In the NOPR, the Commission also proposed to require transmission providers to establish a process, detailed in their OATTs, to provide a state or states (in multi-state transmission planning regions) a time period to negotiate a cost allocation method for a transmission facility (or portfolio of facilities) selected for purposes of cost allocation through Long-Term Regional Transmission Planning that is different than any *ex ante* regional cost allocation method that would otherwise apply. The Commission proposed that, during that time period, if a state or all states within the transmission planning region in which the selected regional transmission facility would be located unanimously agree on an alternate cost allocation method, the transmission provider may elect to file it with the Commission.[1678] The Commission explained that providing states with a time period to propose alternate cost allocation methods could help facilitate the timely development of more efficient or cost-effective regional transmission facilities.[1679]

b. Order No. 1920 Requirements

665. In Order No. 1920, the Commission declined to adopt the NOPR proposal to require transmission providers to seek the agreement of Relevant State Entities regarding the cost allocation method to be applied to Long-Term Regional Transmission

[1677] *Id.* P 314.

[1678] *Id.* P 319.

[1679] *Id.* P 321.

Facilities.[1680] Instead, the Commission established a six-month Engagement Period, during which transmission providers must, among other things, provide a forum for the negotiation of a Long-Term Regional Transmission Cost Allocation Methods(s) and/or a State Agreement Process that enables meaningful participation by Relevant State Entities, and required transmission providers to explain on compliance how they complied with the six-month Engagement Period requirements.[1681] The Commission also declined to adopt the NOPR proposal to require transmission providers to establish a process, detailed in their OATTs, to provide a state or states (in multi-state transmission planning regions) a time period to negotiate a cost allocation method for a transmission facility (or portfolio of facilities) selected for purposes of cost allocation through Long-Term Regional Transmission Planning that is different than any *ex ante* regional cost allocation method that would otherwise apply.[1682]

c. Requests for Rehearing and Clarification

666. NRECA asserts that the requirement in Order No. 1920 for transmission providers to file a Long-Term Regional Transmission Cost Allocation Method with or without the agreement of Relevant State Entities, and to conduct a six-month Engagement Period to provide a forum for negotiation of Long-Term Regional Transmission Cost Allocation Methods and/or a State Agreement Process, is not a logical outgrowth of the NOPR

[1680] Order No. 1920, 187 FERC ¶ 61,068 at P 1354.

[1681] *Id.* PP 1354, 1357.

[1682] *Id.* P 1456.

proposal to require the transmission providers in a transmission planning region to seek agreement with Relevant State Entities as to a Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process.[1683] Undersigned States argue that the NOPR "placed the states in a central role in the regulatory structure by requiring transmission providers to seek the agreement of states for cost allocation," but that Order No. 1920 "removed the requirement that states give their consent on cost allocation," which is "'surprisingly distant' from the states' role in the NOPR and is in essence a new rule that requires new opportunities for comment and input."[1684] West Virginia Commission argues that Order No. 1920 "effectively exceeds the substantive notice of the NOPR" by removing realistic opportunities for states to work cooperatively on cost allocation agreements that will be proposed as *ex ante* cost allocation methods and adding "an ineffective substitute for seeking state agreement for cost allocation" by establishing the six-month Engagement Period.[1685] Utah Commission similarly contends that the elimination of any requirement that a state agree to a cost allocation that its residents must bear, no matter how detached the states' residents are from causing the associated

[1683] NRECA Rehearing Request at 17-18.

[1684] Undersigned States Rehearing Request at 38 (quoting *Int'l Union, United Mine Workers of Am.*, 407 F.3d at 1259-60).

[1685] West Virginia Commission Rehearing Request at 3.

costs or from the associated policies, does not constitute a logical outgrowth of the NOPR.[1686]

d. Commission Determination

667. As discussed elsewhere in this rule, we take steps in this order to expand Relevant State Entities' opportunities to inform and, as needed, provide alternatives to, transmission providers' proposed Long-Term Regional Transmission Cost Allocation Method(s). Therefore, while we disagree with rehearing parties' arguments that the Engagement Period and associated reforms are not a logical outgrowth of the NOPR, we note that certain modifications in this order address, at least in part, concerns that Order No. 1920 diminished the role of states in contrast to the NOPR.[1687]

668. In the NOPR, the Commission proposed to require transmission providers to "seek the agreement"[1688] of Relevant State Entities based upon its finding that "providing state regulators with a formal opportunity to develop a cost allocation method for regional transmission facilities selected through Long-Term Regional Transmission Planning could help increase . . . state[] support for those facilities,"[1689] thereby framing such a

[1686] Utah Commission Rehearing Request at 11-12.

[1687] *See supra* Requirement Concerning Relevant State Entities' Preferred Cost Allocation Methods section; *infra* Duration of the Engagement Period section; Consultation with Relevant State Entities After the Engagement Period section.

[1688] NOPR, 179 FERC ¶ 61,028 at PP 278, 303, 305, 308.

[1689] *Id.* P 299.

formal opportunity for state regulators as the subject for commenter discussion.[1690] Although Order No. 1920 did not adopt the proposed requirement to "seek the agreement" of Relevant State Entities, the Commission adopted a materially similar requirement—the Engagement Period—for transmission providers to provide, over a six-month period, a forum for negotiation of cost allocation methods for Long-Term Regional Transmission Facilities that enables meaningful participation by Relevant State Entities.[1691] The Engagement Period "provide[s] state regulators with a formal opportunity to develop a cost allocation method for regional transmission facilities selected through Long-Term Regional Transmission Planning," precisely as contemplated in the NOPR.[1692] Indeed, as the Commission explained in Order No. 1920, "requiring an Engagement Period provides the same opportunity for robust engagement in the cost allocation process as the NOPR proposal, and thus has the potential to achieve the same important benefits, but will reduce the practical challenges associated with requiring transmission providers to seek the agreement of Relevant State Entities."[1693] The Engagement Period, which facilitates the meaningful involvement of Relevant State Entities in determining cost allocation methods for selected Long-Term Regional

[1690] *Conn. Light & Power Co. v. Nuclear Regul. Comm'n*, 673 F.2d at 533 (holding that an agency's proposed rule must "adequately frame the subjects for discussion").

[1692] *See* NOPR, 179 FERC ¶ 61,028 at P 299.

[1693] Order No. 1920, 187 FERC ¶ 61,068 at P 1362.

Transmission Facilities, is in character with, and consequently a logical outgrowth of, the proposal to require transmission providers to "seek the agreement" of Relevant State Entities for the applicable cost allocation method for selected transmission facilities.[1694]

2. Requests Arguing the Engagement Period is Inferior to a Requirement that Transmission Providers Seek the Agreement of Relevant State Entities

a. Order No. 1920 Requirements

669. In Order No. 1920, the Commission established a six-month Engagement Period, during which transmission providers must: (1) provide notice of the starting and end dates for the six-month time period; (2) post contact information that Relevant State Entities may use to communicate with transmission providers about any agreement among Relevant State Entities on a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process, as well as a deadline for communicating such agreement; and (3) provide a forum for negotiation of a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process that enables meaningful participation by Relevant State Entities.[1695]

[1694] *See, e.g.*, *Am. Paper Inst. v. EPA*, 660 F.2d at 959 n.13 ("An agency may make even substantial changes in its original proposed rule without a further comment period if the changes are in character with the original proposal and are a logical outgrowth of the notice and comments already given."); *accord Chocolate Mfrs. Ass'n of U.S. v. Block*, 755 F.2d 1098, 1105 (4th Cir. 1985).

[1695] Order No. 1920, 187 FERC ¶ 61,068 at P 1354.

b. Requests for Rehearing and Clarification

670. Virginia and North Carolina Commissions and West Virginia Commission request rehearing of Order No. 1920's decision to not adopt the NOPR proposal to require transmission providers to seek the agreement of Relevant State Entities within the transmission planning region regarding the relevant cost allocation method to be applied to Long-Term Regional Transmission Facilities.[1696] West Virginia Commission argues that the Engagement Period is an ineffective substitute for the NOPR proposal to require transmission providers to seek the agreement of Relevant State Entities within the transmission planning region regarding the relevant cost allocation method to be applied to Long-Term Regional Transmission Facilities.[1697] Virginia and North Carolina Commissions argue that, to provide the robust engagement required by Order No. 1920, the Commission should specify and bolster transmission providers' requirements to meaningfully engage with and proactively seek (but not necessarily obtain) the agreement of Relevant State Entities concerning cost allocation issues during the Engagement Period.[1698]

[1696] West Virginia Commission Rehearing Request at 8; Virginia and North Carolina Commissions Rehearing Request at 8-10.

[1697] West Virginia Commission Rehearing Request at 8.

[1698] Virginia and North Carolina Commissions Rehearing Request at 9-10.

c. Commission Determination

671. As discussed in Order No. 1920 and reiterated in this order, it is critical to the success of the Long-Term Regional Transmission Planning reforms that states have an opportunity to have a significant role in the establishment of just and reasonable Long-Term Regional Transmission Cost Allocation Methods and State Agreement Processes. While we are unpersuaded by arguments that the Commission erred in declining to adopt the NOPR proposal to require transmission providers to seek the agreement of Relevant State Entities within the transmission planning region regarding the relevant cost allocation method to be applied to Long-Term Regional Transmission Facilities and instead establishing the Engagement Period,[1699] we believe that the requirements related to the Engagement Period, discussed below, that we adopt herein address the concerns underlying those rehearing requests.

672. In Order No. 1920, the Commission carefully weighed the appropriate level of transmission providers' engagement with Relevant State Entities regarding the cost allocation method to be applied to Long-Term Regional Transmission Facilities by considering the potential challenges inherent in such engagement. Specifically, the Commission found that while "states play a critical role in transmission planning" and "facilitating their engagement in cost allocation may minimize delays and additional costs that can be associated with associated transmission siting proceedings," mandating

[1699] West Virginia Commission Rehearing Request at 8; Virginia and North Carolina Commissions Rehearing Request at 8-10.

that transmission providers seek the agreement of Relevant State Entities on a Long-Term Regional Transmission Cost Allocation Method(s) would present potential difficulties that counseled against adoption of this proposed reform.[1700] For example, the Commission considered the possibility that requiring transmission providers to seek the agreement of Relevant State Entities might create disputes over the rights and responsibilities of individual states or state commissions to veto or otherwise hold up needed region-wide transmission plans.[1701] The Commission also considered the challenges of adopting a definition for "agreement" that would be necessary under a requirement for transmission providers to seek the agreement of Relevant States Entities.[1702]

673. We continue to find, as stated above, that states "play a critical role in transmission planning" and "facilitating their engagement in cost allocation may minimize delays and additional costs that can be associated with associated transmission siting proceedings,"[1703] and we find that establishing an Engagement Period recognizes that critical role while reducing the potential practical challenges discussed above, as

[1700] Order No. 1920, 187 FERC ¶ 61,068 at PP 124, 1362.

[1701] *See id.* P 1362 & n.2906 (citing Minnesota State Entities NOPR Initial Comments).

[1702] *Id.* P 1361 (discussing commenter arguments that the Commission adopt different criteria for "agreement," including a majority, a threshold of one-half of the participating Relevant State Entities, or unanimity).

[1703] *Id.* PP 124, 1362.

compared to requiring transmission providers to seek the agreement of Relevant State Entities.[1704] We also continue to find that the Engagement Period provides the same opportunity for robust engagement in the cost allocation process as the NOPR proposal, and thus has the potential to achieve the same important benefits.[1705] Beyond that, the modification we make here, to require transmission providers to submit any cost allocation methods agreed to by Relevant State Entities in the transmittal or as an attachment to their compliance filings, addresses the same concern and provides Relevant State Entities with additional means to demonstrate to the Commission any preferences around the cost allocation of Long-Term Regional Transmission Facilities. We therefore are unpersuaded by arguments raised by West Virginia Commission on rehearing that the Engagement Period is "ineffective" compared to the NOPR proposal.[1706] Similarly, with respect to Virginia and North Carolina Commissions' request that the Commission require transmission providers to "proactively seek" the agreement of Relevant State Entities to the transmission providers' preferred Long-Term Regional Transmission Cost Allocation Method,[1707] we find that Order No. 1920, as modified on rehearing, provides more opportunities for state engagement than a requirement to simply seek agreement with states for a Long-Term Regional Transmission Cost Allocation Method.

[1704] *Id.* P 1362.

[1705] *Id.*

[1706] West Virginia Commission Rehearing Request at 8.

[1707] Virginia and North Carolina Commissions Rehearing Request at 10.

Specifically, transmission providers must (1) provide the opportunity for Relevant State Entities from all states in a transmission planning region to participate in the Engagement Period;[1708] (2) upon the request of Relevant State Entities, facilitate and participate in a cost allocation discussion during the Engagement Period with Relevant State Entities;[1709] and (3) include, in the transmittal or as an attachment to their compliance filings, any Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process agreed to by Relevant State Entities.[1710]

3. Duration of the Engagement Period

a. Order No. 1920 Requirements

674. In Order No. 1920, the Commission found that limiting the Engagement Period to six months was necessary to ensure that transmission providers have sufficient time to prepare their compliance filings in advance of the compliance deadlines established in Order No. 1920.[1711]

b. Requests for Rehearing and Clarification

675. Several rehearing parties request extension of the Engagement Period.[1712] PJM States and Pennsylvania Commission request that the Commission clarify that the six-

[1708] *See infra* Content of the Engagement Period section.

[1709] *See supra* Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section.

[1710] *See supra* Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section.

[1711] Order No. 1920, 187 FERC ¶ 61,068 at P 1358.

[1712] PJM States Rehearing Request at 3-4; Pennsylvania Commission Rehearing

month Engagement Period will be extended for up to 12 months if states file a unanimous declaration that they are engaged in, but require additional time to complete, cost allocation discussions.[1713] West Virginia Commission requests that the Commission extend the Engagement Period to a minimum of 12 months or, in the alternative, authorize the extension of the Engagement Period if Relevant State Entities submit a declaration stating that they are continuing to engage in cost allocation discussions.[1714] SERTP Sponsors request that the Commission clarify that, upon unanimous consent of all affected state commissions (and the governing authorities for non-jurisdictional transmission providers), the Commission will allow (or, at a minimum, consider good-cause motions for) an extension of time for the development of *ex ante* state agreements to provide those entities with additional time to negotiate during the Engagement Period.[1715] PJM States, Pennsylvania Commission, and West Virginia Commission argue that the Commission should permit an extension of the Engagement Period because there are a large number of Relevant State Entities in PJM, there are highly diverse regulatory models used in those Relevant State Entities in PJM, and there are a wide variety of state

---

Request at 1 (adopting PJM States' arguments); West Virginia Commission Rehearing Request at 13; SERTP Sponsors Rehearing Request at 7-8; Virginia and North Carolina Commissions Rehearing Request at 11 n.27.

[1713] PJM States Rehearing Request at 3-4; Pennsylvania Commission Rehearing Request at 1.

[1714] West Virginia Commission Rehearing Request at 13.

[1715] SERTP Sponsors Rehearing Request at 7-8.

laws and procedures applicable to those Relevant State Entities.[1716] Virginia and North Carolina Commissions argue that it would likely be beneficial to afford transmission providers greater flexibility with respect to the "timeline" of the Engagement Period, to the extent this flexibility would facilitate productive engagement with states without unduly delaying or impeding Order No. 1920's other requirements.[1717]

676. Wyoming Commission asserts that providing states with six months "to reach agreement with the default cost allocation looming is an illusory acknowledgement of state authority."[1718] Arizona Commission states that "the provision for states to negotiate acceptable cost allocations among them is limited to six months" and that "[s]ix months is not enough time for the states to establish rate cases."[1719] Designated Retail Regulators and Undersigned States argue that "reaching an agreement in MISO within the six-month window" may be difficult given states' different goals and agendas,[1720] and that six months is an insufficient amount of time to provide the due process required to approve any State Agreement Process.[1721]

[1716] PJM States Rehearing Request at 3; Pennsylvania Commission Rehearing Request at 1; West Virginia Commission Rehearing Request at 13.

[1721] Designated Retail Regulators Rehearing Request at 9; Undersigned States Rehearing Request at 9.

c. Commission Determination

677. We set aside, in part, Order No. 1920's requirements on the duration of the Engagement Period. In Order No. 1920, the Commission noted that experience with Order No. 1000 has reinforced the critical role that states play in the development of new transmission infrastructure, particularly at the regional level, where transmission projects may physically span, and their costs may be allocated across, multiple states.[1722] Moreover, the Commission found that facilitating state involvement in the regional cost allocation process could minimize delays and additional costs associated with state and local siting proceedings.[1723] In keeping with these findings, and upon further consideration, we find that extending the Engagement Period may be appropriate when Relevant State Entities represent to the Commission that they need additional time to complete cost allocation discussions.

678. Providing the opportunity for such an extension is consistent with the critical role that states play in addressing these issues and ensuring that they have the time necessary to adequately engage in these issues. Therefore, in response to arguments raised by PJM States, Pennsylvania Commission, and West Virginia Commission, we set aside Order No. 1920's requirements, in part, to specify that the Commission will grant an extension of the required Engagement Period for up to an additional six months when Relevant State Entities, consistent with their chosen method to reach agreement, request additional

[1722] Order No. 1920, 187 FERC ¶ 61,068 at P 124.

[1723] *Id.*

time to complete cost allocation discussions. We find that such an extension is warranted in that circumstance to ensure that Relevant State Entities have sufficient time to engage in fulsome discussions. We also clarify that in such circumstances, the Commission will also, as appropriate, extend, *sua sponte*, the relevant Order No. 1920 compliance deadlines to accommodate an extension of the Engagement Period and to ensure that any such extension would not conflict with the required compliance deadlines.

4. Content of the Engagement Period

a. Order No. 1920 Requirements

679. In Order No. 1920, the Commission required the transmission providers in each transmission planning region to provide notice, such as on their OASIS pages or public websites, of the opportunity for any Relevant State Entity to participate in, and the starting and end dates of, the Engagement Period. The Commission required that such notice include contact information for a single point of contact in the transmission planning region that the Relevant State Entities can use to communicate any agreement among Relevant State Entities on a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process, as well as a deadline for communicating such agreement, which must be no earlier than the end date of the Engagement Period.[1724] The Commission also required transmission providers in each transmission planning

[1724] *Id.* P 1356. The Commission noted Relevant State Entities must indicate that they have agreed to any State Agreement Process for any such process to be eligible for acceptance by the Commission in compliance with Order No. 1920. *Id.* P 1356 n.2895.

region to provide a forum for negotiation that enables meaningful participation by Relevant State Entities during the Engagement Period.[1725]

680. The Commission required that transmission providers explain on compliance how they complied with the requirement to establish and provide notice of an Engagement Period for Relevant State Entities to negotiate a Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process, as well as how they complied with the requirement to provide a forum for such negotiation.[1726]

681. The Commission declined to define what constitutes agreement among Relevant State Entities, how such agreement is reached, and which Relevant State Entities must reach such agreement during the Engagement Period, or to establish a minimum set of criteria for a state agreement. Instead, the Commission left such matters, including whether to use existing state processes as a forum for negotiations, to the Relevant State Entities participating in the Engagement Period to determine.[1727] The Commission also declined to expand participation in the Engagement Period beyond Relevant State Entities, stating that it did not find it necessary to allow other stakeholders to participate in the Engagement Period.[1728]

[1725] *Id.* P 1357.

[1726] *Id.*

[1727] *Id.* PP 1360-1361 (citations omitted).

[1728] *Id.* P 1363.

b. Requests for Rehearing and Clarification

682. PJM States and NARUC request that the Commission require transmission providers to include in their compliance filings, at minimum, the setting and communicating of deadlines and the general forum for transmission provider discussions with and outreach to state entities concerning the Engagement Period.[1729] PJM States contend that these and other clarifications would demonstrate the extent to which transmission providers engaged with states during the Engagement Period.[1730]

683. PJM States request clarification that the Engagement Period is actually a "State Engagement Period" and that "states are *the* stakeholder(s) to engage."[1731] PJM States explain that any such clarification should not prohibit states from inviting other entities that might be helpful in assisting states in reaching agreement on cost allocation. Rather, PJM States argue that the Commission should make clear that the Engagement Period is "not for the engagement of all stakeholders" but is instead intended to provide a forum for transmission providers and states to attempt to reach agreement on cost allocation.[1732]

c. Commission Determination

684. In response to the requests of PJM States and NARUC for clarification as to the information that transmission providers must include in their compliance filings

---

[1729] NARUC Rehearing Request at 17; PJM States Rehearing Request at 7.

[1730] PJM States Rehearing Request at 8.

[1731] *Id.* (emphasis in original).

[1732] *Id.* at 8-9.

concerning the Engagement Period,[1733] we clarify that, in order to comply with the requirement that transmission providers explain how they provided a forum for negotiation of a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process during the Engagement Period that enables meaningful participation by Relevant State Entities,[1734] transmission providers must at minimum disclose any deadlines set by transmission providers during the Engagement Period and how transmission providers communicated any such deadlines to Relevant State Entities, and provide a general description of the forum for negotiation.[1735]

685. With respect to PJM States' argument that the Commission should clarify that the Engagement Period is "not for the engagement of all stakeholders,"[1736] we reiterate that the Commission declined to expand participation in the Engagement Period beyond Relevant State Entities, and did not find it necessary to allow other stakeholders to participate in the Engagement Period.[1737] However, we also reiterate that the

[1733] *See id.* at 7; NARUC Rehearing Request at 17-18.

[1734] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 1357.

[1735] We address the requests of PJM States, NARUC, and other parties that the Commission require transmission providers to include additional information related to the Engagement Period in their compliance filings—such as requests that the Commission require each transmission provider to include states' preferred cost allocation method in its compliance filing above in the Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section.

[1736] PJM States Rehearing Request at 8-9.

[1737] Order No. 1920, 187 FERC ¶ 61,068 at P 1363.

Commission allowed Relevant State Entities to permit the participation of other entities subsequently during implementations of a State Agreement Process.[1738] We also reiterate our determination in Order No. 1920 to define Relevant State Entities as any state entity responsible for electric utility regulation or siting electric transmission facilities within the state or portion of a state located in the transmission planning region, including any state entity as may be designated for that purpose by the law of such state,[1739] and we continue to find that this definition recognizes the important role of states while providing sufficient regional flexibility for effective Engagement Period participation.[1740]

686. With respect to PJM States' request for clarification that the Engagement Period is actually a "State Engagement Period" and that the states are the stakeholders with which transmission providers must engage during the Engagement Period,[1741] we grant clarification, in part, and clarify that transmission providers must provide the opportunity for Relevant State Entities from all states in each transmission planning region to participate in the Engagement Period.

[1738] *Id.* P 1402.

[1739] *Id.* P 1355.

[1740] *Id.* P 1364.

[1741] PJM States Rehearing Request at 8.

5. Consultation with Relevant State Entities After the Engagement Period

a. Order No. 1920 Requirements

687. In Order No. 1920, the Commission declined to require future Engagement Periods, but noted that transmission providers may hold future Engagement Periods if they believe that such periods would be beneficial.[1742]

b. Requests for Rehearing and Clarification

688. NARUC and NESCOE request rehearing of Order No. 1920's decision not to require future Engagement Periods.[1743] NESCOE argues that following the initial Engagement Period, any proposed modification to the transmission planning region's Long-Term Regional Transmission Cost Allocation Method should trigger an obligation to establish a new Engagement Period to provide a forum for Relevant State Entities to discuss the proposed Long-Term Regional Transmission Cost Allocation Method. NESCOE explains that absent this obligation, a transmission provider could undo the efforts of Relevant State Entities in agreeing to a Long-Term Regional Transmission Cost Allocation Method during the initial Engagement Period by filing a new Long-Term Regional Transmission Cost Allocation Method without consulting with Relevant State Entities.[1744]

[1742] Order No. 1920, 187 FERC ¶ 61,068 at P 1368.

[1743] NARUC Rehearing Request at 21-22; NESCOE Rehearing Request at 13-14.

[1744] NESCOE Rehearing Request at 13-14 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1430 ("We further clarify that unless voluntarily waived, a transmission provider retains its FPA section 205 filing rights to submit an *ex ante* cost allocation

689. NARUC requests that the Commission create a mechanism that ensures regular re-examination of the Long-Term Regional Transmission Cost Allocation Method(s) and any State Agreement Process in a transmission provider's OATT. Specifically, NARUC argues that the Commission should require each transmission provider to periodically open a new negotiation period with Relevant State Entities.[1745]

690. Virginia and North Carolina Commissions argue that it would likely be beneficial to afford transmission providers greater flexibility with respect to the "frequency" of the Engagement Period, to the extent this flexibility would facilitate productive engagement with states without unduly delaying or impeding Order No. 1920's other requirements.[1746]

c. Commission Determination

691. We are persuaded by NARUC's and NESCOE's arguments raised on rehearing. Accordingly, we set aside Order No. 1920, in part, and require that, as part of transmission providers' obligations with respect to transmission planning and cost allocation, transmission providers shall consult with Relevant State Entities (1) prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State

---

method for Long-Term Regional Transmission Facilities at any time, consistent with any limitations a transmission provider may have agreed to, for example, as part of its membership in an RTO/ISO." (citations omitted))).

[1745] NARUC Rehearing Request at 21-22. In the Requirements Concerning Relevant State Entities' Preferred Cost Allocation Methods section above, we discuss NARUC's alternative request that the Commission require each transmission provider to file a modification to its OATT if states reach the requisite agreement on a different cost allocation method than that reflected in its OATT.

[1746] Virginia and North Carolina Commissions Rehearing Request at 11 n.27.

Agreement Process(es), or (2) if Relevant State Entities seek, consistent with their chosen method to reach agreement, for the transmission provider to amend that method or process. The consultation requirement will provide a mechanism through which transmission providers and Relevant State Entities can engage regarding possible future changes via FPA section 205 to cost allocation methods accepted by the Commission in compliance with Order No. 1920.[1747] We require transmission providers to include in their OATTs a description of how they will consult with Relevant State Entities in these circumstances. Additionally, for a consultation initiated by the transmission providers, we require transmission providers to document publicly on their OASIS or other public website the results of their consultation with Relevant State Entities prior to filing their amendment. For a consultation initiated by Relevant State Entities, if the transmission providers choose not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process(es) preferred by Relevant State Entities during the required consultation, we also require transmission providers to document publicly on their OASIS or other public website the results of their consultation with Relevant State Entities, including an explanation for why they have chosen not to propose any amendments.

[1747] We clarify that this consultation requirement neither requires transmission providers to submit, nor prohibits transmission providers from submitting, FPA section 205 filings to modify cost allocation methods accepted in compliance with Order No. 1920, and transmission providers therefore retain their currently effective FPA section 205 rights. That said, as noted below, transmission providers may satisfy the consultation requirement by voluntarily agreeing to submit FPA section 205 proposals supported by Relevant State Entities. *Infra* P 692.

692. We find that these requirements will ensure that states have the opportunity to be involved in establishing cost allocation methods for Long-Term Regional Transmission Facilities subsequent to the Commission's acceptance of transmission providers' filings made in compliance with Order No. 1920, which has the potential to minimize additional costs and delays in the siting process and to facilitate the development of Long-Term Regional Transmission Facilities.[1748] While we provide transmission providers flexibility as to the form and duration of their required consultation with Relevant State Entities, we note that one way transmission providers could satisfy the requirement to consult with Relevant State Entities is by revising their OATTs to include a process under which the transmission provider must present to the Commission, in addition to its own FPA section 205 proposal, an alternative cost allocation method proposed by Relevant State Entities for evaluation by the Commission on equal footing.[1749] Transmission providers could

[1748] *E.g.*, Order No. 1920, 187 FERC ¶ 61,068 at PP 124, 126.

[1749] *See, e.g.*, ISO New England Inc., FERC FPA Electric Tariff, ISO New England Inc. Agreements and Contracts, TOA, Transmission Operating Agreement (5.0.0), 3.04(h)(vi)(C); *see also The Governors of Conn., Me., Mass., N.H., R.I., Vt.*, 112 FERC ¶ 61,049, at P 25 (2005).

also satisfy the requirement to consult with Relevant State Entities by revising their OATTs to include mechanisms similar to those used in SPP[1750] and MISO.[1751]

D. Design and Operation of State Agreement Processes

1. Definition of Relevant State Entities

a. Order No. 1920 Requirements

693. In Order No. 1920, the Commission defined Relevant State Entities as any state entity responsible for electric utility regulation or siting electric transmission facilities within the state or portion of a state located in the transmission planning region, including any state entity as may be designated for that purpose by the law of such state. The Commission stated that it modified the NOPR proposal's definition to add the word "electric" before "utility regulation" in order to make clear that Relevant State Entities are those state agencies responsible for *electric* utility regulation, and not other types of

[1750] SPP, Governing Documents Tariff, Bylaws, First Revised Volume No. 4 (0.0.0), 7.2 (Regional State Committee) (providing that the Regional State Committee has primary responsibility for determining regional proposals regarding, among other things, "whether license plate or postage stamp rates will be used for the regional access charge," and that when the Regional State Committee "reaches decisions on the methodology that will be used to address any of these issues, SPP will file this methodology pursuant to Section 205 of the [FPA]"); *see also Sw. Power Pool, Inc.*, 106 FERC ¶ 61,110, at PP 218-220, *order on reh'g*, 109 FERC ¶ 61,010, at PP 92-94 (2004); *Sw. Power Pool, Inc.*, 108 FERC ¶ 61,003, at P 127 & n.90 (2004), *order on reh'g*, 110 FERC ¶ 61,138, at P 33 (2005).

[1751] MISO FERC Electric Tariff, MISO Rate Schedules, MISO Transmission Owner Agreement, app. K (Filing Rights Pursuant To Section 205 Of The FPA) (3.0.0), II.E.3.a.i-ii (providing the circumstances under which the OMS Committee "shall have the right to request and MISO shall file for a new or an amendment of any regional cost allocation methodology"); *see also Midwest Indep. Transmission Sys. Operator, Inc.*, 143 FERC ¶ 61,165, at PP 30, 32 (2013).

utility regulation.[1752] In Order No. 1920, the Commission declined requests to expand or clarify the definition of Relevant State Entities and did not modify the definition beyond adding the word "electric," but permitted other participants beyond Relevant State Entities to participate in a State Agreement Process, if agreed to by Relevant State Entities.[1753]

b. Requests for Rehearing and Clarification

694. APPA contends that the Commission erred in excluding municipal electric regulatory bodies from the Relevant State Entity definition.[1754] APPA claims that excluding public power utilities and municipal governing bodies is arbitrary and capricious because: (1) the Commission failed to justify excluding customers served by municipal utilities during the Engagement Period, which is unduly discriminatory;[1755] (2) the Commission gave no meaningful rationale for excluding self-regulated public utilities from the Relevant State Entity definition, and inclusion would increase local support and reduce uncertainty and risk for development of Long-Term Regional Transmission Facilities; and (3) the definition of Relevant State Entity conflicts with the FPA's definition of "state commission" as "the regulatory body of the State or

[1752] Order No. 1920, 187 FERC ¶ 61,068 at P 1355.

[1753] *Id.* PP 1364 & n.2914, 1402.

[1754] APPA Rehearing Request at 2.

[1755] *Id.* at 4.

municipality having jurisdiction to regulate rates and charges for the sale of electric energy to consumers within the State or *municipality*."[1756]

695. Large Public Power claims that non-jurisdictional self-regulating non-public utilities under FPA section 201(f) could be profoundly affected by the Engagement Period without representation, and their exclusion from the definition of Relevant State Entity is arbitrary and capricious.[1757] Large Public Power states that its members are self-regulating entities that possess many of the same regulatory characteristics as state commissions, undertake retail ratemaking publicly, are not represented by state commissions, and in some states represent a market share larger than most individual investor-owned utilities.[1758] Large Public Power states that the FPA explicitly recognizes political subdivisions' authority through exemptions.[1759] Large Public Power argues that the Commission should provide an opportunity for municipal utilities to have a voice equal to that of state utility commissions to ensure that Long-Term Regional Transmission Facilities are not built and paid for by their customers unless such facilities are needed and wanted.[1760] Large Public Power states that the most obvious solution to

[1756] *Id.* at 5 (citing 16 U.S.C. 796(15)) (emphasis in original).

[1757] Large Public Power Rehearing Request at 11.

[1758] *Id.*

[1759] *Id.* at 12.

[1760] *Id.* at 12-13.

this issue would be to grant municipal utilities representation on a load ratio share basis.[1761]

696. City of New Orleans Council requests clarification to confirm that it meets the definition of a Relevant State Entity.[1762] City of New Orleans Council states that it is designated and recognized by the State of Louisiana and the Home Rule Charter of the City of New Orleans as the governmental body that supervises, regulates, and controls public utilities within New Orleans.[1763] City of New Orleans Council states that MISO recognizes the City of New Orleans Council's unique regulatory authority and status.[1764] Noting that Order No. 1920 refers to OMS as an existing mechanism for state involvement, City of New Orleans Council states that it is a member of OMS that represents the collective interests of its members, which are state and local regulators within MISO's footprint.[1765] City of New Orleans Council states that it is also a member of the Entergy Regional State Committee (ERSC), which is comprised of retail regulators from the MISO-South subregion and recognized in MISO stakeholder forums, and that the ERSC bylaws recognize that the City of New Orleans Council is included as a "state

[1761] *Id.* at 13.

[1762] City of New Orleans Council Rehearing Request at 4.

[1763] *Id.* (citing La. Const., art. IV, § 21(c); Home Rule Charter of the City of New Orleans, § 3-130).

[1764] *Id.* at 5.

[1765] *Id.* (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1357).

regulatory agency."[1766] City of New Orleans Council also argues that its recognition within MISO is consistent with PJM's recognition of the District of Columbia.[1767]

697. City of New Orleans Council requests rehearing in the event that the Commission does not grant its request for clarification, noting that the Constitution of the State of Louisiana and the Home Rule Charter of the City of New Orleans recognize City of New Orleans Council's status as the governmental body with the power of supervision, regulation, and control over public utilities, and noting MISO's recognition of the City of New Orleans Council's status.[1768] City of New Orleans Council states that finding that it does not meet the definition of Relevant State Entity would be contrary to such legal and regulatory recognition.[1769]

698. NESCOE requests that the Commission clarify that Regional State Committees are included in the definition of Relevant State Entities, or in the alternative, NESCOE seeks rehearing.[1770] NESCOE states that it is unclear that Regional State Committees, such as NESCOE, which do not necessarily appear in state laws and are not necessarily state

---

[1767] *Id.* at 6-7.

[1768] *Id.* at 8.

[1769] *Id.* at 9.

[1770] NESCOE Rehearing Request at 17-20.

agencies, are Relevant State Entities.[1771] NESCOE states that it appears that the Commission did not deliberately exclude Regional State Committees from the definition of Relevant State Entities, but that the Commission appears to have misapprehended NESCOE's argument in its comments as solely concerned about its unique structure of achieving consensus among the New England states.[1772]

699. NRECA states that, even following its comments to the NOPR, the definition of Relevant State Entity excludes cooperatives and public power utilities not subject to regulation by a state utility commission and the Engagement Period includes only Relevant State Entities. NRECA argues that, as a result, Order No. 1920 allows a Relevant State Entity to dictate cost allocation to electric utilities it does not regulate.[1773]

c. Commission Determination

700. We deny the requests for clarification and disagree with APPA's and Large Public Power's requests for rehearing asking to expand the definition of Relevant State Entity.[1774] As discussed in Order No. 1920, we continue to find that "regional transmission facilities face significant uncertainty and risk of not reaching construction if certain stakeholders – in particular, a state regulator responsible for permitting

[1771] *Id.* at 18-19.

[1772] *Id.* at 19.

[1773] NRECA Rehearing Request at 57-58.

[1774] APPA Rehearing Request at 2, 4-5; Large Public Power Rehearing Request at 11-13.

transmission facilities – do not perceive the regional transmission facilities' value as commensurate with their costs."[1775]

701. Municipal electric regulatory bodies and non-public utility entities provide valuable insight as stakeholders in Commission-sanctioned processes. But in defining Relevant State Entities for the purposes of Order No. 1920, we find that state entities responsible for electric utility regulation or siting electric transmission facilities within the state or portion of a state located in the transmission planning region are, as discussed above, uniquely situated to influence whether or not a Long-Term Regional Transmission Facility reaches completion. On balance, while we recognize the important role that other stakeholders play in Long-Term Regional Transmission Planning, we continue to find that the definition of Relevant State Entities should encompass only any state entities responsible for electric utility regulation or siting electric transmission facilities within the state or portion of a state located in the transmission planning region, including any state entity as may be designated for that purpose by the law of such state.[1776] In Order No. 1920, the Commission further stated, and we continue to believe, that:

> [P]roviding state regulators with a formal opportunity to develop a cost allocation method for Long-Term Regional Transmission Facilities selected through Long-Term Regional Transmission Planning could help increase stakeholder – and

[1775] Order No. 1920, 187 FERC ¶ 61,068 at P 1364 (quoting NOPR, 179 FERC ¶ 61,028 at P 297 (footnote omitted)).

[1776] As noted below, we make no findings here regarding whether any individual municipal electric regulatory body or non-public utility entity meets the definition of a Relevant State Entity, as those determinations properly rest with entities in a state, based upon their interpretation of their state laws. *Infra* P 703.

> state – support for those facilities, which, in turn, may increase the likelihood that those facilities are sited and ultimately developed with fewer costly delays and better ensure just and reasonable Commission-jurisdictional rates.[1777]

702. For the same reasons, we also do not find it necessary to expand the definition of Relevant State Entities for the purposes of Order No. 1920.

703. In response to City of New Orleans Council's and NESCOE's requests,[1778] we will not make a finding on whether an individual state's laws, regulations, and/or policies, or inclusion in a larger association of regulators, deem a certain entity to be a Relevant State Entity, though we note that state law may be a persuasive or dispositive factor in such determinations.[1779] Instead, entities within a state must determine if they qualify as Relevant State Entities based on the definition the Commission provided in Order No. 1920 and based upon their interpretation of their state laws. We also reiterate that Order No. 1920 permits other participants, including municipal electric regulatory bodies and non-public utility entities that do not otherwise meet the definition of a Relevant State Entity, to participate in a State Agreement Process, if agreed to by

[1777] Order No. 1920, 187 FERC ¶ 61,068 at P 1364 (alterations omitted) (citing NOPR, 179 FERC ¶ 61,028 at P 299).

[1778] City of New Orleans Council Rehearing Request at 4, 8; NESCOE Rehearing Request at 17-20.

[1779] Order No. 1920 also allows Relevant State Entities to participate in cost allocation negotiations through a regional body. *See, e.g.*, Order No. 1920, 187 FERC ¶ 61,068 at P 999 (declining to impose specific requirements regarding how consultation with Relevant State Entities will occur, and recognizing need for flexibility "based on the specific needs and makeup of their transmission planning region").

Relevant State Entities.[1780] Finally, we disagree with NRECA's assertion that Order No. 1920 permits Relevant State Entities to dictate cost allocation to utilities they do not regulate.[1781] Order No. 1920, as modified here on rehearing, provides robust opportunities for Relevant State Entities to participate in the development of Long-Term Regional Transmission Cost Allocation Methods, given the critical role that states will play in the success of Long-Term Regional Transmission Planning. However, it is ultimately the Commission that will determine whether cost allocation methods proposed on compliance are just and reasonable and not unduly discriminatory or preferential, and all interested parties will have a full and fair opportunity to participate both in regional stakeholder proceedings and in compliance proceedings before the Commission.

704. In response to APPA's contention that the definition of Relevant State Entity conflicts with the FPA's definition of "state commission" as "the regulatory body of the State or *municipality* having jurisdiction to regulate rates and charges for the sale of electric energy to consumers within the State or *municipality*,"[1782] we find that the definition of Relevant State Entity for purposes of Long-Term Regional Transmission Facility cost allocation is distinct from the purpose of the definition of "state commission" in the FPA and need not align with it. We note, for example, that the FPA

[1780] *Id.* PP 1364 & n.2914, 1402.

[1781] NRECA Rehearing Request at 57-58.

[1782] APPA Rehearing Request at 5 (citing 16 U.S.C. 796(15)) (emphasis in original).

defines "state commission" and "state" separately, and in the final rule we use neither of these two definitions.[1783]

2. Extensions of Time for Negotiation of Cost Allocation Methods Under State Agreement Processes

a. Order No. 1920 Requirements

705. In Order No. 1920, the Commission required that any State Agreement Process be completed, i.e., any resulting cost allocation method must be filed with the Commission, no later than six months after selection of the applicable Long-Term Regional Transmission Facility (or portfolio of such Facilities).[1784] The Commission found that the State Agreement Process can only be effective if there is a limit on the time to reach agreement before defaulting to the Long-Term Regional Transmission Cost Allocation Method that the Commission required transmission providers to include in their OATTs, that the lack of such a deadline could cause delay and increase uncertainty regarding selected Long-Term Regional Transmission Facilities, and that a deadline, bolstered by a default Long-Term Regional Transmission Cost Allocation Method, may increase the incentive for Relevant State Entities to reach agreement on cost allocation for a particular Long-Term Regional Transmission Facility through a State Agreement Process.[1785] The Commission found that six months is a reasonable period for State Agreement Process

[1783] *See* 16 U.S.C. 796(15)) and 16 U.S.C. 796(6), respectively.

[1784] Order No. 1920, 187 FERC ¶ 61,068 at P 1406.

[1785] *Id.* P 1413.

deliberations on a cost allocation method because it balances the need for adequate time for negotiations with transmission providers' need for finality in their Long-Term Regional Transmission Planning.[1786]

b. Requests for Rehearing and Clarification

706. Designated Retail Regulators and Undersigned States argue that the State Agreement Process is unreasonable because Order No. 1920 does not provide adequate time for the adoption of a cost allocation method that follows any approved State Agreement Process.[1787]

707. SERTP Sponsors request that the Commission clarify that upon unanimous consent of state commissions and relevant governing authorities for SERTP Sponsors not subject to the Commission's jurisdiction, the Commission will allow an extension of time for the development of methods resulting from a State Agreement Process.[1788] SERTP Sponsors request that at a minimum, the Commission clarify that it will consider motions for an extension of time for good cause.[1789]

c. Commission Determination

708. We believe that the six-month deadline by which transmission providers must file any cost allocation method that results from a State Agreement Process is reasonable and

---

[1786] *Id.* P 1414.

[1787] Designated Retail Regulators Rehearing Request at 9; Undersigned States Rehearing Request at 8.

[1788] SERTP Sponsors Rehearing Request at 7-8.

[1789] *Id.*

are thus unpersuaded by parties who challenge the sufficiency of this deadline. While we emphasize the benefits of a State Agreement Process, we continue to find that this deadline balances the need for adequate time for Relevant State Entities to conduct negotiations with the need for finality in Long-Term Regional Transmission Planning.[1790] Consistent with Order No. 1920, we find that a deadline, coupled with a default Long-Term Regional Transmission Cost Allocation Method, may encourage Relevant State Entities to timely reach agreement on cost allocation for a particular Long-Term Regional Transmission Facility through a State Agreement Process.[1791] While we grant SERTP Sponsors' request to clarify that transmission providers may file motions for an extension of time for good cause to the State Agreement Process beyond six months after selection of the applicable Long-Term Regional Transmission Facility (or portfolio of such Facilities), we decline at this time to categorically pre-approve extensions (even if unanimous), and thus we deny SERTP Sponsors' associated request for clarification. Instead, the Commission will consider any such requests on the record before it at that time.

[1790] Order No. 1920, 187 FERC ¶ 61,068 at P 1414.

[1791] *Id.* P 1413.

E. Use of Existing Cost Allocation Methods in Long-Term Regional Transmission Planning or Existing Regional Processes

1. Order No. 1920 Requirements

709. In Order No. 1920, the Commission required that, to the extent transmission providers believe that their existing cost allocation methods comply with the requirements of Order No. 1920, they may demonstrate in their compliance filings that such methods, as applied to Long-Term Regional Transmission Facilities, would comply with the requirements of Order No. 1920.[1792] The Commission also required that transmission providers that wish to continue using existing transmission planning and cost allocation processes to consider transmission needs driven by Public Policy Requirements must demonstrate that continued use of any such processes does not interfere with or otherwise undermine Long-Term Regional Transmission Planning.[1793]

2. Requests for Rehearing and Clarification

710. PJM requests that the Commission grant rehearing and confirm that it will consider requests to maintain existing cost allocation methods on compliance unless and until an alternative is filed.[1794] PJM argues that the Commission has not justified why Order No. 1920 "categorically prohibit[s] existing cost allocation methodologies from remaining in place" in such circumstances.[1795] PJM states that it is concerned that

---

[1792] *Id.* PP 1302-1303.

[1793] *Id.* P 243.

[1794] PJM Rehearing Request at 19-23.

[1795] *Id.* at 20.

requiring transmission owners to re-justify existing cost allocation methods will set back efforts to implement its Long-Term Regional Transmission Planning Process.[1796] PJM argues that the requirement to renegotiate all cost allocation methods undercuts the longstanding and widely-accepted notion that knowing how costs for transmission facilities will be allocated is critical for their development.[1797] PJM further states that its existing cost allocation method includes specific cost allocations for reliability-based projects, market efficiency projects, public policy projects addressing state-identified needs, and multi-driver projects.[1798] PJM argues that requiring transmission owners to re-justify the existing cost allocation methods undermines the certainty regarding the development of transmission facilities PJM selects to be built.[1799] PJM states that its existing cost allocation methods are the result of years of close consultation and extensive work among the states in the PJM region and litigation before the Commission. PJM argues that Order No. 1920 effectively erases these efforts.[1800]

711. Ohio Commission Federal Advocate asserts that Order No. 1920 arbitrarily and capriciously requires continued use of PJM's State Agreement Approach to be re-approved by the Commission. Specifically, Ohio Commission Federal Advocate argues

---

[1796] *Id.* at 20-21.

[1797] *Id.* at 21 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 124).

[1798] *Id.* at 22-23.

[1799] *Id.* at 21.

[1800] *Id.* at 22-23.

that the State Agreement Approach has long been approved and used in the PJM region to ensure just and reasonable cost allocation for public policy projects and asks the Commission to revise Order No. 1920 to explicitly allow the continued use of the State Agreement Approach at least to the projects to which it currently applies.[1801]

3. Commission Determination

712. Upon consideration of the rehearing requests, we sustain Order No. 1920's requirement that transmission providers that wish to continue using existing transmission planning and cost allocation processes to consider transmission needs driven by Public Policy Requirements must demonstrate that continued use of any such processes does not interfere with or otherwise undermine Long-Term Regional Transmission Planning. We similarly decline to set aside Order No. 1920's requirement that to use an existing cost allocation method as a Long-Term Regional Transmission Cost Allocation Method, a transmission provider must demonstrate in its compliance filings that such methods, as applied to Long-Term Regional Transmission Facilities, comply with Order No. 1920.

713. We disagree with PJM's request to continue to use existing regional cost allocation methods for Long-Term Regional Transmission Facilities without a showing that such use complies with the requirements of Order No. 1920.[1802] However, we note that Order No. 1920 does not prohibit transmission providers from proposing to use existing regional cost allocation methods to comply with the requirements for Long-Term

[1801] Ohio Commission Federal Advocate Rehearing Request at 12-13.

[1802] PJM Rehearing Request at 19-23.

Regional Transmission Cost Allocation Methods, so long as the transmission providers demonstrate that the existing methods are just and reasonable and not unduly discriminatory or preferential when applied to Long-Term Regional Transmission Facilities and comply with the requirements of Order No. 1920 and the cost causation principle.[1803] Nevertheless, given the deficiencies identified in existing transmission planning and cost allocation processes identified by the Commission in Order No. 1920 and the numerous reforms adopted in Order No. 1920 for Long-Term Regional Transmission Planning to address those deficiencies, it would be unjust and unreasonable for the Commission to accept existing cost allocation methods for Long-Term Regional Transmission Facilities without ensuring that such methods are consistent with Order No. 1920.[1804]

714. We recognize that it may be just and reasonable to apply existing regional cost allocation methods to Long-Term Regional Transmission Facilities for many of the same reasons that the Commission found these methods to be just and reasonable when initially approving them. For this reason, Order No. 1920 specifically provided that transmission providers may demonstrate in their compliance filings that their existing regional cost allocation methods, as applied to Long-Term Regional Transmission Facilities, would comply with the requirements of Order No. 1920.[1805] As such, we disagree with PJM's

[1803] Order No. 1920, 187 FERC ¶ 61,068 at PP 1302-1303.

[1804] *Id.* PP 124-125 (citations omitted), 1302-1303 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 565; Order No. 1000-A, 139 FERC ¶ 61,132 at P 747).

[1805] *Id.* PP 1302-1303. In Order No. 1000, in response to "concerns regarding

assertion that Order No. 1920 will ignore past efforts to facilitate consensus on cost allocation methods.[1806]

715. We disagree with Ohio Commission Federal Advocate's assertion that Order No. 1920 requires that the continued use of PJM's State Agreement Approach must be re-approved by the Commission and that the final rule limits use of PJM's State Agreement Approach.[1807] We note that Order No. 1920 requires reapproval for existing cost allocation methods' use in Long-Term Regional Transmission Planning only if those

---

relitigation of existing Commission-approved transmission cost allocation methods," the Commission declined "to prejudge whether any such existing cost allocation methods compl[ied] with the requirements of [Order No. 1000]," and noted that "[t]o the extent [transmission providers] believe[d] that to be the case with their region, they [could] take such positions during the development of compliance proposals and during Commission review of compliance filings." Order No. 1000, 136 FERC ¶ 61,051 at P 565. On compliance, the Commission found that SPP's existing Balanced Portfolio and Highway/Byway regional cost allocation methods and MISO's existing regional cost allocation methods for Multi-Value Projects (MVPs) and Market Efficiency Projects (MEP) complied with the requirements of Order No. 1000. *Sw. Power Pool, Inc.*, 144 FERC ¶ 61,059, at PP 336, 347 (2013), *order on reh'g and compliance*, 149 FERC ¶ 61,048, at P 276 (2014), *order on reh'g and compliance*, 151 FERC ¶ 61,045, *order on compliance*, 152 FERC ¶ 61,106 (2015); *Midwest Indep. Transmission Sys. Operator, Inc.*, 142 FERC ¶ 61,215, at PP 420, 434 (2013), *order on reh'g and compliance*, 147 FERC ¶ 61,127, at P 404 (2014), *order on reh'g and compliance*, 150 FERC ¶ 61,037 (2015), *order on compliance*, Docket No. ER13-187-010 (Mar. 31, 2015) (delegated order).

[1806] PJM Rehearing Request at 22-23. With respect to PJM's request to continue using its existing regional cost allocation method for public policy projects addressing state-identified needs outside of Long-Term Regional Transmission Planning, we address this issue above in the Requirement to Participate in Long-Term Regional Transmission Planning section.

[1807] Ohio Commission Federal Advocate Rehearing Request at 12-13.

methods are to be used for compliance with Order No. 1920.[1808] PJM's State Agreement Approach is not a regional cost allocation method used to comply with the requirements of Order No. 1000. The Commission approved the existing PJM State Agreement Approach in an order on compliance in the Order No. 1000 proceeding, but did not find that the PJM State Agreement Approach was a regional cost allocation method compliant with the requirements of Order No. 1000.[1809] In addition, PJM's State Agreement Approach is different than the "State Agreement Process" as discussed in Order No. 1920. The State Agreement Process referenced in Order No. 1920 is a new construct under which Relevant State Entities may agree to a different cost allocation method for Long-Term Regional Transmission Facilities than the generally applicable Long-Term Regional Transmission Cost Allocation Method on file. Therefore, we clarify that Order No. 1920 does not prohibit PJM from maintaining its existing State Agreement Approach for transmission facilities that are not selected in either its Order No. 1000 regional transmission planning process or through Long-Term Regional Transmission

[1808] Order No. 1920, 187 FERC ¶ 61,068 at PP 1302-1303.

[1809] *See PJM Interconnection, L.L.C.* 142 FERC ¶ 61,214, at P 142 (2013) ("We find PJM's proposed State Agreement Approach is not needed for PJM to comply with the provisions of Order No. 1000 addressing transmission needs driven by public policy requirements. PJM's State Agreement Approach supplements, but does not conflict or otherwise replace, PJM's process to consider transmission needs driven by public policy requirements as required by Order No. 1000 addressed above. Accordingly, the Commission need not find that the State Agreement Approach and corresponding cost allocation method comply with Order No. 1000."), *order on reh'g and compliance*, 147 FERC ¶ 61,128 (2014), *order on reh'g and compliance*, 150 FERC ¶ 61,038, *order on reh'g and compliance*, 151 FERC ¶ 61,250 (2015).

Planning.[1810] To clarify further, PJM's State Agreement Approach is supplemental to PJM's existing regional transmission cost allocation method and, as a result, is not in any way affected by Order No. 1920.

716. However, if the Relevant State Entities in PJM agree to rely on its existing PJM State Agreement Approach as an Order No. 1920 State Agreement Process that applies to selected Long-Term Regional Transmission Facilities, and if PJM agrees, PJM would have to propose and demonstrate on compliance that its State Agreement Approach complies with all of the State Agreement Process requirements set forth in Order No. 1920. In addition, we reiterate that the *ex ante* Long-Term Regional Transmission Cost Allocation Method(s) that Order No. 1920 prescribes would be used to allocate the costs of selected Long-Term Regional Transmission Facilities if any Order No. 1920-compliant State Agreement Process does not result in a cost allocation method within six months after a project is selected, as described in the final rule. As noted above, the Commission will consider the entire record – including the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process and the transmission provider's proposal – when setting the replacement rate.

[1810] *See supra* Requirement to Participate in Long-Term Regional Transmission Planning section (responding to Pennsylvania Commission's and PJM States' requests regarding the PJM State Agreement Approach).

717. In addition, more generally, we clarify that we permit continued use of other existing state agreement approaches and similar voluntary measures under Order No. 1920, so long as they are consistent with the requirements stated above.

F. Regional Cost Allocation Principles for Long-Term Regional Transmission Facilities

1. Logical Outgrowth

a. NOPR Proposals

718. In the NOPR, the Commission proposed to require that the Long-Term Regional Transmission Cost Allocation Method and any cost allocation method resulting from the State Agreement Process for Long-Term Regional Transmission Facilities comply with the existing six Order No. 1000 regional cost allocation principles.[1811] The Commission made a preliminary finding that compliance with such principles will help ensure that Commission-jurisdictional rates resulting from any State Agreement Process will be just and reasonable and not unduly discriminatory or preferential.[1812] The six regional transmission cost allocation principles adopted in Order No. 1000 are: principle (1), the costs of transmission facilities must be allocated to those within the transmission planning region that benefit from those facilities in a manner that is at least roughly commensurate with estimated benefits; principle (2), those that receive no benefit from transmission facilities, either at present or in a likely future scenario, must not be

[1811] NOPR, 179 FERC ¶ 61,028 at PP 302, 312.

[1812] *Id.* P 312.

involuntarily allocated any of the costs of those transmission facilities; principle (3), a benefit to cost threshold ratio, if adopted, cannot exceed 1.25 to 1; principle (4), costs must be allocated solely within the transmission planning region unless another entity outside the region voluntarily assumes a portion of those costs; principle (5), the method for determining benefits and identifying beneficiaries must be transparent; and principle (6), there may be different regional cost allocation methods for different types of transmission facilities, such as those needed for reliability, congestion relief, or to achieve Public Policy Requirements.[1813]

b. Order No. 1920 Requirements

719. In Order No. 1920, the Commission adopted the NOPR proposal, with modification, to require compliance with Order No. 1000 regional cost allocation principles (1) through (5) for Long-Term Regional Transmission Cost Allocation Methods that transmission providers propose but to which Relevant State Entities have not indicated their agreement. The Commission explained that, because compliance with regional cost allocation principle (6) is not required, transmission providers cannot adopt different *ex ante* Long-Term Regional Transmission Cost Allocation Methods for different types of Long-Term Regional Transmission Facilities, such as those needed for reliability, congestion relief, or to achieve Public Policy Requirements.[1814]

[1813] Order No. 1000, 136 FERC ¶ 61,051 at PP 622, 637, 646, 657, 668, 685.

[1814] Order No. 1920, 187 FERC ¶ 61,068 at P 1469.

720. The Commission additionally determined that compliance with the Order No. 1000 regional cost allocation principles is not required in two situations: (1) Long-Term Regional Transmission Cost Allocation Methods to which Relevant State Entities have agreed as part of the Engagement Period; and (2) cost allocation methods resulting from a State Agreement Process.[1815] The Commission explained that this decision was consistent with application of Order No. 1000 and past precedent, noting that the Commission has previously found that "Order No. 1000 allows market participants, including states, to negotiate voluntarily alternative cost sharing arrangements that are distinct from the relevant regional cost allocation method(s)."[1816] Additionally, the Commission noted that where transmission providers have proposed cost allocation methods corresponding to such voluntary arrangements, the Commission has held that it need not find that those cost allocation methods comply with Order No. 1000.[1817]

c. Requests for Rehearing and Clarification

721. Several commenters argue that Order No. 1920 violates the APA's notice-and-comment requirements because, contrary to the NOPR proposal, it does not require cost allocation methods to comply with Order No. 1000's regional cost allocation principle (6)

[1815] *Id.* P 1470.

[1816] *Id.* P 1476 (quoting *State Voluntary Agreements to Plan & Pay for Transmission Facilities*, 175 FERC ¶ 61,225, at P 3 (2021)).

[1817] *Id.* (citing *PJM Interconnection, L.L.C.*, 142 FERC ¶ 61,214 at PP 142-143, *order on reh'g and compliance*, 147 FERC ¶ 61,128 at P 92; *ISO New England Inc.*, 143 FERC ¶ 61,150, at P 121 (2013); *Consol. Edison Co. of N.Y., Inc.*, 180 FERC ¶ 61,106, at PP 48-50 (2022)).

and prohibits transmission providers from adopting different cost allocation methods for different types of transmission facilities.[1818] NRECA characterizes the change as an "about face" from both the NOPR and existing Commission policy.[1819]

722. NRECA additionally argues that Order No. 1920 violates the APA's notice-and-comment requirements because, contrary to the NOPR, Order No. 1920 does not require a transmission provider's Long-Term Regional Transmission Cost Allocation Method to comply with any of the Order No. 1000 regional cost allocation principles if Relevant State Entities indicate that they agreed to that method as part of the required Engagement Period, and does not require a cost allocation method resulting from the State Agreement Process to comply with any of the Order No. 1000 regional cost allocation principles.[1820] NRECA argues that the "Final Rule's flip-flops on these fundamental requirements for Long-Term Regional Transmission Cost Allocation Methods and the cost allocation methods resulting from a State Agreement Process are not a logical outgrowth of the NOPR's exactly opposite proposals."[1821]

[1818] Arizona Commission Rehearing Request at 17-19; East Kentucky Rehearing Request at 1-2; NRECA Rehearing Request at 6, 16-17.

[1819] NRECA Rehearing Request at 16-17.

[1820] *Id.* at 6, 17.

[1821] *Id.* at 16-17.

d. Commission Determination

723. We find, and disagree with rehearing requests to the contrary, that the Commission provided adequate notice of and opportunity to comment on the determination in Order No. 1920 to require transmission providers to demonstrate compliance with Order No. 1000 regional cost allocation principles (1) through (5) but not Order No. 1000 regional cost allocation principle (6) for Long-Term Regional Transmission Cost Allocation Methods to which Relevant State Entities have not agreed.

724. Courts applying the logical outgrowth doctrine have permitted agencies to drop elements of proposed rules "even if a resulting final rule effectively abandons an agency's initial proposal" if the result is "reasonably foreseeable."[1822] Order No. 1920 is a logical outgrowth of the NOPR in this regard, and the APA's notice-and-comment requirements are therefore satisfied.[1823] In the NOPR, the Commission expressed concern that transmission providers are not engaging in long-term, more comprehensive regional transmission planning and cost allocation processes like MISO's MVP process, which identifies projects that are projected to provide *multiple* kinds of reliability and economic benefits.[1824] The Commission proceeded to endorse this kind of transmission

[1822] *Mid Continent Nail Corp. v. U.S.*, 846 F.3d 1364, 1374 (Fed. Cir. 2017) (citing *Long Island Care*, 551 U.S. at 174-75).

[1823] *Id.* at 1373 ("The dispositive question in assessing the adequacy of notice under the APA is whether an agency's final rule is a 'logical outgrowth' of an earlier request for comment.").

[1824] NOPR, 179 FERC ¶ 61,028 at P 31.

planning.[1825] The Commission also noted expressly that "we preliminarily find that the cost allocation requirements for transmission facilities identified and selected in the regional transmission plan through Long-Term Regional Transmission Planning proposed in this proceeding may differ in part from those established in Order No. 1000."[1826]

725. But allowing transmission providers to establish reliability, economic, or public policy transmission facility types, which would have been possible under the NOPR proposal, reflects a more siloed approach to regional transmission planning and cost allocation that commenters argued is misaligned with the reforms in Order No. 1920 and urged the Commission to avoid.[1827] Indeed, the Commission specifically noted its concern that using "only a subset of benefits in assigning the cost of Long-Term Regional Transmission Facilities may contribute to the risk of free rider problems that impede development of the more efficient or cost-effective regional transmission facilities."[1828] That observation, which was made in the context of benefits used as the basis to allocate

[1825] *Id.* P 33.

[1826] *Id.* P 299. Although the Commission then gave the example of greater state involvement as one way that the cost allocation requirements might differ, that statement was sufficient to put commenters on notice that the Commission would not necessarily adopt in full Order No. 1000's requirements regarding cost allocation. Indeed, as noted below, multiple commenters, including New Jersey Commission and PIOs, expressed support for modifying Order No. 1000's cost allocation principles, indicating their understanding that such potential modifications could be adopted in a final rule.

[1827] *See* Acadia Center and CLF NOPR Initial Comments at 16-17; Massachusetts Attorney General NOPR Initial Comments at 21; PIOs NOPR Initial Comments at 46, 60-62.

[1828] NOPR, 179 FERC ¶ 61,028 at P 325.

the costs of Long-Term Regional Transmission Facilities, further indicated the Commission's concerns with the siloed status quo approach and mirrored the rationale that the Commission adopted in eliminating regional cost allocation principle (6). It was therefore reasonably foreseeable that Order No. 1920 would not require compliance with regional cost allocation principle (6), which allows for project-type-limited Long-Term Regional Transmission Cost Allocation Methods, because such an approach would be inconsistent with Order No. 1920's long-term, forward-looking, more comprehensive regional transmission planning.[1829] However, as noted below, transmission providers and Relevant State Entities have broad flexibility to recognize the different types of benefits provided by Long-Term Regional Transmission Facilities and allocate costs in proportion to those benefits.

726. Further, courts have held that a final rule satisfies the logical outgrowth standard where an agency either finalizes only part of a multi-segment proposal[1830] or chooses not to finalize a proposal.[1831] Order No. 1920 is a logical outgrowth of the NOPR in this

[1829] Order No. 1920, 187 FERC ¶ 61,068 at P 1474.

[1830] *Ariz. Pub. Serv. Co. v. EPA*, 211 F.3d at 1297–1300 (finding sufficient notice where agency first proposed that Indian tribes be required to meet the "same requirements" as states with respect to judicial review of permits issued pursuant to the Clean Air Act, but then adopted a final rule that exempted tribes from some, though not all, such requirements).

[1831] *New York v. EPA*, 413 F.3d at 44 (per curiam) ("One logical outgrowth of a proposal is surely . . . to refrain from taking the proposed step." (quoting *Am. Iron & Steel Inst. v. EPA*, 886 F.2d at 400); *see also Long Island Care*, 551 U.S. at 175 (stating, in the context of rejecting claims that an agency provided legally defective notice because it did not finalize a proposed rule, "[w]e do not understand why such a possibility was not reasonably foreseeable"); *Vanda Pharms.*, 98 F.4th at 498 (finding that the APA's

regard. Because the NOPR proposed to require compliance with the existing six Order No. 1000 regional cost allocation principles, the Commission's decision to refrain from requiring compliance with one of those principles—principle (6)—could have been reasonably anticipated by commenters, especially given the Commission's frequently stated concerns regarding the siloing of transmission facilities into different categories under Order No. 1000.[1832] Indeed, in NOPR comments, parties expressed support for modifying Order No. 1000's cost allocation principles.[1833] Such comments are evidence that parties had adequate notice that the Commission might refrain from taking the NOPR's proposed step—i.e., requiring compliance with all six regional cost allocation principles.[1834]

727. For similar reasons, we also disagree that the Commission failed to provide adequate notice of and opportunity to comment on the determination in Order No. 1920 to not adopt the requirement that transmission providers demonstrate compliance with

---

"notice-and-comment procedure is designed so that an agency can float a potential rule to the public without committing itself to enacting the proposed rule's content").

[1833] New Jersey Commission NOPR Initial Comments at 18 (expressing support for a requirement that any cost allocation method comply with the Order No. 1000 regional cost allocation principles except principle (4)); PIOs NOPR Initial Comments at 61 & n.172 (requesting "that the Commission specifically find that cost allocation of public policy projects without consideration of economic and reliability benefits is unjust, unreasonable, and unduly discriminatory").

[1834] *Miami-Dade Cnty. v. EPA*, 529 F.3d 1049, 1059 (11th Cir. 2008) ("[A]lthough they may not provide the only basis upon which an agency claims to have satisfied the notice requirement, comments may be adduced as evidence of the adequacy of notice.").

any of the six Order No. 1000 regional cost allocation principles for Long-Term Regional Transmission Cost Allocation Methods to which Relevant State Entities have agreed as part of the Engagement Period or for cost allocation methods resulting from a State Agreement Process. In the NOPR, the Commission proposed to require that the Long-Term Regional Transmission Cost Allocation Method and any cost allocation method resulting from the State Agreement Process comply with the six Order No. 1000 regional cost allocation principles.[1835] As noted above, because "[o]ne logical outgrowth of a proposal is surely . . . to refrain from taking the proposed step,"[1836] the Commission's decision to refrain from adopting the entire proposal as to Long-Term Regional Transmission Cost Allocation Methods to which Relevant State Entities have agreed or for cost allocation methods resulting from a State Agreement Process could have been reasonably anticipated by commenters. Moreover, the decision to refrain from adopting the proposal was all the more foreseeable because, as a result of that decision, the cost allocation requirements adopted in Order No. 1920 are more closely aligned with the Commission's existing cost allocation requirements,[1837] which it had already articulated at the time it issued the NOPR, and under which cost allocation methods corresponding

to voluntarily negotiated alternative cost sharing arrangements that are distinct from the relevant regional cost allocation method(s) need not comply with Order No. 1000.[1838]

2. Omission of Regional Cost Allocation Principle No. 6 and Ability to Allocate Costs by Type of Project

a. Order No. 1920 Requirements

728. In Order No. 1920, the Commission declined to require transmission providers to demonstrate that any Long-Term Regional Transmission Cost Allocation Methods that they propose complies with Order No. 1000 regional cost allocation principle (6).[1839] The Commission explained that Order No. 1000 regional cost allocation principle (6) allows for cost allocation methods based on different types of transmission facilities (i.e., reliability, economic, or public policy transmission facility types), but that there can be only one cost allocation method for each type of facility, and that method must be determined in advance.[1840] The Commission found that project-type-limited Long-Term Regional Transmission Cost Allocation Methods that would be permitted by applying regional cost allocation principle (6) are inconsistent with the long-term, forward-looking, more comprehensive regional transmission planning required in Order No. 1920.[1841] As a result, unlike under Order No. 1000, transmission providers cannot adopt

[1838] Order No. 1920, 187 FERC ¶ 61,068 at P 1476 (citing *PJM Interconnection, L.L.C.*, 142 FERC ¶ 61,214 at PP 142-143, *order on reh'g and compliance*, 147 FERC ¶ 61,128 at P 92; *ISO New England Inc.*, 143 FERC ¶ 61,150 at P 121).

[1841] *Id.*

different Long-Term Regional Transmission Cost Allocation Methods for different types of Long-Term Regional Transmission Facilities, such as those needed for reliability, congestion relief, or to achieve Public Policy Requirements.[1842]

b. Requests for Rehearing and Clarification

729. Many parties argue that the Commission erred in not requiring the application of Order No. 1000 regional cost allocation principle (6) and request that the Commission implement such a requirement so that transmission providers may allocate the cost of Long-Term Regional Transmission Facilities by project type.[1843] Nearly all of these parties argue that not requiring the application of regional cost allocation principle (6) will result in cost allocation that violates cost causation or the "beneficiary pays" principle.[1844] Utah Commission asserts that the Commission not requiring the application of regional cost allocation principle (6) in Order No. 1920 violates cost causation

[1842] *Id.* P 1469.

[1843] Arizona Commission Rehearing Request at 18-19; Dominion Rehearing Request at 28-31; East Kentucky Rehearing Request at 3; Idaho Commission Rehearing Request at 2-4; Indicated PJM TOs Rehearing Request at 2-3, 4-6; Montana Commission Rehearing Request at 1, 4-6; Northern Virginia Rehearing Request at 5, 9-13; NRECA Rehearing Request at 49-55; Ohio Commission Federal Advocate Rehearing Request at 13-15; Utah Commission Rehearing Request at 9-10; West Virginia Commission Rehearing Request at 6-8; Wyoming Commission Rehearing Request at 4-6.

[1844] Arizona Commission Rehearing Request at 18-19; Idaho Commission Rehearing Request at 2-4; Indicated PJM TOs Rehearing Request at 2-3, 4-6; Montana Commission Rehearing Request at 1, 4-6; Northern Virginia Rehearing Request at 5, 9-13; NRECA Rehearing Request at 53-54; Utah Commission Rehearing Request at 9-10; West Virginia Commission Rehearing Request at 6-8; Wyoming Commission Rehearing Request at 4-6.

principles by flatly enjoining any cost allocation method that distinguishes between projects that are based on economic or engineering necessity and those based on the "public policy" preferences of states, local governments, and corporations.[1845] Several parties argue that Order No. 1920 will result in cost allocation that fails to reflect the role of state policy in causing costs and will shift the financial burden away from the cost-causing states that imposed those policies.[1846] Idaho Commission argues that Order No. 1920 contradicts the Commission's position in Order No. 1000, which stresses the role of states in consideration of costs potentially allocated across multiple states with respect to transmission needs driven by states' individual Public Policy Requirements.[1847]

730. Ohio Commission Federal Advocate argues that the prohibition against transmission providers allocating costs for Long-Term Regional Transmission Facilities based on reliability, economic, and Public Policy Requirement project types is not possible to reconcile with the principle that cost allocation ought to be roughly commensurate with benefits. Ohio Commission Federal Advocate offers as an example a transmission facility that would not exist but for the policy of one or more states, does not affect the power flow in any neighboring states, and does not provide any tangible benefit

[1845] Utah Commission Rehearing Request at 9-10.

[1846] Idaho Commission Rehearing Request at 3-4; Montana Commission Rehearing Request 5-6; West Virginia Commission Rehearing Request at 7-8; Wyoming Commission Rehearing Request at 5-6.

[1847] Idaho Commission Rehearing Request at 3 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 486).

to any other states, arguing that the Commission ought to clarify that, in this instance, it is wholly appropriate that the sponsoring state or states bear the full cost of the facility and that it would be an unjust and unreasonable result to assign any costs to any other state. Ohio Commission Federal Advocate argues that Ohioans were not afforded the opportunity to weigh in on the policies of other states, nor were they granted a vote on the politicians enacting them, and, as such, should not be assigned any costs associated with those policies.[1848]

731. Some parties assert that the Commission's decision not to require the application of regional cost allocation principle (6) and the prohibition against Long-Term Regional Transmission Facility types and associated cost allocation methods is arbitrary and capricious[1849] because the Commission has not provided a reasonable explanation or any supporting evidence as to how, among other things, this policy will protect consumers from unjust, unreasonable, and unduly discriminatory transmission rates;[1850] the Commission did not explain how the rejection of project-type cost allocation is forward-looking or comprehensive;[1851] and the Commission did not meaningfully distinguish how Long-Term Regional Transmission Planning differs from regional transmission planning

[1848] Ohio Commission Federal Advocate Rehearing Request at 13-15.

[1849] *E.g.*, Northern Virginia Rehearing Request at 5.

[1850] East Kentucky Rehearing Request at 3.

[1851] Ohio Commission Federal Advocate Rehearing Request at 10.

under Order No. 1000.[1852] Dominion asserts that Order No. 1920 does not cite any record evidence, nor is it clear whether any commenters to the NOPR requested this change to Order No. 1000's cost allocation principles.[1853]

732. Dominion argues that Order No. 1920 inappropriately treats all Long-Term Regional Transmission Facilities as equal for cost allocation purposes under the guise of the holistic transmission planning that Order No. 1920 seeks to foster. Dominion further argues that holistic transmission planning can acknowledge that certain projects provide different types of benefits and serve different needs, but together, as a package, serve a variety of needs. Dominion asserts that, if cost allocation cannot be tied to an identified underlying driver for the project, costs are more likely to be inappropriately socialized to customers who did not cause the need and do not benefit from it. Dominion states that the Commission should continue to allow transmission providers to develop different project types and associated cost allocations, but also require that transmission providers have a category of projects to act as a backstop that accounts for all potential benefits.[1854]

733. NRECA argues that the Commission's argument in support of its prohibition on using different cost allocation methods for different types of Long-Term Regional Transmission Facilities is essentially that the Commission can restrict cost allocation

[1852] Dominion Rehearing Request at 29-30.

[1853] *Id.* at 29.

[1854] *Id.* at 29-31.

methods by dictating planning methods.[1855] NRECA contends that this prohibition and reasoning is contrary to precedent and the Order No. 1000 regional cost allocation principle (1) that Order No. 1920 adopts because it would result in the costs of transmission facilities being allocated in a manner that is not at least roughly commensurate with estimated benefits.[1856] NRECA argues that, if Long-Term Regional Transmission Facilities produce multiple types of benefits that must be accounted for in Long-Term Regional Transmission Planning, this is an argument for a more flexible and more tailored approach to cost allocation with different cost allocation methods, not a more prescriptive and less tailored approach.[1857]

734. NRECA contends that allocating costs of a Long-Term Regional Transmission Facility built to satisfy Public Policy Requirements or other expansive factors required by the rule, such as corporate commitments, in the same manner as a facility built for reliability or economic purposes also likely conflicts with Order No. 1000's regional cost allocation principle (2) because those that receive no benefits would likely be involuntarily allocated costs.[1858] NRECA argues that costs associated with Long-Term Regional Transmission Facilities built to satisfy transmission needs driven by corporate

[1855] NRECA Rehearing Request at 53.

[1856] *Id.* (citing *ICC v. FERC I*, 576 F.3d at 477; Order No. 1000, 136 FERC ¶ 61,051 at P 622).

[1857] *Id.* at 54.

[1858] *Id.*

commitments should be borne by the relevant corporations, not by other transmission customers that do not benefit from the facility.[1859]

735. NRECA further argues that the omission of principle (6) and prohibition on using different cost allocation methods for different types of Long-Term Regional Transmission Facilities violates Order No. 1000's regional cost allocation principle (4) because it will likely allow the costs of Long-Term Regional Transmission Facilities built to satisfy a state's Public Policy Requirements to be allocated to customers in other states.[1860]

736. Arizona Commission, Ohio Commission Federal Advocate, and NRECA argue that the Commission's decision not to require the application of regional cost allocation principle (6) and the prohibition against Long-Term Regional Transmission Facility types and associated cost allocation methods replaces flexibility with a one-size-fits-all requirement.[1861] Idaho Commission contends that Order No. 1920 strays from Order No. 1000's "light touch," highlighted in *South Carolina Public Service Authority v. FERC*, where the Commission did not "dictate how costs are to be allocated."[1862]

[1859] *Id.* at 55.

[1860] *Id.* Order No. 1000 regional cost allocation principle (4) provides that costs must be allocated "solely within th[e] transmission planning region unless another entity outside the region or another transmission planning region voluntarily agrees to assume a portion of those costs." Order No. 1000, 136 FERC ¶ 61,051 at P 657.

[1861] Arizona Commission Rehearing Request at 18-19; Ohio Commission Federal Advocate Rehearing Request at 14; NRECA Rehearing Request at 52, 54.

[1862] Idaho Commission Rehearing Request at 3 (quoting *S.C. Pub. Serv. Auth. v.*

737. Indicated PJM TOs request that the Commission clarify that, by precluding transmission providers from adopting Long-Term Regional Transmission Cost Allocation Methods for different project types, it did not intend to preclude transmission providers from adopting cost allocation methods that allocate costs based on the different benefits associated with a particular facility. Indicated PJM TOs argue that such a clarification would be consistent with the Commission's obligation to ensure that the transmission provider allocates the cost in a manner that is at least roughly commensurate with estimated benefits. Indicated PJM TOs state that, if the Commission does not grant this clarification, they seek rehearing of the decision to preclude transmission providers from adopting different Long-Term Regional Transmission Cost Allocation Methods based on a facility's benefits because this outcome is inconsistent with other statements in the NOPR and Order No. 1920 and long-standing cost causation principles and nothing in regional cost allocation principle (6) prevents transmission providers from having this flexibility.[1863]

738. Virginia and North Carolina Commissions argue that the Commission should afford transmission providers, in coordination with Relevant State Entities and other stakeholders, the maximum flexibility possible with respect to potential *ex ante* cost allocation methods, so long as such methods are in compliance with the Commission's cost-causation principles. As a result, Virginia and North Carolina Commissions assert

FERC, 762 F.3d at 81).

[1863] Indicated PJM TOs Rehearing Request at 2-3, 4-6.

that the Commission should clarify on rehearing that Order No. 1920 does not expressly preclude cost allocation methods that allocate costs based on the incremental costs associated with the inclusion of one or more public policy factors.[1864]

c. Commission Determination

739. We sustain Order No. 1920's decision to not require Long-Term Regional Transmission Cost Allocation Methods to which Relevant State Entities do not agree to comply with Order No. 1000 regional cost allocation principle (6), and also sustain the prohibition of cost allocation methods that allocate costs based solely on one type of benefit, such as reliability, economic, and public policy transmission facility types. However, we note our clarification below that transmission providers and Relevant State Entities may consider different types of benefits provided by Long-Term Regional Transmission Facilities and allocate costs in proportion to those benefits.[1865] Recognizing the flexibility to allocate costs in proportion to different types of benefits, we disagree with arguments raised on rehearing that the Commission should require the application of Order No. 1000 regional cost allocation principle (6) to Long-Term Regional Transmission Cost Allocation Methods to which Relevant State Entities have not agreed and arguments that the Commission's decision on this issue is arbitrary and capricious. First, because of the flexibility the Commission provided to transmission providers to propose different cost allocation methods for Long-Term Regional

[1864] Virginia and North Carolina Commissions Rehearing Request at 5-6.

[1865] *See infra* Concerns Regarding Cost Causation section.

Transmission Facilities, we disagree that a requirement not to use cost allocation methods that allocate costs based on project types will result in adoption of cost allocation methods that violate the cost causation principle. We reiterate that, as stated in Order No. 1920, the Commission will evaluate each proposed Long-Term Regional Transmission Cost Allocation Method to ensure that it will allocate costs in a manner that is at least roughly commensurate with the estimated benefits that Long-Term Regional Transmission Facilities will provide, which will ensure compliance with the cost causation principle and the just and reasonable standard more broadly.[1866] To the extent that a party believes that any Long-Term Regional Transmission Cost Allocation Method submitted on compliance, including those discussed herein, violates the cost causation principle, it will have the opportunity to raise those concerns in response to the compliance filing.

740. Additionally, as the Commission found in Order No. 1920, Long-Term Regional Transmission Facilities are likely to provide a diverse array of benefits,1867 and Order No. 1920 specifically required that transmission providers consider seven economic and

[1866] Order No. 1920, 187 FERC ¶ 61,068 at PP 1305 & n.2786, 1478; *see Old Dominion Elec. Coop. v. FERC*, 898 F.3d 1254, 1255 (D.C. Cir. 2018) ("Under the [FPA], electric utilities must charge 'just and reasonable' rates. For decades, the Commission and the courts have understood this requirement to incorporate a 'cost-causation principle'—the rates charged for electricity should reflect the costs of providing it." (internal citations omitted)); *K N Energy, Inc. v. FERC*, 968 F.2d 1295, 1300 (D.C. Cir. 1992) ("FERC and the courts have added flesh to these bare statutory bones [i.e., the just and reasonable standard], establishing what has become known in Commission parlance as the 'cost-causation' principle.").

[1867] Order No. 1920, 187 FERC ¶ 61,068 at PP 123, 126, 722.

reliability benefits,[1868] while not prohibiting them from also considering public policy benefits.[1869] We conclude that Long-Term Regional Transmission Facilities will likely have benefits beyond addressing transmission needs driven by Public Policy Requirements and allowing transmission providers to allocate costs based solely on one type of benefit, such as reliability, economic, or public policy transmission project types, would likely underestimate the benefits provided by the project and, for that reason, be inconsistent with the goals underlying long-term, forward-looking, more comprehensive regional transmission planning required in Order No. 1920.[1870]

741. Nevertheless, we emphasize the fundamental principle that costs must be allocated in a manner that is at least roughly commensurate with estimated benefits, ensuring that ratepayers will not pay for facilities from which they do not benefit.[1871] Regardless of the factors driving the need for that project, if a customer does not derive benefits from the project or if they derive only trivial benefits in relation to the project's costs, the customer cannot be forced to pay for the costs of the project without violating the cost causation principle.[1872]

[1868] *See id.* PP 719-720.

[1869] *Id.* PP 737, 822; *see also id.* P 1515 & n.3220.

[1870] *Id.* P 1474.

[1871] *Id.* P 267.

[1872] *ICC v. FERC I*, 576 F.3d at 476-77; *ICC v. FERC III*, 756 F.3d at 564-65; *see Coal. of MISO Transmission Customers v. FERC*, 45 F.4th 1004, 1009 (D.C. Cir. 2022); *LSP Transmission Holdings II, LLC v. FERC*, 45 F.4th 979, 984 (D.C. Cir. 2022).

742. Additionally, contrary to Dominion's argument,[1873] the long-term, forward-looking, more comprehensive nature of Long-Term Regional Transmission Planning distinguishes it from regional transmission planning under Order No. 1000. Order No. 1000 did not establish similarly long-term, forward-looking, or comprehensive regional transmission planning requirements. As a result, the Commission engaged in reasoned decision-making in relying on the different attributes of Long-Term Regional Transmission Planning when not adopting Order No. 1000 regional cost allocation principle (6).

743. As the Commission also found in Order No. 1920, the application of Order No. 1000 regional cost allocation principles (1) through (5) safeguards against cost causation concerns. Notably, the Commission explained:

> [P]rinciples (1) and (2) require that benefits received are at least roughly commensurate with costs paid and that costs may not be involuntarily allocated to those that do not benefit, respectively. Further, Order No. 1000 regional cost allocation principle (5), as well as the requirements in this final rule to disclose estimates of the benefits of selected Long-Term Regional Transmission Facilities, ensures sufficient transparency for stakeholders to understand how the costs of selected Long-Term Regional Transmission Facilities will be allocated to transmission customers in relation to the benefits that they are forecasted to provide.[1874]

744. Therefore, even if a Long-Term Regional Transmission Facility helps to address a transmission need driven by a state or states' Public Policy Requirements, the costs of

[1873] Dominion Rehearing Request at 30.

[1874] Order No. 1920, 187 FERC ¶ 61,068 at P 1478.

that transmission facility will only be allocated to ratepayers in states without those Public Policy Requirements in relation to the benefits they receive. We note that the benefits of a transmission facility go beyond any particular need that it may address.[1875] As noted below, where Relevant State Entities agree, one potential cost allocation method that could be proposed to comply with Order No. 1920 would allocate costs commensurate with reliability and economic benefits region-wide, while allocating costs commensurate with additional benefits to a subset of states that agree to such cost allocation.[1876]

745. For these reasons, we disagree with rehearing arguments that seem to suggest that, for any Long-Term Regional Transmission Cost Allocation Method to satisfy the cost causation principle or, in NRECA's case, not contradict Order No. 1000 principles (1) and (2),[1877] transmission providers must disaggregate all disparate drivers of Long-Term Transmission Needs so that each identified Long-Term Regional Transmission Facility may precisely be attributed to a particular policy goal or other driver of the transmission

[1875] *See ICC v. FERC I*, 576 at 476 ("To the extent that a utility benefits from the costs of new facilities, it may be said to have 'caused' a part of those costs to be incurred, as without the expectation of its contributions the facilities might not have been built, or might have been delayed."). *See also* Order No. 1000, 136 FERC ¶ 61,051 at P 690 ("If a regional transmission plan determines that a transmission facility serves several functions, as many commenters point out it may, the regional cost allocation method must take the benefits of these functions of the transmission facility into account in allocating costs roughly commensurate with benefits.").

[1876] *See infra* Concerns Regarding Cost Causation section.

[1877] NRECA Rehearing Request at 53-55.

need. As we emphasize throughout this section, transmission providers and Relevant State Entities have broad flexibility to develop cost allocation approaches, provided such approaches comply with the cost causation principle and are otherwise just and reasonable. Consistent with that flexibility, as we clarify below, transmission providers and Relevant State Entities are not precluded from considering in their proposed cost allocation methods the incremental cost of transmission needed to achieve state laws, policies, and regulations beyond the cost of transmission needed in the absence of those laws, policies, and regulations. Nevertheless, we find that requiring transmission providers to conduct Long-Term Regional Transmission Planning in the manner suggested by NRECA might risk undermining the scaling of Long-Term Regional Transmission Facilities to provide a more efficient or cost-effective solution to multiple transmission needs by encouraging piecemeal transmission expansion (e.g., two separate transmission facilities to address two separate transmission needs may be more expensive than one facility meeting both needs) that caused the need for reform in the first place.[1878] In addition, that exercise would likely stymie transmission providers' selection of more efficient or cost-effective transmission solutions by leading them to ignore or otherwise discount the diverse range of benefits that Long-Term Regional Transmission Facilities can provide, likely leading them to underestimate the benefits that the facilities provide to customers.

[1878] Order No. 1920, 187 FERC ¶ 61,068 at PP 85, 112.

746. Moreover, we reiterate that Long-Term Regional Transmission Cost Allocation Methods to which Relevant State Entities have not agreed must satisfy Order No. 1000 regional cost allocation principles (1) through (5), such that transmission customers will only pay for Long-Term Regional Transmission Facilities (or portfolios of such Facilities) when the transmission provider has determined that they meet the transmission providers' selection criteria and transmission customers will only be allocated costs that are at least roughly commensurate with the estimated benefits they receive. As Order No. 1920 noted:

> [U]nder this final rule, customers pay for a more reliable and economic transmission system as identified through open and transparent Long-Term Regional Transmission Planning, and any state's ratepayers only fund the construction of Long-Term Regional Transmission Facilities that provide them with such benefits that are at least roughly commensurate with the costs of those facilities.[1879]

747. Consequently, and contrary to certain parties' arguments,[1880] these requirements will protect customers from unjust, unreasonable, and unduly discriminatory or preferential transmission rates.

748. Regarding NRECA's arguments that the cost allocation requirements of Order No. 1920 violate Order No. 1000 regional cost allocation principle (4),[1881] we disagree. NRECA's arguments are based on an incorrect interpretation of Order No. 1000 regional

[1879] *Id.* P 270.

[1880] *See e.g.*, East Kentucky Rehearing Request at 3.

[1881] NRECA Rehearing Request at 55.

cost allocation principle (4), which states that "[t]he allocation method for the cost of a transmission facility selected in a regional transmission plan must allocate costs solely within that *transmission planning region* unless another entity outside the region or another transmission planning region voluntarily agrees to assume a portion of those costs."[1882] Order No. 1000 regional cost allocation principle (4) concerns transmission planning regions, not individual states as contemplated by NRECA's arguments, and it does not prohibit allocation of costs among customers in states within a single transmission planning region.

749. We disagree with rehearing parties who argue that the lack of a requirement to apply regional cost allocation principle (6), with its prohibition against adopting different Long-Term Regional Transmission Cost Allocation Methods for reliability, economic, and public policy transmission project types, creates a one-size-fits-all approach,[1883] inappropriately treats all Long-Term Regional Transmission Facilities as equal for cost allocation purposes,[1884] or otherwise conflicts with the Commission's "light touch" in Order No. 1000.[1885] In particular, NRECA is incorrect that the prohibition against adopting different Long-Term Regional Transmission Cost Allocation Methods for

[1882] Order No. 1000, 136 FERC ¶ 61,051 at P 657 (emphasis added).

[1883] *See* Arizona Commission Rehearing Request at 18-19; Ohio Commission Federal Advocate Rehearing Request at 14.

[1884] *See* Dominion Rehearing Request at 29-31.

[1885] *See* Idaho Commission Rehearing Request at 3; NRECA Rehearing Request at 52-53.

reliability, economic, and public policy transmission project types means that "transmission providers must similarly use a single cost allocation method."[1886] Rehearing parties' arguments focus on the prohibition against economic, reliability, and public policy types, but do not recognize the broad flexibility otherwise afforded under Order No. 1920's application of Order No. 1000 regional cost allocation principles (1)-(5) and allowance of multiple cost allocation methods for Long-Term Regional Transmission Facilities.[1887] Under Order No. 1920, transmission providers may craft different *ex ante* cost allocation methods to reflect the different proportion of benefits provided by Long-Term Regional Facilities with different underlying drivers.[1888] Thus, we clarify that Order No. 1920's prohibition against types is a prohibition against the allocation of costs based on a single category of benefits—whether reliability, economic, public policy, or another category of benefits. In other words, transmission providers could *not* allocate *all* costs of Long-Term Regional Transmission Facilities on the basis of public policy benefits, if doing so ignores economic and reliability benefits associated with those facilities. Allocating the costs of Long-Term Regional Transmission Facilities

[1886] NRECA Rehearing Request at 53.

[1887] Order No. 1920, 187 FERC ¶ 61,068 at P 1475 ("We clarify that this final rule does not preclude the adoption of multiple Long-Term Regional Transmission Cost Allocation Methods, provided that the Long-Term Regional Transmission Cost Allocation Method that will apply to a Long-Term Regional Transmission Facility (or portfolio of such Facilities) is known before selection, i.e., is an *ex ante* cost allocation method, and does not allocate costs by project type.").

[1888] *Infra* Concerns Regarding Cost Causation section.

entirely on a single category of benefits would likely ignore the diverse range of benefits those Facilities likely provide, as described above, and in doing so violate the cost causation principle.

750. We reiterate the fact that Order No. 1920 provides flexibility previously unafforded in regional transmission planning both in the new types of compliant cost allocation methods (i.e., Long-Term Regional Transmission Cost Allocation Methods agreed to by Relevant State Entities during the Engagement Period and cost allocation methods resulting from a State Agreement Process) and in the lack of restrictions placed on these new state-agreed-to methods (i.e., the only requirement for such methods is compliance with the cost causation principle). We believe the possibilities afforded by state agreement under Order No. 1920 may address the concerns underlying rehearing parties' arguments.

751. Further, we grant Indicated PJM TOs' request for clarification that Order No. 1920 does not preclude transmission providers from adopting Long-Term Regional Transmission Cost Allocation Methods that allocate costs based on the different benefits associated with a particular Long-Term Regional Transmission Facility (or portfolio of Facilities).[1889] Transmission providers may propose *ex ante* Long-Term Regional Transmission Cost Allocation Methods that, for example, assign a portion of the costs of a Long-Term Regional Transmission Facility that are associated with reliability benefits to one set of beneficiaries, a portion of the costs associated with economic benefits to

[1889] Indicated PJM TOs Rehearing Request at 2-3, 4-6.

another set of beneficiaries, and a portion of costs associated with public policy benefits to a different set of beneficiaries. Such a method would not violate the Commission's decision to not apply regional cost allocation principle (6) because the Long-Term Regional Transmission Cost Allocation Method would not create a cost allocation method that is specific to, for example, a transmission facility that satisfies a transmission need driven by economic benefits. As such, elimination of Order No. 1000 regional cost allocation principle (6) does not yield as inflexible an outcome as rehearing partis assert.

752. In response to Virginia and North Carolina Commissions' request that the Commission clarify that Order No. 1920 does not preclude cost allocation methods that allocate costs based on the incremental costs associated with the inclusion of one or more public policy factors,[1890] we clarify that Order No. 1920's cost allocation requirements allow for, but do not require, transmission providers to account for the benefits associated with addressing transmission needs driven by Public Policy Requirements in any *ex ante* cost allocation method.[1891]

3. Concerns Regarding Cost Causation

a. Order No 1920 Requirements

753. In Order No. 1920, the Commission required Long-Term Regional Transmission Cost Allocation Methods not agreed to by Relevant State Entities to comply with Order No. 1000 regional cost allocation principles (1) through (5). The Commission found that

[1890] Virginia and North Carolina Commissions Rehearing Request at 5-6.

[1891] *See infra* Concerns Regarding Cost Causation section.

Order No. 1000 regional cost allocation principles (1) through (5) remain relevant for *ex ante* cost allocation methods for Long-Term Regional Transmission Facilities that transmission providers propose on compliance but for which Relevant State Entities have *not* indicated their agreement.[1892]

754. In Order No. 1920, the Commission did not require transmission providers to demonstrate that Long-Term Regional Transmission Cost Allocation Methods that Relevant State Entities indicate they have agreed to or cost allocation methods resulting from a State Agreement Process comply with any of the Order No. 1000 regional cost allocation principles.[1893] The Commission chose not to adopt the NOPR proposal to require adherence to the six Order No. 1000 regional cost allocation principles in these circumstances because cost allocation methods resulting from a State Agreement Process and Long-Term Regional Transmission Cost Allocation Methods that Relevant State Entities indicate that they have agreed to are likely to facilitate agreement over development of such Long-Term Regional Transmission Facilities by, for example, making the Relevant State Entities more confident that customers in the state are receiving benefits at least roughly commensurate with their share of the cost of such facilities and by reducing the likelihood that selected Long-Term Regional Transmission Facilities cannot be constructed because they do not receive necessary state regulatory

[1892] Order No. 1920, 187 FERC ¶ 61,068 at PP 1469, 1472-1473.

[1893] *Id.* PP 1470, 1476.

approvals.[1894] The Commission further reasoned that affording additional flexibility for these methods by not requiring the application of the six Order No. 1000 regional cost allocation principles may encourage their use, and consequently facilitate the selection of more efficient or cost-effective Long-Term Regional Transmission Facilities.[1895] The Commission noted, however, that such methods must still be just and reasonable and not unduly discriminatory or preferential, and must allocate costs in a manner that is at least roughly commensurate with estimated benefits.[1896] The Commission further explained that this decision was consistent with past precedent, noting that the Commission has previously found that "Order No. 1000 allows market participants, including states, to negotiate voluntarily alternative cost sharing arrangements that are distinct from the relevant regional cost allocation method(s)."[1897] Additionally, the Commission noted that where transmission providers have proposed cost allocation methods corresponding to such voluntary arrangements, the Commission has held that it need not find that those cost allocation methods comply with Order No. 1000.[1898] Consistent with this precedent,

---

[1894] *Id.* P 1477.

[1895] *Id.*

[1896] *Id.* (citation omitted).

[1897] *Id.* P 1476 (quoting *State Voluntary Agreements to Plan & Pay for Transmission Facilities*, 175 FERC ¶ 61,225 at P 3).

[1898] *Id.* (citing *PJM Interconnection, L.L.C.*, 142 FERC ¶ 61,214 at PP 142-143, *order on reh'g and compliance*, 147 FERC ¶ 61,128 at P 92; *ISO New England Inc.*, 143 FERC ¶ 61,150 at P 121; *Consol. Edison Co. of N.Y., Inc.*, 180 FERC ¶ 61,106 at PP 48-50).

the Commission found that cost allocation methods resulting from a State Agreement Process and Long-Term Regional Transmission Cost Allocation Methods that Relevant State Entities indicate they have agreed to and have asked transmission providers to file also qualify as voluntary alternative cost sharing arrangements and, accordingly, the Commission declined to require those methods to adhere to the six Order No. 1000 regional cost allocation principles.[1899] However, the Commission did require that any voluntary alternative cost sharing arrangements still comply with the cost causation principle and any other legal requirements for cost allocation.[1900]

b. Requests for Rehearing and Clarification

755. NRECA argues that Order No. 1920 does not provide a reasonable explanation for its decision not to require a Long-Term Regional Transmission Cost Allocation Method to comply with any of the Order No. 1000 regional cost allocation principles when Relevant State Entities indicate their agreement with such a method as part of the Engagement Period.[1901] NRECA further argues that Order No. 1920 similarly does not provide a reasonable explanation as to why the Commission did not require a cost allocation method resulting from a State Agreement Process to comply with the Order No. 1000 regional cost allocation principles.[1902] NRECA contends that neither Order No.

[1899] *Id.*

[1900] *Id.*

[1901] NRECA Rehearing Request at 55.

[1902] *Id.* at 55-56.

1920's reliance on a 2021 Commission policy statement nor Order No. 1000 allows the Commission to waive the Order No. 1000 regional cost allocation principles as NRECA alleges the Commission does in the final rule.[1903] NRECA asserts that Order No. 1920's reference to prior instances where the Commission has approved voluntary agreements on a case-by-case basis without finding that their cost allocation methods comply with Order No. 1000 does not constitute precedent for a categorical waiver of Order No. 1000's requirements for future cost allocations methods reached under the State Agreement Process.[1904]

756. NRECA argues that Order No. 1920 adopts cost allocation requirements that are more prescriptive in some respects (e.g., prohibiting transmission providers from using different cost allocation methods for different project types) but less prescriptive in other respects (e.g., not requiring compliance with any Order No. 1000 regional cost allocation principles when states agree on a cost allocation method). NRECA contends that this results in opaque, lax, and inconsistent standards for cost allocation for Long-Term Regional Transmission Facilities. NRECA asserts that, as a result, the Commission will be unable to enforce the FPA's requirements against unjust, unreasonable, or unduly discriminatory or preferential rates.[1905]

[1903] *Id.* at 56 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1476; *State Voluntary Agreements to Plan and Pay for Transmission Facilities*, 175 FERC ¶ 61,225).

[1904] *Id.* at 56-57 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1476 n.3150).

[1905] *Id.* at 52.

757. Arizona Commission argues that Order No. 1920 usurps Arizona's constitutional requirements that the Arizona Commission must apply rates that are fair and reasonable and that it must not recover costs from ratepayers that do not cause, or benefit from, a particular cost.[1906] Arizona Commission further argues that the cost allocation methods adopted in the final rule are contrary to existing ratemaking principles, which include providing customers with reliable power at the least cost and allocating costs to the entities that cause them.[1907] Ohio Consumers similarly claim that Order No. 1920 is arbitrary and capricious and violates policy and precedent that requires that costs be allocated consistent with those who receive benefits.[1908]

758. Virginia and North Carolina Commissions assert that the Commission must ensure public policies considered in planning criteria and scenarios are also appropriately accounted for in any *ex ante* cost allocation method to avoid cross-subsidization of state public policy goals. Virginia and North Carolina Commissions state that the Commission should clarify on rehearing that to comport with the Commission's cost-causation principles, any proposed *ex ante* cost allocation method must adequately account for not only the benefits resulting from an identified transmission project, but also the cost drivers (or cost causers) that contribute to the need for the transmission project. Alternatively, Virginia and North Carolina Commissions argue that the Commission

---

[1906] Arizona Commission Rehearing Request at 20-21.

[1907] *Id.* at 20.

[1908] Ohio Consumers Rehearing Request at 9.

should expressly require the same public policy factors included in the Long-Term Scenarios to be considered as potential benefits for cost allocation purposes.[1909]

759. West Virginia Commission and Wyoming Commission argue that Order No. 1920's transmission planning and cost allocation requirements force transmission providers within their states to plan projects based on decarbonization goals of other states in the region.[1910] West Virginia Commission and Wyoming Commission further argue that this would require transmission providers in the state to account for abstract assumed benefits for its retail customers.[1911] West Virginia Commission and Wyoming Commission contend that, in the event that the costs allocated to retail customers exceed benefits that their respective state policies realize from regional transmission projects, they will be forced to assign unjust and unreasonable costs to retail customers or deny a utility a potentially significant portion of its expected cost recovery.[1912] Wyoming Commission argues that this result is contrary to core principles of utility regulation and

[1909] Virginia and North Carolina Commissions Rehearing Request at 3-4.

[1910] West Virginia Commission Rehearing Request at 10; Wyoming Commission Rehearing Request at 7.

[1911] West Virginia Commission Rehearing Request at 10; Wyoming Commission Rehearing Request at 7.

[1912] West Virginia Commission Rehearing Request at 10; Wyoming Commission Rehearing Request at 7-8.

wrongfully empowers states to exact the costs of their policy initiatives from ratepayers in other states.[1913]

c. Commission Determination

760. We disagree with NRECA's arguments that the Commission did not provide a reasonable explanation for its decision not to require cost allocation methods resulting from a State Agreement Process or Long-Term Regional Transmission Cost Allocation Methods that Relevant State Entities indicate that they have agreed to and have asked transmission providers to file to comply with any of the Order No. 1000 regional cost allocation principles.[1914] We continue to find that cost allocation methods resulting from a State Agreement Process and Long-Term Regional Transmission Cost Allocation Methods that Relevant State Entities indicate that they have agreed to are likely to facilitate agreement concerning development of such Long-Term Regional Transmission Facilities by, for example, making the Relevant State Entities more confident that customers in the state are receiving benefits at least roughly commensurate with their share of the costs of such facilities and by reducing the likelihood that selected Long-Term Regional Transmission Facilities cannot be constructed because they do not receive necessary state regulatory approvals.[1915] Further, we continue to find that affording additional flexibility for these methods may encourage their use, which would facilitate

[1913] Wyoming Commission Rehearing Request at 8.

[1914] NRECA Rehearing Request at 55-56.

[1915] Order No. 1920, 187 FERC ¶ 61,068 at P 1477.

the selection of more efficient or cost-effective Long-Term Regional Transmission Facilities.[1916] In short, we find that the benefits of providing additional flexibility for state-agreed-upon cost allocation methods for Long-Term Regional Transmission Facilities outweigh NRECA's concerns regarding not applying the Order No. 1000 regional cost allocation principles, such that it represents a just and reasonable approach to these issues.

761. Additionally, we highlight that the cost causation principle and Commission precedent require the Commission to evaluate each proposed cost allocation method to determine whether it will allocate costs in a manner that is at least roughly commensurate with estimated benefits and whether the proposed method is just and reasonable and not unduly discriminatory or preferential, as stated in Order No. 1920.[1917] This is the case whether or not we specifically require these cost allocation methods to comply with the Order No. 1000 regional cost allocation principles.

762. For cost allocation methods resulting from a State Agreement Process or Long-Term Regional Transmission Cost Allocation Methods that Relevant State Entities indicate that they have agreed to and have asked transmission providers to file, we continue to find that such methods qualify as voluntary alternative cost sharing arrangements, consistent with the Commission's previous findings that "Order No. 1000

[1916] *Id.* (citation omitted).

[1917] *See, e.g.*, *id.* P 1506 (citing *ICC v. FERC I*, 576 F.3d at 477; *ICC v. FERC III*, 756 F.3d at 564).

allows market participants, including states, to negotiate voluntarily alternative cost sharing arrangements that are distinct from the relevant regional cost allocation method(s)"[1918] and that the Commission need not find that cost allocation methods corresponding to such voluntary agreements comply with Order No. 1000.[1919] Therefore, in response to NRECA, we continue to decline to require such cost allocation methods to adhere to the six Order No. 1000 regional cost allocation principles.[1920]

763. We further disagree with NRECA's arguments that the cost allocation requirements adopted in Order No. 1920 will result in inconsistent standards for cost allocation for Long-Term Regional Transmission Facilities and will result in the Commission's inability to enforce the FPA's requirements against unjust, unreasonable, and unduly discriminatory or preferential rates.[1921] We recognize that there are different requirements for cost allocation methods resulting from a State Agreement Process or Long-Term Regional Transmission Cost Allocation Methods that Relevant State Entities indicate that they have agreed to and have asked transmission providers to file as compared to Long-Term Regional Transmission Cost Allocation Methods to which states

[1918] *Id.* P 1476 (quoting *State Voluntary Agreements to Plan & Pay for Transmission Facilities*, 175 FERC ¶ 61,225 at P 3).

[1919] *Id.* (citing *See PJM Interconnection, L.L.C.*, 142 FERC ¶ 61,214 at PP 142-143, *order on reh'g and compliance*, 147 FERC ¶ 61,128 at P 92; *ISO New England Inc.*, 143 FERC ¶ 61,150 at P 121; *Consol. Edison Co. of N.Y., Inc.*, 180 FERC ¶ 61,106 at PP 48-50).

[1920] *Id.*

[1921] NRECA Rehearing Request at 52.

do not agree, but we find that the potential for differences is appropriate to give states flexibility.[1922] Regardless, we reiterate that all cost allocation methods must comply with the cost causation principle, as required by the FPA.[1923] Additionally, we note that nothing in FPA section 206 requires that transmission providers adopt the same or similar proposals on compliance provided that they comply with Order No. 1920.

764. We also disagree with arguments raised by Arizona Commission and Ohio Consumers on rehearing that Order No. 1920's transmission planning and cost allocation requirements are inconsistent with cost causation principles.[1924] All cost allocation methods for Long-Term Regional Transmission Facilities, including Long-Term Regional Transmission Cost Allocation Methods, regardless of whether they are agreed to by Relevant State Entities, and cost allocation methods resulting from Commission-approved State Agreement Processes, must comply with the cost causation principle and ensure that the costs of transmission facilities are allocated in a manner at least roughly commensurate with estimated benefits.[1925]

[1922] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 1477.

[1923] *Id.* P 1305 & n.2786.

[1924] Arizona Commission Rehearing Request at 20; Ohio Consumers Rehearing Request at 9.

[1925] Order No. 1920, 187 FERC ¶ 61,068 at PP 1305 & n.2786, 1506 (citing *ICC v. FERC I*, 576 F.3d at 477; *ICC v. FERC III*, 756 F.3d at 564).

765. In light of our clarification noted below, we find it unnecessary, as requested by Virginia and North Carolina Commissions,[1926] to require transmission providers to demonstrate on compliance how both the benefits resulting from an identified transmission project and the cost drivers contributing to the need for that project are appropriately accounted for in their proposed Long-Term Regional Transmission Cost Allocation Method, or alternatively to require that the same public policy factors included in Long-Term Scenarios be considered as potential benefits for the purposes of cost allocation. Specifically, we note that our clarification regarding the recognition of benefits below in response to West Virginia Commission and Wyoming Commission's request may address Virginia and North Carolina Commissions' concerns regarding the consideration of public policy factors in cost allocation methods. Further, we find that requiring transmission providers to show that the relevant cost allocation methods comply with cost causation by ensuring that costs are allocated in a manner roughly commensurate with benefits will provide flexibility and account for regional diversity while also ensuring that those cost allocation methods comply with the requirements of the FPA.[1927]

766. We disagree with arguments raised on rehearing by West Virginia Commission and Wyoming Commission that Order No. 1920's transmission planning and cost allocation requirements force transmission providers within their states to plan

[1926] Virginia and North Carolina Commissions Rehearing Request at 3-4.

[1927] *See* Order No. 1920, 187 FERC ¶ 61,068 at 1510.

transmission projects based on decarbonization goals of other states in the transmission planning region and require transmission providers to account for abstract assumed benefits.[1928] First, as discussed above, because of the flexibility provided by the Commission regarding cost allocation, it is premature and speculative to assert that a requirement not to use cost allocation methods based on project type will result in adoption of cost allocation methods that violate cost causation principles. We also reiterate that, in the context of transmission facilities, the cost causation principle requires the Commission to ensure that any cost allocation method allocates costs in a manner roughly commensurate with estimated benefits, meaning that if consumers do not benefit from a project they will not be required to pay for it nor will they be required to bear a share of project costs that does not reflect their share of the project's benefits.[1929]

767. Further, we clarify that Order No. 1920 does not prevent transmission providers from recognizing different types of benefits and using them to allocate costs in proportion

[1928] West Virginia Commission Rehearing Request at 10; Wyoming Commission Rehearing Request at 7.

[1929] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 1305 & n.2786 ("The cost causation principle requires costs to be allocated to those who cause the costs to be incurred and reap the resulting benefits.") (citation omitted)); *ICC v. FERC I*, 576 F.3d at 476 ("To the extent that a utility benefits from the costs of new facilities, it may be said to have 'caused' a part of those costs to be incurred, as without the expectation of its contributions the facilities might not have been built, or might have been delayed."); *see also* Order No. 1000, 136 FERC ¶ 61,051 at P 690 ("If a regional transmission plan determines that a transmission facility serves several functions, as many commenters point out it may, the regional cost allocation method must take the benefits of these functions of the transmission facility into account in allocating costs roughly commensurate with benefits.").

to those benefits. As an example, one potential cost allocation method that could be proposed to comply with Order No. 1920 would allocate costs commensurate with reliability and economic benefits region-wide, while allocating costs commensurate with additional benefits to a subset of states that agree to such cost allocation. Under this potential cost allocation method, these costs and benefits could be identified based on one or more additional analyses, such as additional scenarios, run by the transmission providers for the purposes of informing cost allocation, e.g., scenarios that consider the incremental cost of transmission needed to achieve state laws, policies, and regulations beyond the cost of transmission needed in the absence of those laws, policies, and regulations. For example, the cost allocation method agreed to by the Relevant State Entities may allocate those incremental costs to states with those applicable laws, policies, and regulations.

768. Noting this clarification, and where Long-Term Regional Transmission Cost Allocation Methods that Relevant State Entities agree to are concerned, at the request of the Relevant State Entities in a multistate region, the following *ex ante* method for cost allocation may be proposed. In providing this example, we are not foreclosing other approaches for allocating the costs of Long-Term Regional Transmission Facilities on either an *ex ante* basis or through a State Agreement Process. Nor are we suggesting that cost allocation methods must adopt a similar approach to this framework in order to comply with the requirements of Order No. 1920. This example is as follows:

(1) For the purposes of cost allocation, transmission providers shall run an additional scenario analysis to identify transmission needs using the same Long-Term Scenarios and

sensitivities used in its Long-Term Regional Transmission Planning process, except that the inputs to such additional scenarios shall not include state laws, policies and regulations. Transmission providers shall identify transmission facilities to meet the needs identified in such additional scenario analysis and those facilities' costs. Transmission providers shall then determine the difference in costs between the set of Long-Term Regional Transmission Facilities selected in the regional transmission plan for purposes of cost allocation and the set of transmission facilities that would be selected based upon the additional scenario analysis.

(2) The portion of total selected Long-Term Regional Transmission Facility costs identified in (1) could be cost allocated according to an existing Commission-accepted cost allocation method that may be proposed on compliance with Order No. 1920.

(3) The amount representing the cost difference between the costs of projects selected pursuant to the Long-Term Regional Transmission Planning process and (1) shall be allocated as follows:

> a. The transmission providers shall identify by state the specific state laws, policies, and regulations that were used to plan and select the Long-Term Regional Transmission Facilities and shall quantify *by state* the specific costs of such Facilities.
>
> b. The costs identified in 3(a) shall be allocated solely to the state or states that are the sources of the policies used in planning and selection. The total difference between the costs of Long-Term Regional Transmission Facilities selected pursuant to the Long-Term Regional Transmission Planning process and (1) would be fully accounted for using this method of allocating costs among the states. For RTOs/ISOs, the cost allocation to transmission customers in a transmission pricing zone *within* a state would be developed by the applicable Transmission Owner(s). For non-RTOs/ISOs, the costs allocated to transmission customers in a

transmission provider's retail distribution service territory or footprint within a state would be developed by the applicable transmission provider.

G. General Benefits Requirements Related to Cost Allocation

1. Logical Outgrowth

a. NOPR Proposals

769. In the NOPR, the Commission proposed for consideration a list of Long-Term Regional Transmission Benefits for transmission providers to apply in Long-Term Regional Transmission Planning and cost allocation processes.[1930] Additionally, the Commission proposed to require that transmission providers identify on compliance the benefits they will use in any *ex ante* cost allocation method, how they will calculate those benefits, and how the benefits will reasonably reflect the benefits of regional transmission facilities to meet identified transmission needs driven by changes in the resource mix and demand.[1931] The NOPR also proposed to require transmission providers to explain the rationale for using the benefits identified.[1932] Additionally, the Commission requested comment on the proposed requirements, whether the Commission should require that transmission providers account for the full list of benefits contained in the NOPR's Evaluation of the Benefits of Regional Transmission Facilities section, or whether no change to the benefits used in existing regional transmission processes was needed.[1933]

[1930] NOPR, 179 FERC ¶ 61,028 at PP 185, 326.

[1931] *Id.* P 326.

[1932] *Id.*

[1933] *Id.* P 327.

b. Order No. 1920 Requirements

770. In Order No. 1920, the Commission declined to adopt the NOPR proposal regarding the use of benefits in Long-Term Regional Transmission Cost Allocation Methods.[1934] Instead, as discussed above in the Regional Cost Allocation Principles for Long-Term Regional Transmission Facilities section, the Commission required transmission providers in each transmission planning region to demonstrate that any Long-Term Regional Transmission Cost Allocation Method(s) that Relevant State Entities have *not* indicated that they agree to complies with Order No. 1000 regional cost allocation principles (1) through (5). The Commission did not require transmission providers to demonstrate that Long-Term Regional Transmission Cost Allocation Methods that Relevant State Entities indicate they have agreed to or cost allocation methods resulting from a State Agreement Process comply with any of the Order No. 1000 regional cost allocation principles, but the Commission noted that such methods must still be just and reasonable and not unduly discriminatory or preferential, and must allocate costs in a manner that is at least roughly commensurate with estimated benefits.[1935] The Commission did not require that any particular benefit used in the evaluation and selection of Long-Term Regional Transmission Facilities be reflected in a

[1934] Order No. 1920, 187 FERC ¶ 61,068 at P 1505.

[1935] *Id.* PP 1470, 1476-1477.

Long-Term Regional Transmission Cost Allocation Method filed with the Commission.[1936]

771. The Commission explained that the modified approach to the relationship of benefits used in Long-Term Regional Transmission Planning and Long-Term Regional Transmission Cost Allocation Methods provides transmission providers with flexibility to propose a Long-Term Regional Transmission Cost Allocation Method(s), allowing for negotiation in the Engagement Period, which the Commission believed will increase the likelihood that Long-Term Regional Transmission Facilities selected as the more efficient or cost-effective regional transmission solution will be developed. The Commission additionally explained that the requirements in Order No. 1920 to disclose estimates of the benefits of selected Long-Term Regional Transmission Facilities will provide transparency and help to ensure cost allocation is just and reasonable.[1937] Additionally, the Commission reasoned that this flexible approach is consistent with the approach the Commission took in Order No. 1000 and in subsequent orders on transmission providers' Order No. 1000 compliance filings, where the Commission allowed a wide variety of cost allocation methods and did not require that such methods specifically account for all benefits used in evaluation and selection processes.[1938]

[1936] *Id.* P 1506.

[1937] *Id.*

[1938] *Id.* P 1507 (citing Order No. 1000, 136 FERC ¶ 61,051 at PP 560, 624).

c. Requests for Rehearing and Clarification

772. NRECA contends that Order No. 1920's determination not to require transmission providers to disclose which benefits, if any, they use in their regional cost allocation proposals is not a logical outgrowth of the NOPR.[1939] NRECA argues that the requirement to use a stated set of benefits in evaluating and selecting Long-Term Regional Transmission Facilities, without requiring transmission providers to disclose which benefits were used in their regional cost allocation proposals, allows cost allocation to be "completely opaque and divorced from the measured benefits."[1940]

d. Commission Determination

773. In response to NRECA's argument that the Commission violated the APA's notice-and-comment requirements by declining to adopt the NOPR proposal to require transmission providers to disclose the benefits used in Long-Term Regional Transmission Cost Allocation Methods, we note that certain clarifications adopted herein may alleviate the concerns underlying NRECA's argument. Specifically, as discussed in the Minimum Requirements section above, we clarify in this order that, once transmission providers make a selection decision, i.e., for each selected Long-Term Regional Transmission Facility (or portfolio of such Facilities) and the applicable cost allocation method is determined, transmission providers must make available, on a password-protected portion of OASIS or other password-protected website, a breakdown of how those estimated

[1939] NRECA Rehearing Request at 12-13.

[1940] *Id.*

costs will be allocated, by zone (i.e., by transmission provider retail distribution service territory/footprint or RTO/ISO transmission pricing zone), and a quantification of the estimated benefits as imputed to each zone, as such benefits can be reasonably estimated, when a cost allocation method is agreed upon under a State Agreement Process or, if no State Agreement Process is used, at the time of project selection.

774. Noting this clarification, we nevertheless disagree with NRECA that the Commission violated the APA's notice-and-comment requirements. Agency final rules need not be identical to proposed rules, and notice is sufficient if the final rule represents a "logical outgrowth" of the proposed rule.[1941] Here, the NOPR proposed to require transmission providers to disclose the benefits used in Long-Term Regional Transmission Cost Allocation Methods after noting the Commission's concern that, among other things, the Commission's existing regional transmission planning and cost allocation requirements may result in transmission providers undervaluing the benefits of Long-Term Regional Transmission Facilities for purposes of allocating the costs of such facilities to beneficiaries in a manner that is roughly commensurate with estimated benefits.[1942] While Order No. 1920 did not adopt the NOPR proposal, it included safeguards that will ensure an adequate accounting for benefits in cost allocation methods

[1941] *Long Island Care*, 551 U.S. at 174-75. *See also Am. Paper Inst. v. EPA*, 660 F.2d at 959 n.13 ("An agency may make *even substantial changes* in its original proposed rule without a further comment period if the changes are in character with the original proposal and are a logical outgrowth of the notice and comments already given." (emphasis added)).

[1942] NOPR, 179 FERC ¶ 61,028 at PP 325-326.

for Long-Term Regional Transmission Facilities, in addition to the new safeguard we adopt in this order, noted above. For instance, Order No. 1920 noted that any cost allocation method for Long-Term Regional Transmission Facilities will be required to comply with cost allocation precedent, including that costs be allocated in a manner at least roughly commensurate with estimated benefits.[1943] That standard requires that transmission providers show, on compliance, that their proposed cost allocation methods match the allocation of costs associated with the project in a manner that is at least roughly commensurate with the estimated benefits of the project. We find that this approach is sufficiently similar, in practice, to the proposal in the NOPR that it can be said to "follow logically from" the NOPR, that the NOPR "adequately frame[d] the subjects for discussion,"[1944] and that "a reasonable member of the regulated class" could "anticipate the general aspects of the [final] rule."[1945]

2. Substantive Issues

a. Order No. 1920 Requirements

775. In Order No. 1920, the Commission required transmission providers in each transmission planning region to demonstrate on compliance that the required Long-Term

[1943] Order No. 1920, 187 FERC ¶ 61,068 at P 1305 & n.2786 (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 87; Order No. 1000, 136 FERC ¶ 61,051 at P 10; *ICC v. FERC I*, 576 F.3d at 476).

[1944] *Conn. Light & Power Co. v. Nuclear Regul. Comm'n*, 673 F.2d at 533.

[1945] *Telesat Canada v. FCC*, 999 F.3d 707, 713 (D.C. Cir. 2021) (quotations omitted).

Regional Transmission Cost Allocation Method(s) that Relevant State Entities have *not* indicated that they agree to comply with Order No. 1000 regional transmission cost allocation principles (1) through (5) and do not allocate costs by project type (i.e., reliability, economic, or transmission needs driven by Public Policy Requirements).[1946]

b. Requests for Rehearing and Clarification

776. Clean Energy Associations assert that the Commission should clarify the rights, obligations, and limits associated with transmission providers' adoption of multiple Long-Term Regional Transmission Cost Allocation Methods for comparable transmission facilities within its overall footprint. Further, Clean Energy Associations argue that the Commission should clarify that transmission providers must allocate the costs of similarly situated transmission facilities similarly to avoid undue discrimination and unjust and unreasonable rates.[1947] Clean Energy Associations assert that, although presently unclear, it seems plausible that under Order No. 1920, transmission providers could attempt to allocate the costs of two comparable transmission facilities (similar in costs and benefits) using entirely different methods if the transmission provider considers them to be different "types" of projects, based on any categorization rubric other than Order No. 1000's regional cost allocation principle (6).[1948] Clean Energy Associations

[1946] Order No. 1920, 187 FERC ¶ 61,068 at PP 1505-1506.

[1947] Clean Energy Associations Rehearing Request at 30-32.

[1948] *Id.* at 31.

also request clarification that Order No. 1920 does not preclude transmission providers from adopting a cost allocation approach that seeks to maximize net benefits.[1949]

777. Dominion seeks clarification on the consideration of the seven required benefits in cost allocation such that if a transmission provider opts to rely on all or some of the seven benefits in its cost allocation method, then it may apply different weighting to different benefits, e.g., based on probability of occurrence and certainty of benefit in later years.[1950]

c. Commission Determination

778. We deny Clean Energy Association's request to clarify the rights, obligations, and limits associated with transmission providers' potential adoption of multiple Long-Term Regional Transmission Cost Allocation Methods for comparable transmission facilities within its overall footprint. Order No. 1920 provided guidance regarding transmission providers' use of multiple Long-Term Regional Transmission Cost Allocation Methods, including that transmission providers may adopt multiple Long-Term Regional Transmission Cost Allocation Methods, provided that the Long-Term Regional Transmission Cost Allocation Method that will apply to a Long-Term Regional Transmission Facility (or portfolio of such Facilities) is known before selection and does

[1949] *Id.* at 32-33.

[1950] Dominion Rehearing Request at 26-27.

not allocate costs by project type (i.e., reliability, economic, or transmission needs driven by Public Policy Requirements).[1951]

779. In response to Clean Energy Associations' concern that transmission providers could attempt to allocate the costs of two comparable transmission facilities (similar in costs and benefits) using entirely different cost allocation methods if the transmission provider considers them to be different "types" of projects (other than those delineated in Order No. 1000's regional cost allocation principle (6)), we note that even if the costs of similar facilities are allocated using different cost allocation methods, the fundamental requirements associated with a just and reasonable rate (i.e., adherence to the cost causation principle and the requirement that costs be allocated in a manner that is at least roughly commensurate with estimated benefits) remain the same.1952 Therefore, a transmission provider may allocate the costs of two similar transmission facilities using different cost allocation methods and meet the requirements of Order No. 1920. In addition, we note that Order No. 1920 also does not preclude transmission providers from proposing on compliance a cost allocation approach that seeks to maximize net benefits.[1953]

[1951] Order No. 1920, 187 FERC ¶ 61,068 at PP 1475, 1506. *See supra* P 749.

[1952] Order No. 1920, 187 FERC ¶ 61,068 at P 1305.

[1953] *See id.* P 964 ("We adopt the NOPR proposal, with modification, to require that transmission providers in each transmission planning region propose evaluation processes, including selection criteria, that seek to maximize benefits accounting for costs over time without over-building transmission facilities.").

780. Regarding Dominion's request for clarification that if a transmission provider opts to rely on all or some of the seven required benefits in its cost allocation method for Long-Term Regional Transmission Facilities, then it may apply different weighting to different benefits, we note that Order No. 1920 includes no limitation on weighting of the seven required benefits for purposes of accounting for such benefits in the cost allocation method for Long-Term Regional Transmission Facilities save that costs must be allocated in a manner that is at least roughly commensurate with estimated benefits. Further, transmission providers can consider additional benefits for cost allocation purposes, including, but not limited to, those agreed to by Relevant State Entities and those described elsewhere in Order No. 1920, provided that costs are allocated in a way that is at least roughly commensurate with estimated benefits.

H. Additional Cost Allocation Issues

1. Order No. 1920 Requirements

781. In Order No. 1920, the Commission declined to adopt a particular time frame for determining the cost allocation for a Long-Term Regional Transmission Facility. The Commission stated that imposing a standardized time frame to determine cost allocation was unnecessary and could impede the regional flexibility that the Commission provided to transmission providers under Order No. 1920. The Commission added, however, that the determination of the applicable cost allocation must occur by or before selection of a particular Long-Term Regional Transmission Facility (or portfolio of such Facilities) if

only a Long-Term Regional Transmission Cost Allocation Method is available for that Facility (or portfolio of such Facilities).[1954]

782. Also in Order No. 1920, the Commission stated that, following the Engagement Period, Relevant State Entities may agree to, and ask the transmission providers to file, a State Agreement Process, which, if accepted by the Commission, would be the cost allocation process used by the transmission providers in the transmission planning region prior to using the relevant Long-Term Regional Transmission Cost Allocation Method as a backstop.[1955] Further, in response to NOPR comments requesting that a beneficiary-pays approach be used rather than a postage stamp load ratio share model for cost allocation methods, the Commission in Order No. 1920 found that any cost allocation method applied to a Long-Term Regional Transmission Facility must ensure that costs are allocated in a manner that is at least roughly commensurate with the estimated benefits of the facility, consistent with cost causation and court precedent, and noted that the Commission will evaluate whether a proposed cost allocation method satisfies this standard on a fact-specific basis, relying on the record in a given proceeding. The Commission found that load ratio share, which charges transmission customers in proportion to their use of the transmission system as measured by their relative share of

[1954] *Id.* P 1521.

[1955] *Id.* P 1296.

load, is a cost allocation method that may be consistent with the beneficiary-pays approach.[1956]

783. Separately, in Order No. 1920, the Commission found that commenters' statements regarding cost containment were outside the scope of the proceeding.[1957] The Commission noted that it is examining issues related to transmission planning and cost containment in other proceedings.[1958]

2. Requests for Rehearing and Clarification

784. Dominion seeks clarification regarding the deadline imposed by Order No. 1920's requirement that "the determination of the applicable cost allocation must occur by or before its selection."[1959] Dominion avers that this requirement implies that there could be situations "when a Long-Term Regional Transmission Facility Cost Allocation Method would not be applied to a Long-Term Regional Transmission Facility."1960 Dominion states that its understanding is that "a Long-Term Regional Transmission Facility Cost

[1956] *Id.* P 1305 (citations omitted).

[1957] *Id.* P 1523. Specifically, the Commission was responding to comments by: (1) Joint Commenters in support of a cost management framework overseen by the Commission; and (2) State Water Contractors, who asserted that the need for cost containment is acute for consumers in California and an essential component of the justness and reasonableness of any final rule. *Id.* P 1518.

[1958] *Id.* P 1523 (citing Supplemental Notice of Technical Conference, Transmission Planning and Cost Management, Docket No. AD22-8-000 (Oct. 4, 2022)).

[1959] Dominion Rehearing Request at 32 (quoting Order No. 1920, 187 FERC ¶ 61,068 at P 1521).

[1960] *Id.* (emphasis omitted).

Allocation Method must be used, and that method could be one of several methods: the Transmission Provider's default *ex ante* cost allocation method, some other approved *ex ante* cost allocation method, or a State Agreement Process."1961 Dominion requests that, to the extent the Commission was referring to the deadline of six months after project selection for submission of cost allocation methods resulting from a State Agreement Process, the Commission provide clarification.[1962]

785. Dominion further asks the Commission to clarify whether only the cost allocation method must be determined by project selection, or whether it must be applied (and costs actually allocated) by project selection. Dominion notes its understanding is that only the method must be determined by selection and states that this clarification on timing would help to alleviate the concern about the challenges transmission developers will face in obtaining state regulatory approval for transmission projects designed to meet a predicted need 20 years in the future. Specifically, Dominion states that it is impossible to meet even a "roughly commensurate" standard when projected beneficiaries subject to the cost allocation decision are so far removed from the in-service date of the facilities, particularly in the context of an RTO/ISO in which transmission owning entities are permitted to leave and join.[1963]

[1961] *Id.*

[1962] *Id.* at 32-33.

[1963] *Id.* at 31, 33-34.

786. Designated Retail Regulators and Undersigned States argue that any Long-Term Regional Transmission Cost Allocation Method should not include a postage-stamp-type cost allocation, as the costs imposed on non-consenting states should be allocated to cost causers and beneficiaries on as granular a basis as possible. They further argue that postage stamp-type cost allocation method should not be adopted merely to simplify the work of an RTO and to facilitate the construction of such projects.[1964]

787. Wyoming Commission asserts that if a portion of the costs of a Long-Term Regional Transmission Facility are to be recovered from Wyoming retail customers, the Wyoming Commission must evaluate the costs and benefits derived from the project on a *post hoc* basis to determine that costs allocated to retail customers and rates designed to recover those costs are just and reasonable. Wyoming Commission avers that Order No. 1920 does not accommodate this process.[1965]

788. Industrial Customers request rehearing of Order No. 1920's finding that commenters' statements regarding cost containment are outside the scope of this proceeding, arguing that such a finding is arbitrary and capricious because the Commission failed to meaningfully engage arguments and evidence supporting the current need for cost management and cost containment. According to Industrial Customers, while the Commission in Order No. 1920 stated that it is examining issues

[1964] Designated Retail Regulators Rehearing Request at 39; Undersigned States Rehearing Request at 34.

[1965] Wyoming Commission Rehearing Request at 8.

related to transmission planning and cost containment in other proceedings, Order No. 1920 does not compel the Commission to act in the proceeding in Docket No. AD22-8-000, which is the only pending proceeding that is sufficiently broad to complement Order No. 1920. Industrial Customers add that Order No. 1920 does not demonstrate that cost containment and cost mitigation measures are unrelated to the cost issues at hand or are, in fact, outside the scope of Order No. 1920.[1966]

3. Commission Determination

789. Regarding Dominion's request for clarification regarding the intent of the requirement that "the determination of the applicable cost allocation must occur by or before its selection,"[1967] we clarify that this requirement applies only to Long-Term Regional Transmission Cost Allocation Methods. We further clarify that Long-Term Regional Transmission Cost Allocation Methods refer only to *ex ante* cost allocation methods used to allocate the costs of selected Long-Term Regional Transmission Facilities.[1968]

790. Dominion requested clarification as to whether "the determination of the applicable cost allocation must occur by or before its selection"[1969] means that only the

[1966] Industrial Customers Rehearing Request at 21-23 (citing *State Farm*, 463 U.S. at 43).

[1967] Order No. 1920, 187 FERC ¶ 61,068 at P 1521.

[1968] *Id.* P 1291.

[1969] *Id.* P 1521.

cost allocation method must be determined by a Long-Term Regional Transmission Facility's selection or whether it must be applied (and costs actually allocated) by project selection. Noting our clarification above that this requirement applies only to Long-Term Regional Transmission Cost Allocation Methods, we clarify that Dominion is correct that only the applicable cost allocation method must be determined by project selection. While it is possible that certain Long-Term Regional Transmission Cost Allocation Methods will be designed in a way that actual costs to be allocated may be known by selection, such a requirement would needlessly limit the flexibility provided to transmission providers and could, in particular, create unnecessary obstacles to transmission providers' ability pursuant to Order No. 1920 to demonstrate that use of existing cost allocation methods to allocate the cost of Long-Term Regional Transmission Facilities would be compliant with Order No. 1920's requirements.[1970]

791. We are not persuaded by arguments raised by Designated Retail Regulators and Undersigned States regarding postage-stamp cost allocation. As in Order No. 1920,[1971] we continue to find that the record does not support a blanket prohibition on postage-stamp-type cost allocation. We will evaluate whether a proposed cost allocation method allocates costs in a manner that is at least roughly commensurate with estimated benefits

[1970] For example, requiring that actual costs be allocated would preclude transmission providers from proposing that DFAX-based or postage-stamp cost allocation methods comply with Order No. 1920 because the amounts each transmission customer will pay are not known at the time of selection for those methods.

[1971] Order No. 1920, 187 FERC ¶ 61,068 at P 1305 (citing Certain TDUs NOPR Initial Comments at 2, 7, 8-9; R Street NOPR Initial Comments at 4, 12).

on a case-specific basis, relying on the record to ensure that it complies with the cost-causation principle by allocating costs in a manner that is at least roughly commensurate with estimated benefits. We continue to find that the flexibility that we provide to consider benefits in cost allocation does not prevent transmission providers in a particular transmission planning region from adopting a more granular approach.[1972]

792. In response to Wyoming Commission, we reiterate that Order No. 1920 does not change existing mechanisms for cost-recovery through retail rates.[1973] We also emphasize that Order No. 1920 neither aims at nor conflicts with state authority over retail rates.[1974] However, we decline to modify Order No. 1920 to enable states to conduct a *post hoc* review of costs allocated to retail customers. Order No. 1920 does not alter the requirement for states to pass through Commission-jurisdictional rates to retail customers.[1975]

793. Finally, we disagree with Industrial Customers that the Commission failed to engage in reasoned decision making by determining that various NOPR comments regarding cost containment were outside the scope of the proceeding. First, to the extent

[1972] *Id.* P 1512.

[1973] *Id.* P 259.

[1974] *Id.* P 998.

[1975] *See Narragansett Elec. Co. v. Burke,* 381 A.2d 1358, 1361-63 (R.I. 1977) (holding that the state could not inquire into the reasonableness of the Commission-approved wholesale rate and, consequently, must treat it as a reasonable operating expense in the company's retail cost of service).

that Industrial Customers are arguing that the Commission did not consider transmission-related costs to consumers, as noted above, addressing costs to ratepayers was central to the reforms the Commission adopted in Order No. 1920, and the Commission cited evidence that more comprehensive, longer-term regional transmission planning results in the selection of more efficient or cost-effective transmission solutions, which has significant benefits for customers.[1976] Second, the NOPR did not propose to address cost containment reform per se, and we continue to find that certain comments regarding cost containment reform, including those proposing a specific cost management framework, are outside the scope of this proceeding.[1977] Third, we are unpersuaded by Industrial Customers' unsupported argument that the Commission was required to make a binding commitment to finalize cost containment and cost mitigation measures in another docket—we are unaware of any such requirement. Finally, we disagree that Order No. 1920 is arbitrary and capricious because it failed to meaningfully engage with arguments and evidence supporting the need for transmission cost management and cost containment, in contravention of *State Farm.*[1978] *State Farm*, which held that rescission of a prior regulation was arbitrary and capricious because it was done without adequate

[1976] *See supra* The Overall Need for Reform section.

[1977] Order No. 1920, 187 FERC ¶ 61,068 at P 1523.

[1978] Industrial Customers Rehearing Request at 23 (citing *State Farm*, 463 U.S. at 43).

explanation,[1979] did not hold that every aspect of a problem within an agency's jurisdiction must be addressed in a single rulemaking, or that a final rule must include requirements that address comments that were outside the scope of the proceeding.[1980]

IX. Construction Work in Progress Incentive

A. CWIP

1. Order No. 1920

794. In Order No. 1920, the Commission declined to act to finalize the NOPR proposal to not permit transmission providers to take advantage of the allowance for inclusion of 100% of Construction Work in Progress (CWIP) costs in rate base (CWIP Incentive) for Long-Term Regional Transmission Facilities.[1981] The Commission concluded that any action on the CWIP Incentive is more appropriately considered in a separate proceeding to allow for a holistic approach to transmission incentives after the Commission has finalized its Long-Term Regional Transmission Planning reforms.[1982] The Commission found that, in particular, whether the Commission's incentives are appropriately "benefitting consumers by ensuring reliability and reducing the cost of delivered power"

[1979] *State Farm*, 463 U.S. at 34.

[1980] *See N.Y. v. FERC*, 535 U.S. at 27 (holding that "[b]ecause FERC determined that the remedy it ordered constituted a sufficient response to the problems FERC had identified in the wholesale market, FERC had no [FPA section] 206 obligation" to adopt further reforms).

[1981] Order No. 1920, 187 FERC ¶ 61,068 at PP 1524, 1547.

[1982] *Id.* P 1547.

is a question better evaluated by considering the Commission's transmission incentives comprehensively for all regional transmission facilities.[1983]

2. Requests for Rehearing and Clarification

795. Several parties request rehearing on the grounds that the Commission failed to conduct reasoned decision-making in declining to act to finalize the NOPR proposal to limit the availability of the CWIP Incentive for Long-Term Regional Transmission Facilities.[1984] NARUC, for instance, states that the Commission not only failed to rebut arguments that ratepayers will have to pay in advance for facilities that may not ever be used, but also simply declined to finalize the NOPR proposal until the Commission can address other incentives at the same time, which NARUC contends is not reasoned decision-making.[1985] Ohio Consumers agree, and argue that retaining the CWIP Incentive for Long-Term Regional Transmission Facilities without an analysis on the justness and reasonableness of rates of return is arbitrary and capricious.[1986]

796. Some parties argue on rehearing that not adopting the NOPR proposal to limit the availability of the CWIP Incentive for Long-Term Regional Transmission Facilities will shift risks to ratepayers.[1987] Ohio Consumers state that the failure of the Commission to

---

[1983] *Id.* (quoting 16 U.S.C. 824s(a)).

[1984] Industrial Customers Rehearing Request at 24, 26; NARUC Rehearing Request at 5, 8, 10-11; Ohio Consumers Rehearing Request at 11-12.

[1985] NARUC Rehearing Request at 9-11.

[1986] Ohio Consumers Rehearing Request at 12.

[1987] NARUC Rehearing Request at 8-9; Ohio Consumers Rehearing Request at 11;

eliminate the CWIP Incentive for Long-Term Regional Transmission Facilities shifts the risk of long-term transmission planning to consumers who may never benefit from a project if it does not go into service, but who will still be required to pay for it.[1988]

797. Certain parties request that, if the Commission does not grant rehearing in this proceeding and eliminate the CWIP Incentive for Long-Term Regional Transmission Facilities, the Commission should move quickly to address the CWIP Incentive in a separate proceeding.[1989] For instance, Virginia Attorney General implores the Commission to act with expediency to scale back transmission incentives comprehensively in Docket No. RM20-10-000, or another docket as appropriate, if the Commission does not grant rehearing in this proceeding and limit the availability of the CWIP Incentive for Long-Term Regional Transmission Facilities.[1990]

798. Arizona Commission argues that "walk[ing] back" the proposal to disallow the CWIP Incentive is not a logical outgrowth of the NOPR, and failure to provide for

[1990] Virginia Attorney General Rehearing Request at 5.

additional notice and comment on this "fundamental" change is a direct violation of the APA.[1991]

3. Commission Determination

799. We are unpersuaded by arguments raised on rehearing that the Commission erred by failing to limit the availability of the CWIP Incentive for Long-Term Regional Transmission Facilities. We continue to find that any action on the CWIP Incentive is more appropriately considered in a separate proceeding to allow for a holistic approach to transmission incentives,[1992] and we disagree with parties that argue that the Commission's decision in Order No. 1920 to defer acting on the CWIP Incentive was arbitrary and capricious. The Commission reviewed all of the comments received on this proposal in response to the NOPR and concluded that whether the Commission's transmission incentives, including the CWIP Incentive, are appropriately "benefitting consumers by ensuring reliability and reducing the cost of delivered power" is a question better evaluated by considering the Commission's transmission incentives comprehensively for all regional transmission facilities.[1993] We continue to reach this conclusion and find that evaluating a single transmission incentive for a regional

[1991] Arizona Commission Rehearing Request at 17-19 (citing 5 U.S.C. 706(2)(A), (2)(C), (2)(D)).

[1992] Order No. 1920, 187 FERC ¶ 61,068 at P 1547.

[1993] *Id.* (quoting 16 U.S.C. 824s(a)).

transmission facility may fail to holistically consider benefits and risks to consumers from transmission incentives.

800. Further, with respect to the argument that the Commission's decision declining to finalize the NOPR proposal to limit the availability of the CWIP Incentive for Long-Term Regional Transmission Facilities was not a logical outgrowth of the NOPR, we disagree. As courts have explained, "[o]ne logical outgrowth of a proposal is surely . . . to refrain from taking the proposed step."[1994] The same is true here. We acknowledge the interest and support for evaluating the CWIP Incentive, particularly among several states, along with other transmission incentives, and note that the Commission will continue to evaluate the appropriate manner for considering transmission incentives, including the CWIP Incentive, for all regional transmission facilities.

X. Exercise of a Federal Right of First Refusal in Commission-Jurisdictional Tariffs and Agreements

A. Order No. 1920 Requirements

801. In Order No. 1920, the Commission stated that, after careful consideration of the record, it was declining to finalize the NOPR proposal to amend Order No. 1000's findings and nonincumbent transmission developer reforms, in part, to permit the

[1994] *New York v. EPA*, 413 F.3d at 44 (quoting *Am. Iron & Steel Inst. v. EPA*, 886 F.2d at 400); *see also Long Island Care*, 551 U.S. at 175 (stating, in the context of rejecting a claim that an agency provided legally defective notice because it did not finalize a proposed rule, "[w]e do not understand why such a possibility was not reasonably foreseeable"); *Vanda Pharms.*, 98 F.4th at 498 (stating that the APA's "notice-and-comment procedure is designed so that an agency can float a potential rule to the public without committing itself to enacting the proposed rule's content").

exercise of federal rights of first refusal for selected regional transmission facilities, conditioned on the incumbent transmission provider with the federal right of first refusal for such regional transmission facilities establishing joint ownership of the transmission facilities consistent with certain proposed requirements described in the NOPR. The Commission stated that it will continue to consider potential federal right of first refusal reforms along with other transmission reforms in the future.[1995]

B. Request for Rehearing

802. NRECA states that declining to adopt the NOPR's conditional federal right of first refusal proposal was a missed opportunity because it would have encouraged transmission providers to pursue planning and expanding transmission through joint ownership arrangements with load-serving entities.[1996]

C. Commission Determination

803. The Commission explained in Order No. 1920 that it will continue to consider the NOPR proposal and potential federal rights of first refusal issues in other proceedings, a course of action we continue to find to be reasonable.[1997] As noted in Order No. 1920, comments on the NOPR raised both concerns about whether incumbent transmission

[1995] Order No. 1920, 187 FERC ¶ 61,068 at PP 1548, 1563-1564.

[1996] NRECA Rehearing Request at 2.

[1997] Order No. 1920, 187 FERC ¶ 61,068 at PP 1563-1564. NRECA did not request rehearing on this issue or include it in NRECA's Statement of Issues. *See* 18 CFR 385.713(c)(2) (any issue not listed in the Statement of Issues will be deemed waived). We nevertheless address NRECA's concern.

providers face perverse investment incentives due to Order No. 1000's reforms and concerns about whether the NOPR proposal would adequately and appropriately address those incentives.[1998]

XI. Local Transmission Planning Inputs in the Regional Transmission Planning Process

A. Need for Reform

1. Order No. 1920

804. In Order No. 1920, the Commission found substantial evidence to support the conclusion that existing requirements governing transparency in local transmission planning processes and coordination between local and regional transmission planning processes are unjust, unreasonable, and unduly discriminatory or preferential.[1999] Therefore, the Commission adopted the NOPR findings that local transmission planning processes may lack adequate provisions for transparency and meaningful input from stakeholders, and that regional transmission planning processes may not adequately coordinate with local transmission planning processes.[2000]

805. The Commission explained that local and regional transmission planning processes serve essential and complementary roles in ensuring that customers' transmission needs are identified and met at a just and reasonable cost.[2001] The

[1998] Order No. 1920, 187 FERC ¶ 61,068 at P 1564.

[1999] Order No. 1920, 187 FERC ¶ 61,068 at PP 1565, 1569.

[2000] *Id.* P 1569.

[2001] *Id.* P 1570.

Commission added that information and transmission solutions developed through local transmission planning serve as a foundation for regional transmission planning, and it is therefore critical that the processes are appropriately designed and aligned to ensure that transmission providers and stakeholders have the information needed, including from the local transmission planning process, to conduct effective regional transmission planning.[2002] Additionally, the Commission stated that, while the broader reforms directed in Order No. 1920 are focused on improving the regional transmission planning process, there are discrete deficiencies in the local transmission planning process and its coordination with the regional transmission planning process that must be addressed to ensure Commission-jurisdictional rates are just and reasonable.[2003]

806. The Commission first found that local transmission planning processes lack adequate provisions for transparency and meaningful input from stakeholders. The Commission recognized the critical role stakeholders serve in effective transmission planning,[2004] and noted prior reforms to facilitate their meaningful participation in both local and regional transmission planning.[2005] However, the Commission found that the record demonstrates that existing transparency and coordination requirements in local

[2002] *Id.* P 1570.

[2003] *Id.* P 1570.

[2004] *Id.* P 1571 (citing Order No. 890, 118 FERC ¶ 61,119 at P 454; Order No. 1000, 136 FERC ¶ 61,051 at P 152).

[2005] *Id.* (citing Order No. 890, 118 FERC ¶ 61,119 at PP 454, 488, 557; Order No. 1000, 136 FERC ¶ 61,051 at P 152.).

transmission planning do not consistently provide stakeholders with sufficient information regarding the development of local transmission plans.[2006] The Commission found that the absence of minimal standards or specified procedures to implement the transmission planning principles required by Order No. 890 contributes to inadequate transparency and opportunities for stakeholders to engage in local transmission planning processes.[2007] The Commission explained that the combined effect of these deficiencies is that stakeholders who wish to participate in transmission planning, at both the local and regional level, may not be able to effectively do so. More specifically, the Commission found that, when engaging in the regional transmission planning process, stakeholders lack sufficient information about underlying local transmission needs and potential solutions that is necessary to ensure that the more efficient or cost-effective regional transmission solutions are identified, evaluated, and selected.[2008] The Commission stated that, given the importance of stakeholder participation in effective transmission planning, reforms were needed to ensure that Commission-jurisdictional local and regional transmission planning processes remain just, reasonable, and not unduly discriminatory or preferential.[2009]

[2006] *Id.* (citations omitted).

[2007] *Id.*

[2008] P 1572.

[2009] *Id.*

807. The Commission also concluded that additional coordination between the local and regional transmission planning processes regarding the replacement of aging infrastructure is needed. The Commission found that the record showed that many incumbent transmission providers are replacing aging transmission infrastructure as it reaches the end of its useful life. The Commission specifically noted that, in PJM and NYISO, a significant portion of transmission assets either need to be replaced or will soon need to be replaced.[2010] The Commission stated that replacing these transmission facilities will require substantial investment, which will directly affect Commission-jurisdictional rates.[2011]

808. The Commission stated, however, that because its existing requirements do not obligate transmission providers to share sufficient information regarding these replacement projects, transmission providers in the regional transmission planning process are not consistently evaluating whether those replacement transmission facilities could be modified (i.e., right-sized) to more efficiently or cost-effectively address transmission system needs.[2012] Therefore, the Commission concluded, the lack of a requirement for transmission providers in each transmission planning region to evaluate whether those replacement transmission facilities could be modified (i.e., right-sized) to more efficiently or cost-effectively address Long-Term Transmission Needs results in a

[2010] *Id.* P 1573 (citations omitted).

[2011] *Id.*

[2012] *Id.* P 1574.

regional transmission planning process that fails to identify opportunities to right-size planned in-kind replacement transmission facilities and may result in the development of inefficiently sized or designed, duplicative, or unnecessary transmission facilities that increase costs to customers and render Commission-jurisdictional rates unjust and unreasonable.[2013]

809. The Commission disagreed with claims from commenters that the Commission lacked jurisdiction to impose the requirements in Order No. 1920 or that the Commission did not justify those requirements.[2014] The Commission explained that consistent with Order Nos. 890 and 1000, the Commission has the authority to establish requirements related to local transmission planning processes and the inputs to regional transmission planning processes.[2015]

810. In response to claims from commenters questioning whether the Commission properly demonstrated under FPA section 206 that existing rates are unjust, unreasonable, or unduly discriminatory or preferential in instituting a federal right of first refusal for right-sized replacement transmission facilities, the Commission explained that it found transmission providers' OATTs to be unjust and unreasonable due to the lack of right-

[2013] *Id.* P 1574.

[2014] *Id.* P 1575 (citations omitted).

[2015] *Id.* (citing Order No. 890, 118 FERC ¶ 61,119 at P 435; Order No. 1000, 136 FERC ¶ 61,051 at PP 68, 148, 1520).

sizing requirements that may lead to the identification, evaluation, and selection of more efficient or cost-effective Long-Term Regional Transmission Facilities.[2016]

811. Because the Commission found that existing requirements governing transparency in the local transmission planning process and coordination between local and regional transmission planning processes were insufficient to ensure just and reasonable and not unduly discriminatory or preferential rates, the Commission required, pursuant to FPA section 206, transmission providers to adopt, with modifications, the two reforms the Commission identified in the NOPR: (1) enhance the transparency of the local transmission planning process; and (2) require transmission providers to evaluate whether transmission facilities that need replacing can be "right-sized" to more efficiently or cost-effectively address Long-Term Transmission Needs identified in Long-Term Regional Transmission Planning.[2017] The Commission found that the first reform will result in transmission providers providing enhanced transparency for stakeholders while providing those same stakeholders with opportunities to more effectively engage in local and regional transmission planning processes. The Commission found that the second reform will result in transmission providers identifying, evaluating, and selecting replacement transmission facilities that more efficiently or cost-effectively address Long-Term Transmission Needs. Finally, the Commission found that, taken together, these reforms

[2016] *Id.* P 1576 (citations omitted).

[2017] *Id.* P 1577.

will ensure that Commission-jurisdictional rates are just and reasonable and not unduly discriminatory or preferential.[2018]

812. On rehearing, several parties challenge the Commission's findings. We address their arguments below.

2. Analysis under FPA Section 206

a. Rehearing Requests

813. Advanced Energy and Competition Coalition contend that the Commission failed to engage in reasoned decision-making, in violation of the APA and the required analysis under FPA section 206, by ignoring relevant considerations, failing to address applicable precedent, and inadequately explaining its decision to grant incumbent transmission providers a right of first refusal for right-sized replacement transmission facilities.[2019] Competition Coalition adds that the Commission has failed to prove that the reform is just and reasonable, supported by substantial evidence, the product of reasoned decision-making, and consistent with the public interest.[2020]

814. Competition Coalition, Industrial Customers, and Designated Retail Regulators request rehearing on the grounds that, in adopting the reforms in Order No. 1920 regarding enhanced transparency of local transmission planning inputs and identifying

[2018] *Id.*

[2019] Advanced Energy Rehearing Request at 4; Competition Coalition Rehearing Request at 8.

[2020] Competition Coalition Rehearing Request at 59-60.

opportunities to right-size replacement transmission facilities, the Commission failed to satisfy the requirement to make a finding, supported by substantial evidence, that the existing relevant tariff provisions result in rates that are unjust, unreasonable, or unduly discriminatory.[2021] Competition Coalition and Industrial Customers, for example, argue that Order No. 1920 does not support with substantial evidence the Commission's claim that the interrelationship between local and regional transmission planning yields unjust, unreasonable, or unduly discriminatory rates, and therefore does not reflect reasoned decision-making.[2022] Similarly, Designated Retail Regulators argue that the Commission failed to provide an analysis of the justness and reasonableness of the local transmission planning processes as a prerequisite to adopting the local transmission planning and right-sizing reforms in Order No. 1920.[2023] Competition Coalition contends that Order No. 1920's findings on encouraging transmission providers to provide their best in-kind replacement estimates and removing other disincentives do not provide a basis for satisfying the first prong of FPA section 206.[2024]

[2021] Competition Coalition Rehearing Request at 14 (citing *Emera Maine v. FERC*, 854 F.3d 9 (D.C. Cir. 2017) (*Emera Maine*)); Industrial Customers Rehearing Request at 4-5; Designated Retail Regulators Rehearing Request at 7, 41.

[2022] Competition Coalition Rehearing Request at 14; Industrial Customers Rehearing Request at 4-5.

[2023] Designated Retail Regulators Rehearing Request at 7.

[2024] Competition Coalition Rehearing Request at 18.

815. Several parties separately assert that the Commission failed to satisfy the first prong of FPA section 206 when it adopted the federal right of first refusal requirement for right-sized replacement transmission facilities.[2025] Competition Coalition contends, and Industrial Customers agree, that Order No. 1920 fails to identify the specific regional transmission planning and cost allocation tariff requirements, particularly those that relate to in-kind replacement processes, that are unjust, unreasonable, or unduly discriminatory or preferential as a result of the lack of an incumbent preference.[2026] Rather, Competition Coalition argues, the identified concern—lack of transparency in local transmission planning as an input to regional transmission planning—has nothing to do with the lack of a right of first refusal in the regional transmission planning process.[2027] Competition Coalition further states that the absence of any nexus between the identified problem in Order No. 1920—that existing regional transmission planning processes are unjust and unreasonable—and the prescribed remedy is glaring as it concerns the federal right of first refusal for right-sized replacement transmission facilities.[2028]

816. Competition Coalition also asserts that Order No. 1920 fails to provide substantial evidence that the existing regional transmission planning framework as it relates to

[2025] *Id.* at 6, 11-19, 36-37; Industrial Customers Rehearing Request at 13-15.

[2026] Competition Coalition Rehearing Request at 12-13; Industrial Customers Rehearing Request at 12-13.

[2027] Competition Coalition Rehearing Request at 13.

[2028] *Id.* at 13.

incumbent public utility preferences for regionally planned, regionally cost allocated projects in existing transmission provider tariff provisions is unjust, unreasonable, or unduly discriminatory or preferential. Competition Coalition also contends that Order No. 1920 does not elaborate on, or support with substantial evidence, the reference to "coordination" in the context of its finding under the first prong of FPA section 206.[2029] Competition Coalition states that substantial evidence is "relevant evidence that a reasonable mind might accept as adequate to support a conclusion."[2030]

b. Commission Determination

817. We sustain the finding in Order No. 1920 that existing requirements governing transparency in local transmission planning processes and coordination between local and regional transmission planning processes are unjust, unreasonable, and unduly discriminatory or preferential.[2031] We continue to find that Order No. 1920's reforms to transparency in local transmission planning inputs and coordination between local and regional transmission planning processes are necessary to ensure that Commission-jurisdictional rates are just, reasonable, and not unduly discriminatory or preferential.

818. We disagree with Competition Coalition and Advanced Energy that the Commission failed to satisfy the required analysis of FPA section 206 in adopting the reforms to enhance the transparency of local transmission planning inputs and

[2029] *Id.* at 13-14.

[2030] *Id.* at 9.

[2031] Order No. 1920, 187 FERC ¶ 61,068 at P 1569.

coordination between the local and regional transmission planning processes. As the Commission noted in Order No. 1920, reforms to better ensure more consistent implementation of the Order No. 890 transmission planning principles are timely and important in light of the significant investments in transmission infrastructure that now occur through local transmission planning processes.[2032] Further, we continue to find that local and regional transmission planning processes serve essential and complementary roles in ensuring that customers' transmission needs are identified and met at just and reasonable rates, including through the identification, evaluation, and selection of more efficient or cost-effective transmission solutions through regional transmission planning.[2033] As the Commission stated in Order No. 1920, information and transmission solutions developed through local transmission planning serve as a foundation for regional transmission planning.[2034]

819. The Commission supported its findings in Order No. 1920 with comments and studies in the record highlighting that the lack of transparency and coordination requirements in local transmission planning do not consistently provide stakeholders with sufficient information regarding the development of local transmission plans.[2035] Specifically, the Commission also found that additional coordination between the local

[2032] *Id.* P 1572; *see also id.* P 109.

[2033] *Id.* P 1570.

[2034] *Id.*

[2035] *Id.* P 1571.

and regional transmission planning processes regarding the replacement of aging infrastructure is needed, especially in light of the record evidence that incumbent transmission providers across the country are replacing aging transmission infrastructure as it reaches the end of its useful life[2036] without considering whether a regional transmission solution could be more efficient or cost-effective. Ultimately, the Commission concluded, based on these findings, that the existing requirements governing transparency in local transmission planning processes and coordination between local and regional transmission planning processes were unjust, unreasonable, and unduly discriminatory or preferential.[2037]

820. We also disagree with arguments raised by Competition Coalition, Industrial Customers, and Designated Retail Regulators that the Commission's findings under FPA section 206 are not supported by substantial evidence and find that Competition Coalition's reliance on *Emera Maine* is misplaced.[2038] Rehearing parties' arguments on this issue ignore the Commission's extensive explanation of the circumstances that have rendered the existing rates and practices affecting those rates unlawful.[2039] The Commission first identified a lack of adequate provisions for transparency and

[2036] *Id.* P 1573, nn.3363-3365.

[2037] *Id.* PP 1573-1574, 1576.

[2038] *See Emera Maine v. FERC*, 854 F.3d 9 (D.C. Cir. 2017).

[2039] *Id.* PP 1571, 1572.

meaningful input from stakeholders within local transmission planning processes.[2040] In support of this finding, the Commission: (1) cited prior final rules recognizing stakeholders' critical role in effective transmission planning; and (2) found that those prior final rules required reforms to provide for stakeholders' meaningful participation in both local and regional transmission planning processes.[2041]

821. The Commission next identified the lack of a requirement for transmission providers in each transmission planning region to evaluate whether replacement transmission facilities could be modified (i.e., right-sized) to more efficiently or cost-effectively address transmission needs. As noted above, the Commission highlighted evidence from the record that, for example, PJM and NYISO anticipate soon replacing a substantial portion of their aging transmission infrastructure as it reaches the end of its useful life, which will directly affect Commission-jurisdictional rates.[2042] Based on this evidence, the Commission concluded that existing requirements governing transparency in local transmission planning processes and coordination between local and regional transmission planning processes may result in the development of inefficiently sized or designed, duplicative, or unnecessary transmission facilities that increase costs to

[2040] *Id.* P 1571.

[2041] *Id.* P 1571 (citing Order No. 890, 118 FERC ¶ 61,119 at PP 454, 488, 557; Order No. 1000, 136 FERC ¶ 61,051 at P 152).

[2042] *Id.* P 1573, nn.3363-3365.

customers and render Commission-jurisdictional rates unjust and unreasonable.[2043] We therefore conclude that the Commission found, based on substantial evidence, that these requirements are unjust, unreasonable, or unduly discriminatory, and determined that the identified deficiencies must be addressed to ensure that Commission-jurisdictional rates are just and reasonable.

822. Order No. 1920 also pointed out that the federal right of first refusal for selected right-sized replacement transmission facilities will provide transmission providers with certainty that they will not lose the opportunity to invest in any in-kind replacement transmission facility that is then selected as a right-sized replacement transmission facility, and this, in turn, will encourage transmission providers to provide their best in-kind replacement estimates.[2044] Accordingly, the Commission found that that a federal right of first refusal will remove a disincentive for transmission providers to consider right-sizing in Long-Term Regional Transmission Planning. The Commission added that this will help to ensure that transmission providers identify and select the more efficient or cost-effective regional transmission solution to Long-Term Transmission Needs.[2045]

[2043] *Id.* P 1574.

[2044] *Id.* P 1703; *see infra* Identifying Potential Opportunities to Right-Size Replacement Transmission Facilities section. The Commission defined "in-kind replacement estimates" as "estimates of the transmission facilities operating at and above the specified kV threshold that an individual transmission provider that owns the transmission facility anticipates replacing in-kind with a new transmission facility during the next 10 years . . . ." Order No. 1920, 187 FERC ¶ 61,068 at P 1677. We clarify that these estimates include, at minimum, identification of the transmission facilities themselves.

[2045] *See infra* Right of First Refusal for Right-Sized Replacement Transmission

823. As Competition Coalition points out in its rehearing request, substantial evidence is "relevant evidence that a reasonable mind might accept as adequate to support a conclusion."[2046] The above discussion makes clear that the Commission examined the relevant data and articulated a rational connection between the facts found and the choices made in enacting the reforms in Order No. 1920. We thus continue to find that the Commission engaged in reasoned decision-making and considered all important aspects of the problem and meaningfully responded to the arguments raised before it.

3. Departure from Commission Precedent

a. Rehearing Requests

824. Competition Coalition opines that no explanation can be offered for how the right-sizing proposal is not in conflict with FPA section 206 because Order Nos. 1000 and 1000-A required the elimination of federal rights of first refusal.[2047] Competition Coalition also asserts that Order No. 1920 departs from Commission precedent without explanation.[2048]

Facilities Selected to Meet Long-Term Transmission Needs section.

[2048] *Id.* at 37 n.112, 40.

b. Commission Determination

825. We are unpersuaded by Competition Coalition's argument that Order No. 1920 does not provide a reasoned explanation regarding Order No. 1920's departure from Order Nos. 1000 and 1000-A in establishing a federal right of first refusal for right-sized replacement transmission facilities. In Order No. 1920, the Commission recognized that the establishment of a federal right of first refusal for right-sized replacement transmission facilities is an exception to Order No. 1000's general requirement for transmission providers to eliminate any federal right of first refusal for regional transmission facilities selected in a regional transmission plan. The Commission then found that requiring a federal right of first refusal for right-sized replacement transmission facilities aligns with Order No. 1000.[2049] The Commission explained that, in Order No. 1000, transmission providers were required to remove federal rights of first refusal from their OATTs because they undermined the consideration of more efficient or cost-effective potential transmission solutions proposed at the regional level, which could lead to unjust and unreasonable rates for Commission-jurisdictional services.[2050] The Commission also explained that, in Order No. 1000, it found that federal rights of first refusal created a barrier to entry that discouraged nonincumbent transmission developers from proposing alternative solutions for consideration at the regional level.[2051]

[2049] Order No. 1920, 187 FERC ¶ 61,068 at P 1704.

[2050] *Id.* P 1705; *infra* Right of First Refusal for Right-Sized Replacement Transmission Facilities Selected to Meet Long-Term Transmission Needs section.

[2051] Order No. 1920, 187 FERC ¶ 61,068 at P 1705 (citing Order No. 1000, 136

826. The Commission further explained that Order No. 1000 did not require the elimination of federal rights of first refusal for local transmission facilities, nor did it alter the rights of incumbent transmission providers to build, own, and recover costs for upgrades to their own transmission facilities, regardless of whether the upgrade is selected in the regional transmission plan for the purposes of cost allocation.[2052] Because a right-sized replacement transmission facility has the potential to both meet an individual transmission provider's responsibility to maintain the reliability of its existing transmission system and also address a Long-Term Transmission Need more efficiently or cost-effectively than an in-kind replacement transmission facility or another Long-Term Regional Transmission Facility, which includes the need for replacements of existing transmission facilities via local transmission planning processes, the Commission concluded that the reasons for removing federal rights of first refusal in Order No. 1000 do not apply to right-sized replacement transmission facilities.[2053] Specifically, Order No. 1920 found that requiring a federal right of first refusal for right-sized replacement transmission facilities does not undermine the consideration of more efficient or cost-effective potential transmission solutions proposed at the regional level. Rather, the Commission found that a federal right of first refusal will promote the consideration of

FERC ¶ 61,051 at P 257).

[2052] *See id.* P 1705 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 319.)

[2053] *Id.* P 1706; *see infra* Right of First Refusal for Right-Sized Replacement Transmission Facilities Selected to Meet Long-Term Transmission Needs section.

more efficient or cost-effective potential regional transmission solutions to address Long-Term Transmission Needs because it captures both an individual transmission provider's responsibilities and a Long-Term Transmission Need, we believe the right-sizing reform preserves transmission providers' ability to invest in replacements of their own transmission facilities, even if such facilities are right-sized and selected in the regional transmission plan for purposes of cost allocation.[2054] Furthermore, the Commission noted that the reasons for removing federal rights of first refusal in Order No. 1000 do not apply to right-sized replacement transmission facilities because transmission providers may have existing rights and responsibilities with respect to maintaining and, when necessary, replacing their transmission facilities.[2055]

827. We therefore continue to find that providing for a federal right of first refusal for right-sized replacement transmission facilities aligns with the text and stated purpose of Order No. 1000 by ensuring that transmission providers consider more efficient or cost-effective regional transmission solutions.[2056] We also reaffirm that the right-sizing reform does not depart, without explanation, from Commission precedent related to an individual transmission provider's ability to proceed with an in-kind replacement

[2054] *See infra* Right of First Refusal for Right-Sized Replacement Transmission Facilities Selected to Meet Long-Term Transmission Needs section.

[2055] Order No. 1920, 187 FERC ¶ 61,068 at PP 1706-1707; *see infra* Right of First Refusal for Right-Sized Replacement Transmission Facilities Selected to Meet Long-Term Transmission Needs section.

[2056] Order No. 1920, 187 FERC ¶ 61,068 at P 1704.

transmission facility. Further, we believe that, without a federal right of first refusal, the incumbent transmission provider whose in-kind replacement transmission facility is selected to be right-sized would likely opt to develop the less efficient or cost-effective in-kind replacement transmission facility rather than a right-sized replacement transmission facility.[2057] Therefore, we continue to find that the establishment of the federal right of first refusal for right-sized replacement transmission facilities that are evaluated and selected as part of Long-Term Regional Transmission Planning is necessary to effectuate this reform and ensure that Commission-jurisdictional rates are just and reasonable.[2058] As the Commission reasoned in Order No. 1920, by establishing a process that requires transmission providers to evaluate opportunities to right-size in-kind replacement transmission facilities to meet transmission needs, the right-sizing reform will encourage transmission providers to provide their best in-kind replacement estimates, as they will have certainty that they will not lose the opportunity to invest in any in-kind replacement transmission facility that is then selected as a right-sized replacement transmission facility. The Commission concluded that together, these reforms will enable transmission providers to ensure that the more efficient or cost-effective regional solution to transmission needs is identified, evaluated, and selected, and therefore that Commission-jurisdictional rates are just and reasonable.

4. Commission Authority Under the FPA

a. Rehearing Requests

828. Competition Coalition argues that FPA section 206 cannot support the Commission's adoption of a monopoly preference when FPA section 206 mandates the opposite result (prohibition on unduly discriminatory or preferential rates or practices affected rates).[2059] Advanced Energy argues that the FPA lacks a plausible textual basis for the Commission to bestow on the incumbent utilities a "monopoly right" to develop and own certain types of transmission infrastructure.[2060] Thus, Advanced Energy and Competition Coalition assert, the Commission exceeded its authority under FPA section 206.[2061]

829. Both Advanced Energy and Competition Coalition assert that the Commission's application of FPA section 206 is inconsistent with U.S. Supreme Court precedent.[2062] Advanced Energy states that the Commission's reliance on FPA section 206 to bestow a federal right of first refusal raises serious constitutional questions and, therefore, is inconsistent with the constitutional-doubt canon of statutory construction.[2063] Advanced

[2063] Advanced Energy Rehearing Request at 10 (citing Antonin Scalia & Bryan A. Garner, *Reading Law: The Interpretation of Legal Texts* 247-48 (2012) (citing *Crowell v.*

Energy claims that since FPA section 206 contains no explicit language regarding development or ownership of transmission facilities or authorizing the establishment of a federal right of first refusal, relying on FPA section 206 to adopt the right-sizing reform calls into question whether Congress delegated such authority to the Commission and, if so, whether that delegation was proper.[2064]

830. Advanced Energy states that, in enacting FPA section 216, Congress reinforced the FPA's longstanding jurisdictional framework that the Commission does not possess the authority to prevent "any person" from constructing or modifying a transmission facility.[2065] Advanced Energy argues that, as a result, the Commission exceeded its authority under the FPA by granting incumbents a right of first refusal to develop and own right-sized replacement transmission facilities, to the exclusion of all others.[2066] Similarly, Competition Coalition attests that Order No. 1920 failed to demonstrate that the Commission has the legal authority under the FPA to mandate the federal right of first refusal of transmission facilities, and further argues that the FPA provides the

Benson, 285 U.S. 22, 62 (1932))).

[2064] *Id.* at 10, 21 (citing *West Virginia*, 597 U.S. 697).

[2066] *Id.* at 5, 8.

Commission no authority to do so.[2067] Undersigned States argue that right-sizing intrudes upon state authority.2068

b. Commission Determination

831. We disagree with Advanced Energy's, Competition Coalition's, and Undersigned States' arguments that the reforms in this section, specifically the right-sizing reform and the federal right of first refusal for right-sized replacement transmission facilities, exceed the Commission's authority.[2069] The Commission's authority under FPA section 201 includes "the transmission of electric energy in interstate commerce," and under FPA section 206 the Commission's authority is to ensure that practices affecting Commission-jurisdictional rates are just and reasonable.[2070] As explained in *EPSA*, this jurisdiction extends to practices that "directly affect" such rates.[2071] The federal right of first refusal acknowledges existing precedent recognizing state laws providing an individual transmission provider's ability to proceed with an in-kind replacement transmission facility and encourages transmission providers to provide their best in-kind replacement estimates by preserving the transmission providers' ability to invest in facilities selected

[2067] Competition Coalition Rehearing Request at 7, 21-23.

[2068] Undersigned States Rehearing Request at 36.

[2069] *See* Advanced Energy Rehearing Request at 4-12; Competition Coalition Rehearing Request at 7, 20-40; Undersigned States Rehearing Request at 36.

[2070] *See supra* Federal/State Division of Authority section.

[2071] 577 U.S. at 278.

as right-sized replacement transmission facilities.[2072] The Commission explained that the establishment of a federal right of first refusal in this regard will result in transmission providers identifying, evaluating, and selecting replacement transmission facilities that more efficiently or cost-effectively address transmission needs.

832. Indeed, rights of first refusal have generally been found to be practices affecting rates, thus confirming that they are within the Commission's jurisdiction—albeit in the context of their removal.[2073] Thus, the Commission's action in Order No. 1920 is entirely consistent with Order No. 1000 in that respect. Advanced Energy and Competition Coalition fail to recognize the inherent contradiction in their arguments. When addressing our statutory authority, the relevant question is whether the Commission can regulate rights of first refusal, not how it chooses to regulate them. The claim that the establishment of a federal right of first refusal for right-sized replacement transmission facilities is beyond the Commission's authority is squarely contrary to Order No. 1000 and *South Carolina*.[2074]

833. We are unpersuaded by arguments that the Commission lacks authority under the FPA to require the right-sizing reform. FPA section 206 provides the Commission with

---

[2072] Order No. 1920, 187 FERC ¶ 61,068 at P 1707.

[2073] *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 72.

[2074] *Id.* at 73-76 (finding that the Commission was authorized to regulate the right of first refusal provisions in Commission-jurisdictional tariffs and that the Commission correctly concluded that inclusion of rights of first refusal in tariffs and agreements was a "practice affecting a rate triggering the Commission's authority under FPA section 206.").

the authority to determine the just and reasonable rate following a finding that any rate, charge, regulation, or practice is unjust, unreasonable, unduly discriminatory or preferential. The D.C. Circuit has recognized that regional transmission planning and cost allocation processes are practices affecting rates subject to the Commission's exclusive jurisdiction[2075] and that transmission providers use those processes to "determine which transmission facilities will more efficiently or cost-effectively meet" transmission needs, the development of which directly impacts the rates, terms, and conditions of Commission-jurisdictional service.[2076]

834. We also are unpersuaded by Advanced Energy's and Competition Coalition's claims that the right of first refusal for right-sized replacement transmission facilities requires explicit congressional authorization and find that, notwithstanding references to *West Virginia* in their rehearing requests, the major questions doctrine is not implicated here. As discussed in detail above,[2077] the major questions doctrine is a context-specific analysis that applies only in "extraordinary cases" where an agency action is so extravagant that it is akin to discovering an "elephant in a mousehole."[2078] More specifically, the major questions doctrine comes into play where, despite a "colorable

[2075] Order No. 1920, 187 FERC ¶ 61,068 at P 86 (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d 41 at 55-59, 84; *see* Order No. 1000-A, 139 FERC ¶ 61,132 at P 577).

[2076] *Id.* (citing *S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d at 56).

[2077] *See supra* Major Questions Doctrine section.

[2078] *See West Virginia*, 597 U.S. at 746.

textual basis" for the agency's claim of authority, the agency action was so extravagant when viewed in light of the statutory context that it was unlikely that Congress would have afforded this claimed authority to the agency, and particularly would not have done so in an oblique or subtle way.[2079]

835. The Advanced Energy and Competition Coalition rehearing requests do not meaningfully engage with the context-specific factors associated with the application of the major questions doctrine. Advanced Energy's theory that the doctrine applies boils down to its characterization of the federal right of first refusal as a "monopoly franchise right" and assertion that replacing transmission projects is extremely expensive.[2080] Competition Coalition similarly relies on a largely conclusory invocation of *West Virginia*, without analysis beyond asserting that this is an "extraordinary case" because the Commission has never previously asserted that Congress granted it this power.[2081]

836. We continue to conclude that the major questions doctrine does not apply to Order No. 1920, which is a rulemaking under the Commission's broad authority over transmission planning processes affecting Commission-jurisdictional rates. Specifically, here, Order No. 1920's inclusion of a federal right of first refusal for right-sized replacement transmission facilities falls well within the Commission's authority under FPA section 206 over "practice[s] . . . affecting" rates, the same grant of statutory

[2079] *Id.* at 722-23.

[2080] Advanced Energy Rehearing Request at 9-10

[2081] Competition Coalition Rehearing Request at 34, 36.

authority supporting issuance of Order No. 1920.[2082] As a result, for all the reasons that we find that the major questions doctrine is inapplicable to Order No. 1920 as a whole,[2083] we likewise find that Advanced Energy and Competition Coalition have not shown that the major questions doctrine applies to Order No. 1920's inclusion of a federal right of first refusal for right-sized replacement transmission facilities.

837. We are also unpersuaded by Advanced Energy's claims that Order No. 1920's establishment of a federal right of first refusal for right-sized replacement transmission facilities raises constitutional questions and is therefore inconsistent with the constitutional-doubt canon of statutory construction.[2084] Advanced Energy does not discuss the substance of this doctrine, cite any authority that relates to this doctrine, or explain how—by authorizing the Commission to regulate practices affecting rates, which includes the local transparency improvements and the right-sizing reform—Congress would have impermissibly delegated legislative power to the Commission.[2085]

838. We also disagree with Advanced Energy that the Commission exceeded its authority under FPA section 216 and find such arguments to be misplaced. FPA section

[2083] *See supra* Major Questions Doctrine section.

[2084] *See* Advanced Energy Rehearing Request at 10 (citing Antonin Scalia & Bryan A. Garner, *Reading Law: The Interpretation of Legal Texts*, at 247-48 (2012) (citing *Crowell v. Benson,* 285 U.S. at 62)).

[2085] *Id.*; *see also supra* Major Questions Doctrine section

216 governs the Commission's authority with respect to authorization of a construction permit for a transmission facility located within a National Interest Electric Transmission Corridor under certain circumstances. FPA section 216 does not alter or restrict the Commission's authority to identify a replacement rate under section 206 of the FPA, including the provision for or the removal of a federal right of first refusal, to ensure transmission providers' OATTs are just and reasonable and not unduly discriminatory or preferential. The federal right of first refusal for right-sized replacement transmission facilities is not aimed at, nor does it directly regulate, an area of state authority.[2086] As discussed in Order No. 1920 and above, the Commission is not unlawfully supplanting state authority, including siting and development processes.[2087] States retain their authority over those processes and the federal right of first refusal for right-sized replacement transmission facilities is not directed at those practices nor does it divest states of their authority. As explained above, the right-sizing processes, including the right of first refusal for right-sized replacement transmission facilities, are directed at Commission-jurisdictional transmission planning processes.

[2086] *See supra* Federal/State Division of Authority section (explaining that Commission regulations are not unlawful even if they substantially affect areas of reserved state jurisdiction so long as the Commission is directly regulating within its areas of authority under the FPA, rather than attempting to directly regulate within state jurisdiction).

[2087] *See supra* Federal/State Division of Authority section; *See also* Order No. 1920, 187 FERC ¶ 61,068 at P 271.

839. We are not persuaded by Advanced Energy's acontextual reading of FPA section 216(g) which posits that—in providing backstop siting authority to the Commission under FPA section 216 and allowing the Commission, in certain circumstances, to grant construction permits for transmission facilities within designated National-Interest Electric Transmission Corridors—Congress was subtly intending to negate the Commission's authority in FPA sections 205 or 206, particularly with respect to the right-sizing rights of first refusal or rights of first refusal more generally. The far more natural interpretation of this provision is that it means what it says, clarifying the impact of "this section" of the FPA: that despite creating such backstop permitting authority residing with the Commission, FPA section 216 does not preclude the construction or modification of transmission facilities in accordance with state law.[2088]

5. Policy Against Anticompetitive Practices

a. Rehearing Requests

840. Both Competition Coalition and Advanced Energy claim that Order No. 1920's establishment of a federal right of first refusal for right-sized replacement transmission facilities is inconsistent with federal policy against anticompetitive practices.[2089] Specifically, Advanced Energy asserts that the federal right of first refusal is inconsistent

[2088] We note, further, that Order No. 1920 is not a regulation under FPA section 216 and no part of the right-sizing right of first refusal relies on Commission authority under FPA section 216.

[2089] Competition Coalition Rehearing Request at 67-68 (citing Exec. Order No. 14,036, 3 CFR 100.1); Advanced Energy Rehearing Request at 10-11.

with Supreme Court finding that "the history of Part II of the Federal Power Act indicates an overriding policy of maintaining competition to the maximum extent possible consistent with the public interest."[2090] Competition Coalition contends that the reform is contrary to appellate courts' affirmation that monopoly preferences are against the public interest.

b. Commission Determination

841. Order No. 1920's conclusion that the federal right of first refusal for right-sized replacement transmission facilities is within the Commission's authority is further supported by the history and context of the FPA broadly, and rights of first refusal generally—contrary to the arguments in the rehearing requests. As the Supreme Court has recognized, electric utilities have historically been vertically integrated monopolies, including as to transmission.[2091]

842. When Congress enacted the FPA, it charged the Commission with ensuring that rates and practices were "just and reasonable" and not unduly discriminatory or preferential. Within these parameters, the statutory text does not require a particular approach. Thus, Advanced Energy's and Competition Coalition's invocation of a policy

[2090] Advanced Energy Rehearing Request at 10-11 (citing *Otter Tail v. U.S.*, 410 U.S. 366, 374 (1973)).

[2091] *Morgan Stanley Cap. Grp. Inc. v. Pub. Util. Dist. No. 1 of Snohomish Cnty., Wash.*, 554 U.S. 527, 535–36 (2008) (finding that, historically, electric utilities have been monopolies).

against anticompetitive practices is unpersuasive.[2092] The Commission's authority is defined and delineated by the FPA, not by reference to a general policy that may favor competition. Notably, the case Advanced Energy cites in this context, *Otter Tail*, did not address the Commission's authority under FPA section 205 or 206, and instead considered whether provisions of the FPA implicitly repealed otherwise applicable antitrust laws.[2093]

6. Other Arguments

a. Rehearing Requests

843. Competition Coalition asserts that Order No. 1920 fails to meaningfully engage with NOPR arguments and rebut arguments presented in those comments. Competition Coalition also asserts that the phrase federal rights of first refusal is a "made-up phrase" that has no history in the FPA.[2094] Competition Coalition adds that the federal right of first refusal for right-sized replacement transmission facilities is likely to encourage gaming.[2095]

b. Commission Determination

844. We also find that Competition Coalition's remaining arguments are unpersuasive as they fail to engage with the statutory text or context and, ultimately, have little to do

---

[2092] Advanced Energy Rehearing Request at 10-11.

[2093] *See id.* at 10 n.30.

[2094] Competition Coalition Rehearing Request at 24-29.

[2095] *Id.* at 61, 68-71.

with the Commission's statutory authority, notwithstanding how they are categorized in Competition Coalition's rehearing request.

845. A large swath of Competition Coalition's arguments discuss the history of the phrase "federal right of first refusal," arguing that "the phrase was nothing more than a made-up general reference for clauses in [Commission]-jurisdictional contracts or tariffs implemented by existing transmission owners to impede independent transmission developers seeking to develop cost-of-service transmission."[2096] We find that this discussion has little bearing on the issue of the Commission's authority, which is defined by the statutory text and relevant precedent construing this text. As discussed above, we find that establishing the federal right of first refusal for right-sized replacement transmission facilities is within our authority and consistent with that history. We also note that Order No. 1000 did not require the removal of all rights of first refusal. Thus, Order No.1000 does not suggest that establishment of a federal right of first refusal for right-sized replacement transmission facilities is beyond the Commission's authority.

846. We also find that most of Competition Coalition's other arguments—although housed in a portion of their request for rehearing contending that Order No. 1920 exceeds the Commission's statutory authority—are mislabeled. On their substance, these arguments amount to disputes over whether the federal right of first refusal for right-sized replacement transmission facilities is just and reasonable and not unduly discriminatory

[2096] *Id.* at 24-29 (arguing that such provisions were not based on requirements of the FPA or rights inherent in the FPA).

or preferential and whether the Commission departed from its precedent without adequate explanation, albeit peppered with assertions that the federal right of first refusal for right-sized replacement transmission facilities is not supported by the FPA.[2097] Throughout this order, we affirm that the replacement rate set by the Commission in Order No. 1920 is just and reasonable and not unduly discriminatory.[2098] We find that the Commission's authority is plainly stated in FPA section 206 to evaluate rates and practices to determine whether they are unjust and unreasonable or unduly discriminatory or preferential, and, if so, prescribe a replacement rate that is just and reasonable and not unduly discriminatory or preferential. On its face, the federal right of first refusal for right-sized replacement transmission facilities is an exercise of that authority, as discussed above.

[2097] *See id.* at 32-40 (arguing that Order No. 1920 departs from the approach of previous Commission orders seeking to curtail transmission provider self-interest and challenging the Commission's rationale for adopting the federal right of first refusal for right-sized replacement transmission facilities); *id.* at 35-36 (arguing that the rationale of *Orangeburg, S.C. v.* FERC, 862 F.3d 1071 (2017), and the Commission's findings in Order No. 1000, require the elimination of disparate treatment of nonincumbent transmission providers); *id.* at 36-40 (arguing that FPA section 206 requires "elimination of preferential rates or practices affecting rates" and that the federal right of first refusal for right-sized replacement transmission facilities is inconsistent with this requirement, that the Commission cannot "ignore its prior declaration that rights of first refusal are unduly discriminatory or preferential," and that Order No. 1920 is disingenuous in distinguishing precedent or claiming that it is not creating a "new preference"); *cf. id.* at 29-32 (discussing Order Nos. 1000 and 1000-A, arguing that because the Commission rejected "monopoly preference provisions" in those orders, even applying a heightened contract review, there is "no support for an assumption that the Commission enjoys Congressionally granted authority to simply create a federally sanctioned 'cartel-like' monopoly preference").

[2098] *See supra* The Commission Demonstrated that the Replacement Rate is Just and Reasonable section.

B. Enhanced Transparency of Local Transmission Planning Inputs in the Regional Transmission Planning Process

1. Order No. 1920

847. In Order No. 1920, the Commission required transmission providers to revise the regional transmission planning process in their OATTs to enhance the transparency of: (1) the criteria, models, and assumptions that they use in their local transmission planning process; (2) the local transmission needs that they identify through the local transmission planning process; and (3) the potential local or regional transmission facilities that they will evaluate to address those local transmission needs.[2099] Specifically, the Commission required that the regional transmission planning process include at least three publicly noticed stakeholder meetings per regional transmission planning cycle concerning the local transmission planning process of each transmission provider that is a member of the transmission planning region before each transmission provider's local transmission plan can be incorporated into the transmission planning region's planning models.[2100] The Commission stated that the requirement to establish this process ensures that stakeholders have meaningful opportunities to participate in and provide feedback on local transmission planning throughout the regional transmission planning process.[2101] The Commission also clarified that these requirements applied only to local transmission

[2099] Order No. 1920, 187 FERC ¶ 61,068 at P 1625.

[2100] *Id.* P 1626.

[2101] *Id.*

planning that is within the scope of Order No. 890 and is therefore already subject to Order No. 890 transparency requirements. As such, the Commission stated, this requirement does not apply to asset management projects.[2102]

848. The Commission required that prior to the submission of local transmission planning information to the transmission planning region for inclusion in the regional transmission planning process, transmission providers in each transmission planning region must convene, collectively, as part of the regional transmission planning process, a stakeholder meeting to review the criteria, assumptions, and models related to each transmission provider's local transmission planning (Assumptions Meeting).[2103] Furthermore, the Commission required that no fewer than 25 calendar days after the Assumptions Meeting, transmission providers in each transmission planning region must convene, collectively, as part of the regional transmission planning process a stakeholder meeting to review identified reliability criteria violations and other transmission needs that drive the need for local transmission facilities (Needs Meeting).[2104] Finally, the Commission required that, no fewer than 25 calendar days after the Needs Meeting, transmission providers in each transmission planning region must convene, collectively,

[2102] *Id.* P 1625 (citing *S. Cal. Edison Co.*, 164 FERC ¶ 61,160, at PP 30-40 (2018); *Cal. Pub. Utils. Comm'n v. Pac. Gas. & Elec. Co.*, 164 FERC ¶ 61,161, at PP 65-74 (2018) (finding that Order No. 890's local transmission planning requirements do not apply to asset management projects that do not increase capacity or do so incidentally)).

[2103] *Id.* P 1627.

[2104] *Id.*

as part of the regional transmission planning process, a stakeholder meeting to review potential solutions to those reliability criteria violations and other transmission needs (Solutions Meeting).[2105]

849. Additionally, the Commission required that the materials for stakeholder review during these three meetings be publicly posted and that stakeholders have opportunities before and after each meeting to submit comments.[2106] Specifically, the Commission required transmission providers to publicly post the meeting materials no fewer than five calendar days prior to each of the three publicly noticed stakeholder meetings to allow time for stakeholders to review materials in advance of each meeting.[2107] The Commission also required that transmission providers allow for a period of no fewer than 25 calendar days following the Solutions Meeting to review and consider stakeholder feedback on the local transmission solutions identified to meet the local transmission needs before the local transmission plan can be incorporated in the transmission planning region's planning models.[2108] Lastly, the Commission required that transmission providers must respond to questions or comments from stakeholders such that it allows stakeholders to meaningfully participate in these three required stakeholder meetings.[2109]

[2105] *Id.*

[2106] *Id.*

[2107] *Id.* P 1628.

[2108] *Id.*

[2109] *Id.*

850. In Order No. 1920, the Commission declined to adopt alternatives requested by commenters to this set of reforms because such proposals were not included in the NOPR and, as a result, the requests were beyond the scope of the proceeding.[2110] The Commission noted, however, that several of these issues may be examined in the Commission's ongoing Transmission Planning and Cost Management proceeding.[2111]

2. Requests for Additional Reforms

a. Requests for Rehearing and Clarification

851. Several parties request rehearing of the Commission's decision to exclude asset management projects from the local transmission planning transparency requirements in the final rule.[2112] Old Dominion states that the Commission failed to address the lack of meaningful transparency in local transmission planning by deciding to exclude asset management projects from the local transmission planning transparency requirements, which it argues is an error that will perpetuate unjust and unreasonable rates.[2113] Further, Old Dominion contends that the Commission's assertion that there is not sufficient record evidence or that it would be outside the scope of the proceeding to adopt reforms that were not proposed in the NOPR is unreasonable and inconsistent with other aspects of the

[2110] *Id.* P 1648.

[2111] Transmission Planning and Cost Management, Notice of Technical Conference, Docket No. AD22-8-000 (Apr. 21, 2022).

[2112] NESCOE Rehearing Request at 26-31; Ohio Commission Federal Advocate Rehearing Request at 21-24; Old Dominion Rehearing Request at 4, 5-9.

[2113] Old Dominion Rehearing Request at 5, 9.

final rule where the Commission adopted proposals that were neither supported by sufficient record evidence nor included in the NOPR.[2114] Old Dominion states that if the Commission does not grant rehearing on this issue, then the Commission should undertake further reforms for local transmission planning, such as in Docket No. AD22-8-000.[2115]

852. NESCOE states that the Commission's decision to exclude asset management projects[2116] from the scope of the local transmission planning transparency enhancements does not constitute reasoned decision-making, because the final rule does not sufficiently address concerns that asset condition projects are not subject to sufficient transparency, scrutiny, and review requirements.[2117] NESCOE further argues that, despite the Commission's acknowledgement that reforms are needed to ensure regional transmission planning and cost allocation are just and reasonable, the Commission's failure to adopt such reforms based on a single-sentence rationale demonstrates that the Commission has not "made a reasoned decision based upon substantial evidence in the record," nor has it "articulate[d] a satisfactory explanation for its action including a rational connection

[2114] *Id.* at 5-6, 8 (contending that Order No. 1920 prohibits different cost allocation methods for economic, reliability, and public policy requirements, which the Commission did not propose in the NOPR).

[2115] *Id.* at 9.

[2116] NESCOE notes that these in-kind replacement projects are known as asset condition projects in New England. NESCOE Rehearing Request at 6.

[2117] *Id.* at 26-33, 34.

between the facts found and the choice made."[2118] NESCOE argues that the exemption of asset management projects from the local transmission planning transparency requirements results in a regulatory gap where transmission costs are unreviewed at both the state and federal level.[2119] NESCOE contends that this is a particularly acute concern in New England where, since February 2023, transmission owners have brought $3.3 billion in asset management projects through ISO-NE's Planning Advisory Committee.[2120]

853. Ohio Commission Federal Advocate argues that the Commission's adoption of "perfunctory" transparency reforms for local planning processes was arbitrary and capricious, and will do nothing to close the regulatory gap or provide oversight for local projects.[2121] Ohio Commission Federal Advocate notes that given the increasing portion of transmission facilities that are considered "supplemental projects"[2122] in PJM, the reforms adopted in Order No. 1920 do little to shift the scales and the reforms may increase the portion of the transmission system built through a local transmission planning process.[2123] As such, Ohio Commission Federal Advocate contends that the

[2118] *Id.* at 30-31 (citing *Cal. Pub. Utils. Comm'n v. FERC*, 20 F.4th at 800).

[2119] *Id.* at 29.

[2120] *Id.* at 28.

[2121] Ohio Commission Federal Advocate Rehearing Request at 21-22.

[2122] In PJM, "supplemental projects" is the term used for local projects. *Id.* at 23.

[2123] *Id.*at 23-24.

Commission neglected its duty under the FPA to ensure just and reasonable rates by imposing reforms that will not curb rising transmission costs or result in holistic transmission planning.[2124]

854. Industrial Customers request rehearing and argue the Commission failed to engage requests that call for implementation of an independent transmission monitor. Given the increase in spending on transmission projects, Industrial Customers argue that clarifying or expanding existing independent market monitor functions or creating an independent transmission monitor would be a timely and appropriate exercise of the Commission's authority to remedy unjust and unreasonable rates.[2125] Moreover, Industrial Customers contend that Order No. 1920 falls short of ensuring just and reasonable rates because it does not undertake reforms of transmission formula rates or the Commission's prudence standard.[2126] Industrial Customers argue that since Order No. 1920 failed to implement any concrete reforms to protect consumers, rehearing is warranted.[2127]

855. PIOs request rehearing arguing that the Commission has sidestepped evidence that they and other parties offered when the Commission concluded that certain suggestions regarding the local transmission planning process were outside the scope of the

[2124] *Id.* at 21, 23.

[2125] Industrial Customers Rehearing Request at 29-31.

[2126] *Id.* at 33-34.

[2127] *Id.* at 38.

proceeding.[2128] PIOs argue that while Order No. 1920's reforms take some steps in the right direction, Order No. 1920 does not actually require the kind of comprehensive information transparency, scenario-based planning, multi-benefit analysis, and process coordination necessary for stakeholders to verify whether local transmission projects are prudent or whether a regional solution is more appropriate.[2129] PIOs argue that the Commission must require transmission providers to meet their burden under FPA section 205(e) to prove that their local transmission projects are the least-cost way to meet the needs of the transmission system. PIOs further argue the Commission should grant rehearing to ensure that utilities only construct local transmission projects when they are the best option for maintaining reliability and at least cost to consumers.[2130]

b. Commission Determination

856. We sustain the determination in Order No. 1920 to exclude asset management projects from the information on local transmission planning inputs that transmission providers must include for stakeholder review as part of the Assumptions, Needs, and Solutions Meetings. We reiterate that planning for asset management projects, which do not increase transmission capacity or only do so incidentally, is not required to be included within the scope of local transmission planning that is subject to Order No. 890

[2128] PIOs Rehearing Request at 50.

[2129] *Id.* at 51-52.

[2130] *Id.* at 53-54 (citing *Ky. Mun. Energy Agency v. FERC*, 45 F.4th 162, 178 (D.C. Cir. 2022)) (other citations omitted).

transparency requirements,[2131] and as such, it was reasonable for the Commission to exclude them from the requirements in Order No. 1920.[2132] Moreover, the Commission did not propose in the NOPR to require transmission providers to include information related to asset management projects in the information that they provide as part of the Assumptions, Needs, and Solutions Meetings. Instead, to enhance stakeholders' visibility into local transmission planning inputs as they are integrated into the regional transmission planning process, the Commission proposed in the NOPR – and adopted in the final rule – requirements to enhance the transparency of such inputs, which are already subject to the local transmission planning transparency requirements of Order No. 890, in the regional transmission planning process.[2133] We continue to expect these

[2131] Order No. 1920, 187 FERC ¶ 1625 (citing *S. Cal. Edison Co.*, 164 FERC ¶ 61,160 at PP 30-40; *Cal. Pub. Utils. Comm'n v. Pac. Gas. & Elec. Co.*, 164 FERC ¶ 61,161 at PP 65-74 (finding that Order No. 890's local transmission planning requirements do not apply to asset management projects that do not increase capacity or do so incidentally)).

[2132] *Id.* P 1625.

[2133] NOPR, 179 FERC ¶ 61,028 at P 398 (identifying the need for reform based in part on a finding that "implementation of [the Order No. 890 local transmission planning principles] in local transmission planning processes appears to remain uneven", and that "reforms to better ensure more consistent implementation of these principles may be timely"); *id*. P 400 (proposing to require transmission providers to revise their OATTs "to enhance transparency of: (1) the criteria, models, and assumptions that they use in their local transmission planning process; (2) the local transmission needs that they identify through that process; and (3) the potential local or regional transmission facilities that they will evaluate to address those local transmission needs."); *id.* P 402 (stating that "requirements are needed to ensure just and reasonable Commission-jurisdictional rates because the information provided will better facilitate the identification of regional transmission facilities"); Order No. 1920, 187 FERC ¶ 61,068 at P 1625 (clarifying that the requirement "applies only to local transmission planning that is within the scope of Order No. 890 and is therefore already subject to Order No. 890 transparency

reforms to enhance the transparency between the local and regional transmission planning processes, which will help reduce the possibility that transmission providers will develop local transmission facilities without adequately considering whether there is a more efficient or cost-effective regional transmission solution that could address their local transmission needs.[2134] That said, we note that nothing in Order No. 1920 prevents transmission providers from choosing to apply Order No. 1920's requirements to enhance the transparency of local transmission planning inputs to asset management projects.

857. We disagree with parties that request rehearing on the grounds that the Commission's decision-making was arbitrary and capricious or failed to consider the record evidence. Further, we disagree with Ohio Commission Federal Advocate that the Commission neglected its duty under the FPA to ensure just and reasonable rates. We continue to find, as we found in Order No. 1920, that the enhanced transparency requirements are specifically designed to provide needed transparency to ensure that Commission-jurisdictional rates are just and reasonable and not unduly discriminatory or preferential.[2135] As such, we find that the scope of the relevant reforms required by Order No. 1920 is sufficient to remedy the deficiencies in local transmission planning that the

---

requirements" and does not apply to asset management projects)).

[2134] Order No. 1920, 187 FERC ¶ 61,068 at P 1629.

[2135] *Id.* P 1632.

Commission set out to resolve in Order No. 1920, even if some parties would have preferred that the Commission had gone further.[2136]

858. For similar reasons, we are unpersuaded by Industrial Customers' and PIOs' requests for additional reforms to transmission planning processes generally. The proposals raised by these parties in their rehearing requests were not included in either the NOPR or Order No. 1920 and, as noted above, we find that the relevant reforms required pursuant to Order No. 1920 are sufficient to remedy the problem that Order No. 1920 set out to solve.[2137] The Commission will continue to consider potential additional local transmission planning reforms, such as independent transmission monitors, along with other transmission reforms in the future.[2138]

3. Stakeholder Meeting Clarifications

a. Request for Rehearing and Clarification

859. SERTP Sponsors request clarification that the standard for evaluating transmission providers' obligation to respond to stakeholder feedback is consistent with Order No. 890 and applies equally to local, regional, and Long-Term Regional Transmission

[2136] *See New York v. FERC*, 531 U.S. at 26-27 (affirming that the Commission did not have an obligation extend its open access remedy to bundled retail transmissions because the remedy it ordered constituted a sufficient response to the problems the Commission had identified in the wholesale market).

[2137] *See* Order No. 1920, 187 FERC ¶ 61,068 at PP 1648, 1737.

[2138] We note, for example, the ongoing proceeding in Docket No. AD22-8-000 on Transmission Planning and Cost Management.

Planning.[2139] Specifically, SERTP Sponsors assert that further clarification is necessary with respect to the Commission's statement that transmission providers are encouraged "to be as responsive as possible to stakeholder comments and questions" because this statement could be read to go beyond standards previously established in Order No. 890 and expand transmission providers' obligation to respond beyond what is necessary to support meaningful participation in stakeholder meetings.[2140] Thus, SERTP Sponsors request that the Commission clarify that transmission providers are not obligated to incorporate stakeholder proposals or comments into their transmission plans and that the ultimate transmission planning responsibility is with the transmission provider.[2141]

860. Regarding the Assumptions Meeting, the Needs Meeting, and the Solutions Meeting, SERTP Sponsors also request that the Commission clarify that these meetings of different transmission providers do not need to be held as one. SERTP Sponsors explain that their transmission planning region consists of multiple transmission providers over a 12-state footprint, and they contend that the Commission should clarify that this requirement can be satisfied by a single transmission provider holding separate meetings that include its own Assumptions, Needs, and Solutions Meetings.[2142] SERTP

[2139] SERTP Sponsors Rehearing Request at 23-24.

[2140] *Id.* at 24 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1645) (emphasis omitted).

[2141] *Id.*

[2142] *Id.* at 24-25.

Sponsors assert that, in the event that the Commission does not so clarify, the requirements for the Assumptions Meeting, the Needs Meeting, and the Solutions Meeting may become unduly burdensome and inconsistent with Order No. 1920's requirement, which is based on the model used by PJM's transmission owners to hold separate meetings for different local transmission owners' local plans.[2143] SERTP Sponsors argue that holding "collective" Assumptions, Needs, and Solutions Meetings is unnecessary to achieve the Commission's transparency objections, and further contends that requiring so would be an unexplained departure from the PJM precedent and otherwise arbitrary and capricious.[2144]

b. Commission Determination

861. We clarify, in response to SERTP Sponsors' request, that transmission providers are not obligated to incorporate stakeholder proposals or comments resulting from the stakeholder meeting process into their transmission plans, and we agree with SERTP Sponsors that the ultimate transmission planning responsibility remains with the transmission provider.[2145] In encouraging transmission providers to be as responsive as possible to stakeholder comments and questions as part of the stakeholder meeting process, the Commission in Order No. 1920 did not establish new requirements for transmission providers that did not previously apply; rather, the description of the

[2143] *Id.* at 25.

[2144] *Id.* at 25 (citations omitted).

[2145] *Id.* at 24.

requirement that transmission providers respond to questions or comments in a manner that allows stakeholders to meaningfully participate in the stakeholder meetings explains existing requirements established under Order No. 890 and that apply to local transmission planning processes, existing Order No. 1000 regional transmission planning processes, and Long-Term Regional Transmission Planning processes.[2146]

862. In response to SERTP Sponsors' request that the Commission clarify that the stakeholder meetings of the different transmission providers do not need to be held collectively as a single meeting,[2147] we agree and clarify that, provided that the transmission provider meets the requirements of Order No. 1920 with respect to public notices and opportunities for stakeholders to submit comments before and after each meeting, transmission providers need not hold a single stakeholder meeting among all transmission providers in a transmission planning region. We recognize that transmission planning regions often cover significant geographic range and are comprised of many diffuse transmission providers, such that imposing a requirement that each stakeholder meeting includes all transmission providers and stakeholders may create undue burden

[2146] *See* Order No. 890, 118 FERC ¶ 61,119 at P 452 ("Transmission providers are, however, required to craft a process that allows for a reasonable and meaningful opportunity to meet or otherwise interact meaningfully."); *id*. P 454 ("This means that customers must be included at the early stages of the development of the transmission plan and not merely given an opportunity to comment on transmission plans that were developed in the first instance without their input."); *id*. P 488 ("The transmission planning required by this Final Rule is intended to provide transmission customers and other stakeholders a meaningful opportunity to engage in planning along with their transmission providers.").

[2147] SERTP Sponsors Rehearing Request at 25.

and impede meaningful participation. Instead, transmission providers may hold separate Assumptions Meetings, Needs Meetings, and Solutions Meetings for individual transmission providers within a transmission planning region, provided that the process ensures that stakeholders have meaningful opportunities to participate in and provide feedback on local transmission planning information throughout the regional transmission planning process and otherwise meets all the Order No. 1920 requirements described above.

C. Identifying Potential Opportunities to Right-Size Replacement Transmission Facilities

1. Eligibility

a. Order No. 1920

863. In Order No. 1920, the Commission required transmission providers, as part of each Long-Term Regional Transmission Planning cycle, to evaluate whether transmission facilities (1) operating above a specified kV threshold and (2) that an individual transmission provider that owns the transmission facility anticipates replacing in-kind with a new transmission facility during the next 10 years, can be "right-sized" to more efficiently or cost-effectively address a Long-Term Transmission Need.[2148] The Commission also required that each transmission provider submit its in-kind replacement estimates (i.e., estimates of the transmission facilities operating at and above the specified kV threshold that an individual transmission provider that owns the transmission facilities

[2148] Order No. 1920, 187 FERC ¶ 61,068 at P 1677.

anticipates replacing in-kind with a new transmission facility during the next 10 years) for use in Long-Term Regional Transmission Planning sufficiently early in each Long-Term Regional Transmission Planning cycle.[2149]

864. The Commission further adopted the NOPR proposal to define "right-sizing" as the process of modifying a transmission provider's in-kind replacement of an existing transmission facility to increase that facility's transfer capability.[2150] The Commission clarified that, for the purposes of the right-sizing reform, an "in-kind replacement transmission facility" is a new transmission facility that: (1) would replace an existing transmission facility that a transmission provider has identified in its in-kind replacement estimate as needing to be replaced; (2) would result in no more than an incidental increase in capacity over the existing transmission facility identified as needing to be replaced; and (3) is located in the same general route as, and/or uses the existing rights-of-way of, the existing transmission facility identified as needing to be replaced.[2151]

865. Similarly, the Commission also clarified that, for the purposes of the right-sizing reform, a "right-sized replacement transmission facility" is a new transmission facility that: (1) would meet the need to replace an existing transmission facility that a transmission provider has identified in its in-kind replacement estimate as one that it plans to replace with an in-kind replacement transmission facility while also addressing a

[2149] *Id.*

[2150] *Id.* P 1678 & n.3580.

[2151] *Id.* P 1678.

Long-Term Transmission Need; (2) results in more than an incidental increase in the capacity of an existing transmission facility that a transmission provider has identified for replacement in its in-kind replacement estimate; and (3) is located in the same general route as, and/or uses or expands the existing rights-of-way of, the existing transmission facility that a transmission provider has identified for replacement in its in-kind replacement estimate.[2152]

866. In Order No. 1920, the Commission also required transmission providers to establish a multi-step process in their OATTs that provides for the implementation of the right-sizing reform. Specifically, the Commission required that transmission providers in each transmission planning region must propose a point sufficiently early in each Long-Term Regional Transmission Planning cycle at which each individual transmission provider in the transmission planning region will submit its in-kind replacement estimates for use in Long-Term Regional Transmission Planning.[2153] Next, the Commission required that, if transmission providers identify a right-sized replacement transmission facility as a potential solution to a Long-Term Transmission Need as part of Long-Term Regional Transmission Planning, that right-sized replacement transmission facility must be evaluated in the same manner as any other proposed Long-Term Regional Transmission Facility to determine whether it is the more efficient or cost-effective

[2152] *Id.* P 1679.

[2153] *Id.* P 1681.

transmission facility to address the transmission need.[2154] The Commission clarified that it is at this stage that transmission providers must use the in-kind replacement estimates to determine if in-kind replacement transmission facilities could be right-sized to more efficiently or cost-effectively address a Long-Term Transmission Need(s).[2155] Finally, the Commission required that, if a right-sized replacement transmission facility addresses the transmission provider's need to replace an existing transmission facility, meets the applicable selection criteria included in Long-Term Regional Transmission Planning, and is found to be the more efficient or cost-effective solution, then the right-sized replacement transmission facility must be considered for selection.[2156]

867. The Commission further required that, for the purposes of implementing the right-sizing reform, transmission providers must propose on compliance a threshold that does not exceed 200 kV to be used in identifying transmission facilities that an individual transmission provider anticipates replacing in-kind with a new transmission facility during the next 10 years, which it must then include in its in-kind replacement estimates.[2157] The Commission clarified that the 10-year timeframe for in-kind replacement estimates should reflect a transmission provider's estimates of the

[2154] *Id.*

[2155] *Id.*

[2156] *Id.* As explained in the Right of First Refusal section below, the Commission required the establishment of a federal right of first refusal for a right-sized replacement transmission facility that is selected to meet Long-Term Transmission Needs. *Id.* P 1702.

[2157] *Id.* PP 1677, 1683 & n.3584.

transmission facilities operating at and above the specified kV threshold that an individual transmission provider that owns the transmission facility anticipates replacing in-kind with a new transmission facility during the next 10 years beginning at the start of each Long-Term Regional Transmission Planning cycle.[2158]

b. Requests for Rehearing and Clarification

868. In its rehearing request, Advanced Energy argues that the term "right-sized replacement facility" is too vague.[2159] Competition Coalition argues that the definition of the term ignores Order No. 1000-A because the Commission has already determined in Order No. 1000-A that the replacement of an entire transmission facility is an entirely new transmission facility.[2160] Competition Coalition notes that, in Order No. 1000-A, the Commission addressed the issue of granting a preference for an incumbent transmission owner to build a transmission project for upgrades and not an entirely new transmission facility, determining that an upgrade involves the replacement of only part of an existing facility.[2161] Competition Coalition argues that since Order No. 1920 fails to acknowledge the justification for the Commission's departure from existing Commission precedent that

[2158] *Id.* at P 1685.

[2159] Advanced Energy Rehearing Request at 14-15 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1678).

[2160] Competition Coalition Rehearing Request at 51-57 (citing Order No. 1000-A, 139 FERC ¶ 61,132 at P 426; *NYISO*, 151 FERC ¶ 61,040 at P 96 (additional citation omitted)).

[2161] Competition Coalition at 51-52 (citing Order No. 1000-A, 139 FERC ¶ 61,132 at P 426).

limits retention of a preference only for a regional transmission project that represents a replacement of part of an existing transmission facility and not the replacement of an entire transmission facility, Order No. 1920 is arbitrary and capricious.[2162]

869. Similarly, some petitioners argue that Order No. 1920's findings regarding rights-of-way are flawed or inconsistent with Commission precedent.[2163] For example, Advanced Energy highlights that language regarding the "same general route as, and/or use [] the existing rights-of-way of, the existing transmission facility identified as needing to be replaced" could require anything from zero land acquisition cost (if the facility is entirely within a wholly owned right-of-way) to millions of dollars (if the facility is entirely outside of an existing right-of-way but follows the same general route).[2164] Advanced Energy argues that, given such vagueness, to have the chance of passing muster under the APA, the Commission should remove this ambiguity by limiting any right of first refusal to a right-sized replacement facility that is entirely within existing, permanent rights-of-way.[2165] NESCOE similarly argues that the final rule's lack of a definition of "general route" or discussion of why it is appropriate to use a

---

[2162] *Id.* at 52.

[2163] Advanced Energy Rehearing Request at 14-15 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1678); Competition Coalition Rehearing Request at 57-59 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1678; *MISO*, 147 FERC ¶ 61,127 at P 244; *NYISO*, 151 FERC ¶ 61,040 at P 96).

[2164] Advanced Energy Rehearing Request at 14 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1678).

[2165] *Id.* at 14-15.

vague term in place of the well-established "rights-of-way" necessitates the Commission to act to fulfill its statutory duty under the FPA and that, as written, the right-sizing reform could be interpreted to the detriment of consumers.[2166]

870. Competition Coalition argues that the Commission's right-sizing reform contravenes existing Commission precedent regarding the use of rights-of-way, noting that, under Order No. 1000-A, the Commission found that the use of an existing right-of-way is not determinative of whether the facility is a new transmission facility but rather the relevant issue was "whether the new transmission facility is an upgrade to an incumbent transmission provider's own facilities."[2167] Competition Coalition further points to Commission rejection of a proposal from MISO to give preference to transmission owners for facilities built on the existing rights-of-way since the Commission determined that issues surrounding rights-of-way is an issue for the authority granting the rights-of-way.[2168]

871. Competition Coalition argues that the OATT language associated with the right-sizing reform is ambiguous, unworkable, and will cause confusion and litigation.[2169] Competition Coalition highlights the terms "anticipates," "right-sizing," "as discussed in

[2166] NESCOE Rehearing Request at 32-33.

[2167] Competition Coalition Rehearing Request at 57-58 (citing Order No. 1000-A, 139 FERC ¶ 61,132 at P 427).

[2168] *Id.* (citing *MISO*, 147 FERC ¶ 61,127 at P 244).

[2169] *Id.* at 72.

Order No. 1920," "not to exceed 200 kV," "more efficiently," and "cost-effectively" as being undefined in the final rule.[2170] Competition Coalition also contends that the absence of OATT language that gives an independent entity the responsibility to carry out and administer right-sizing opportunities or monitor against potential planning abuses confirms the need for an independent transmission system planner or monitor.2171

872. In its rehearing request, Dominion requests clarification of the proposed 200 kV threshold for determining whether a transmission facility is eligible for right-sizing.[2172] Specifically, Dominion explains that while the Commission refers to a "maximum threshold," Dominion seeks clarification that the use of the word "maximum" does not foreclose evaluation of projects above and below that threshold. Dominion explains that, in simpler terms, transmission providers must consider for right-sizing purposes all transmission facilities with projected in-kind replacements currently operating at or above 200 kV, but they may propose a lower threshold on compliance.[2173]

c. Commission Determination

873. We sustain our findings in response to Advanced Energy's, Competition Coalition's, and NESCOE's rehearing requests pertaining to the term "right-sized replacement facility." As the Commission explained in Order No. 1920, the right-sizing

[2170] *Id.* at 73-74.

[2171] *Id.* at 74.

[2172] Dominion Rehearing Request at 35.

[2173] *Id.* at 35-36.

reform was adopted, as modified from the NOPR proposal, with additional requirements to ensure that the use of the right-sizing reform addresses *replacement* transmission facilities and not entirely new transmission facilities.[2174] As highlighted in Order No. 1920, a right-sized replacement transmission facility would replace the existing transmission facility that the transmission provider included in its in-kind replacement estimate, and extends to any portion of the right-sized replacement facility located within a given transmission provider's retail distribution service territory or footprint.[2175] The Commission found that a right-sized replacement transmission facility has the potential to both meet an individual transmission provider's responsibility to maintain the reliability of its existing transmission system and address a Long-Term Transmission Need more efficiently or cost-effectively than an in-kind replacement transmission facility or another Long-Term Regional Transmission Facility.[2176]

874. In response to Competition Coalition's argument that Order No. 1920 is inconsistent with Order No. 1000-A, which specified that upgrades do not include entirely new transmission facilities, we note that the Commission is entitled to change its approach and depart from prior precedent, provided that it acknowledges the change in policy and provides a reasoned explanation for the new approach.[2177] We acknowledge

[2174] *Id.* P 1679.

[2175] *Id.* P 1702.

[2176] *Id.* P 1682.

[2177] *FCC v. Fox Television Stations, Inc.*, 556 U.S. at 515-516; *In re Permian Basin Area Rate Cases*, 390 U.S. 747, 784 (1968); *see also State Farm*, 463 U.S. at 42

that in Order No. 1920, the Commission, with explanation, departed from its precedent in Order No. 1000-A, as well as in *MISO* and *NYISO*.[2178] In Order No. 1920, the Commission explicitly recognized that "the establishment of a federal right of first refusal for right-sized replacement transmission facilities is an exception to Order No. 1000's general requirement for transmission providers to eliminate any federal right of first refusal for regional transmission facilities selected in a regional transmission plan."[2179] However, the Commission found that the Commission's reasons for removing federal rights of first refusal in Order No. 1000 do not apply to right-sized replacement transmission facilities.[2180] The Commission then explained at length why this is the case,

("[W]e fully recognize that regulatory agencies do not establish rules of conduct to last forever.") (internal quotations omitted); *Greater Bos. Television Corp. v. FCC*, 444 F.2d 841, 852 (D.C. Cir. 1970) (an agency may change its course as long as it "suppl[ies] a reasoned analysis indicating that prior policies and standards are being deliberately changed, not casually ignored."), *cert. denied*, 403 U.S. 923 (1971).

[2178] *See MISO*, 147 FERC ¶ 61,127 at P 238; *NYISO*, 151 FERC ¶ 61,040 at P 96. In Order No. 1000-A, the Commission clarified that "the term upgrade means an improvement to, addition to, or replacement of a part of, an existing transmission facility. The term upgrades does not refer to an entirely new transmission facility." Order No. 1000-A, 139 FERC ¶ 61,132 at P 426.

[2179] Order No. 1920, 187 FERC ¶ 61,068 at P 1704.

[2180] *Id.* P 1706; *see also* Order No. 1920, 187 FERC ¶ 61,068 at P 1705 (explaining that Order No. 1000 required transmission providers to remove federal rights of first refusal from their OATTs because they undermined the consideration of more efficient or cost-effective potential transmission solutions proposed at the regional level and created a barrier to entry that discouraged nonincumbent transmission developers from proposing alternative solutions at the regional level) (citations omitted).

satisfying the Commission's obligation to provide a reasoned explanation for its new policy.

875. Specifically, the Commission found that requiring a federal right of first refusal for right-sized replacement transmission facilities does not undermine the consideration of more efficient or cost-effective potential transmission solutions at the regional level; instead, it will *promote* the consideration of potential regional transmission solutions to address Long-Term Transmission Needs.[2181] When compared against the alternative of piecemeal development of in-kind replacement facilities, the right-sizing reform ensures that Long-Term Regional Transmission Planning considers a broader set of needs, including needs related to replacement of aging transmission infrastructure.[2182] The Commission further stated that, absent a federal right of first refusal for right-sized replacement transmission facilities, the incumbent transmission provider whose in-kind replacement transmission facility is selected to be right-sized would likely proceed to develop the less efficient or cost-effective in-kind replacement transmission facility because it would prefer the assurance of a federal right of first refusal for the in-kind replacement transmission facility over the uncertainty of subjecting a right-sized replacement transmission facility to the Order No. 1000 competitive transmission development process.[2183] Thus, the federal right of first refusal for right-sized

[2181] *Id.* P 1706.

[2182] *Id.*

[2183] *Id.*

replacement transmission facilities will remove a barrier to development of more efficient or cost-effective regional solutions that could encompass both replacements of aging transmission infrastructure and regional transmission solutions to address Long-Term Transmission Needs. Similarly, the Commission found that requiring the establishment of a federal right of first refusal for a right-sized replacement transmission facility that is selected to meet Long-Term Transmission Needs will encourage transmission providers to provide their best in-kind replacement estimates because they will have certainty that they will not lose the opportunity to invest in any in-kind replacement transmission facility that is then selected as a right-sized replacement transmission facility.[2184]

876. The Commission found that, given this incentive structure and the fact that the transmission provider holds the leverage as to whether to build a right-sized replacement transmission facility or a less efficient in-kind replacement transmission facility, the establishment of a federal right of first refusal for right-sized replacement transmission facilities is necessary to effectuate the right-sizing reform and ensure that Commission jurisdictional rates are just and reasonable.[2185] We sustain this finding, and we continue to conclude that a federal right of first refusal for right-sized replacement transmission facilities will remove a disincentive for transmission providers to consider right-sizing in Long-Term Regional Transmission Planning, helping to ensure that the more efficient or cost-effective regional transmission solution to Long-Term Transmission Needs is

[2184] *Id.* P 1703.

[2185] *Id.* P 1706.

selected and likely built, and therefore that the Commission-jurisdictional rates that customers pay are just and reasonable.[2186] As such, we find that the Commission has provided a reasoned explanation for its decision to depart from prior precedent and require a federal right of first refusal for right-sized replacement transmission facilities.

877. We are unpersuaded by Advanced Energy's, Competition Coalition's, and NESCOE's claims regarding the use of the term "rights-of-way" in defining a right-sized replacement transmission facility. As in Order No. 1000, we find that the retention, modification, or transfer of rights-of-way remain subject to relevant law or regulation granting the rights-of-way,[2187] and nothing in the definition of "in-kind replacement transmission facility" or "right-sized replacement transmission facility" would affect the retention, modification, or transfer of rights-of-way. While we recognize Advanced Energy's argument that a right-sized replacement transmission facility may require additional land for a right-of-way, we decline to speculate on land acquisition costs because land acquisition costs vary from transmission facility to transmission facility. In any case, the fact that there may be additional land acquisition costs does not, as Advanced Energy argues, render the definition of a right-sized replacement transmission facility vague. We note, however, that transmission providers could consider the potential for such costs when they are evaluating whether a particular right-sized

[2186] *See id.* P 1703.

[2187] *Id.* P 319.

replacement transmission facility is a more efficient or cost-effective regional transmission solution to address Long-Term Transmission Needs.

878. Moreover, we disagree that Order No. 1920's inclusion of the term "general route" in the definition of "in-kind replacement transmission facility" and "right-sized replacement transmission facility" renders those definitions vague. Rather, we find the term "general route," when read in the context of Order No. 1920's example detailing which transmission facilities would be eligible for right-sizing,[2188] makes clear that the right-sizing reform considers existing topology of the transmission system to ensure that the right-sizing reform applies to *replacement* transmission facilities only.[2189] We find that it is important to include this term to provide a reasonable bound of the definition of both in-kind replacement transmission facilities and right-sized replacement transmission facilities. Further, a right-sized replacement transmission facility may require changes to or expansions of rights-of-way to accommodate that right-sized replacement transmission facility, and it is not feasible to list every type or circumstance that may bear upon existing rights-of-way. Accordingly, we find that the requirement for a right-sized replacement transmission facility to also be located in the same general route as the existing transmission facility identified for replacement provides a reasonable limitation on the location of such a right-sized replacement transmission facility. For example, if a transmission provider anticipates replacing an existing transmission facility because it has

[2188] *Id.* P 1680.

[2189] *Id.* PP 1678, 1679.

reached the end of its useful life and the replacement transmission facility (either in-kind or right-sized) requires modifications to that facility's rights-of-way to accommodate other infrastructure projects or avoid environmentally sensitive areas, those modifications to existing rights-of-way are permitted under the term "same general route." We note that Order No. 1920's example relied on interconnection points to describe which in-kind replacement transmission facilities would be eligible for right-sizing,[2190] specifically, that a right-sized replacement transmission facility that connects the same interconnection points to which an in-kind replacement transmission facility connects qualifies under the term "same general route." We reiterate that these limitations are appropriate to ensure that the right-sizing reform applies to *replacement* transmission facilities only. For example, a new transmission facility would not qualify as a right-sized replacement transmission facility if it has significantly different interconnection points than the in-kind replacement facility.

879. Furthermore, we find Competition Coalition's contention that the definition of "right-sized replacement transmission facility" is inconsistent with Order No. 1000 regarding the use of rights-of-way to be inapposite. In Order No. 1000, the Commission stated that the requirement to "eliminate a federal right of first refusal does not apply to any upgrade, even where the upgrade requires the expansion of an existing right-of-way."[2191] The Commission stated that "[t]he issue is not whether the upgrade would be

[2190] *Id.* P 1680.

[2191] Order 1000-A, 139 FERC ¶ 61,132 at P 427.

located in an existing right-of-way, but whether the new transmission facility is an upgrade to an incumbent transmission provider's own facilities."[2192] In other words, the Commission found in Order No. 1000 that whether a regional transmission facility does or does not require the expansion of an existing right-of-way is not relevant to whether that facility is an upgrade. In contrast, for the reasons discussed directly above, in Order No. 1920 the Commission found it necessary that, to qualify as a right-sized replacement transmission facility, a transmission facility must be located in the same general route as, and/or use or expand the existing rights-of-way of, the existing transmission facility that a transmission provider has identified for replacement in its in-kind replacement estimate.

880. We are unpersuaded by Competition Coalition's arguments regarding specific terminology in the right-sizing reform. However, we provide additional context for certain terms and phrases included in the right-sizing reform. We sustain the definition of "right-sizing" to mean "the process of modifying a transmission provider's in-kind replacement of an existing transmission facility to increase that facility's transfer capability."[2193] The Commission noted that right-sizing could include, for example, increasing the transmission facility's voltage level, adding circuits to the towers (e.g., redesigning a single-circuit line as a double circuit line), or incorporating advanced technologies (such as advanced conductor technologies).[2194] Regarding the other terms

[2192] *Id.*.

[2193] Order No. 1920, 187 FERC ¶ 61,068 at P 1678.

[2194] *Id.* P 1678 n.3580.

highlighted by Competition Coalition, we find that, read in the context of the right-sizing reform, as well as Order No. 1920, these terms are clear, , and we disagree with Competition Coalition that the absence of independent transmission monitor language confirms the need for such an entity in the context of right-sizing.[2195]

881. We grant clarification to Dominion's requests regarding the 200 kV threshold for determining whether a transmission facility is eligible for right-sizing. We clarify that the Commission's finding in Order No. 1920 that the kV threshold must not exceed 200 kV means that transmission providers must include in their in-kind replacement estimates all transmission facilities operating at or above 200 kV that they anticipate replacing in-kind during the next 10 years. We also clarify that transmission providers may establish a threshold *lower* than 200 kV to ensure that a larger number of transmission facilities may be included. Put simply, transmission providers may propose a threshold for all transmission facilities that are eligible to be right-sized, so long as that threshold is under 200 kV.

[2195] The Commission will continue to consider potential additional local transmission planning reforms, such as independent transmission monitors, along with other transmission reforms in the future. *See supra* Enhanced Transparency of Local Transmission Planning Inputs in the Regional Transmission Planning Process section.

2. Right of First Refusal for Right-Sized Replacement Transmission Facilities Selected to Meet Long-Term Transmission Needs

a. Order No. 1920

882. In Order No. 1920, the Commission required the establishment of a federal right of first refusal for a right-sized replacement transmission facility that is selected to meet Long-Term Transmission Needs.[2196] In adopting a federal right of first refusal requirement for a right-sized replacement transmission facility, the Commission noted that a federal right of first refusal is an exception to Order No. 1000's general requirement for transmission providers to eliminate any federal right of first refusal for regional transmission facilities selected in a regional transmission plan.[2197] The Commission explained that requiring a federal right of first refusal for right-sized replacement transmission facilities does not undermine the consideration of more efficient or cost-effective potential transmission solutions proposed at the regional level; rather, the Commission found that it will *promote* the consideration of more efficient or cost-effective potential regional transmission solutions to address Long-Term Transmission Needs. Further, the Commission explained that, when compared against the alternative of piecemeal development of in-kind replacement transmission facilities, the right-sized replacement transmission facility represents the more efficient or cost-

[2196] Order No. 1920, 187 FERC ¶ 61,068 at P 1702; *see also supra* Analysis under Section 206 section.

[2197] *Id.* P 1704 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 313).

effective regional transmission solution to address Long-Term Transmission Needs (otherwise it would not be selected).[2198]

883. Additionally, the Commission explained that, in requiring a federal right of first refusal for a right-sized replacement transmission facility, Order No. 1000 did not alter the rights of incumbent transmission providers to build, own, and recover costs for upgrades to their own transmission facilities, regardless of whether the upgrade is selected.[2199]

b. Requests for Rehearing and Clarification

884. Certain parties request rehearing of Order No. 1920's establishment of a federal right of first refusal for a right-sized replacement transmission facility that is selected to meet Long-Term Transmission Needs, on the grounds that the Commission deviated from prior precedent without reasoned explanation and, therefore, such requirements are arbitrary and capricious.[2200] For example, Advanced Energy states that the Commission failed to explain how providing for a right of first refusal for right-sized replacement transmission facilities in Order No. 1920 was consistent with prior Commission findings

[2198] *Id.* P 1706.

[2199] *Id.* P 1705 (citing Order No. 1000, 136 FERC ¶ 61,051 at P 319 (internal citation omitted)).

[2200] Advanced Energy Rehearing Request at 15-16; Competition Coalition Rehearing Request at 40-43; Designated Retail Regulators Rehearing Request at 41-42; Industrial Customers Rehearing Request at 9.

that granting an incumbent utility a federal right of first refusal can lead to rates that are unjust and unreasonable.[2201]

885. Advanced Energy further argues that the Commission's provision of a federal right of first refusal for right-sized replacement transmission facilities is inconsistent with the general federal policy against anticompetitive practices.[2202]

886. Relatedly, Advanced Energy, Competition Coalition, and PIOs argue that the inclusion of a federal right of first refusal as part of the right-sizing reform will create incentives for incumbent transmission owners to use the local transmission planning processes to undermine the regional transmission planning process, resulting in less efficient or cost-effective solutions and, therefore, unjust and unreasonable rates.[2203] For instance, Competition Coalition argues that a profit-motivated incumbent transmission owner will have incentives to add even more in-kind replacements into its local transmission plan because of the possibility that the transmission planning region will then right-size those projects into an even larger facility in which the incumbent utility would be allowed to invest without any competition, thus preserving, reinforcing, and expanding its monopoly position.[2204]

[2204] Competition Coalition Rehearing Request at 69-70.

c. Commission Determination

887. We are unpersuaded by rehearing requests arguing that Order No. 1920's establishment of a federal right of first refusal for right-sized replacement transmission facilities selected to meet Long-Term Transmission Needs is arbitrary and capricious. In Order No. 1000, the Commission required transmission providers to eliminate federal rights of first refusal because those federal rights of first refusal allowed transmission providers to undermine the consideration of more efficient or cost-effective potential transmission solutions proposed at the regional level, which could lead to unjust and unreasonable rates for Commission-jurisdictional services.[2205] Moreover, in Order No. 1000 the Commission found that federal rights of first refusal created a barrier to entry that discouraged nonincumbent transmission developers from proposing alternative solutions at the regional level.[2206]

888. In Order No. 1920, the Commission found that that a right-sized replacement transmission facility has the potential to both meet an individual transmission provider's responsibility to maintain the reliability of its existing transmission system and to address a Long-Term Transmission Need more efficiently or cost-effectively than an in-kind replacement transmission facility or another Long-Term Regional Transmission Facility.[2207] The Commission further explained that, compared to the alternative of

[2205] Order No. 1000, 136 FERC ¶ 61,051 at PP 253, 256, 313.

[2206] *Id.* P 257.

[2207] Order No. 1920, 187 FERC ¶ 61,068 at P 1682.

piecemeal development of in-kind replacement transmission facilities, a federal right of first refusal for right-sized transmission facilities is appropriate because right-sized replacement transmission facilities represent the more efficient or cost-effective regional transmission solution to address Long-Term Transmission Needs (otherwise, they would not be selected).[2208]

889. We recognize that requiring the federal right of first refusal for right-sized replacement transmission facilities is a departure from the Order No. 1000's requirement that transmission providers eliminate federal rights of first refusal for transmission facilities selected in a regional transmission plan for purposes of cost allocation. However, we find the departure, in this instance, to be necessary in order to shift the balance of transmission facility construction and remove a barrier to the selection of more efficient or cost-effective regional transmission facilities. As the Commission found, the existing piecemeal approach to upgrading the transmission system results in inefficiencies and increased rates for consumers.[2209] The Commission is improving the efficiency of the transmission planning process and ensuring rates are just and reasonable by promoting the consideration of right-sized replacement transmission facilities, subject to evaluation and selection processes in Long-Term Regional Transmission Planning, and

[2208] *Id.* P 1706.

[2209] *Id.* PP 1574, 1706.

by establishing the availability of the federal right of first refusal for such right-sized replacement transmission facilities.[2210]

890. We sustain Order No. 1920's finding that the right-sizing reform will promote the consideration of more efficient or cost-effective potential regional transmission solutions to address Long-Term Transmission Needs. Specifically, the federal right of first refusal will provide transmission providers with certainty that they will not lose the opportunity to invest in any in-kind replacement transmission facility that is then selected as a right-sized replacement transmission facility, and this, in turn, will encourage transmission providers to provide their best in-kind replacement estimates.[2211] Accordingly, we continue to find that a federal right of first refusal will remove a disincentive for transmission providers to consider right-sizing in Long-Term Regional Transmission Planning, helping to ensure that the more efficient or cost-effective regional transmission solution to Long-Term Transmission Needs is identified and selected, and therefore that Commission-jurisdictional rates are just and reasonable.

891. In Order No. 1920, the Commission explained that, in the context of the right-sizing reform, a federal right of first refusal will *promote* the consideration of more

[2210] Although we find that the Commission has supported the inclusion of the right-sizing reforms as a component of a just and reasonable replacement rate, we consider these reforms as an enhancement to, rather than essential to, the Long-Term Regional Transmission Planning process. Absent the right-sizing reforms, the Commission would have established the other Long-Term Regional Transmission Planning requirements as a sufficient just and reasonable replacement rate.

[2211] Order No. 1920, 187 FERC ¶ 61,068 at P 1703.

efficient or cost-effective potential regional transmission solutions to address Long-Term Transmission Needs because, absent the right-sizing reform, those needs would be addressed in a piecemeal manner.[2212] This will in turn benefit consumers by helping to ensure that the rates that they pay are just and reasonable. Furthermore, we believe that providing a federal right of first refusal for selected right-sized replacement transmission facilities is consistent with Order No. 1920's finding that the absence of sufficiently long-term, forward-looking, and comprehensive transmission planning requirements causes transmission providers to fail to appropriately evaluate the benefits of transmission infrastructure, and results in piecemeal transmission expansion to address relatively near-term transmission needs.[2213] As such, as discussed in the Eligibility section above, we find that it is appropriate to alter the Commission's policy regarding the removal of the federal right of first refusal by providing a federal right of first refusal for selected right-sized replacement transmission facilities. This is particularly true because the reforms that we require here serve a similar purpose as removing the federal right of first refusal for regional transmission facilities selected in the regional transmission plan for purposes of cost allocation in Order No. 1000. In each instance, the Commission's goal was to ensure that the more efficient or cost-effective regional transmission facilities are considered, thereby ensuring that Commission-jurisdictional rates are just and reasonable – in Order No. 1000, that was accomplished by removing the federal right of first refusal

[2212] *Id.* P 1706.

[2213] *Id.* P 85.

for selected regional transmission facilities in certain instances, while in Order No. 1920, it was by establishing a federal right of first refusal in the limited instances where it incentivizes transmission providers to consider right-sized replacement transmission facilities as more efficient or cost-effective regional transmission solutions to Long-Term Transmission Needs. The reforms related to the federal right of first refusal in Order Nos. 1000 and 1920 each seek to ensure that more efficient or cost-effective regional transmission facilities are considered thereby resulting in just and reasonable rates. Protecting consumers and ensuring Commission-jurisdictional rates are just and reasonable are fundamental requirements of the Federal Power Act and we believe that the reforms in Order No. 1920 accomplish these mandates.

892. We also note that this federal right of first refusal applies only to selected right-sized replacement transmission facilities, which, absent the right-sizing reform, would likely not otherwise be identified for potential selection in either the existing Order No. 1000 regional transmission planning process or the Long-Term Regional Transmission Planning process. That is because there is currently no requirement for transmission providers to submit their in-kind replacement transmission facilities to the regional transmission planning process for potential right-sizing. In addition, as the Commission explained in Order No. 1920, the right-sizing reform does not alter existing laws related to an individual transmission provider's ability to proceed with an in-kind replacement transmission facility, and we continue to find that, absent a federal right of first refusal, the incumbent transmission provider whose in-kind replacement transmission facility is selected to be right-sized would likely proceed to develop the less efficient or cost-

effective in-kind replacement transmission facility.[2214] This is because, absent the federal right of first refusal, the incumbent transmission provider would not be assured that it would have the opportunity to invest in the right-sized replacement transmission facility and therefore very likely would chose to build the less efficient or cost-effective in-kind replacement transmission facility. Therefore, the right-sizing reform's federal right of first refusal provides the needed incentives to ensure that in-kind replacement transmission facilities are considered in the Long-Term Regional Transmission Planning process and selected when they are more efficient or cost-effective transmission solutions while also not substantially reducing the number of transmission facilities that would otherwise be subject to a competitive transmission development process.

893. We are also unpersuaded by Advanced Energy's arguments that the federal right of first refusal associated with the right-sizing reform is inconsistent with federal policies against anticompetitive practices. As we note above, given the existing federal rights of first refusal that transmission owners have and that we are not altering here, it is unlikely that right-sized replacement transmission facilities would ever be considered in competitive transmission development processes. Therefore, we do not believe that the right-sizing reform will significantly decrease competition compared to the status quo.

894. We are unpersuaded by rehearing requests that argue that the federal right of first refusal associated with the right-sizing reform will create incentives for incumbent transmission providers to use local transmission planning processes to undermine

[2214] *Id.* P 1706.

regional transmission planning processes. Under Order No. 1920's right-sizing reforms, incumbent transmission owners will have an incentive to identify in-kind replacement transmission facilities that could be right-sized to retain a federal right of first refusal over regional transmission facilities, but that incentive does not undermine the regional transmission planning process. Instead, it will enhance regional transmission planning by expanding the range of potential regional transmission solutions to Long-Term Transmission Needs considered through Long-Term Regional Transmission Planning, facilitating the identification and selection of more efficient or cost-effective regional transmission facilities and helping to ensure just and reasonable Commission-jurisdictional rates. Moreover, because Order No. 1920 requires that a right-sized replacement transmission facility be evaluated in the same manner as any other proposed Long-Term Regional Transmission Facility to determine whether it is the more efficient or cost-effective transmission facility to address the transmission need,[2215] a right-sized replacement transmission facility will be selected only where it is the more efficient or cost-effective transmission solution. As such, there is no guarantee that an in-kind replacement transmission facility that a transmission provider identifies in its in-kind replacement estimates list will be right-sized and selected. To the extent that the evaluation of a transmission provider's in-kind replacement transmission facility determines that the in-kind replacement transmission facility cannot be right-sized to

[2215] *Id.* P 1681.

more efficiently or cost-effectively address Long-Term Transmission Needs, then it will not be selected as a right-sized replacement transmission facility.

3. Confidentiality of In-Kind Replacement Estimates

a. Order No. 1920

895. In Order No. 1920, the Commission explained that to the extent customers or stakeholders request access to a transmission provider's list of in-kind replacement estimates, that transmission provider may subject access to that list of in-kind replacement estimates to confidentiality provisions. However, the Commission added that, once transmission providers have determined, as part of Long-Term Regional Transmission Planning, that an in-kind replacement transmission facility can be right-sized to constitute a right-sized replacement transmission facility, the transmission providers must make public the underlying in-kind replacement transmission facility.[2216]

b. Requests for Rehearing and Clarification

896. In their rehearing requests, Dominion and Indicated PJM TOs argue that the Commission's decision on confidentiality for in-kind replacement estimate lists fails to adequately address concerns regarding the possible harm caused by release of the in-kind replacement estimate lists.[2217] Both Dominion and Indicated PJM TOs argue that considering the Commission's determination that once a replacement transmission

[2216] Order No. 1920, 187 FERC ¶ 61,068 at P 1736.

[2217] Dominion Rehearing Request at 36-37; Indicated PJM TOs Rehearing Request at 6-7.

facility can be right-sized, that information will be made publicly available to stakeholders, there is limited value in providing the in-kind replacement estimate list to others.[2218]

897. Further, Indicated PJM TOs argue that confidentiality agreements or provisions do not provide adequate protection against the damage of disclosure of in-kind replacement estimate lists since non-disclosure agreements do not impose any specific safeguards on the information disclosed.[2219] Indicated PJM TOs note that the Commission's general Non-Disclosure Agreement for CEII provides that violations of that agreement "may result in criminal or civil sanctions" against the recipient, and the Commission's Model Protective Order provides that "[a]ny violation of this Protective Order and of any Non-Disclosure Certificate executed hereunder shall constitute a violation of an order of the Commission."[2220] Indicated PJM TOs argue that the requirement that a transmission owner make public 10-years' worth of replacement information before transmission plans are made public as part of the Long-Term Regional Transmission Planning process gives

[2218] Dominion Rehearing Request at 36-37; Indicated PJM TOs Rehearing Request at 7-8.

[2219] Indicated PJM TOs Rehearing Request at 8-9.

[2220] *Id.* at 9 (citing FERC, CEII General Non-Disclosure Agreement (Apr. 19, 2020), https://www.ferc.gov/media/1928; FERC, Model Protective Order (May 11, 2020), available at https://www.ferc.gov/administrative-litigation-0).

competing developers a competitive advantage that is inconsistent with the FPA's prohibition on undue discrimination and preferences.[2221]

c. Commission Determination

898. In response to Dominion's and Indicated PJM TOs' arguments regarding the possible harm caused by release of the in-kind replacement estimate lists, we continue to find that existing rules governing confidential or commercially sensitive information provide for the safekeeping of that information. We note that Order No. 890 required transmission providers, in consultation with affected parties, to develop mechanisms like confidentiality agreements and password-protected access to information, in order to manage confidentiality and CEII concerns.[2222] To the extent that transmission providers believe that existing provisions are inadequate, they may submit an FPA section 205 filing with additional protections, and the Commission will evaluate them to ensure they are just and reasonable and otherwise comply with the applicable requirements. Moreover, in determining that disclosure of in-kind replacement estimate lists may occur subject to confidentiality provisions, the Commission balanced concerns about disclosure against the importance of transparency and meaningful stakeholder participation in regional transmission planning and cost allocation processes, as required under Order Nos. 890 and 1000. We continue to find, consistent with prior precedent, that disclosure

[2221] *Id.* at 10.

[2222] Order No. 890, 118 FERC ¶ 61,119 at P 460.

subject to appropriate mechanisms for confidentiality strikes an appropriate balance between these interests.[2223]

XII. Interregional Transmission Coordination

A. Order No. 1920

899. In Order No. 1920, the Commission required transmission providers in each transmission planning region to revise their existing interregional transmission coordination procedures to reflect the Long-Term Regional Transmission Planning reforms adopted in Order No. 1920. More specifically, the Commission required transmission providers in neighboring transmission planning regions to revise their existing interregional transmission coordination procedures (and regional transmission planning processes, as needed) to provide for: (1) the sharing of information regarding their respective Long-Term Transmission Needs, as well as Long-Term Regional Transmission Facilities to meet those needs; and (2) the identification and joint evaluation of interregional transmission facilities that may be more efficient or cost-effective transmission facilities to address Long-Term Transmission Needs.[2224]

[2223] *Tri-State Generation & Transmission Ass'n*, 170 FERC ¶ 61,222, at P 27 (2020); *see also Astoria Generating Co. v. N.Y. Indep. Sys. Operator, Inc.*, 136 FERC ¶ 61,155, at PP 21-25 (2011) (adopting protective order and directing respondent to file confidential information and simultaneously release the information to parties who signed non-disclosure certificate); *Pac. Gas Transmission Co.*, 44 FERC ¶ 61,209, at 61,766-67 (1988) (remanding matter to administrative law judge with direction to balance potential harm of disclosing confidential business information sought during discovery against the requesting parties' need for the information).

[2224] Order No. 1920, 187 FERC ¶ 61,068 at P 1751.

Additionally, the Commission required transmission providers in neighboring transmission planning regions to revise their interregional transmission coordination procedures (and regional transmission planning processes, as needed) to allow an entity to propose an interregional transmission facility in the regional transmission planning process as a potential solution to Long-Term Transmission Needs.[2225]

900. The Commission also required transmission providers in each transmission planning region to provide certain additional information concerning Long-Term Regional Transmission Planning on their public websites or through the email list used for communication of information related to interregional transmission coordination procedures.[2226]

B. Comments

901. In its comments, Grid United argues that Order No. 1920 does not solve the challenges of developing transmission, including interregional transmission, and requests that the Commission open a new proceeding focused on interregional transmission and its challenges.[2227]

C. Commission Determination

902. Although we acknowledge Grid United's request that the Commission continue to build upon the progress in Order No. 1920 for regional transmission planning by

[2226] Order No. 1920, 187 FERC ¶ 61,068 at P 1753.

[2227] Grid United June 12, 2024 Comments at 1-2.

addressing interregional transmission, we decline to open a new docket at this time, as requested by Grid United.[2228] We find that Order No. 1920 adequately addressed the interregional transmission coordination reforms needed to account for the rule's Long-Term Regional Transmission Planning reforms.[2229] In particular, we continue to find that the reforms in Order No. 1920, taken together, will ensure that Long-Term Transmission Needs identified through Long-Term Regional Transmission Planning can be considered in existing interregional transmission coordination and cost allocation processes, and that there is an opportunity for transmission providers in neighboring transmission planning regions to consider whether there are interregional transmission facilities that could more efficiently or cost-effectively address the identified Long-Term Transmission Needs, helping to ensure just and reasonable Commission-jurisdictional rates.[2230] Furthermore, as the Commission found in Order No. 1920, and we reiterate here, the Commission currently has an open proceeding in Docket No. AD23-3-000 to consider whether and how to establish a minimum requirement for Interregional Transfer Capability including the transmission planning and cost allocation related to such a requirement.[2231] To the

[2228] As noted above, the pleading filed by Grid United is deficient under 18 CFR 385.712(c)(2). Nevertheless, we address Grid United's arguments to provide clarity. *See infra* Introduction and Background section.

[2229] Order No. 1920, 187 FERC ¶ 61,068 at PP 1740-1758.

[2230] *Id.* P 1754.

extent that the Commission determines that further investigation of this issue is warranted, it can open a new docket at an appropriate time or consider such issues in pending proceedings,[2232] as appropriate.

XIII. Compliance Procedures

A. Order No. 1920

903. In Order No. 1920, the Commission required each transmission provider to submit a compliance filing revising its OATT and other document(s) subject to the Commission's jurisdiction as necessary to demonstrate that it meets all of the requirements adopted in Order No. 1920, except those adopted in the Interregional Transmission Coordination section above, within 10 months of the effective date of Order No. 1920. The Commission explained that a 10-month compliance period allows transmission providers to fully develop proposals to comply with Order No. 1920 and allows stakeholders, including Relevant State Entities, to meaningfully engage in the process of developing such proposals. Additionally, the Commission required transmission providers in each transmission planning region to propose an effective date for the OATT revisions necessary to comply with Order No. 1920 that is no later than the date on which they will commence the first Long-Term Regional Transmission Planning

[2232] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 1758 ("[W]e note that the Commission currently has an open proceeding in Docket No. AD23-3-000 to consider whether and how to establish a minimum requirement for Interregional Transfer Capability, and may consider further reforms in other proceedings, as appropriate.").

cycle.[2233] The Commission noted, however, that transmission providers may propose an earlier effective date for some or all parts of their revised OATTs to allow them to begin implementing any aspects of the required reforms sooner than the one-year deadline to commence the first Long-Term Regional Transmission Planning cycle.[2234]

904. The Commission further required each transmission provider to submit a compliance filing revising its OATT and other document(s) subject to the Commission's jurisdiction as necessary to demonstrate that it meets the interregional transmission coordination requirements within 12 months of the effective date of Order No. 1920. The Commission explained that a longer compliance timeframe will allow transmission providers to coordinate with the transmission providers in each of their neighboring transmission planning regions to develop interregional transmission coordination proposals.[2235]

905. Additionally, the Commission required transmission providers that are not public utilities to adopt the requirements of Order No. 1920 as a condition of maintaining the

[2233] Order No. 1920, 187 FERC ¶ 61,068 at P 1768. The Commission noted that Order No. 1920 required transmission providers in each transmission planning region to propose on compliance a date, no later than one year from the date on which initial filings to comply with Order No. 1920 are due, on which they will commence the first Long-Term Regional Transmission Planning cycle (unless additional time is needed to align the first Long-Term Regional Transmission Planning cycle with existing transmission planning cycles). *Id.*

[2234] *Id.* P 1768.

[2235] *Id.* P 1770.

status of their safe harbor tariffs or otherwise satisfying the reciprocity requirement of Order No. 888.[2236]

906. Finally, in Order No. 1920, the Commission explained that it made no changes to the standards used to judge requested variations, as described in Order Nos. 888, 2000, 890, and 1000 and, accordingly, declined a request to apply the independent entity variation standard, rather than the "consistent with or superior to" standard, for proposed deviations from the requirements of Order No. 1920.[2237] The Commission stated that, consistent with findings in Order No. 890, the Commission will continue to apply the "consistent with or superior to" standard in the context of transmission planning.[2238] The Commission explained that, to the extent that a transmission provider believes that it already complies with any of the requirements in Order No. 1920, it should describe in its compliance filing how the relevant requirements are satisfied, including by referencing specific tariff sheets already on file with the Commission.[2239]

[2239] *Id.* P 1773.

B. Requests for Rehearing and Clarification

907. Dominion and NARUC request rehearing of Order No. 1920's compliance timeframes.[2240] Dominion argues that the Commission failed to consider that many of the same personnel responsible for implementing Order No. 2023 are also responsible for managing the implementation of Order No. 1920's requirements.[2241] NARUC asserts that Order No. 1920's 10-month compliance deadline is insufficient to allow state entities to meaningfully engage on developing cost allocation proposals given existing state retail regulatory duties, the steep learning curve on issues related to Order No. 1920, and internal legal and procedural issues they will need to sort through. NARUC suggests that the record justifies a 14-month compliance period.[2242]

908. Dairyland and PJM request rehearing of Order No. 1920's requirement that transmission providers demonstrate proposed deviations from the requirements of Order No. 1920 are "consistent with or superior to" the requirements of Order No. 1920.[2243] Both Dairyland and PJM request that the Commission adopt an independent entity variation standard for compliance with the final rule. Dairyland argues that the Commission failed to consider information and arguments submitted in support of the

[2240] Dominion Rehearing Request at 37-39; NARUC Rehearing Request at 18-21.

[2241] Dominion Rehearing Request at 38 (citing *State Farm*, 463 U.S. at 43).

[2242] NARUC Rehearing Request at 20-21.

[2243] Dairyland Rehearing Request at 3-7; PJM Rehearing Request at 10-14.

independent entity variation[2244] and made no attempt to explain why the precedent of Order No. 2003, which identified bases for a different compliance standard for independent entities, is distinguishable or should not be used here.[2245] Along similar lines, PJM argues that aspects of Order No. 1920 are arbitrary and capricious because: (1) the final rule is internally inconsistent given the Commission's recognition of the need for regional flexibility while also including "numerous prescriptive requirements" and rejecting requests to apply an "independent entity variation" standard of review and instead applying the "consistent with or superior to" standard for proposed deviations from the final rule;[2246] and (2) the Commission failed to consider the evidence offered by ISO/RTOs that they need flexibility to implement Long-Term Regional Transmission Planning.[2247]

909. APPA and TAPS request clarification of Order No. 1920's requirements for consultation with stakeholders.[2248] APPA requests that the Commission clarify that transmission providers have an obligation to consult with stakeholders—including public power entities and load-serving entities—in developing compliance filings.[2249] TAPS

[2244] Dairyland Rehearing Request at 4.

[2245] *Id.* at 3-4, 6-7; *see also* PJM Rehearing Request at 13 n.60.

[2247] PJM Rehearing Request at 11-14, 42.

[2248] APPA Rehearing Request at 6-7; TAPS Rehearing Request at 14-19.

[2249] APPA Rehearing Request at 7.

requests the Commission to clarify that Order No. 1000's general obligation to consult with stakeholders in developing the associated transmission provider's compliance filing applies to all aspects of Order No. 1920 compliance filings, including the evaluation process, selection criteria, and the calculation of benefits.[2250]

910. In its rehearing request, Large Public Power argues that the Commission should clarify that non-public utilities can satisfy the reciprocity requirement of Order No. 888 through one of three means: (1) providing service to a public utility transmission provider under a safe harbor tariff; (2) providing service under a bilateral agreement; or (3) seeking waiver.[2251]

911. SPP requests clarification from the Commission that SPP can deviate from the specific requirements of Order No. 1920 and propose its own Consolidated Planning Process. SPP requests that the Commission clarify that a transmission provider may propose on compliance a new transmission planning process and cost allocation method that deviates from the requirements of Order No. 1920, and that the Commission could issue an order approving such a cost allocation process as consistent with or superior to the requirements of Order No. 1920.[2252]

912. WIRES states that the Commission should grant clarification or, in the alternative, rehearing, that transmission providers are not required to implement the proposed tariff

[2250] TAPS Rehearing Request at 18-19.

[2251] Large Public Power Rehearing Request at 23-24.

[2252] SPP Rehearing Request at 2-4.

revisions submitted in compliance with Order No. 1920 until the Commission issues "a final order on compliance."[2253] WIRES states that Order No. 1920 could be read to create a scenario where transmission providers would be required to begin implementing their OATT provisions submitted in compliance with the requirements of Order No. 1920 *before* receiving a Commission order on compliance accepting such revised Tariff provisions. WIRES argues that this would put transmission providers in the untenable position of expending a significant amount of time and resources in implementing Long-Term Regional Transmission Planning cycles that the Commission could find in a later order are not compliant with Order No. 1920.[2254]

913. Versant Power requests that the Commission clarify, or in the alternative grant rehearing, regarding: (1) what is generally required for a transmission provider to receive a waiver of Order No. 1920's requirements; and (2) whether and how waivers of previous, relevant orders affect Order No. 1920's requirements for transmission providers with those waivers.[2255]

C. Commission Determination

914. We sustain Order No. 1920's requirement that each transmission provider submit a compliance filing within 10 months of the effective date of Order No. 1920 revising its

[2253] WIRES Rehearing Request at 5-6, 16-18.

[2254] WIRES Rehearing Request at 16-18.

[2255] Versant Power Rehearing Request at 9-16. Versant Power notes that its request for clarification may be withdrawn because of a separate waiver filing. *Id.* at 1 n.4. Versant Power withdrew its rehearing request on September 10, 2024.

OATT and other document(s) subject to the Commission's jurisdiction as necessary to demonstrate that it meets the requirements adopted in Order No. 1920, except those requirements adopted in the Interregional Transmission Coordination section above. As we noted in Order No. 1920, we continue to find that a 10-month compliance period will allow transmission providers adequate time to fully develop proposals to comply with Order No. 1920.[2256] We also sustain Order No. 1920's requirement that each transmission provider submit a separate compliance filing within 12 months of the effective date of Order No. 1920 revising its OATT and other document(s) subject to the Commission's jurisdiction as necessary to demonstrate that it meets the interregional transmission coordination requirements adopted in Order No. 1920.[2257] Nevertheless, as noted above in the Duration of the Engagement Period section above, if we grant an extension of the required Engagement Period when Relevant State Entities make a showing that they require additional time to finalize cost allocation discussions, we will also, as appropriate, extend, *sua sponte*, the relevant Order No. 1920 compliance deadlines to ensure that any extension of the Engagement Period would not conflict with the required compliance deadlines.

915. We clarify that the effective date associated with this order on rehearing and clarification does not extend the relevant compliance deadlines associated with Order No. 1920. In calculating the required dates for compliance filings (e.g., 10 months for

[2256] Order No. 1920, 187 FERC ¶ 61,068 at P 1768.

[2257] *Id.* P 1770.

revisions to a transmission provider's OATT and other document(s) subject to the Commission's jurisdiction as necessary to demonstrate that it meets the requirements adopted in Order No. 1920, and 12 months for revisions to a transmission provider's OATT and other document(s) subject to the Commission's jurisdiction as necessary to demonstrate that it meets the interregional transmission coordination requirements adopted in Order No. 1920), transmission providers should use the effective date of Order No. 1920 (i.e., August 12, 2024) and not the effective date for the changes to Order No. 1920 made in this order on rehearing and clarification.

916. We are unpersuaded by Dominion's and NARUC's arguments that the Commission should require a longer compliance period. We note that in Order No. 1920 the Commission modified the NOPR proposal for an eight-month compliance period to allow an additional two months.[2258] While we appreciate Dominion's concerns regarding personnel responsible for implementing both Order Nos. 1920 and 2023, we believe that we have provided sufficient time for transmission providers to develop compliance filings.

917. We also sustain Order No. 1920's requirement that, consistent with the Commission's findings in Order No. 890, transmission providers must demonstrate that proposed deviations from the requirements of Order No. 1920 are "consistent with or superior to" the requirements in Order No. 1920.[2259]

[2258] *Id.* P 1768.

[2259] *Id.* P 1772 (citing Order No. 890, 118 FERC ¶ 61,119 at P 160).

918. We disagree with Dairyland's assertion that the Commission's use of the "consistent with or superior to" standard in Order No. 1920 is an unexplained departure from Commission precedent.[2260] To the contrary, in Order No. 1920, the Commission made no changes to the standard used to judge requested variations in the context of transmission planning, including in Order Nos. 888, 2000, 890, and 1000,[2261] and instead followed precedent in applying the "consistent with or superior to" standard of review to proposed new and existing variations from its transmission planning and cost allocation requirements.[2262] Rather, allowing for the use of the independent entity variation standard of review in this proceeding, as Dairyland and PJM request, would be a departure from this line of precedent and an importation of the independent entity variation standard from the interconnection context into the transmission planning context that would require further explanation.[2263] As discussed below, neither Dairyland nor PJM justify such a departure.

919. Further, we disagree with PJM's and Dairyland's claims that Order No. 1920 is internally inconsistent because it recognizes the need for regional flexibility while also including prescriptive requirements without allowing for independent entity

[2260] Dairyland Rehearing Request at 3, 6.

[2261] Order No. 1000, 136 FERC ¶ 61,051 at P 815; Order No. 890, 118 FERC ¶ 61,119 at P 109; Order No. 2000, FERC Stats. & Regs. ¶ 31,089 at 31,164; Order No. 888, FERC Stats. & Regs. ¶ 31,036, at 31,769-70.

[2262] Order No. 1920, 187 FERC ¶ 61,068 at P 1772.

[2263] *See FCC v. Fox Television Stations, Inc.*, 556 U.S. at 515.

variations.[2264] In a number of areas, Order No. 1920 provides transmission providers with the flexibility to accommodate regional differences, and this flexibility can be incorporated into the regional transmission planning requirements.[2265] Although in other areas the Commission provided less flexibility, we believe that the Commission struck a reasonable overall balance in Order No. 1920 between, on the one hand, transmission providers' need for flexibility in implementing Long-Term Regional Transmission Planning in their transmission planning regions and, on the other hand, ensuring that transmission providers adopt reforms that will result in transmission providers identifying, evaluating, and selecting more efficient or cost-effective regional transmission facilities to address Long-Term Transmission Needs and thus Commission-jurisdictional rates that are just and reasonable and not unduly discriminatory or preferential.[2266]

920. We are unpersuaded by PJM's and Dairyland's arguments that the rationale for application of the independent entity variation standard to RTOs/ISOs in the

[2264] PJM Rehearing Request at 11-12; Dairyland Rehearing Request at 7.

[2265] For example, Order No. 1920 provides for flexibility such as: (1) allowing transmission providers to measure and use additional benefits in Long-Term Regional Transmission Planning; (2) allowing transmission providers to develop evaluation processes and selection criteria that can accommodate regional differences; and (3) declining to impose a selection requirement as transmission providers require the flexibility to balance competing interests in the transmission planning region and to exercise engineering judgment to ensure the reliable operation of the transmission system and compliance with a variety of regulatory requirements. *See* Order No. 1920, 187 FERC ¶ 61,068 at PP 729, 924, 1027.

[2266] Order No. 1920, 187 FERC ¶ 61,068 at P 237.

interconnection context in Order No. 2003 applies equally to the circumstances of Order No. 1920.[2267] The requirements of Order No. 2003 were established to achieve greater standardization of interconnection terms and conditions and to address evidence of undue discrimination in interconnection processes.[2268] The Commission granted independent entities greater flexibility to deviate from the provisions of the *pro forma* OATT on the basis that these entities do not own generation and therefore face fewer incentives to act in an unduly discriminatory or preferential manner toward certain generators.[2269] That rationale does not apply to the requirements in Order No. 1920, which were adopted to address deficiencies in regional transmission planning processes, as those processes fail to identify, evaluate, and select regional transmission facilities that can more efficiently or cost-effectively meet Long-Term Transmission Needs and therefore to ensure just and

[2267] PJM Rehearing Request at 13 n.60 (citing *Standardization of Generator Interconnection Agreements & Procs.*, Order No. 2003, 68 FR 49846 (Aug. 19, 2003), 104 FERC ¶ 61,103 (2003), *order on reh'g*, Order No. 2003-A, 69 FR 15932 (Mar. 26, 2004), 106 FERC ¶ 61,220, at PP 756, 759, *order on reh'g*, Order No. 2003-B, 70 FR 265 (Jan. 4, 2005), 109 FERC ¶ 61,287 (2004), *order on reh'g*, Order No. 2003-C, 70 FR 37661 (June 30, 2005), 111 FERC ¶ 61,401 (2005), *aff'd sub nom. Nat'l Ass'n of Regul. Util. Comm'rs v. FERC*, 475 F.3d 1277; *Improvements to Generator Interconnection Procs. & Agreements*, Order No. 2023, 88 FR 61014 (Sept. 6, 2023), 184 FERC ¶ 61,054, at P 1764, *order on reh'g*, 185 FERC ¶ 61,063 (2023), *order on reh'g*, Order No. 2023-A, 89 FR 27006 (Apr. 16, 2024), 186 FERC ¶ 61,199, *errata notice*, 188 FERC ¶ 61,134 (2024)); Dairyland Rehearing Request at 5, 6 (citing MISO NOPR Reply Comments at 5-8).

[2268] Order No. 2003, 104 FERC ¶ 61,103 at PP 11-12.

[2269] *Id.* PP 822, 827; Order No. 2003-A, 106 FERC ¶ 61,220 at P 759.

reasonable rates.[2270] The need for regional transmission planning processes that meet the Commission's requirements in Order No. 1920 applies to all transmission providers to the same extent regardless of their independence or complexity. Beyond noting the independence and complexity of RTOs/ISOs, neither PJM nor Dairyland have justified or offered evidence of why RTOs/ISOs should be treated differently than other transmission providers for purposes of compliance with Order No. 1920's requirements.

921. However, in light of PJM's and Dairyland's arguments, we clarify that, in analyzing Order No. 1920 compliance filings, we will apply the "consistent with or superior to" standard to proposed variations from *all* requirements of Order No. 1920 and not limit the standard to proposed variations from *pro forma* OATT provisions developed in Order No. 1920. Consistent with Commission practice,[2271] it is appropriate to apply

the "consistent with or superior to" standard both to variations from *pro forma* OATT provisions and to variations from requirements not accompanied by *pro forma* OATT provisions (i.e., those requirements that transmission providers must satisfy by developing or revising their own OATT provisions). The "consistent with or superior to" standard "is a tool for ensuring that a proposed tariff revision will still meet the standards of the FPA" despite varying from the "minimum provisions necessary" to ensure just, reasonable, and not unduly discriminatory or preferential Commission-jurisdictional rates.[2272] Both *pro forma* OATT provisions and requirements not accompanied by *pro forma* OATT provisions set "common starting point[s]"[2273] to ensure that Commission-jurisdictional rates satisfy the requirements of the FPA. The Commission will review proposed variations from requirements established in Order No. 1920 to ensure that they continue to meet the requirements of FPA sections 205 and 206.

---

[2273] *N.Y. State Elec. & Gas Corp.*, 82 FERC at 61,822 n.4.

922. In response to SPP's clarification request regarding its own Consolidated Planning Process, we reiterate that Order No. 1920 requires transmission providers to demonstrate that proposed deviations from Order No. 1920 are "consistent with or superior to" the requirements in Order No. 1920.[2274] To the extent that a transmission provider, like SPP, believes that its existing practices or potential provisions submitted as part of its compliance filing deviate from Order No. 1920's requirements, it must demonstrate that any such deviations, including any existing processes or OATT provisions, are consistent with or superior to the requirements of Order No. 1920.

923. We grant APPA's and TAPS' requests for clarification on the role of stakeholders in developing transmission providers' compliance filings. Specifically, we clarify that transmission providers must consult with their stakeholders to develop the processes, procedures, and OATT revisions necessary to comply with Order No. 1920.[2275] We note that this requirement is consistent with the approach that the Commission took in Order Nos. 890 and 1000.[2276]

924. We grant Large Public Power's clarification request regarding reciprocity. Order No. 1920 required that transmission providers that are not public utilities must adopt the

---

[2274] Order No. 1920, 187 FERC ¶ 61,068 at P 1772.

[2275] We note that the requirement for transmission providers to consult with stakeholders to develop their compliance filings is separate from and in addition to Order No. 1920's requirement for transmission providers to conduct an Engagement Period for Relevant State Entities, as discussed in the Cost Allocation section above.

[2276] *See., e.g.*, Order No. 890, 118 FERC ¶ 61,119 at P 582; Order No. 1000, 136 FERC ¶ 61,051 at PP 151, 206, 227, 336, 588, 793.

requirements of Order No. 1920 as a condition of maintaining the status of their safe harbor tariffs or otherwise satisfy the reciprocity requirement of Order No. 888.2277 As relevant to Large Public Power's clarification request, Order No. 888 provides that a non-public transmission provider may satisfy the reciprocity condition in one of three ways: (1) it may provide service under a tariff that has been approved by the Commission under the voluntary "safe harbor" provision of the *pro forma* OATT; (2) it may provide service to a public utility transmission provider under a bilateral agreement; or (3) it may seek a waiver of the reciprocity condition from the transmission provider.2278

925. Issues concerning effective dates are most appropriately addressed in specific compliance proceedings and, therefore, we decline to grant WIRES' clarification request. However, as explained in the Implementation of Long-Term Regional Transmission Planning section above, we set aside, in part, Order No. 1920's requirement that transmission providers in each transmission planning region must propose on compliance a date, no later than one year from the date on which initial filings to comply with the final rule are due, on which they will commence the first Long-Term Regional Transmission Planning cycle[2279] and instead require transmission providers to propose on compliance a date, no later than *two* years from the date on which initial filings to comply

[2277] Order No. 1920, 187 FERC ¶ 61,068 at P 1771 (citing Order No. 888, FERC Stats. & Regs. ¶ 31,036 at 31,760-63).

[2278] Order No. 888, FERC Stats. & Regs. ¶ 31,036 at 31,760-63.

[2279] Order No. 1920, 187 FERC ¶ 61,068 at P 1072.

with Order No. 1920 are due, on which they will commence the first Long-Term Regional Transmission Planning cycle. Because we sustain Order No. 1920's requirement that transmission providers must propose an effective date for the OATT revisions necessary to comply with Order No. 1920 that is no later than the date on which they will commence the first Long-Term Regional Transmission Planning cycle,[2280] we note that this modification should help to address WIRES' concern.

926. We note that Versant Power's rehearing request has been withdrawn.[2281] Nevertheless, we clarify that, consistent with Order No. 890 and Order No. 1000, entities that have existing waivers of the obligation to file an OATT or otherwise offer open access transmission service in accordance with Order No. 888, as well as entities that have been granted waiver of the regional transmission planning requirements of Order No. 1000, do not also have to seek waiver of Order No. 1920.[2282] This clarification,

---

[2280] Order No. 1920, 187 FERC ¶ 61,068 at P 1768.

[2281] *See* Versant Power September 10, 2024 Notice of Withdrawal. Pursuant to Rule 216 of the Commission's Rules of Practice and Procedure, the withdrawal of any pleading is effective at the end of 15 days from the date of the filing if no motion in opposition to the notice of withdrawal is filed within that period and if the Commission takes no action disallowing withdrawal. 18 CFR 385.216. No motion in opposition to Versant Power's Notice of Withdrawal has been filed, and its request for rehearing accordingly is withdrawn.

[2282] Order No. 1000-A, 139 FERC ¶ 61,132 at P 753 & n.880 (2012); *see also* Order No. 890, 118 FERC ¶ 61,119 at P 135 n.105 ("The Commission clarifies that existing waivers of the obligation to file an OATT or otherwise offer open access transmission service in accordance with Order No. 888 shall remain in place. The reforms to the pro forma OATT adopted in this Final Rule therefore do not apply to transmission providers with such waivers, although we expect those transmission providers to participate in the regional planning processes in place in their regions, as discussed in more detail in section V.B. Whether an existing waiver of OATT requirements should be

however, is not meant to affect the ability of an entity that does not have an existing waiver to seek one. The Commission will consider requests for waiver of Order No. 1920 on a case-by-case basis from any entity that believes it meets the criteria for such waiver.

XIV. Overarching Logical Outgrowth Challenges

A. Requests for Rehearing

927. Several rehearing parties argue broadly that Order No. 1920 is not a logical outgrowth of the NOPR and therefore violates the notice-and-comment requirements of the APA.[2283] Arizona Commission asserts that the Commission failed to provide notice of and opportunity to comment on six "fundamental" changes between the NOPR and Order No. 1920 and that, because such changes are not logical outgrowths of the NOPR, the Commission violated the APA's notice-and-comment requirements, rendering Order No. 1920 unlawful.[2284] Specifically, Arizona Commission alleges that Order No. 1920, unlike the NOPR: (1) imposed preferential and corporate-driven costs on consumers in non-consenting states by requiring the filing of one or more *ex ante* cost allocation methods to apply to selected Long-Term Transmission Facilities; (2) mandated a specific

revoked will be considered on a case-by-case basis in light of the circumstances surrounding the particular transmission provider.").

[2283] Arizona Commission Rehearing Request at 18-19 (citing 5 U.S.C. 706(2)(A), (C), (D)); Designated Retail Regulators Rehearing Request at 44, 49 (citing 5 U.S.C. 553); NRECA Rehearing Request at 6, 19 (citing 5 U.SC. 553).

[2284] Arizona Commission Rehearing Request at 18-19.

set of "planning criteria" and purported benefits, which is "simply a way of 'pre-cooking' outcomes"; (3) abandoned regional cost allocation principle (6); (4) effectively eliminated the use of a voluntary State Agreement Process; (5) left the CWIP incentive intact; and (6) made local transmission planning less transparent.[2285]

928. NRECA alleges that Order No. 1920 violated the APA's notice-and-comment requirements by: (1) mandating that transmission providers use a set of seven required benefits for evaluating and selecting Long-Term Regional Transmission Facilities; (2) imposing specific requirements for limited reevaluation of previously selected Long-Term Regional Transmission Facilities; (3) requiring that certain interconnection-related transmission needs must be evaluated for selection in existing Order No. 1000 regional transmission planning and cost allocation processes; (4) not requiring Long-Term Regional Transmission Planning cost allocation methods to comply with all of the Commission's six regional cost allocation principles; and (5) substantially diminishing the proposed role of state regulators in Long-Term Regional Transmission Planning and cost allocation.[2286] NRECA requests that the Commission withdraw Order No. 1920 and issue a supplemental NOPR because "so many of [Order No. 1920's] key provisions" are "brand new" and were not subjected to public comment.[2287]

[2285] Arizona Commission Rehearing Request at 18-19. *Id.*

[2286] NRECA Rehearing Request at 6.

[2287] *Id.* at 19.

929. Designated Retail Regulators contend that Order No. 1920 contains a number of significant changes that drastically depart from the NOPR, rendering the final rule "surprisingly distant" from and not a logical outgrowth of the NOPR, in violation of the APA's notice-and-comment requirements.[2288] Designated Retail Regulators add that Order No. 1920 "is in essence a new rule that requires new opportunities for comment and input."[2289] Designated Retail Regulators claim that Order No. 1920 differs from the NOPR because Order No. 1920: (1) declined to adopt the NOPR proposal requiring transmission providers to seek the agreement of Relevant State Entities and substantially diminished Relevant State Entity involvement in cost allocation; (2) provided transmission providers complete discretion to decide whether to file a State Agreement Process or Long-Term Regional Transmission Cost Allocation Method in its tariff, even if agreed to by Relevant State Entities; and (3) did not require transmission providers to obtain the support of Relevant State Entities prior to proposing an evaluation process and selection criteria on compliance.[2290]

B. Commission Determination

930. We disagree with Arizona Commission's, Designated Retail Regulators', and NRECA's arguments that Order No. 1920 violates the APA's notice-and-comment

[2288] Designated Retail Regulators Rehearing Request at 46-50 (quoting *Int'l Union, United Mine Workers of Am. v. Mine Safety and Health Admin.*, 407 F.3d 1250, 1260 (D.C. Cir. 2005)).

[2289] *Id.* at 10.

[2290] *Id.* at 46-50.

requirements and is not a logical outgrowth of the NOPR. Relatedly, we decline to adopt NRECA's suggestion that the Commission withdraw Order No. 1920 in its entirety and issue a supplemental NOPR. As an initial matter, rehearing parties' conclusory arguments lack the specificity required to satisfy FPA section 313(a), which states that an "application for rehearing shall set forth *specifically* the ground or grounds upon which such application is based."[2291] In claiming that Order No. 1920 violated the APA's notice-and-comment requirements, rehearing parties merely point to sections or provisions of Order No. 1920 that allegedly run afoul of those requirements and then assert, without support or further explanation, that Order No. 1920, as a whole, violates the APA's notice-and-comment provision. Arizona Commission, Designated Retail Regulators, and NRECA do not cite, and we are unaware of, any precedent supporting what appears to be their claim that cumulative logical outgrowth challenges to individual provisions would compel a finding that Order No. 1920, as a whole, is not a logical outgrowth of the NOPR. Accordingly, we reject this sweeping argument as lacking the specificity required on rehearing.[2292]

931. In any event, these arguments also lack merit. As discussed throughout this order, the individual provisions of Order No. 1920, which certain rehearing parties claim the

[2291] 16 U.S.C. 825*l*(a) (emphasis added).

[2292] A rehearing request must set forth with specificity the grounds on which the request is based. 16 U.S.C. 825*l*(a); 18 CFR 385.713(c)(2) (2024); *see ZEP Grand Prairie Wind, LLC*, 183 FERC ¶ 61,150, at P 10; *Ind. Util. Regul. Comm'n v. FERC*, 668 F.3d at 738-40.

Commission adopted without adequate notice and opportunity to comment, are, in fact, logical outgrowths of the NOPR and otherwise satisfy the APA's notice-and-comment requirements.[2293] Thus, given that the constituent components of Order No. 1920 satisfy the APA's notice-and-comment requirements, the sum of those components—i.e., Order No. 1920 as a whole—necessarily also satisfies these requirements, and rehearing parties have not shown otherwise.

XV. Information Collection Statement

932. The Paperwork Reduction Act[2294] requires each Federal agency to seek and obtain the Office of Management and Budget's (OMB) approval before undertaking a collection of information directed to 10 or more persons or contained in a rule of general applicability. OMB regulations require approval of certain information collection requirements contained in final rules published in the *Federal Register*.[2295] Upon approval of a collection of information, OMB will assign an OMB control number and an expiration date. Respondents subject to the filing requirements of this order on rehearing

[2293] *See supra* Requirement for Transmission Providers to Use and Measure a Set of Seven Required Benefits section; Minimum Requirements section; Role of Relevant State Entities section; Reevaluation section; Transmission Planning Process Evaluation section; Obligation to File an *Ex Ante* Long-Term Regional Transmission Cost Allocation Method and Its Use as a Backstop section; Design and Operation of the Engagement Period section; Regional Cost Allocation Principles for Long-Term Regional Transmission Facilities section; General Benefits Requirements Related to Cost Allocation section; CWIP section.

[2294] 44 U.S.C. 3501-3521.

[2295] *See* 5 CFR 1320.12 (2024).

will not be penalized for failing to respond to the collection of information unless the collection of information displays a valid OMB control number.

933. **Summary:** On rehearing of Order No. 1920, the Commission is further revising the *pro forma* OATT to remedy deficiencies in the Commission's existing regional transmission planning and cost allocation and local transmission planning requirements. This order on rehearing addresses arguments raised on rehearing, sets aside, in part, and clarifies Order No. 1920. The information collection requirements included in Order No. 1920 were previously approved by OMB under the FERC information collection number FERC-917: *Electric Transmission Facilities* (OMB Control No. 1902-0233). Order No. 1920 required transmission providers to conduct Long-Term Regional Transmission Planning to ensure the identification, evaluation, and selection, as well as the allocation of the costs, of more efficient or cost-effective regional transmission solutions to address Long-Term Transmission Needs.

934. Previously, the Commission submitted to OMB the information collection requirements arising from Order No. 1920, and OMB approved those requirements. In this order on rehearing, the Commission makes five substantive changes to those requirements. In Order No. 1920, the Commission required transmission providers in each transmission planning region to incorporate seven specific categories of factors in the development of Long-Term Scenarios.[2296] Here, we set aside, in part, the requirement for transmission providers to incorporate seven specific categories of factors in the

[2296] Order No. 1920, 187 FERC ¶ 61,068 at P 409.

development of Long-Term Scenarios by excluding corporate commitments from Factor Category Seven. We no longer require transmission providers to separately identify corporate commitments as a factor in their development of Long-Term Scenarios given that the effects of such commitments will be sufficiently incorporated in Long-Term Regional Transmission Planning through the incorporation of other Factor Categories.

935. In Order No. 1920, the Commission required transmission providers in each transmission planning region to develop, at least once during the five-year Long-Term Regional Transmission Planning cycle, at least three distinct Long-Term Scenarios.[2297] Here, we clarify that transmission providers, when requested by Relevant State Entities in a transmission planning region, are required to conduct a reasonable number of additional analyses or scenarios, to provide Relevant State Entities with information that they can use to inform the application of Long-Term Regional Cost Allocation Method(s) or the development of cost allocation methods through the State Agreement Process(es).

936. In Order No. 1920, the Commission required transmission providers in each transmission planning region to revise the regional transmission planning process in their OATTs to outline an open and transparent process that provides stakeholders, including federally-recognized Tribes and states, with a meaningful opportunity to propose potential factors and to provide timely input on how to account for specific factors in the development of Long-Term Scenarios.[2298] In addition, the Commission required

[2297] *Id.* P 559.

[2298] *Id.* P 528.

transmission providers to post this information after stakeholders, including states, have had the meaningful opportunity to propose potential factors and to provide input on how to account for specific factors in the development of Long-Term Scenarios.[2299] Here, we clarify that transmission providers must consult with and consider the positions of the Relevant State Entities and any other entity authorized by a Relevant State Entity as its representative as to how to account for factors related to states' laws, policies, and regulations when determining the assumptions that will be used in the development of Long-Term Scenarios.

937. In Order No. 1920, the Commission required transmission providers' evaluation processes, including selection criteria, to be transparent and not unduly discriminatory, and the Commission explained that transmission providers' evaluation of Long-Term Regional Transmission Facilities must culminate in a determination that is sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility (or portfolio of Long-Term Regional Transmission Facilities) was selected or not selected.[2300] Here, we clarify that, once a transmission provider makes a selection decision, i.e., for each selected Long-Term Regional Transmission Facility (or portfolio of such Facilities), and, if a State Agreement Process is used, once a cost allocation method is agreed upon, transmission providers must make available, on a password-protected portion of OASIS or other password-protected website, a breakdown

[2299] *Id.* P 533.

[2300] *Id.* P 954

of how those estimated costs will be allocated, by zone (i.e., by transmission provider retail distribution service territory/footprint or RTO/ISO transmission pricing zone), and a quantification of those estimated benefits as imputed to each zone, as such benefits can be reasonably estimated.

938. In Order No. 1920, the Commission declined to require future Engagement Periods, but noted that transmission providers may hold future Engagement Periods if they believe that such periods would be beneficial.[2301] Here, we set aside Order No. 1920, in part, and require that, as part of transmission providers' obligations with respect to transmission planning and cost allocation, transmission providers shall consult with Relevant State Entities (1) prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process(es), or (2) if Relevant State Entities seek, consistent with their chosen method to reach agreement, for the transmission provider to amend that method or process.

939. **Public Reporting Burden:** The estimated burden and cost for the requirements contained in this order on rehearing follow.

Changes Due to Order on Rehearing in Docket No. RM21-17-001[2302]				
A. Area of Modification	**B. Annual Number of Respondents**	**C. Total Annual Estimated Number**	**D. Average Burden Hours & Cost[2303] per Response**	**E. Total Estimated Burden Hours & Total Estimated Cost**

[2301] Order No. 1920, 187 FERC ¶ 61,068 at P 1368.

[2302] In the table, Year 1 figures are one-time implementation hours and cost. "Subsequent years" show ongoing burdens and costs starting in Year 2.

[2303] The hourly cost (for salary plus benefits) uses the figures from the Bureau of

		of Responses		(Column C x Column D)
FERC-917, Electric Transmission Facilities (OMB Control No. 1902-0233)				
Establish a six-month time period during which transmission providers must, among other things, provide a forum for negotiation that enables participation by Relevant State Entities and to discuss potential Long-Term Regional Transmission Cost Allocation Methods and/or a State Agreement Process. Also require transmission providers to consult with Relevant State Entities prior to amending Long-Term Regional Transmission Cost Allocation Methods and/or State Agreement Process on file with the Commission.	48 transmission providers with OATTs	48	One Time: 390 hours; $36,307 Ongoing: 39 hours per year; $3,631 per year	One Time: 18,720 hours; $1,742,734 Ongoing: 1,872 hours per year; $174,274 per year
Participate in Long-Term Regional Transmission Planning, which	48 transmission providers with OATTs	48	One Time: 0 hours; $0	One Time: 0 hours; $0

Labor Statistics (BLS) for three positions involved in the reporting and recordkeeping requirements. These figures include salary (based on BLS data for May 2022, issued April 25, 2023, http://bls.gov/oes/current/naics2_22.htm) and benefits (based on BLS data for September 2023; issued December 15, 2023, http://www.bls.gov/news.release/ecec.nr0.htm) and are Manager (Occupation Code 11-0000, $122.48/hour), Electrical Engineer (Occupation Code 17-2071, $89.04/hour), and File Clerk (Occupation Code 43-4071, $42.43/hour). The hourly cost for the reporting requirements ($105.76) is an average of the hourly cost (wages plus benefits) of a manager and engineer. The hourly cost for recordkeeping requirements uses the cost of a file clerk.

includes creating and updating datasets, developing Long-Term Scenarios, evaluating the benefits of Long-Term Regional Transmission Facilities, and establishing criteria in consultation with Relevant State Entities and stakeholders to select Long-Term Regional Transmission Facilities in the regional transmission plan for purposes of cost allocation.			Ongoing: 4,995 hours per year; $465,010 per year	Ongoing: 239,760 hours per year; $22,320,457 per year
	77 transmission providers without OATTs	77	One Time: 0 hours; $0 Ongoing: 202 hours per year; $18,805 per year	One Time: 0 hours; $0 Ongoing: 15,554 hours per year; $1,448,000 per year
Total new burden for FERC 917 (due to Docket No. RM21-17-001)	48 transmission providers with OATTs	48	One Time: 1,113 hours; $103,614 Ongoing: 5,329 hours per year; $496,103 per year	One Time: 53,424 hours; $4,973,495 Ongoing: 255,792 hours per year; $23,812,956 per year
	77 transmission providers without OATTs	77	One Time: 20 hours; $1,862 Ongoing: 262 hours per year; $24,391 per year	One Time: 1,540 hours; $143,366 Ongoing: 20,174 hours per year; $1,878,099 per year
	Totals for all 125 transmission providers			One Time: 54,964 hours; $5,116,861 Ongoing: 275,966 hours per year; $25,691,055 per year

940. Order No. 1920 estimated the ongoing total burden and cost for the 48 transmission providers with OATTs to be 230,160 total hours per year and $21,426,693 per year. Similarly, Order No. 1920 estimated the ongoing total burden and cost for the 77 transmission providers without OATTs to be 20,020 total hours per year and $1,863,757 per year. Given the prior discussion regarding excluding corporate

commitments from Factor Category Seven and clarifications related to the potential for additional scenarios, additional consultation with Relevant State Entities, and posting or making available certain details of a selection decision on OASIS or other password-protected website, we estimate that these changes will result in an increase of burden hours. Therefore, we estimate that the ongoing total burden and cost, as revised herein, for the 48 transmission providers with OATTs to be 255,792 total hours per year and $23,812,956 per year. Similarly, we estimate that the ongoing total burden and cost, as revised herein, for the 77 transmission providers without OATTs to be 20,174 total hours per year and $1,878,099 per year. No other information collection requirements contained in Order No. 1920 are affected by this order on rehearing.

941. **Title:** Electric Transmission Facilities (FERC-917).

942. **Action:** Revision of collections of information in accordance with Docket No. RM21-17-001.

943. **OMB Control No.:** 1902-0233 (FERC-917)

944. **Respondents:** Transmission providers, including RTOs/ISOs.

945. **Frequency of Information Collection:** One time during Year 1. Occasional times during subsequent years, at least once every five years.

946. **Necessity of Information:** The modifications in this order on rehearing will correct deficiencies in the Commission's existing regional transmission planning and cost allocation and local transmission planning requirements to ensure that Commission-jurisdictional rates remain just and reasonable and not unduly discriminatory or preferential.

947. **Internal Review:** We have reviewed the requirements set forth in this order on rehearing that impose information collection burdens and have determined that such requirements are necessary. These requirements conform to the Commission's need for efficient information collection, communication, and management within the energy industry. We have specific, objective support for the burden estimates associated with the information collection requirements.

948. Interested persons may obtain information on the reporting requirements by contacting Kayla Williams, Office of the Executive Director, Federal Energy Regulatory Commission, 888 First Street, NE, Washington, DC 20426 via email (DataClearance@ferc.gov) or telephone (202) 502-6468.

949. Comments concerning the collection of information and the associated burden estimates may also be sent to: Office of Information and Regulatory Affairs, Office of Management and Budget, 725 17th Street, NW, Washington, DC 20503 [Attention: Desk Officer for the Federal Energy Regulatory Commission]. Due to security concerns, comments should be sent electronically to the following email address: oira_submission@omb.eop.gov. Comments submitted to OMB should refer to FERC-917 (OMB Control No. 1902-0233). Copies of the comments can be sent to the Commission (identified by Docket No. RM21-17-001 and the specific FERC collection number (FERC-917) electronically through https://www.ferc.gov. For those unable to file electronically, comment copies may be filed by USPS mail or by hand (including courier) delivery: Mail via U.S. Postal Service Only: Addressed to: Federal Energy Regulatory Commission, Secretary of the Commission, 888 First Street, NE, Washington,

DC 20426. Or hand (including courier) delivery: Deliver to: Federal Energy Regulatory Commission, 12225 Wilkins Avenue, Rockville, MD 20852.

XVI. Environmental Analysis

950. The Commission is required to prepare an Environmental Assessment or an Environmental Impact Statement for any action that may have a significant adverse effect on the human environment.[2304] The Commission has categorically excluded certain actions from this requirement including approval of actions under FPA sections 205 and 206 relating to the filing of schedules containing all rates and charges for the transmission or sale of electric energy subject to the Commission's jurisdiction, plus the classification, practices, contracts and regulations that affect rates, charges, classifications, and services.[2305] Because the final rule promulgated by Order No. 1920, and revised herein, falls within this categorical exclusion, preparation of an environmental assessment or an environmental impact statement is not required.

XVII. Regulatory Flexibility Act

951. The Regulatory Flexibility Act of 1980 (RFA)[2306] generally requires a description and analysis of final rules that will have significant economic impact on a substantial number of small entities. The Small Business Administration (SBA) sets the threshold

---

[2304] *Reguls. Implementing the Nat'l Env'l Pol'y Act*, Order No. 486, 52 FR 47897 (Dec. 17, 1987), FERC Stats. & Regs. ¶ 30,783 (1987) (cross-referenced at 41 FERC ¶ 61,284).

[2305] 18 CFR 380.4(a)(15).

[2306] 5 U.S.C. 601-612.

for what constitutes a small business. Under SBA's size standards,[2307] RTOs/ISOs, transmission planning regions, and transmission owners all fall under the category of Electric Bulk Power Transmission and Control (NAICS code 221121), with a size threshold of 950 employees (including the entity and its associates).[2308]

952. In Order No. 1920, the Commission, pursuant to RFA section 605(b), certified that the final rule would not have a significant economic impact on a substantial number of small entities.[2309] This order on rehearing does not disturb that conclusion. For the same reasons cited in Order No. 1920,[2310] the final rule, as revised herein, would not have a significant economic impact on a substantial number of small entities.

XVIII. Document Availability

953. In addition to publishing the full text of this document in the *Federal Register*, the Commission provides all interested persons an opportunity to view and/or print the contents of this document via the Internet through the Commission's Home Page (http://www.ferc.gov).

[2307] 13 CFR 121.201.

[2308] The RFA definition of "small entity" refers to the definition provided in the Small Business Act, which defines a "small business concern" as a business that is independently owned and operated and that is not dominant in its field of operation. The SBA's regulations define the threshold for a small Electric Bulk Power Transmission and Control entity (NAICS code 221121) to be 950 employees. 13 CFR 121.201; *see* 5 U.S.C. 601(3) (citing section 3 of the Small Business Act, 15 U.S.C. 632).

Note: Proposed deletions are in brackets and proposed additions are in italics.

ATTACHMENT K

Transmission Planning Process

Local Transmission Planning

The Transmission Provider shall establish a coordinated, open, and transparent local transmission planning process with its Network and Firm Point-to-Point Transmission Customers and other interested parties to ensure that the Transmission System is planned to meet the needs of both the Transmission Provider and its Network and Firm Point-to-Point Transmission Customers on a comparable and not unduly discriminatory basis. The Transmission Provider's coordinated, open, and transparent local transmission planning process shall be provided as an attachment to the Transmission Provider's Tariff. The Transmission Provider's local transmission planning process shall provide stakeholders with meaningful opportunities to participate and provide feedback, and shall satisfy the following nine principles, as defined in Order No. 890: coordination, openness, transparency, information exchange, comparability, dispute resolution, regional participation, economic planning studies, and cost allocation for new transmission projects. The local transmission planning process also shall include the procedures and mechanisms for considering transmission needs driven by Public Policy Requirements consistent with Order No. 1000. The local transmission planning process also shall provide a mechanism for the recovery and allocation of transmission planning

costs consistent with Order No. 890. The description of the Transmission Provider's local transmission planning process must include sufficient detail to enable Transmission Customers to understand:

(i) The process for consulting with customers;

(ii) The notice procedures and anticipated frequency of meetings;

(iii) The methodology, criteria, and processes used to develop a transmission plan;

(iv) The method of disclosure of criteria, assumptions, and data underlying a transmission plan;

(v) The obligations of and methods for Transmission Customers to submit data to the Transmission Provider;

(vi) The dispute resolution process;

(vii) The Transmission Provider's study procedures for economic upgrades to address congestion or the integration of new resources;

(viii) The Transmission Provider's procedures and mechanisms for considering transmission needs driven by Public Policy Requirements, consistent with Order No. 1000; and

(ix) The relevant cost allocation method or methods.

Regional Transmission Planning

The Transmission Provider shall participate in a regional transmission planning process through which transmission facilities and non-transmission alternatives may be proposed and evaluated. The regional transmission planning process also shall develop a regional transmission plan that identifies the transmission facilities necessary to meet the

needs of transmission providers and transmission customers in the transmission planning region. The regional transmission planning process must be consistent with the provision of Commission-jurisdictional services at rates, terms, and conditions that are just and reasonable and not unduly discriminatory or preferential, as described in Order Nos. 1000 and 1920. The regional transmission planning process shall be described in an attachment to the Transmission Provider's Tariff.

The Transmission Provider's regional transmission planning process shall satisfy the following seven principles, as established in Order Nos. 890 and 1000: coordination, openness, transparency, information exchange, comparability, dispute resolution, and economic planning studies. The description of the regional transmission planning process in the Tariff also shall include the procedures and mechanisms for considering transmission needs driven by Public Policy Requirements, consistent with Order No. 1000. The regional transmission planning process shall provide a mechanism for the recovery and allocation of "transmission planning costs" consistent with Order Nos. 890 and 1000.

The regional transmission planning process shall include a clear enrollment process for public and non-public utility transmission providers that make the choice to become part of a transmission planning region. The regional transmission planning process shall be clear that enrollment will subject enrollees to cost allocation if they are found to be beneficiaries of new transmission facilities selected in the regional transmission plan for purposes of cost allocation. Each Transmission Provider shall maintain a list of enrolled entities in the Transmission Provider's Tariff.

The regional transmission planning process must include at least three stakeholder meetings concerning the local transmission planning process of each Transmission Provider that is a member of the transmission planning region. The three meetings must occur before each Transmission Provider's local transmission planning information can be incorporated into the transmission planning region's transmission planning models. The three stakeholder meetings for local transmission planning information are the Assumptions Meeting, the Needs Meeting, and the Solutions Meeting, and the three stakeholder meetings must meet the requirements in Order No. 1920.

As part of the regional transmission planning process, the Transmission Providers in each transmission planning region shall conduct Long-Term Regional Transmission Planning, meaning regional transmission planning on a sufficiently long-term, forward-looking, and comprehensive basis to identify Long-Term Transmission Needs, identify transmission facilities that meet such needs, measure the benefits of those transmission facilities, and evaluate those transmission facilities for potential selection in the regional transmission plan for purposes of cost allocation as the more efficient or cost-effective regional transmission facilities to meet Long-Term Transmission Needs. As part of this Long-Term Regional Transmission Planning, the Transmission Providers in each transmission planning region shall meet the requirements set forth in Order No. 1920, including: (1) identifying Long-Term Transmission Needs and Long-Term Regional Transmission Facilities to meet those needs through the development of Long-Term Scenarios that satisfy the requirements set forth in Order No. 1920; (2) measuring the required seven benefits consistent with the requirements set forth in Order No. 1920;

(3) using the measured benefits to evaluate Long-Term Regional Transmission Facilities; and (4) using selection criteria consistent with the requirements set forth in Order No. 1920 that provide the opportunity for Transmission Providers to select Long-Term Regional Transmission Facilities in the regional transmission plan for purposes of cost allocation that more efficiently or cost-effectively address Long-Term Transmission Needs.

The process through which the Transmission Providers in each transmission planning region develop Long-Term Scenarios must comply with the following six transmission planning principles established in Order No. 890: coordination; openness; transparency; information exchange; comparability; and dispute resolution. The Transmission Providers in each transmission planning region shall outline in their Tariffs an open and transparent process that provides stakeholders, including states, with a meaningful opportunity to propose potential factors and to provide input on how to account for specific factors in the development of Long-Term Scenarios. The Transmission Providers in each transmission planning region shall also outline in their Tariffs an open and transparent process that provides stakeholders, including states, with a meaningful opportunity to propose which future outcomes are probable and can be captured through assumptions made in the development of Long-Term Scenarios. *Transmission Providers shall consult with and consider the positions of the Relevant State Entities, and any other entity authorized by a Relevant State Entity as its representative, as to whether a specific state policy must be accounted for as a factor within each category, how to account for the specific state policy in the development of*

Long-Term Scenarios, and how to adjust the treatment of the specific state policy across Long-Term Scenarios. When requested by Relevant State Entities in a transmission planning region, Transmission Providers shall conduct a reasonable number of additional analyses or scenarios to inform the application of Long-Term Regional Cost Allocation Method(s) or the development of cost allocation methods through the State Agreement Process(es). Transmission Providers shall not use any such additional analyses to identify Long-Term Transmission Needs, identify Long-Term Regional Transmission Facilities, or to meet the requirement that Transmission Providers estimate the costs and measure the benefits of Long-Term Regional Transmission Facilities for purposes of selection. Transmission Providers also shall not condition the selection of a Long-Term Regional Transmission Facility on the information provided in these additional analyses.

The Transmission Providers in each transmission planning region shall include in their Tariffs a general description of how they will measure each of the seven required benefits used to evaluate Long-Term Regional Transmission Facilities. The Transmission Providers in each transmission planning region shall measure and use the seven benefits, as described in Order No. 1920, in Long-Term Regional Transmission Planning.

As part of Long-Term Regional Transmission Planning, the Transmission Providers in each transmission planning region shall include in their Tariffs an evaluation process, including selection criteria, that: (1) is transparent and not unduly discriminatory; (2) aims to ensure that more efficient or cost-effective transmission

facilities are selected in the regional transmission plan for purposes of cost allocation; (3) seeks to maximize benefits accounting for costs over time without over-building transmission facilities; and (4) otherwise satisfies the requirements set forth in Order No. 1920. *Once Transmission Providers make a selection decision ,and, if a State Agreement Process is used, once a cost allocation method is agreed upon, Transmission Providers shall make available, on a password-protected portion of OASIS or other password-protected website, a breakdown of how the estimated costs of a Long-Term Regional Transmission Facility will be allocated, by zone, and a quantification of the Long-Term Regional Transmission Facility's estimated benefits as imputed to each zone, as such benefits can be reasonably estimated.*

The Transmission Providers in each transmission planning region shall include in their Tariffs one or more Long-Term Regional Transmission Cost Allocation Methods, which is an ex ante regional cost allocation method for one or more Long-Term Regional Transmission Facilities (or portfolio of such Facilities) that are selected in the regional transmission plan for purposes of cost allocation and that complies with the requirements set forth in Order No. 1920. The Transmission Providers in each transmission planning region may also, subject to (1) the agreement of Relevant State Entities and (2) Commission acceptance, include in their Tariffs a State Agreement Process. A State Agreement Process is a process by which one or more Relevant State Entities may voluntarily agree to a cost allocation method for Long-Term Regional Transmission Facilities (or a portfolio of such Facilities) either before or no later than six months after the facilities are selected in the regional transmission plan for purposes of cost allocation.

The Tariff must describe how the State Agreement Process will result in a cost allocation being filed, including which entities can participate in the State Agreement Process; what constitutes an agreement on cost allocation in that process; how agreement is communicated to the *T*[t]ransmission *P*[p]rovider; and the circumstances under which, or the information necessary for, a *T*[t]ransmission *P*[p]rovider to file or to consider filing the agreed cost allocation.

Transmission Providers shall include in their Tariffs a description of how they will consult with Relevant State Entities (1) prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process(es), or (2) if Relevant State Entities seek, consistent with their chosen method to reach agreement, for the Transmission Provider to amend that method or process. For a consultation initiated by the Transmission Providers, Transmission Providers shall document publicly on their OASIS or other public website the results of their consultation with Relevant State Entities prior to filing their amendment. For a consultation initiated by Relevant State Entities, if the Transmission Providers choose not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process(es) preferred by Relevant State Entities during the required consultation, Transmission Providers shall document publicly on their OASIS or other public website the results of their consultation with Relevant State Entities, including an explanation for why they have chosen not to propose any amendments.

As part of evaluating new regional transmission facilities, as well as upgrades to existing transmission facilities, the Transmission Providers in each transmission planning

region shall consider in all of their regional transmission planning and cost allocation processes whether selecting transmission facilities that incorporate the following technologies would be more efficient or cost-effective than selecting new regional transmission facilities or upgrades to existing transmission facilities that do not incorporate these technologies: dynamic line ratings, as defined in 18 CFR § 35.28(b)(14), advanced power flow control devices, advanced conductors, and/or transmission switching. Specifically, such consideration must include both: (1) whether incorporating dynamic line ratings, advanced power flow control devices, advanced conductors, and/or transmission switching into existing transmission facilities could meet the same regional transmission need more efficiently or cost-effectively than other potential transmission facilities; and (2) when evaluating transmission facilities for potential selection in the regional transmission plan for purposes of cost allocation, whether incorporating dynamic line ratings, advanced power flow control devices, advanced conductors, and/or transmission switching as part of any potential regional transmission facility would be more efficient or cost-effective. Transmission *P*[p]roviders must evaluate the benefits of incorporating the enumerated alternative transmission technologies into Long-Term Regional Transmission Facilities in a manner consistent with the requirements in the Evaluation of Benefits of Regional Transmission Facilities and Evaluation and Selection of Long-Term Regional Transmission Facilities sections of Order No. 1920.

The Transmission Providers in each transmission planning region shall evaluate for potential selection in the regional transmission plan for purposes of cost allocation

regional transmission facilities that address interconnection-related transmission needs originally identified through the generator interconnection process. This requirement applies in the existing Order No. 1000 regional transmission planning processes. The Transmission Providers must modify their Tariffs to include these requirements. The interconnection-related transmission needs that Transmission Providers must evaluate in the existing Order No. 1000 regional transmission planning process are those for which:

(1) Transmission Providers in the transmission planning region have identified the relevant interconnection-related transmission need in interconnection studies in at least two interconnection queue cycles *(or in at least two individual interconnection studies for Transmission Providers that use a first-come, first-served serial generator interconnection process)* [during the preceding five years (looking back from the effective date of the accepted tariff provisions proposed to comply with this reform in Order No. 1920, and the later-in-time withdrawn interconnection request occurring after the effective date of the accepted tariff provisions)];

(2) the interconnection-related Network Upgrade identified through the generator interconnection process to meet the relevant interconnection-related transmission need has a voltage of at least 200 kV and an estimated cost of at least $30 million;

(3) [the interconnection-related Network Upgrade identified through the generator interconnection process to meet the relevant interconnection-related transmission need is not currently planned to be developed because] the

interconnection request[(]s[)] that led to the identification of the interconnection-related transmission need *in two or more interconnection queue cycles (or two individual interconnection studies if the Transmission Provider uses a first-come, first-served serial generator interconnection process) have* [has]been withdrawn *and no more than five calendar years have passed between the date of an earlier interconnection request withdrawal and the date of a later interconnection request withdrawal*;[and]

(4) the Transmission Providers have not identified a different interconnection-related Network Upgrade to meet the relevant interconnection-related transmission need in an executed Generator Interconnection Agreement or in a Generator Interconnection Agreement that the interconnection customer requested that the Transmission Provider file unexecuted with the Commission[.]*; and*

(5) The interconnection request withdrawals associated with the repeatedly identified interconnection-related transmission need occurred no earlier than seven calendar years prior to the commencement date of the Order No. 1000 regional transmission planning and cost allocation cycle. The initial evaluation should occur in the first Order No. 1000 regional transmission planning and cost allocation cycle to occur after the effective date of the tariff revisions implementing this reform. The Transmission Provider need not evaluate an interconnection-related transmission need that has been evaluated in a previous Order No. 1000 regional transmission planning and cost

allocation cycle.

The description of the regional transmission planning process must include sufficient detail to enable Transmission Customers to understand:

(i) The process for enrollment in the regional transmission planning process;

(ii) The process for consulting with customers;

(iii) The notice procedures and anticipated frequency of meetings;

(iv) The methodology, criteria, and processes used to develop a transmission plan;

(v) The method of disclosure of criteria, assumptions, and data underlying a transmission plan;

(vi) The obligations of and methods for transmission customers to submit data;

(vii) The process for submission of data by nonincumbent developers of transmission projects that wish to participate in the regional transmission planning process and seek regional cost allocation;

(viii) The process for submission of data by merchant transmission developers that wish to participate in the regional transmission planning process;

(ix) The dispute resolution process;

(x) The study procedures for economic upgrades to address congestion or the integration of new resources; and

(xi) The relevant cost allocation method or methods.

The regional transmission planning process must include cost allocation methods that satisfy the requirements set forth in Order Nos. 1000 and 1920.

Identifying Potential Opportunities to Right-Size Replacement Transmission Facilities

As part of each Long-Term Regional Transmission Planning cycle, Transmission Providers in each transmission planning region shall evaluate whether transmission facilities operating at or above a voltage threshold not to exceed 200 kV that an

individual Transmission Provider that owns the transmission facility anticipates replacing in-kind with a new transmission facility during the next 10 years can be "right-sized" to more efficiently or cost-effectively address Long-Term Transmission Needs, as discussed in Order No. 1920. The process to identify potential opportunities to right-size replacement transmission facilities must follow the process outlined in Order No. 1920. The Transmission Providers in each transmission planning region shall include in their Tariffs a cost allocation method for right-sized replacement transmission facilities that are selected in the regional transmission plan for purposes of cost allocation.

Interregional Transmission Coordination

The Transmission Provider, through its regional transmission planning process, must coordinate with the public utility transmission providers in each neighboring transmission planning region within its interconnection to address transmission planning coordination issues related to interregional transmission facilities. The interregional transmission coordination procedures must include a detailed description of the process for coordination between public utility transmission providers in neighboring transmission planning regions (i) with respect to each interregional transmission facility that is proposed to be located in both transmission planning regions and (ii) to identify possible interregional transmission facilities that could address transmission needs more efficiently or cost-effectively than separate regional transmission facilities. The interregional transmission coordination procedures shall be described in an attachment to the Transmission Provider's Tariff.

The Transmission Provider must ensure that the following requirements are included in any applicable interregional transmission coordination procedures:

(1) A commitment to coordinate and share the results of each transmission planning region's regional transmission plans (including information regarding the Long-Term Transmission Needs and potential transmission facilities to meet those needs) to identify possible interregional transmission facilities that could address transmission needs more efficiently or cost-effectively than separate regional transmission facilities, as well as a procedure for doing so;

(2) A formal procedure to identify and jointly evaluate transmission facilities that are

proposed to be located in both transmission planning regions, including those that may be more efficient or cost-effective transmission solutions to Long-Term Transmission Needs;

(3) An agreement to exchange, at least annually, planning data and information; and

(4) A commitment to maintain a website or e-mail list for the communication of information related to the coordinated planning process, including:

(a) the Long-Term Transmission Needs discussed in the interregional transmission coordination meetings;

(b) any interregional transmission facilities proposed or identified in response to the Long-Term Transmission Needs;

(c) the voltage level, estimated cost, and estimated in-service date of the interregional transmission facilities proposed or identified as part of Long-Term Regional Transmission Planning;

(d) the results of any cost-benefit evaluation of such interregional transmission facilities, with results including both any overall benefits identified, as well as any benefits particular to each transmission planning region; and

(e) the interregional transmission facilities, if any, selected in the regional transmission plan for purposes of cost allocation to meet Long-Term Transmission Needs.

The Transmission Provider must work with transmission providers located in neighboring transmission planning regions to develop a mutually agreeable method or methods for allocating between the two transmission planning regions the costs of a new

interregional transmission facility that is located within both transmission planning regions. Such cost allocation method or methods must satisfy the six interregional cost allocation principles set forth in Order No. 1000 and must be included in the Transmission Provider's Tariff.

UNITED STATES OF AMERICA
FEDERAL ENERGY REGULATORY COMMISSION

Building for the Future Through Electric Regional Transmission Planning and Cost Allocation — Docket No. RM21-17-001

(Issued November 21, 2024)

CHRISTIE, Commissioner, *concurring in part*:

1. Today's order makes major changes to Order No. 1920. I am deeply grateful to my colleagues for their willingness to negotiate in good faith and ultimately to agree to these changes.

2. Order No. 1920 was based on purported authority derived from section 206 of the Federal Power Act (FPA).[1] Section 206 essentially requires that two prongs must be satisfied: First, the complainant, here the Commission, bears the burden to prove that existing rates – in this case, the transmission planning procedures of every transmission provider in the country, both Regional Transmission Organization (RTO)/Independent System Operator (ISO) and non-RTO/ISO – are unjust, unreasonable and/or unduly discriminatory or preferential. If the first prong (burden of proof) is met, in the second prong, the Commission must establish a just and reasonable replacement rate.[2] I concur with this order solely as to specific changes made in Order No. 1920-A to the replacement rate established in Order No. 1920.[3]

3. In my dissent to Order No. 1920, I made it clear that one of my major areas of disagreement was that it failed to fulfill the promise of a necessary and appropriate role for the states that was established in the Notice of Proposed Rulemaking (NOPR) that

[1] 16 U.S.C. § 824e.

[2] *Id.* ("Whenever the Commission, after a hearing held upon its own motion or upon complaint, shall find that any rate, charge, or classification, demanded, observed, charged, or collected by any public utility for any transmission or sale subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory or preferential, *the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order*. . . ." (emphasis added)).

[3] The specific changes which I support and to which I concur are described in the Appendix to this statement.

preceded Order No. 1920.[4] This promised state role was the primary reason I voted for the NOPR. As I have said repeatedly, state utility regulators are the first line of defense for their consumers and must have the authority to protect their consumers from unwarranted or excessive transmission costs, which are the fastest rising part of most consumers' monthly power bills and are reaching ever more burdensome levels.[5] The changes made today in Order No. 1920-A to the replacement rate set by Order No. 1920 go a *long* way towards restoring the state role to what the NOPR promised, and I am pleased to support these changes. Among them are the following positive and fundamental changes:

4. *Submission of State-Agreed Alternative*. In contrast to Order No. 1920, Order No. 1920-A requires that, if the states in a region agree to a cost allocation proposal, the transmission provider *must* include that agreement in its compliance filing. Furthermore, the Commission can choose the state agreement over the transmission provider's proposal.[6]

5. *Pre-Amendment State Consultation*. In addition, states *must* be consulted before the transmission provider considers any future changes to the cost allocation method or state agreement processes or if the states seek to amend the cost allocation method or state agreement processes.[7]

6. *Cost Allocation Flexibility*. In contrast to Order No. 1920, states are given far more flexibility to develop and agree to cost allocation processes and *ex ante* formulae that will suit their needs in diverse multistate regions such as PJM Interconnection, L.L.C. (PJM), Midcontinent Independent System Operator, Inc., and the Southeastern Regional Transmission Planning region. For example, states in PJM will now have explicit assurance that the PJM State Agreement Approach, in use for more than a decade, is preserved as an option for allocating to the sponsoring states the costs of public

[4] *Bldg. for the Future Through Elec. Reg'l Transmission Planning & Cost Allocation & Generator Interconnection*, NOPR, 179 FERC ¶ 61,028 (2022) (Christie, Comm'r, concurring at PP 5, 11, 14).

[5] *Bldg. for the Future Through Elec. Reg'l Transmission Planning & Cost Allocation*, Order No. 1920, 187 FERC ¶ 61,068 (2024) (Christie, Comm'r, dissenting at P 15 & nn.49-54).

[6] *See* Appendix at P 1.

[7] *Id.* P 2.

policy-driven projects, such as New Jersey's offshore wind and others that would not be selected for regional cost allocation.[8]

7. *State Input on Factors*. As part of the planning process, transmission providers must consult with the states before running the scenarios required by Order No. 1920 and must consider the views of the states as to how to account for and weigh the factors related to, or derived from, state public policies.[9]

8. *State Input on Baseline Scenarios*. Order No. 1920-A also clarifies that, for purposes of cost allocation, states in PJM and other diverse multistate regions can now choose a new *ex ante* process that will enable the states to request that the transmission provider run additional scenarios, including a baseline scenario that contains only optimal reliability or economic projects and excludes public policy-driven projects, so that states can compare the costs of the baseline scenario versus the larger, multi-driver scenarios that include public policy-driven projects. Most importantly, states can agree that the difference in costs between the baseline scenario and the larger, multi-driver scenarios that include projects derived from state policies or other policy goals will be allocated to the states whose policies are the source of the added costs and will not be regionally cost allocated.[10]

9. *Removal of Corporate Power Preferences and Cost-Shifting*. The requirement in Order No. 1920 that large corporate power-purchasing preferences must be a factor in planning long-term scenarios is explicitly removed.[11] That was one of the most unconscionable, special-interest driven features of Order No. 1920, directing transmission providers to plan hundreds of billions of dollars of transmission projects to subsidize the power-purchasing preferences of huge multinational corporations and shifting the costs to residential and small-business consumers already struggling to pay their monthly power bills.

10. *New Required Transparency*. Order No. 1920-A also emphasizes transparency and clarifies that the purported benefits of one or more states' public policies are clearly identified and quantified. This will enable states to determine whether they are being

[8] *Id.* at P 7.

[9] *Id.* P 4.

[10] *Id.* PP 3, 8-11.

[11] *Id.* P 6.

charged for other states' public policies, which benefits they are paying for, and how much.[12]

11. Collectively, these changes give the states a much bigger toolbox containing far more effective tools they can use to protect their consumers and the interests of their states. I urge state regulators to use them aggressively. Further, let me emphasize that, if the process of compliance – always complicated and challenging even with rulemakings of far smaller size and less complexity than this one – demonstrates that state flexibility and authority remain materially insufficient, further action by the Commission may become necessary.

12. And on the issue of compliance, I would add that the broad purpose of these changes is to allow the states sufficient flexibility and authority to protect their consumers from paying unfair or unnecessary costs. *That purpose should and must inform the compliance process.*

13. For these reasons, I respectfully concur to these changes established in Order No. 1920-A that are listed specifically in the Appendix. Again, I express my deep appreciation to my colleagues for their willingness to engage in good-faith negotiations leading to these important changes to the replacement rate.

For these reasons I respectfully concur in part.

_____
Mark C. Christie
Commissioner

[12] *Id.* P 10.

Appendix – Major Changes Incorporated in Order No. 1920-A

1. **Require transmission providers to include in their filings state agreements on cost allocation, with enough detail so that any separate proposals can be considered and enable the Commission to adopt the states' agreement on compliance.**

The order directs transmission providers to include in the transmittal of their compliance filings any Long-Term Regional Transmission Cost Allocation Method(s), and/or State Agreement Process(es) agreed to by Relevant State Entities, during the Engagement Period. The order also clarifies that transmission providers must include such cost allocation methods and/or State Agreement Processes in the transmittal of their compliance filings even when transmission providers propose on compliance a separate cost allocation method and/or declined to propose a State Agreement Process.

As part of this requirement, the order clarifies that transmission providers must include any and all supporting evidence and/or justification related to Relevant State Entities' agreed-upon cost allocation method and/or State Agreement Process that Relevant State Entities request that transmission providers include in their compliance filing. However, the order clarifies that transmission providers are not required to separately characterize Relevant State Entities' agreement or independently justify Relevant State Entities' preferred cost allocation.

When acting under FPA section 206, the Commission's statutory burden is to establish a just and reasonable and not unduly discriminatory replacement rate that is supported by substantial evidence and is the product of reasoned decision making. In satisfying this burden with respect to cost allocation, it is not the case that the Commission necessarily must adopt the transmission provider's proposal if that proposal complies with the final rule's requirements; rather, the Commission need only weigh competing views (if they exist), select an approach with adequate support in the record, and then intelligibly explain the reasons for its choice.

To be clear, this means that the Commission will consider the entire record—including the Relevant State Entities' agreed-upon cost allocation and the transmission provider's proposal. Specifically, when the Commission reviews transmission providers' compliance filings, the Commission is not required to accept a cost allocation proposal from a transmission provider simply because it may comply with Order No. 1920. Instead, the Commission may accept any cost allocation method proposed by the Relevant State Entities and submitted on compliance so long as it complies with Order No. 1920.

2. **Require transmission providers to revise their OATTs to add a requirement that they consult with Relevant State Entities before making a future filing under FPA section 205 to revise the Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process(es) that is on file.**

The order requires that, as part of transmission providers' obligations with respect to transmission planning and cost allocation, transmission providers shall consult with Relevant State Entities prior to amending the *ex ante* Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process(es) agreed to by Relevant State Entities, or if Relevant State Entities seek to amend that method or process. The order requires transmission providers to document publicly on their website the results of that consultation prior to submitting their amendment. In addition, transmission providers must describe their reasoning for not using the results of the consultation with the Relevant State Entities. As an example, a jumpball framework, such as exists in MISO, SPP, and ISO-NE, could satisfy these requirements.

3. **If Relevant State Entities request additional scenarios to inform their consideration of cost allocation methods, transmission providers shall develop those additional scenarios.**

The order clarifies that transmission providers may develop additional scenarios, beyond the three Long-Term Scenarios that Order No. 1920 requires, to provide Relevant State Entities with information that they can use to inform the development of Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process(es). The order further clarifies that, when developing these additional scenarios used to inform cost allocation, transmission providers have the flexibility to depart from Order No. 1920's requirements related to the development of Long-Term Scenarios. For example, transmission providers may develop scenarios that consider the incremental cost of transmission needed to achieve state laws, policies, and regulations beyond the cost of transmission needed in the absence of those laws, policies, and regulations. The order further clarifies that, if the Relevant State Entities wish for the transmission provider to develop a reasonable number of additional scenarios for cost allocation, then the transmission providers will develop these scenarios.

4. **Clarify that, while transmission providers have discretion over how to consider the effects of factors, transmission providers must consult with Relevant State Entities regarding factors related to state public policies.**

The order clarifies that transmission providers must consult with and consider the positions of the Relevant State Entities as to how to account for factors related to state public policies in transmission planning assumptions. Specifically, the transmission provider shall consult with Relevant State Entities as to how to run the Long-Term

Scenarios mandated by the final rule, as they may incorporate planning for state laws, policies, and regulations, including assumptions of transmission needs that may be attributable to, or derived from, state or local policies, such as assumptions about changing generation resources.

5. Allow states six additional months for the engagement period, upon request.

The order clarifies that, if Relevant State Entities, consistent with their chosen method to reach agreement, request additional time to complete cost allocation discussions, the Commission will extend the Engagement Period for up to an additional six months. The order finds that such an extension is warranted in that circumstance to ensure that Relevant State Entities have sufficient time to engage in fulsome discussions. The order also clarifies that the Commission will extend the relevant compliance deadlines, as appropriate, to accommodate an extension to the Engagement Period.

6. Exclude corporate commitments from Factor Category Seven.

The order eliminates the requirement for transmission providers to incorporate corporate commitments in Factor Category Seven when developing Long-Term Scenarios. The order finds that requiring transmission providers to consider corporate commitments when developing Long-Term Scenarios may introduce the risk of one class of transmission users cross-subsidizing another class of transmission users.

7. Expressly permit continued use of both new and/or existing state agreement approaches and similar voluntary measures.

The order clarifies that Order No. 1920 does not require reapproval of PJM's State Agreement Approach. The order clarifies that the Commission interprets PJM's State Agreement Approach to be supplemental to PJM's existing regional transmission cost allocation method. As a result, it is not in any way affected by the final rule. The order further clarifies (see #1 above) that, in their compliance filings, transmission providers shall include any State Agreement Process(es) agreed to by Relevant State Entities.

8. Transmission providers will allocate the costs of a Long-Term Regional Transmission Facility commensurate to its benefits.

The order clarifies that Order No. 1920 does not prevent transmission providers from recognizing different types of benefits and using them to allocate costs in proportion to those benefits. One potential cost allocation method that could be proposed to comply with Order No. 1920 would allocate costs commensurate with reliability and economic benefits region-wide, while allocating costs commensurate with additional benefits to a subset of states that agree to such cost allocation. Under this potential cost allocation method, these costs and benefits could be identified based on one or more additional

scenarios run by the transmission planner for the purposes of informing cost allocation, e.g., scenarios that consider the incremental cost of transmission needed to achieve state laws, policies, and regulations beyond the cost of transmission needed in the absence of those laws, policies, and regulations. For example, the cost allocation method agreed to by the Relevant State Entities may allocate those incremental costs to states with those applicable laws, policies, and regulations.

9. Clarify that states and/or transmission providers may define additional benefits to those enumerated in Order No. 1920.

Further, the order clarifies that costs borne by ratepayers must be roughly commensurate with benefits received. Transmission providers can consider additional benefits for cost allocation purposes, including as agreed to by Relevant State Entities and described elsewhere in this rule, provided that costs are allocated in a way that is at least roughly commensurate with estimated benefits.

10. Clarify that, for a selected project or tranche of projects, transmission providers shall, for each pricing zone, quantify the benefits and costs associated with such project or tranche.

The order clarifies that, for each selected project or tranche of projects, each transmission provider is required to make publicly available, on OASIS or other password-protected website, a breakdown of the allocated costs, by transmission pricing zone, and a quantification of the benefits imputed to each zone, as such benefits can be reasonably estimated.

11. Include, as an example of an approach that could be proposed to comply with Order No. 1920, the below *ex ante* cost allocation method language for Relevant State Entities. The inclusion of this example does not foreclose states from agreeing to other cost allocation approaches, each of which shall be evaluated on its own merits.

At the request of the Relevant State Entities in a multistate region, the following *ex ante* method for cost allocation may be proposed. In providing this example, the order is not foreclosing other approaches for allocating the costs of Long-Term Regional Transmission Facilities on either an *ex ante* or project-specific basis. Nor is the order suggesting that cost allocation methodologies must adopt a similar approach to this framework in order to comply with the requirements of this final rule:

(1) For purposes of cost allocation, the transmission providers shall run a scenario that otherwise complies with the Long-Term Regional Transmission Planning requirements of Order No. 1920 but does not include state laws, policies, and regulations and quantify the costs of the projects that would be selected from this

scenario.

(2) The costs identified in (1) could be cost allocated according to an alternative *ex ante* formula filed by the transmission owners for the region.

(3) The amount representing the cost difference between the costs of projects selected pursuant to the Long-Term Regional Transmission Planning process and (1) shall be allocated as follows:

a. The transmission provider shall identify by state the specific state laws, policies, and regulations that were used to plan and select the facilities and shall quantify *by state* the specific costs of such facilities.

b. The costs identified in 3(a) shall be allocated solely to the state or states that are the sources of the policies used in planning and selection. The total difference between the costs of projects selected pursuant to the Long-Term Regional Transmission Planning process and (1) would be fully accounted for using this method of allocating costs among the states. The costs by zone *within* a state (Intrastate Costs) would be developed and filed by the applicable Transmission Owner(s).

[Docket No. RM21-17-003; Order No. 1920-B]

Building for the Future Through Electric Regional Transmission Planning and Cost Allocation

(Issued April 11, 2025)

AGENCY: Federal Energy Regulatory Commission.

ACTION: Order on rehearing and clarification

SUMMARY: In this order, the Federal Energy Regulatory Commission addresses arguments raised on rehearing, grants clarification, in part, and denies clarification, in part, of Order No. 1920-A, which addressed arguments raised on rehearing of, set aside, in part, and clarified Order No. 1920. Order No. 1920 required transmission providers, *inter alia*, to conduct Long-Term Regional Transmission Planning to ensure the identification, evaluation, and selection, as well as the allocation of the costs, of more efficient or cost-effective regional transmission solutions to address Long-Term Transmission Needs.

DATES: The effective date of the document published on December 6, 2024 (89 FR 97,174), is confirmed: January 6, 2025.

I. Introduction

1. In Order No. 1920,[1] the Federal Energy Regulatory Commission (Commission) revised the *pro forma* Open Access Transmission Tariff (OATT) to adopt reforms to its existing electric transmission planning and cost allocation requirements pursuant to section 206 of the Federal Power Act (FPA).[2] The Commission found that existing regional transmission planning and cost allocation processes are unjust, unreasonable, and unduly discriminatory or preferential because, *inter alia*, the Commission's existing transmission planning and cost allocation requirements do not require transmission providers[3] to: (1) perform a sufficiently long-term assessment of transmission needs that

[1] *Bldg. for the Future Through Elec. Reg'l Transmission Plan. & Cost Allocation*, Order No. 1920, 89 FR 49280 (June 11, 2024), 187 FERC ¶ 61,068, *order on reh'g & clarification*, Order No. 1920-A, 89 FR 97174 (Dec. 6, 2024), 189 FERC ¶ 61,126 (2024).

[2] 16 U.S.C. 824e.

[3] FPA Section 201(e), 16 U.S.C. 824(e), defines "public utility" to mean "any person who owns or operates facilities subject to the jurisdiction of the Commission under this subchapter." As stated in the Order No. 888 *pro forma* OATT, "transmission provider" is a "public utility (or its Designated Agent) that owns, controls, or operates facilities used for the transmission of electric energy in interstate commerce and provides transmission service under the Tariff." *Promoting Wholesale Competition Through Open Access Non-Discriminatory Transmission Servs. by Pub. Utils.; Recovery of Stranded Costs by Pub. Utils. & Transmitting Utils.*, Order No. 888, 61 FR 21540 (May 10, 1996), FERC Stats. & Regs. ¶ 31,036 (1996) (cross-referenced at 75 FERC ¶ 61,080), *order on reh'g*, Order No. 888-A, 62 FR 12274 (Mar. 14, 1997), FERC Stats. & Regs. ¶ 31,048

identifies Long-Term Transmission Needs;[4] (2) adequately account on a forward-looking basis for known determinants of Long-Term Transmission Needs; and (3) consider the broader set of benefits of regional transmission facilities planned to meet those Long-Term Transmission Needs.[5] Building on Order Nos. 890[6] and 1000,[7] Order No. 1920 addresses these deficiencies by establishing requirements to ensure that

(cross-referenced at 78 FERC ¶ 61,220), *order on reh'g*, Order No. 888-B, 81 FERC ¶ 61,248 (1997), *order on reh'g*, Order No. 888-C, 82 FERC ¶ 61,046 (1998), *aff'd in relevant part sub nom. Transmission Access Pol'y Study Grp. v. FERC*, 225 F.3d 667 (D.C. Cir. 2000), *aff'd sub nom. N. Y. v. FERC*, 535 U.S. 1 (2002); *pro forma* OATT section I.1 (Definitions). The term "transmission provider" includes a public utility transmission owner when the transmission owner is separate from the transmission provider, as is the case in regional transmission organizations (RTO) and independent system operators (ISO).

[4] For purposes of Order No. 1920, Long-Term Transmission Needs are transmission needs identified through Long-Term Regional Transmission Planning by, among other things and as discussed in Order Nos. 1920 and 1920-A, running scenarios and considering the enumerated categories of factors. Order No. 1920, 187 FERC ¶ 61,068 at P 299; Order No. 1920-A, 189 FERC ¶ 61,126 at P 20 n.16.

[7] *Transmission Plan. & Cost Allocation by Transmission Owning & Operating Pub. Utils.*, Order No. 1000, 76 FR 49842 (Aug. 11, 2011), 136 FERC ¶ 61,051 (2011), Order No. 1000-A, 77 FR 32184 (May 31, 2012), 139 FERC ¶ 61,132 (2012), *order on reh'g & clarification*, Order No. 1000-B, 141 FERC ¶ 61,044 (2012), *aff'd sub nom. S.C. Pub. Serv. Auth. v. FERC*, 762 F.3d 41 (D.C. Cir. 2014) (*South Carolina*).

Commission-jurisdictional rates remain just and reasonable and not unduly discriminatory or preferential, including, *inter alia*, a requirement that transmission providers in each transmission planning region participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning,[8] which will ensure the identification, evaluation, and selection of more efficient or cost-effective regional transmission facilities to address Long-Term Transmission Needs, as well as the just and reasonable allocation of the costs of those facilities.[9]

2. In Order No. 1920-A, the Commission largely sustained the reforms adopted in Order No. 1920 while refining and improving those reforms to address concerns raised in response to Order No. 1920 and to ensure that states have a robust role in Long-Term Regional Transmission Planning and in the cost allocation processes established in the final rule. Specifically, and as relevant here, the Commission set aside, in part, and clarified, in part, Order No. 1920 to provide that: (1) transmission providers may not plan for the needs of a non-jurisdictional transmission provider if that non-jurisdictional transmission provider has not enrolled in the transmission planning region and thereby

[8] For purposes of Order No. 1920, Long-Term Regional Transmission Planning means regional transmission planning on a sufficiently long-term, forward-looking, and comprehensive basis to identify Long-Term Transmission Needs, identify transmission facilities that meet such needs, measure the benefits of those transmission facilities, and evaluate those transmission facilities for potential selection in the regional transmission plan for purposes of cost allocation as the more efficient or cost-effective regional transmission facilities to meet Long-Term Transmission Needs. Order No. 1920, 187 FERC ¶ 61,068 at PP 38, 250-252; Order No. 1920-A, 189 FERC ¶ 61,126 at P 21 n.17.

[9] Order No. 1920, 187 FERC ¶ 61,068 at PP 1-2.

has not agreed to any cost allocation method applicable to selected Long-Term Regional Transmission Facilities;[10] (2) when Relevant State Entities[11] agree on a Long-Term Regional Transmission Cost Allocation Method(s)[12] and/or State Agreement Process[13] resulting from the Engagement Period,[14] transmission providers must include that

[10] Order No. 1920-A, 189 FERC ¶ 61,126 at P 323. For purposes of Order No. 1920, a Long-Term Regional Transmission Facility is a regional transmission facility, as defined in Order No. 1000, that is identified as part of Long-Term Regional Transmission Planning to address Long-Term Transmission Needs. Order No. 1920, 187 FERC ¶ 61,068 at PP 41, 250; Order No. 1920-A, 189 FERC ¶ 61,126 at P 21 n.18.

[11] For purposes of Order No. 1920, a Relevant State Entity is any state entity responsible for electric utility regulation or siting electric transmission facilities within the state or portion of a state located in the transmission planning region, including any state entity as may be designated for that purpose by the law of such state. Order No. 1920, 187 FERC ¶ 61,068 at PP 44, 1355; Order No. 1920-A, 189 FERC ¶ 61,126 at P 23 & n.23.

[12] For purposes of Order No. 1920, a Long-Term Regional Transmission Cost Allocation Method is an *ex ante* regional cost allocation method for one or more Long-Term Regional Transmission Facilities (or a portfolio of such Facilities) that are selected in the regional transmission plan for purposes of cost allocation. Order No. 1920, 187 FERC ¶ 61,068 at P 1291; Order No. 1920-A, 189 FERC ¶ 61,126 at P 612 n.1539.

[13] For purposes of Order No. 1920, a State Agreement Process is a process by which one or more Relevant State Entities may voluntarily agree to a cost allocation method for Long-Term Regional Transmission Facilities (or a portfolio of such Facilities) before or no later than six months after they are selected in the regional transmission plan for purposes of cost allocation. Order No. 1920, 187 FERC ¶ 61,068 at P 45; Order No. 1920-A, 189 FERC ¶ 61,126 at P 24 n.28.

[14] For purposes of Order No. 1920, an Engagement Period is a six-month time period during which transmission providers must: (1) provide notice of the starting and end dates for the six-month time period; (2) post contact information that Relevant State Entities may use to communicate with transmission providers about any agreement among Relevant State Entities on a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process, as well as a deadline for communicating such agreement; and (3) provide a forum for negotiation of a Long-Term Regional

method(s) and/or process in the transmittal or as an attachment to their Order No. 1920 regional transmission planning and cost allocation compliance filings, along with any information that Relevant State Entities provide to transmission providers regarding the state negotiations during the Engagement Period, even if transmission providers propose a different Long-Term Regional Transmission Cost Allocation Method or do not propose to adopt a State Agreement Process;[15] (3) the Commission will consider the entire record—including the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and the transmission provider's proposal—when setting the replacement rate in Order No. 1920 regional transmission planning and cost allocation compliance proceedings;[16] and (4) transmission providers must consult with Relevant State Entities prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process or, if Relevant State Entities seek, consistent with their chosen method to reach agreement, for the transmission providers to amend that method or process.[17] As further relevant here, the Commission disagreed with certain arguments raised on rehearing of Order No. 1920 and continued to: (1) find that the Commission

---

Transmission Cost Allocation Method(s) and/or a State Agreement Process that enables robust participation by Relevant State Entities. Order No. 1920, 187 FERC ¶ 61,068 at PP 5, 1354; Order No. 1920-A, 189 FERC ¶ 61,126 at P 24.

[15] Order No. 1920-A, 189 FERC ¶ 61,126 at P 651.

[16] *Id.* P 659.

[17] *Id.* P 691.

made adequate findings and marshalled sufficient evidence under the first prong of FPA section 206 to establish that existing Commission-jurisdictional regional transmission planning and cost allocation processes are unjust and unreasonable;[18] and (2) define Relevant State Entities as any state entity responsible for electric utility regulation or siting electric transmission facilities within the state or portion of a state located in the transmission planning region, including any state entity as may be designated for that purpose by the law of such state.[19]

3. Seven petitioners have sought further rehearing and clarification of the Commission's determinations in Order No. 1920-A,[20] and the Commission received two additional filings.[21] Pursuant to *Allegheny Defense Project v. FERC*,[22] the rehearing

[18] *See id.* PP 72-86.

[19] *See id.* P 685.

[20] Appendix A includes a list of petitioners submitting requests for rehearing and/or clarification of Order No. 1920-A.

[21] On February 5, 2025, NRECA sent a letter to Chairman Mark Christie addressing Order No. 1920-A. On February 12, 2025, Developers Advocating Transmission Advancements submitted a late-filed pleading and white paper in response to the 2021 Advanced Notice of Proposed Rulemaking. To the extent that they intend to seek rehearing, these pleadings are untimely and we therefore reject them. 16 U.S.C. 825*l*(a); 18 CFR 385.713(b) (2024). They also do not include a separate section entitled "Statement of Issues" listing each issue presented to the Commission in a separately enumerated paragraph, as required by Rule 713(c)(2) of the Commission's Rules of Practice and Procedure. 18 CFR 385.713(c)(2). Below, we address NRECA's rehearing request, which raised similar issues to those NRECA raised in its letter. *See infra* Definition of Relevant State Entities section.

[22] 964 F.3d 1 (D.C. Cir. 2020) (en banc).

requests filed in this proceeding may be deemed denied by operation of law. However, as permitted by FPA section 313(a),[23] we are modifying the discussion in Order No. 1920-A and continue to reach the same result in this proceeding, as discussed below.[24] That is, in this order, we do not change the outcome of Order No. 1920-A.[25] This order also does not amend the Commission's regulations or the provisions of Attachment K to the *pro forma* OATT.

4. We also grant, in part, and deny, in part, the requests for clarification. Specifically, we clarify one aspect of the Commission's discussion in Order No. 1920-A to explain that, consistent with Order No. 1000, transmission providers are not required to plan for the Long-Term Transmission Needs of unenrolled non-jurisdictional transmission providers, but voluntary arrangements for regional transmission planning and cost allocation that comply with the FPA and the Commission's cost causation precedent are not prohibited.[26] In addition, we sustain the requirement in Order

[23] 16 U.S.C. 825*l*(a) ("Until the record in a proceeding shall have been filed in a court of appeals, as provided in subsection (b), the Commission may at any time, upon reasonable notice and in such manner as it shall deem proper, modify or set aside, in whole or in part, any finding or order made or issued by it under the provisions of this chapter.").

[24] *Allegheny Def. Project*, 964 F.3d at 16-17.

[25] *See Smith Lake Improvement & Stakeholders Ass'n v. FERC*, 809 F.3d 55, 56-57 (D.C. Cir. 2015).

[26] *See* Order No. 1920-A, 189 FERC ¶ 61,068 at P 323; *infra* Planning for the Long-Term Transmission Needs of Unenrolled Non-Jurisdictional Transmission Providers section.

No. 1920-A that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process resulting from the Engagement Period, and associated information provided to transmission providers regarding the state negotiations during the Engagement Period, in transmission providers' transmittal or as an attachment to their Order No. 1920 regional transmission planning and cost allocation compliance filings.[27] We further sustain the requirement that transmission providers consult with Relevant State Entities: (1) prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process; or (2) if Relevant State Entities seek, consistent with their chosen method to reach agreement, for the transmission provider to amend that method or process.[28] We are not persuaded, however, by NRECA's request to expand the definition of Relevant State Entity to include any entity that establishes or regulates electric rates under state law.[29] Finally, we reject as procedurally barred Indicated PJM TOs' and SPP TOs' arguments that the Commission's findings under the first prong of FPA section 206 were insufficient to support its exercise of authority in Order No. 1920.[30]

[29] Order No. 1920-A, 189 FERC ¶ 61,126 at P 701; *infra* Definition of Relevant State Entities section.

[30] Order No. 1920-A, 189 FERC ¶ 61,126 at PP 72-86; *infra* Other Cost Allocation Issues section.

5. We continue to find that these reforms, as refined and improved in Order No. 1920-A, ensure that transmission providers will conduct sufficiently long-term, forward looking, and comprehensive transmission planning and cost allocation processes to meet the demands of the modern transmission grid, while facilitating meaningful participation by the states, consistent with the jurisdictional boundaries delineated in the FPA.

II. Long-Term Regional Transmission Planning

A. Planning for the Long-Term Transmission Needs of Unenrolled Non-Jurisdictional Transmission Providers

1. Order Nos. 1920 and 1920-A

6. In Order No. 1920, the Commission required transmission providers in each transmission planning region to participate in a regional transmission planning process that includes Long-Term Regional Transmission Planning, meaning regional transmission planning on a sufficiently long-term, forward-looking, and comprehensive basis to identify Long-Term Transmission Needs, identify transmission facilities that meet such needs, measure the benefits of those transmission facilities, and evaluate those transmission facilities for potential selection in the regional transmission plan for purposes of cost allocation as the more efficient or cost-effective transmission facilities to meet Long-Term Transmission Needs.[31] To identify Long-Term Transmission Needs and to identify and evaluate transmission facilities that meet such needs, transmission

[31] Order No. 1920, 187 FERC ¶ 61,068 at P 224; *see also* Order No. 1920-A, 189 FERC ¶ 61,126 at P 138.

providers must develop a set of at least three plausible and diverse Long-Term Scenarios,[32] each of which must: (1) incorporate seven specific categories of factors that represent known determinants of Long-Term Transmission Needs; and (2) account for factors within each such category that the transmission provider determines are likely to affect Long-Term Transmission Needs.[33] Factor Category Three comprises state-approved integrated resource plans and expected supply obligations for load-serving entities.[34]

7. In Order No. 1920-A, the Commission clarified that, for purposes of complying with the requirements of Order No. 1920, transmission providers must plan for the needs of non-jurisdictional entities that are among the transmission providers' transmission customers as they would plan for the needs of any other transmission customer. For example, each Long-Term Scenario must account for and be consistent with factors within Factor Category Three once transmission providers in a transmission planning region have determined that such factors are likely to affect Long-Term Transmission Needs. This includes any non-jurisdictional transmission customer's resource planning

[32] Order No. 1920 defines Long-Term Scenarios as scenarios that incorporate various assumptions using best available data inputs about the future electric power system over a sufficiently long-term, forward-looking transmission planning horizon to identify Long-Term Transmission Needs and enable the identification and evaluation of transmission facilities to meet such transmission needs. Order No. 1920, 187 FERC ¶ 61,068 at PP 40, 302.

[33] *Id*. PP 298, 409, 415.

[34] *Id*. P 447; *see also* Order No. 1920-A, 189 FERC ¶ 61,126 at PP 139, 263, 279.

and procurement processes that have been approved by that entity's respective governing authority.[35]

8. The Commission further clarified in Order No. 1920-A that "transmission providers may *not* plan for the needs of a non-jurisdictional utility transmission provider if that non-jurisdictional transmission provider has not enrolled in the transmission planning region and thereby has not agreed to any cost allocation method applicable to selected Long-Term Regional Transmission Facilities."[36] The Commission stated that, if transmission providers were to plan for and consider non-jurisdictional transmission providers' Long-Term Transmission Needs without a way to ensure the non-jurisdictional transmission provider contributes to the costs of the resulting Long-Term Regional Transmission Facilities, the resulting cost allocation could violate the cost causation principle and result in free-ridership.[37]

2. Rehearing Requests

9. NRECA and WestConnect CTOs request rehearing and/or clarification of the statement in Order No. 1920-A that "transmission providers may *not* plan for the needs of

[35] Order No. 1920-A, 189 FERC ¶ 61,126 at P 323 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 507, 510). The Commission issued this clarification in response to a request to clarify that the resource planning and procurement processes of non-jurisdictional transmission providers that have been approved by their respective governing authorities should be included in Factor Category Three. *Id.* P 315 (citing SERTP Sponsors June 12, 2024 Rehearing Request at 5).

[36] *Id.* P 323 (citing Order No. 1000-A, 139 FERC ¶ 61,132 at P 276).

[37] *Id.* (citing *El Paso Elec. Co. v. FERC*, 76 F.4th 352, 363-66 (5th Cir. 2023) (*El Paso*)).

a non-jurisdictional utility transmission provider if that non-jurisdictional transmission provider has not enrolled in the transmission planning region and thereby has not agreed to any cost allocation method applicable to selected Long-Term Regional Transmission Facilities."[38] In particular, NRECA and WestConnect CTOs assert that this statement could be read to prohibit transmission providers from voluntarily agreeing to plan for the needs of unenrolled non-jurisdictional transmission providers.[39]

10. NRECA asks the Commission to clarify that Order No. 1920-A does not change the Commission's existing regulations and policy, and thus transmission providers in a transmission planning region continue to have the discretion to plan for the needs of a non-jurisdictional transmission provider that has not enrolled in the regional transmission planning process.[40] NRECA asserts that its requested interpretation of Order No. 1920-A is supported by the Commission's own citation to the language in Order No. 1000-A, stating that the regional transmission planning process is not required to plan for the

[38] NRECA Rehearing Request at 3 (quoting Order No. 1920-A, 189 FERC ¶ 61,126 at P 323); WestConnect CTOs Rehearing Request at 1 (same).

[39] NRECA Rehearing Request at 3, 17; WestConnect CTOs Rehearing Request at 1-5 (asserting that Order No. 1920-A, misinterpreting *El Paso*, establishes a prohibition on voluntary planning with unenrolled non-jurisdictional transmission providers).

[40] NRECA Rehearing Request at 3; *see also id.* at 16 ("NRECA requests that the Commission clarify that 'may *not* plan' means 'is not *required* to plan' rather than 'is not *permitted* to plan.'" (emphasis in original)).

transmission needs of a non-jurisdictional, unenrolled transmission provider.[41] NRECA states that the Commission has interpreted Order No. 1000-A as neither prohibiting nor compelling regional transmission planning processes from planning for the transmission needs of unenrolled non-jurisdictional transmission providers, i.e., non-jurisdictional transmission providers that have not agreed to accept any applicable cost allocation method for selected regional transmission facilities.[42]

11. NRECA also argues that its requested interpretation of Order No. 1920-A is consistent with the next sentence of Order No. 1920-A, which states that, "[i]f the transmission provider were to plan for and consider non-jurisdictional transmission providers' Long-Term Transmission Needs without a way to ensure the non-jurisdictional transmission provider contributes to the costs of the resulting Long-Term Regional Transmission Facilities, the resulting cost allocation could violate the cost causation principle and result in free-ridership."[43] NRECA asserts that this rationale supports Order No. 1000-A's statement that the public utility transmission providers in a transmission planning region are not compelled to plan for the transmission needs of an unenrolled non-jurisdictional transmission provider that has not agreed to accept any

[41] *Id.* at 16 (citing Order No. 1920-A, 189 FERC ¶ 61,126 at P 323 n.914 (citing Order No. 1000-A, 139 FERC ¶ 61,132 at P 276)).

[42] *Id.* at 16, 17 (citing *Pub. Serv. Co. of Colo.*, 148 FERC ¶ 61,213 (2014), *order on reh'g*, 151 FERC ¶ 61,128 (2015), *vacated & remanded*, *El Paso Elec. Co. v. FERC*, 832 F.3d 495 (5th Cir. 2016)).

[43] *Id.* at 16 (citing Order No. 1920-A, 189 FERC ¶ 61,126 at P 323).

applicable cost allocation method for selected regional transmission facilities, but does not justify prohibiting voluntary planning for such needs if transmission providers in a transmission planning region can ensure that they will not be required to subsidize transmission projects that benefit the unenrolled non-jurisdictional transmission providers.[44]

12. NRECA and WestConnect CTOs each argue that the court in *El Paso* did not hold that the FPA requires the Commission to prohibit transmission providers in a transmission planning region from voluntarily planning for unenrolled non-jurisdictional transmission providers' needs.[45] NRECA states that the *El Paso* court had no reason for such a holding in reviewing an Order No. 1000 regional compliance filing but simply quoted with approval the Commission's "'clear' statement" in Order No. 1000-A.[46] Thus, NRECA contends, Order No. 1000-A and *El Paso* allow transmission providers in a transmission planning region to agree to plan for the transmission needs of unenrolled non-jurisdictional transmission providers if they have assurance that the enrolled

[44] *Id.* at 16-17.

[45] *Id.* at 17 (citing *El Paso*, 76 F.4th at 363); WestConnect CTOs Rehearing Request at 4 (asserting that *El Paso* holds only that public utilities may not be required to plan for the transmission needs of unenrolled non-jurisdictional utilities that do not accept the allocation of costs related to regional transmission projects from which they benefit (citing *El Paso*, 76 F.4th at 362-63)).

[46] NRECA Rehearing Request at 17 (quoting *El Paso*, 76 F.4th at 363).

transmission providers will not be required to subsidize transmission projects that benefit the unenrolled non-jurisdictional transmission providers.[47]

13. WestConnect CTOs assert that the issue on which the transmission providers prevailed in *El Paso* was their objection to being forced to subsidize transmission projects from which unenrolled non-jurisdictional transmission providers who did not commit to the allocation of costs might nonetheless benefit. WestConnect CTOs assert that members of WestConnect believed that the risk of subsidization could be sufficiently minimized to allow their long history of beneficial coordinated transmission planning to continue without enrollment of the WestConnect unenrolled non-jurisdictional transmission providers.[48] WestConnect CTOs argue that, contrary to the Commission's statement in Order No. 1920-A, it is untrue that transmission providers cannot ensure that an unenrolled non-jurisdictional transmission provider contributes to the cost of a regional transmission project from which it benefits without enrolling in the transmission planning region.[49] WestConnect CTOs assert that prohibiting joint regional transmission planning is based on a false binary choice—that non-jurisdictional transmission providers are not required to enroll in a transmission planning region and can only participate if

[47] *Id.*

[48] WestConnect CTOs Rehearing Request at 6 (citing *Ariz. Pub. Serv. Co.*, 181 FERC ¶ 61,223, at P 14 (2022)).

[49] *Id.* at 5 (citing Order No. 1920-A, 189 FERC ¶ 61,126 at P 323).

they enroll.[50] WestConnect CTOs represent that the WestConnect transmission planning region's transmission providers remain open to considering a modified coordinating transmission owner framework that provides them reasonable assurance that they will not have to subsidize their non-jurisdictional counterparts without requiring their enrollment.[51]

14. WestConnect CTOs further state that banning the possibility of voluntary arrangements for joint regional transmission planning with unenrolled non-jurisdictional transmission providers violates FPA section 202(a), under which the Commission is "affirmatively not only 'empowered,' but '*directed* to divide the country into regional districts for the voluntary interconnection and coordination of facilities for the generation, transmission, and sale of electric energy.'"[52]

15. WestConnect CTOs and NRECA argue that a ban on regional transmission planning by public utilities and unenrolled non-jurisdictional transmission providers would be an unacknowledged, unexplained, and hence arbitrary departure from Order No. 1000 precedent.[53] WestConnect CTOs argue that the Commission's

---

[50] *Id.* at 6; *see also id.* at 9 n.17 (citing *Pub. Serv. Co. of Colo.*, WestConnect CTOs Request for Clarification, Docket No. ER13-75-014, et al., at n.2 (filed Nov. 18, 2024)).

[51] *Id.* at 5 (citing *Pub. Serv. Co. of Colo.*, WestConnect CTOs Request for Clarification, Docket No. ER13-75-014, et al. (filed Nov. 18, 2024)).

[52] *Id.* (quoting 16 U.S.C. 824a(a) (emphasis added)).

[53] *Id.* at 2-3, 6; NRECA Rehearing Request at 4-5, 18 (citing 5 U.S.C. § 706(2)(A) (other citations omitted)).

misinterpretation of *El Paso* is counterproductive to the Commission's professed goal of Order Nos. 1000 and 1920—to encourage and enhance regional transmission planning.[54]

16. WestConnect CTOs state that the Commission has noted that it "accepted the WestConnect public utility transmission providers' proposed participation framework [(i.e., the coordinating transmission owner framework)] under which non-public utility transmission providers could participate in WestConnect as either enrolled transmission owners or coordinating transmission owners."[55] WestConnect CTOs also state that the Commission expressly held that Order No. 1000 "does not preclude the enrolled public utility transmission providers in a transmission planning region from conducting transmission planning for unenrolled non-public utility transmission providers if the enrolled public utility transmission providers elect to do so."[56] WestConnect CTOs argue

[54] WestConnect CTOs Rehearing Request at 6; *see also id.* at 6-7 (asserting that, in Order No. 1000 compliance proceedings, WestConnect transmission providers explained that non-jurisdictional transmission providers' enrollment was not a prerequisite to their participation in regional transmission planning and would run contrary to the goals of Order No. 1000) ("It was precisely because of the presence of a large number of both public utility and non-jurisdictional utility transmission owners in the WestConnect region that the [j]urisdictional [u]tilities strove to create a compliance structure that would be superior to one in which non-jurisdictional utilities unwilling to subject themselves to Order No. 1000 cost allocation would be excluded from the region's planning process entirely." (quoting *Pub. Serv. Co. of Colo.*, Motion for Leave to Answer and Answer of the WestConnect Jurisdictional Utilities, Docket No. ER13-75-003 et al., at 13-14 (filed Nov. 8, 2013))).

[55] *Id.* at 7 (quoting *Pub. Serv. Co. of Colo.*, 189 FERC ¶ 61,028, at P 6 (2024) (WestConnect Remand Order), *order on reh'g*, 190 FERC ¶ 61,128 (2025) (Remand Rehearing Order)).

[56] *Id.* at 7-8 (quoting *Pub. Serv. Co. of Colo.*, 148 FERC ¶ 61,213 at P 55).

that this holding underpinned the development of WestConnect's existing coordinating transmission owner framework and was not challenged or addressed in *El Paso*. On the contrary, WestConnect CTOs argue, *El Paso* does not alter—and could not have altered—Order No. 1000's holdings, which were affirmed by the U.S. Court of Appeals for the D.C. Circuit (D.C. Circuit).[57]

17. WestConnect CTOs argue that the Commission's prohibition on transmission providers planning for the needs of unenrolled non-jurisdictional transmission providers fails to acknowledge, explain, or consider WestConnect CTOs' substantial reliance interest in the Commission's prior approval of the coordinating transmission owner framework.[58]

18. WestConnect CTOs further note that, in Order No. 1000, the Commission required that the scope of a transmission planning region "be governed by the integrated nature of the regional power grid."[59] WestConnect CTOs allege that the Commission stated that without the participation of non-jurisdictional transmission providers interspersed throughout the WestConnect transmission planning region that make up half of its membership, WestConnect would be like "swiss cheese."[60] WestConnect CTOs state

[57] *Id.* at 8 (citing *South Carolina*, 762 F.3d 41).

[58] *Id.* (citing *FCC v. Fox Television Stations, Inc.*, 556 U.S. 502, 515 (2009); *Dep't of Homeland Sec. v. Regents of the Univ. of Cal.*, 591 U.S. 1, 30 (2020)).

[59] *Id.* (citing WestConnect Remand Order, 189 FERC ¶ 61,028 at P 23 & n.49).

[60] *Id.* at 8-9 (citing *Pub. Serv. Co. of Colo.*, 142 FERC ¶ 61,206, at P 349 (2013), *order on reh'g*, 148 FERC ¶ 61,213, *order on reh'g*, 151 FERC ¶ 61,128, *vacated &*

that one of the reasons coordinating transmission owners supported WestConnect's coordinating transmission owner framework was the institutional difficulties non-jurisdictional transmission providers face in agreeing to enrollment rather than case-by-case acceptance of cost allocation for regional transmission projects.[61] WestConnect CTOs argue that Order No. 1920-A does not acknowledge or explain how transmission providers barred from joint regional transmission planning with unenrolled non-jurisdictional transmission providers can meet Order No. 1000's integration requirement in a transmission planning region like WestConnect.[62]

19. WestConnect CTOs state that while the Commission found in its order on remand from *El Paso* that WestConnect remains an integrated transmission planning region even without participation of coordinating transmission owners, the Commission does not incorporate or reference that finding in Order No. 1920-A.[63] Nevertheless, WestConnect CTOs object to the Commission's determination in its order on remand from *El Paso* regarding the continued integration of the WestConnect transmission planning region.[64]

---

remanded, *El Paso Elec. Co. v. FERC*, 832 F.3d 495). The order that WestConnect CTOs cite does not contain this statement.

[61] *Id.* at 9.

[62] *Id.*

[63] *Id.* at 9 n.17 (citing WestConnect Remand Order, 189 FERC ¶ 61,028 at P 23).

[64] *Id.* (quoting *Pub. Serv. Co. of Colo.*, WestConnect CTOs Request for Clarification, Docket No. ER13-75-013, et al. (filed Nov. 18, 2024) (internal quotations omitted)).

20. WestConnect CTOs assert that the ban on use of a coordinating transmission owner framework would all but ensure the failure of regional transmission planning in WestConnect, contrary to the objectives of Order Nos. 1000 and 1920. WestConnect CTOs contend that the Commission's failure to acknowledge its departure from existing policy or explain how a mandatory enrollment requirement would be consistent with Order No. 1000's integration requirement was arbitrary.[65]

3. Commission Determination

21. We agree with rehearing petitioners that Order No. 1920-A does not modify the requirements of Order No. 1000 with respect to planning for the needs of unenrolled non-jurisdictional transmission providers.[66] Although Order No. 1000 does not require a coordinating transmission owner framework, Order No. 1000 and *El Paso* do not explicitly foreclose the possibility that a voluntary arrangement for regional transmission planning *and* cost allocation that includes unenrolled non-jurisdictional transmission providers could comply with the FPA's mandate for just and reasonable rates and the Commission's cost causation precedent.[67] Accordingly, we clarify the Commission's statement in Order No. 1920-A that transmission providers may *not* plan for the needs of a non-jurisdictional transmission provider if that non-jurisdictional transmission provider

[65] *Id.* at 9 (citing *FCC v. Fox Television Stations, Inc.*, 556 U.S. at 515).

[66] *See* NRECA Rehearing Request at 3, 17; WestConnect CTOs Rehearing Request at 8.

[67] *See* Remand Rehearing Order, 190 FERC ¶ 61,128 at P 28.

has not enrolled in the transmission planning region and thereby has not agreed to any cost allocation method applicable to selected Long-Term Regional Transmission Facilities.[68] Specifically, we agree with NRECA that transmission providers are not *required* to plan for the Long-Term Transmission Needs of unenrolled non-jurisdictional transmission providers.[69] In *El Paso*, the U.S. Court of Appeals for the Fifth Circuit held that the Commission's orders accepting WestConnect's coordinating transmission owner framework were incompatible with the FPA and with the application of the cost causation principle in Order No. 1000 because they permitted non-public utility transmission providers to cause transmission costs to be incurred through the WestConnect regional transmission planning process without bearing cost responsibility.[70] The Commission will evaluate any voluntary arrangement for regional transmission planning and cost allocation that includes unenrolled non-jurisdictional transmission providers if and when it comes before the Commission, and that is unaffected by Order No. 1920-A. We

[68] Order No. 1920-A, 189 FERC ¶ 61,068 at P 323. We find moot WestConnect CTOs' arguments that the relevant language in Order No. 1920-A violates the Commission's obligations under FPA section 202(a) and the objectives of Order No. 1000 as well as NRECA's argument that this language conflicts with other statements in Order No. 1920-A. *See* WestConnect CTOs Rehearing Request at 4-5, 9; NRECA Rehearing Request at 16-17. Our clarification of Order No. 1920-A in relevant part resolves these claims.

[69] *See* Order No. 1000-A, 139 FERC ¶ 61,132 at P 276 ("[T]he regional transmission planning process is not required to plan for the transmission needs of such a non-public utility transmission provider that has not made the choice to join a transmission planning region."); *see also El Paso*, 76 F.4th at 362-63 (quoting the same).

[70] *El Paso*, 76 F.4th at 365-66; *id*. at 363 (discussing cost causation concerns).

emphasize that any transmission provider proposing to include unenrolled non-jurisdictional transmission providers in regional transmission planning and cost allocation, including Long-Term Regional Transmission Planning, must demonstrate that its proposed arrangement will not result in free ridership in violation of the cost causation principle and otherwise complies with the requirements of Order No. 1000, Order No. 1920, *El Paso*, and the FPA.[71]

22. To the extent that WestConnect CTOs request that the Commission address in this order the appropriate geographic scope of the WestConnect transmission planning region or any other transmission planning region,[72] we decline to address such a request here because it is outside the scope of this proceeding.[73] We further note that the Commission responded to these concerns in the Remand Rehearing Order and continued to find that the WestConnect transmission planning region complies with Order No. 1000's

[71] *Id*. at 361-62; WestConnect Remand Order, 189 FERC ¶ 61,028 at PP 15-17.

[72] *See* WestConnect CTOs Rehearing Request at 9 n.17.

[73] The Commission has declined to evaluate the appropriate geographic scope of any particular transmission planning region in our transmission planning rules. *See* Order No. 1000, 136 FERC ¶ 61,051 at P 160; Order No. 890, 118 FERC ¶ 61,119 at P 527. Instead, it is Commission practice to evaluate the proper scope of transmission planning regions in individual compliance or FPA section 205 proceedings. *See, e.g.*, *Sw. Power Pool, Inc.*, 144 FERC ¶ 61,059, at P 31 (2013); *Louisville Gas & Elec. Co.*, 144 FERC ¶ 61,054, at PP 28, 30 (2013), *order on reh'g*, *Duke Energy Carolinas, LLC*, 147 FERC ¶ 61,241, at PP 46, 48 (2014); *Me. Pub. Serv. Co.*, 142 FERC ¶ 61,129, at P 21 (2013); *S. Co. Servs., Inc.*, 124 FERC ¶ 61,265, at P 71 (2008). *See also PacifiCorp*, 170 FERC ¶ 61,298, at P 29 (2020) (evaluating scope of transmission planning region proposed pursuant to FPA section 205).

requirement that the scope of a transmission planning region should be governed by the integrated nature of the regional power grid.[74]

III. Regional Transmission Cost Allocation

A. Requirements Concerning Relevant State Entities' Agreed-upon Cost Allocation Methods

1. Order Nos. 1920 and 1920-A

a. Inclusion in Transmission Providers' Compliance Filings of Relevant State Entities' Agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process

23. In Order No. 1920, the Commission: (1) required transmission providers in each transmission planning region to revise their OATTs to include one or more Long-Term Regional Transmission Cost Allocation Method(s) for Long-Term Regional Transmission Facilities that are selected; and (2) permitted transmission providers to additionally revise their OATTs to include a State Agreement Process, if Relevant State Entities indicate that they have agreed to such a process.[75]

24. The Commission also established in Order No. 1920 a six-month Engagement Period, during which transmission providers must, among other things, provide a forum for the negotiation of a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process that enables meaningful participation by Relevant State Entities, and the Commission required transmission providers to explain on compliance

[74] *See* Remand Rehearing Order, 190 FERC ¶ 61,128 at PP 30-32.

[75] Order No. 1920, 187 FERC ¶ 61,068 at P 1291.

how they complied with the six-month Engagement Period requirements.[76] The Commission found that, if the Relevant State Entities participating in an Engagement Period agree on a Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and provide that Method(s) and/or State Agreement Process to the transmission providers no later than the deadline for communicating agreement,[77] the transmission providers may file the agreed-to Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process on compliance. The Commission noted, however, that the ultimate decision as to whether to file a Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process to which Relevant State Entities have agreed will continue to lie with the transmission providers.[78] The Commission did not impose any obligation on transmission providers to file a cost allocation method for Long-Term Regional Transmission Facilities with which they disagree, even if such a method were proposed to the transmission providers pursuant to a Commission-approved State Agreement Process, unless the transmission providers have

[76] *Id.* PP 1354, 1357.

[77] Order No. 1920 requires that transmission providers in each transmission planning region provide notice, such as on their OASIS or other public website, of the deadline for Relevant State Entities to communicate their agreement on a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process, and this deadline must be no earlier than the end date of the Engagement Period. *Id.* P 1356.

[78] *Id.* PP 1359, 1363.

clearly indicated their assent to do so as part of a Commission-approved State Agreement Process in their OATT.[79]

25. In Order No. 1920-A, the Commission set aside Order No. 1920, in part, and required that, when Relevant State Entities notify transmission providers by the deadline for communicating agreement that they agree on a Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process resulting from the Engagement Period, the transmission providers must include that method or process in the transmittal or as an attachment to their compliance filing, even if the transmission providers propose a different Long-Term Regional Transmission Cost Allocation Method or do not propose to adopt a State Agreement Process.[80] The Commission further directed transmission providers to include in the transmittal or as an attachment to their compliance filings any information that Relevant State Entities provide to them regarding the state negotiations during the Engagement Period.[81] As part of this requirement, the

[79] *Id.* P 1429.

[80] Order No. 1920-A, 189 FERC ¶ 61,126 at P 651. The Commission clarified that, under this approach, the transmission providers decide what to submit as their actual Order No. 1920 compliance proposal, including relevant tariff language and supporting evidence or arguments, whether they decide to propose the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process or a different Long-Term Regional Transmission Cost Allocation Method. The requirement to include Relevant State Entities' Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process as an addition to the compliance filing does not constitute a "proposal" from the transmission provider. *Id.* P 654 n.1651.

[81] *Id.* P 651.

Commission clarified that transmission providers must include any and all supporting evidence and/or justification related to Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process that Relevant State Entities request that transmission providers include in their compliance filing.[82]

26. The Commission found that the additional requirements adopted in Order No. 1920-A will allow the Commission to better evaluate whether transmission providers have complied with Order No. 1920's requirement to provide a forum for negotiation that enables meaningful participation by Relevant State Entities during the Engagement Period.[83] The Commission recognized that it is critical to the success of the Long-Term Regional Transmission Planning reforms that states have an opportunity to have a significant role in the establishment of just and reasonable Long-Term Regional Transmission Cost Allocation Methods and State Agreement Processes.[84] The Commission found that Order No. 1920, as modified in Order No. 1920-A, strikes a reasonable balance between, on the one hand, recognizing the rights and responsibilities of the Commission and transmission providers over regional transmission planning and,

[82] *Id.* P 655. However, the Commission declined to require transmission providers to independently characterize this information. For example, the Commission did not require transmission providers to separately characterize Relevant State Entities' agreement or independently justify Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process. *Id.*

[83] *Id.* P 657 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1357).

[84] *Id.* P 649 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1415).

on the other, the states' critical interests in the resulting Long-Term Regional Transmission Facilities and how the costs associated with those facilities will be allocated.[85]

27. Furthermore, noting that it was directing these facilitation and informational requirements on compliance pursuant to the Commission's authority under FPA section 206, the Commission found that these reforms do not implicate or infringe upon transmission providers' filing rights under FPA section 205.[86] The Commission reiterated its determination in Order No. 1920 that existing regional transmission planning and cost allocation requirements are unjust, unreasonable, and unduly discriminatory or preferential under FPA section 206,[87] and that the Commission therefore has both the authority and responsibility to "determine the just and reasonable . . . practice . . . to be thereafter observed and in force," consistent with the Commission's findings in Order No. 1920.[88] The Commission explained that, pursuant to its authority under FPA section 206, the Commission required transmission providers to submit on compliance an *ex ante* cost allocation method. The Commission further explained that this compliance filing, submitted pursuant to FPA section 206, is not an

[85] *Id.* P 660.

[86] *Id.* P 657.

[88] *Id.* (quoting 16 U.S.C. 824e(a)).

FPA section 205 filing[89] and is thus distinct from any FPA section 205 filing that a transmission provider might file in the future following compliance to propose a change to its cost allocation method(s) for Long-Term Regional Transmission Facilities.[90]

b. Commission Consideration of Relevant State Entities' Agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Processes

28. In Order No. 1920-A, the Commission noted that, when acting under FPA section 206, the Commission's statutory burden is to "establish *a* just and reasonable and not unduly discriminatory replacement rate that is supported by substantial evidence."[91] The Commission further noted that the statute does not necessarily require the Commission to adopt the transmission provider's proposal on compliance, even if that proposal complies with the final rule's requirements. Rather, the Commission need only select a replacement rate that complies with the final rule and that is adequately supported in the record, and then intelligibly explain the reasons for its choice.[92]

[89] *Id.* (citing *ISO New England Inc.*, 165 FERC ¶ 61,202 (2018), *order on reh'g*, 173 FERC ¶ 61,204, at P 8 (2020)).

[92] *Id.* (citing *Entergy Ark., LLC v. FERC*, 40 F.4th 689, 701–02 (D.C. Cir. 2022) (*Entergy*) (noting that the Commission "is not required to choose the best solution, only a reasonable one" (first quoting *Petal Gas Storage, LLC v. FERC*, 496 F.3d 695, 703 (D.C. Cir. 2007); and then quoting *FERC v. Elec. Power Supply Ass'n*, 577 U.S. 260, 295 (2016) (*EPSA*)))).

29. The Commission recognized that, while it generally does not consider alternate compliance proposals other than those filed by the relevant public utility,[93] there are "good reasons" for considering such alternatives with respect to cost allocation under Order No. 1920.[94] The Commission explained that states play a unique role in Long-Term Regional Transmission Planning, as their laws, regulations, and policies drive the need for Long-Term Regional Transmission Facilities, and they typically will have responsibility to consider and approve the siting, permitting, and construction of Long-Term Regional Transmission Facilities selected in a regional transmission plan. As such, states affect whether Long-Term Regional Transmission Facilities are timely, efficiently, and cost-effectively developed such that customers actually receive the benefits associated with the selection of more efficient or cost-effective transmission solutions.[95] The Commission further found that given the inherent uncertainty involved in planning to meet Long-Term Transmission Needs, state-developed cost allocation methods and State Agreement Processes take on heightened importance.[96] The Commission explained that this means that it will consider the entire record—including

the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and the transmission provider's proposal—when setting the replacement rate. Specifically, the Commission found that it is not required to accept a cost allocation proposal from a transmission provider on compliance simply because it may comply with Order No. 1920 but may adopt any cost allocation method proposed by the Relevant State Entities and submitted on compliance so long as it complies with Order No. 1920.[97]

2. Challenges to Order No. 1920-A

a. Statutory Filing Rights Under the FPA

i. Rehearing Requests

30. Several of the rehearing requests argue that Order No. 1920-A unlawfully impinges on transmission providers' FPA section 205 filing rights by requiring transmission providers to include, in their transmittal or as an attachment to their compliance filings, Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process.[98] Multiple

[97] *Id.*

[98] *See, e.g.*, SPP TOs Rehearing Request at 7, 12-15 (alternately describing Order No. 1920-A as requiring transmission providers to include Relevant State Entities' preferred Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings, or as granting "preferential filing privileges" to Relevant State Entities); Indicated PJM TOs Rehearing Request at 6 (describing Order No. 1920-A as "granting filing rights" to Relevant State Entities); MISO TOs Rehearing Request at 20 (describing Order No. 1920-A a "giv[ing] filing rights to Relevant State Entities").

rehearing petitioners assert that this requirement in Order No. 1920-A is inconsistent with the division of authority set forth in the FPA, which provides public utilities with unilateral and exclusive FPA section 205 filing rights to propose rates, terms, and conditions of service, and provides the Commission with the authority to modify existing rates under FPA section 206 after finding that the existing rate is unjust, unreasonable, or unduly discriminatory or preferential.[99]

31. Rehearing petitioners contend that requiring transmission providers to include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in transmission providers' compliance filings unlawfully conditions or encumbers transmission providers' FPA section 205 filing rights. MISO TOs state that this requirement disrupts the balance set by FPA sections 205 and 206—allowing FPA section 206 to usurp FPA section 205—and encroaches on transmission providers' FPA section 205 filing rights.[100] MISO TOs and

[99] *See, e.g.*, MISO TOs Rehearing Request at 5-7 (arguing that Order No. 1920-A disrupts the balance between the filing rights afforded to public utilities under FPA section 205 versus those afforded to the Commission under FPA section 206); *id.* at 7-8; SPP TOs Rehearing Request at 3; *id.* at 4-5 ("The FPA's distinction between section 205 and 206 filing rights is well-established and binding on the Commission."); EEI Rehearing Request at 7-8; WIRES Rehearing Request at 7-8, 10-11; Indicated PJM TOs Rehearing Request at 3-4.

[100] *See, e.g.,* MISO TOs Rehearing Request at 6-7; *id.* at 10-11; ("[T]he Commission uses its FPA section 206 authority to mandate a broad encroachment on transmission providers' FPA section 205 filing rights. Given this encumbrance, transmission providers will be unable to exercise the full breadth of their FPA section 205 rights."); *id.* at 24-27 (arguing also that even if FPA sections 205 and 206 are ambiguous as to whether the Commission has this authority, a reviewing court will no longer afford the Commission's interpretation deference).

SPP TOs argue that states may not force public utilities to make FPA section 205 filings or require them to relinquish their filing rights to other entities.[101] Indicated PJM TOs assert that this requirement "effectively forces utilities to cede their filing rights to others, contravening the statutory directive by Congress in [FPA] section 205 that grants utilities the exclusive right to propose their rates and terms of service."[102]

32. Some rehearing petitioners assert that the Commission misconstrues the structure of FPA sections 205 and 206, and particularly the rights afforded to public utilities under FPA section 205. For instance, they argue that FPA section 205 is intended for the benefit of the public utility, granting it the proactive right to initiate rate changes, in contrast to the passive role played by the Commission under that provision.[103] Rehearing petitioners also assert that the FPA section 205 rights of public utilities to initiate rate

[101] *Id.* at 18 (citing *Mass. Dep't of Pub. Utils v. FERC*, 729 F.2d 886, 886-87 (1st Cir. 1984) (*Massachusetts Department of Public Utilities*)); SPP TOs Rehearing Request at 4-5 (asserting that "states may not force public utilities to make section 205 filings"); *see also id.* at 5-6 (arguing that circumstances in which public utilities voluntarily cede statutory filing rights to others are distinct from those in which the Commission attempts to encroach on those rights).

[102] Indicated PJM TOs Rehearing Request at 2; *id.* at 10-11. *See also* EEI Rehearing Request at 6-8 (arguing that this requires utilities to file cost allocation methods they are opposed to and that the Commission did not identify text in the FPA authorizing this approach); WIRES Rehearing Request at 2, 15 (same).

[103] *See, e.g.*, MISO TOs Rehearing Request at 5-6 (citing *Emera Me. v. FERC*, 854 F.3d 9, 24 (D.C. Cir. 2017) (*Emera Maine*)); *id.* at 8-9, 11, 20, 25; Indicated PJM TOs Rehearing Request at 3-4, 19 n.69; *see also* SPP TOs Rehearing Request at 3.

changes are exclusive and unilateral.[104] Rehearing petitioners further contend that public utilities are the entities entitled to submit filings under FPA section 205 to set their rates and initiate rate changes.[105]

33. In addition, petitioners cite precedent that, they contend, reflects the fact that the Commission cannot diminish public utilities' FPA section 205 filing rights and, therefore, Order No. 1920-A's requirement for transmission providers to submit Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process with their compliance filings is unlawful. Many of the rehearing requests argue that the requirement to include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in transmission providers' compliance filings is contrary to *Atlantic City Electric. Co. v. FERC*.[106] They assert that *Atlantic City I* holds that public utilities—and only public utilities—have FPA section 205 filing rights to propose rate changes and that public utilities cannot be involuntarily divested of those rights as a result

[104] *See, e.g.*, Indicated PJM TOs Rehearing Request at 2-3, 10, 16; MISO TOs Rehearing Request at 5, 8, 12-15; SPP TOs Rehearing Request at 5; EEI Rehearing Request at 6-8, 12-13; WIRES Rehearing Request at 6.

[105] *See, e.g.*, WIRES Rehearing Request at 6, 8; EEI Rehearing Request at 10-11, 11 n.34; SPP TOs Rehearing Request at 9, 16 n.43, 19, 21; Indicated PJM TOs Rehearing Request at 7.

[106] 295 F.3d 1 (D.C. Cir. 2002) (*Atlantic City I*); *see also Atl. City Elec. Co. v. FERC*, 329 F.3d 856 (D.C. Cir. 2003) (*Atlantic City II*) (granting a petition for review seeking to enforce the mandate of *Atlantic City I* in response to the Commission's order on remand after *Atlantic City I*).

of an FPA section 206 compliance directive.[107] Several rehearing petitioners point to other decisions that, they contend, rejected attempts by the Commission to limit or compromise public utilities' (or, in the parallel context of the Natural Gas Act (NGA),[108] natural-gas companies') statutory authority to file rates.[109] A number of the rehearing requests also rely on *Massachusetts Department of Public Utilities*,[110] asserting that

[107] *See* MISO TOs Rehearing Request at 11-15 (discussing *Atlantic City I* and *Atlantic City II*, and asserting that these cases "stand as foundational determinations about the lawful statutory framework created by Congress vesting certain rights in public utilities under FPA section 205 and other rights in the Commission under section 206, and denying the Commission authority to overextend its authority under FPA section 206 when directing public utilities on compliance"); Indicated PJM TOs Rehearing Request at 2, 6, 11-12 (arguing that the requirement to include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in the transmittal or as an attachment to transmission providers' compliance filing forces transmission providers to cede their exclusive rights to Relevant State Entities and grants Relevant State Entities rights not provided by the FPA); SPP TOs Rehearing Request at 4-5, 9, 11-16; EEI Rehearing Request at 8-9 ("The precedent in *Atlantic City II*, is clear—the Commission cannot condition or encumber a utility's right under FPA section 205 to initiate rate changes, even as a result of an FPA section 206 compliance directive."); WIRES Rehearing Request at 5-6, 8, 10.

[110] 729 F.2d at 888.

"states may not force public utilities to make section 205 filings" or require utilities to submit "'regulator-compelled' utility-proposed changes."[111]

34. MISO TOs assert that Order No. 1920-A contravenes restrictions on the Commission's FPA section 206 authority because, by requiring attachment of Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process to transmission providers' compliance filings, it requires transmission providers to relinquish their right to file rate changes under FPA section 205 to Relevant State Entities.[112] MISO TOs argue that the Commission in Order No. 1920 acknowledged that it could not encumber these filing rights by initially allowing transmission providers to determine which Long-Term Regional Transmission Cost Allocation Method(s) to file as part of their compliance filings.[113] Indicated PJM TOs assert that FPA section 206 "does not authorize the Commission to provide [Relevant State Entities] with the statutory authority reserved solely to public utilities,

[111] SPP TOs Rehearing Request at 4-5; EEI Rehearing Request at 8 n.27; Indicated PJM TOs Rehearing Request at 6, 10; *see also* MISO TOs Rehearing Request at 9, 18, 25.

[112] MISO TOs Rehearing Request at 16-19 (arguing that this effectively forces transmission providers to make FPA section 205 filings that are not their own; also characterizing this as involuntarily transferring to Relevant State Entities the right to make FPA section 205 filings to make rate changes (citing *Atlantic City I*, 295 F.3d at 9-11; *Atlantic City II*, 329 F.3d at 858-59; *NRG Power Mktg.*, 862 F.3d at 114; *PJM Power Providers Grp.*, 88 F.4th at 270 n.122; *Emera Maine*, 854 F.3d at 24)).

[113] *See id.* at 16-17 (noting that, under Order No. 1920, filing a Relevant State Entity's proposed Long-Term Regional Transmission Cost Allocation Method was voluntary).

nor does it authorize the Commission to require public utilities to cede those rights to [Relevant State Entities] by forcing them to submit proposals and materials prepared by those [Relevant State Entities] that the public utilities do not support."[114] EEI argues that, "[b]y requiring the public utilities to file the Relevant State Entities' proposals, the Commission is requiring those public utilities to cede their statutory rights to make filings under the FPA to the Relevant State Entities and to provide those entities with statutory rights that Congress did not intend them to have."[115] SPP TOs argue that Order No. 1920-A gives "preferential filing privileges to states that the FPA does not authorize the Commission to grant," and thereby diminishes the FPA section 205 filing rights of public utilities.[116] WIRES states that the Commission does not have statutory authority to require a public utility to file another entity's rate proposal, and that Order No. 1920-A

[114] Indicated PJM TOs Rehearing Request at 11-12 (citing 16 U.S.C. 824d; *Atlantic City I*, 295 F.2d at 9-11; *Massachusetts Department of Public Utilities*, 729 F.2d at 888).

[115] EEI Rehearing Request at 8 (citing *Atlantic City II*, 329 F.3d at 858-59) (arguing that the Commission "acknowledges this when it concedes that it generally does not consider alternate compliance proposals other than those filed by the relevant public utility" (quotation marks omitted)); *see id.* at 9-12 (arguing that under the FPA the Commission may not, in setting a replacement rate, divest public utilities of their filing rights and give them to Relevant State Entities).

[116] SPP TOs Rehearing Request at 13; *see id.* at 14 ("The FPA does not contemplate any party, including states, being allowed to make compliance filings on a regulated public utility's behalf. Nor does it authorize third parties to somehow join or commandeer a public utility's compliance filing."); *id.* at 17 ("The fact that states are unable to file cost allocation methods themselves and must instead either comment on transmission providers' proposals or file section 206 complaints is exactly what the FPA requires." (quotation marks omitted)).

does not reflect a "mere change in the filing process" but rather a substantive change that the Commission is not authorized to make.[117] WIRES further argues that Order No. 1920-A effectively elevates states to the equivalent of public utilities in requiring that their proposals be included in the compliance filing, which will be assessed under the same just and reasonable standard articulated in FPA section 205.[118]

35. Many rehearing petitioners also contest the Commission's explanation for why this compliance filing requirement was statutorily permissible. MISO TOs assert that the Commission's explanation that a Relevant State Entity's proposed method or process does not constitute a "proposal" is an "empty formalism with no grounding in the statutory text" that does not change the impact of the requirement on transmission

[117] WIRES Rehearing Request at 11-12; *id.* at 13 ("[B]y requiring a transmission provider to include in its compliance filing a state-agreed upon method or process, the transmission provider is forced to share its statutory filing rights with another entity under a just and reasonable standard.").

[118] *See id.* at 13-14 (arguing that the Commission has not previously taken the approach set forth in Order No. 1920-A and that, as the Commission recognizes, transmission planning is the tariff obligation of transmission providers); *see also id.* at 10-11 ("Procedurally, the public utility's obligation under compliance is the same as that under FPA section 205, *i.e.*, the public utility must submit a just and reasonable rate."); *id.* at 15-16 ("Whether a filing is submitted under FPA section 205 or 206, the public utility's filing is equally subject to a just and reasonable standard, as both statutory provisions ultimately rely on the same standard."); *cf.* SPP TOs Rehearing Request at 30 (claiming that "[t]he Commission failed to acknowledge that it was changing policy when it decided to afford public utility and state proposals equal status when the Commission's previous approach was to favor compliance proposals by the regulated entities that were the actual subject of compliance mandates").

providers' FPA section 205 filing rights.[119] WIRES similarly argues that, despite this clarification and the fact that transmission providers are not required to characterize or justify the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process,[120] the compliance requirement remains unlawful because neither states nor Relevant State Entities are public utilities entitled to make FPA section 205 filings.[121]

36. MISO TOs argue that the Commission's distinction between FPA section 205 filings and compliance filings under FPA section 206 is a "hollow explanation" that does not allow the Commission to give filing rights to Relevant State Entities in violation of the FPA or require public utilities to cede their filing rights under FPA section 205.[122] SPP TOs acknowledge that Commission precedent distinguishes between FPA section 205 filings and compliance filings under FPA section 206,[123] but still contend that Order No. 1920-A's mandates are unlawful because they are forced encroachments on

[119] MISO TOs Rehearing Request at 19 (quoting Order No. 1920-A, 189 FERC ¶ 61,126 at P 654 n.1651).

[121] *See id.*

[122] MISO TOs Rehearing Request at 19-20.

[123] SPP TOs Rehearing Request at 3-4 (citing *N.Y. Indep. Sys. Operator, Inc.*, 131 FERC ¶ 61,242, at P 32 (2010); *PJM Interconnection, L.L.C.*, 85 FERC ¶ 61,111, at 61,413 (1998); *PJM Interconnection, L.L.C.*, 142 FERC ¶ 61,214, at PP 5-7, 21 (2013)).

public utility filing rights under the FPA, which may only be relinquished voluntarily.[124] EEI also recognizes that a compliance filing under FPA section 206 is not a change initiated by a public utility but rather one directed by the Commission,[125] but asserts that, even if the Commission were to act pursuant to FPA section 206 or via rulemaking, whatever rate or regulation the Commission establishes may not usurp the rights of public utilities to file proposed rates.[126]

37. SPP TOs argue that the Commission has rejected attempts to use compliance filings to bypass the FPA's filing requirements and circumvent FPA notice requirements, and that the Commission has recognized that it could not circumvent these requirements even by invoking FPA section 309.[127] They contend that the Commission's approach could lead it to improperly "bypass" FPA sections 205 and 206 in future cases, e.g., in complaint proceedings, by authorizing "favored parties to include their preferred alternative remedies in other parties' compliance filings without first having to make the first step showings under FPA section 206 that are normally required of complainants or

[124] *See id.* at 4-5 ("Courts have firmly rebuffed various attempts to alter the FPA framework, especially when the purpose was to weaken public utilities' ability to independently exercise their statutory filing rights."); *id* at 6.

[125] EEI Rehearing Request at 8-9 (citing *S. Co. Servs, Inc.*, 61 FERC ¶ 61,339, at 62,328-29 (1992), *order on reh'g*, 63 FERC ¶ 61,217 (1993)).

[127] SPP TOs Rehearing Request at 15 (citing 16 U.S.C. 825h; *PJM Interconnection, L.L.C.*, 178 FERC ¶ 61,083, at P 29 (2022)).

protestors."[128] SPP TOs claim that Order No. 1920-A's attempt to weaken FPA sections 205 and 206's statutory constraints wrongly attempts to resolve a "major question" under the statute in ways that Congress did not authorize and could not have foreseen.[129]

38. Indicated PJM TOs argue that Order No. 1920-A's requirement to include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in transmission providers' compliance filings intrudes into the decision making processes of public utilities as to whether to submit a filing under FPA section 205.[130] Indicated PJM TOs state that these are "internal decisions by the public utility determined by its governing authority" that are beyond the Commission's authority to regulate and contrary to the "passive role" assigned to the Commission under FPA section 205.[131] They assert that this requirement is a "direct intervention into a public utility's decision regarding what to file even before the filing is

[128] *Id*. at 15 & n.39 ("The states or third parties would not have to show that the existing rates were unjust and unreasonable as they would under section 206.").

[129] SPP TOs Rehearing Request at 17-18 (citing *Biden v. Neb.*, 143 S. Ct. 2355, 2374 (2023); *W. Va. v. EPA*, 597 U.S. 697, 724 (2022)).

[130] Indicated PJM TOs Rehearing Request at 2-3, 6-7, 12-15.

[131] *Id.* at 12-15 (also arguing that under *EPSA*, 577 U.S. 260 and *Cal. Indep. Sys. Operator Corp. v. FERC*, 372 F.3d 395, 403 (D.C. Cir. 2004) (*CAISO*), the Commission's authority is limited to regulating practices directly affecting jurisdictional rates and does not extend to regulating how a public utility makes decisions).

made" and not a "practice affecting a rate" subject to Commission regulation.[132] Indicated PJM TOs further assert that Commission precedent addressing RTO/ISO governance is not relevant, as the two cases addressing participation in the bodies that vote on rate proposals were decided prior to the Supreme Court's decision in *Loper Bright Enterprises v. Raimondo*, did not "advance[ ] to judicial review," and did not "address[ ] the D.C. Circuit's decision in *CAISO*."[133]

39. EEI, SPP TOs, and WIRES assert that there are other avenues for parties to be heard with respect to cost allocation, such that infringing on transmission providers' FPA section 205 rights is not necessary or justified. EEI argues that parties may file protests to a transmission provider's compliance filing if they wish to advocate for an alternative approach.[134] SPP TOs argue that, because states are not authorized to file cost allocation proposals, they are limited to commenting on or protesting transmission providers' proposals or filing FPA section 206 complaints.[135] WIRES argues that there are ways of evaluating whether transmission providers have provided state regulators with a formal

[132] *Id.* at 14 (citing *Atlantic City I*, 295 F.3d at 10).

[133] *Id.* at 15 (citing *PJM Interconnection, L.L.C.*, 154 FERC ¶ 61,147, *order on reh'g,* 157 FERC ¶ 61,229 (2016); *New England Power Pool Participants Comm.*, 166 FERC ¶ 61,062 (2019)).

[134] EEI Rehearing Request at 9-10 (arguing that "[t]he Commission fails to explain what procedural infirmity would be created by requiring Relevant State Entities and other stakeholders to provide comments and feedback on these filings throughout the traditional regulatory process" and that the approach adopted in Order No. 1920-A could lead to confusion as to which proposal to provide feedback on); *see also id.* at 12.

[135] SPP TOs Rehearing Request at 17-18; *see also id.* at 15-16, 18-19.

opportunity to develop a Long-Term Regional Transmission Cost Allocation Method other than compelling transmission providers to include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filing, but that Order No. 1920-A adopts an adversarial approach of dueling compliance proposals.[136]

40. MISO TOs assert that, under Order No. 1920-A, the Commission is particularly likely to accept Relevant State Entities' Long-Term Regional Transmission Cost Allocation Methods rather than transmission providers proposals because they assert that Order No. 1920-A provides that Relevant State Entities' proposals "will be afforded heightened preference over transmission providers' own proposals."[137] MISO TOs argue that accepting Relevant State Entities' cost allocation method over the transmission provider's proposed cost allocation method would "subvert[ ] future FPA section 205 filings related to that rate scheme in a manner that disfavors the transmission provider's FPA section 205 proposals."[138]

41. Indicated PJM TOs and SPP TOs argue that, in claiming that the Commission need not accept a transmission provider's proposal on compliance even if the proposal complies with the final rule's requirements, the Commission's reliance on

[136] WIRES Rehearing Request at 14.

[137] MISO TOs Rehearing Request at 7; *see id.* at 24-25 (citing Order No. 1920-A, 189 FERC ¶ 61,126 at P 659); *id.* at 9, 33-37.

[138] *Id.* at 24-25.

Entergy Arkansas, LLC v. FERC is misplaced.[139] They contend that *Entergy* is inapposite because the Commission there rejected MISO's compliance filing before selecting a different replacement rate.[140] SPP TOs argue that the Commission can accept a proposed replacement rate from a third party (including Relevant State Entities) only after finding that the transmission provider's compliance filing does not comport with the Commission's directives.[141]

42. Indicated PJM TOs assert that the preference the Commission has articulated in its precedent for accepting public utilities' compliant, just and reasonable proposals rather than competing proposals[142] is, in fact, mandated by the FPA.[143] Indicated PJM TOs state that FPA sections 205 and 206 are part of a single statutory structure under which rates

[139] Indicated PJM TOs Rehearing Request at 22-23 (citing *Entergy*, 40 F.4th at 701-02); SPP TOs Rehearing Request at 18-19 n.49 (same); *see* Order No. 1920-A, 189 FERC ¶ 61,126 at P 658 & n.1656.

[140] Indicated PJM TOs Rehearing Request at 22-23; SPP TOs Rehearing Request at 18-19 & n.49 ("[S]tates, like every other third party, should have to show that a public utility's proposed replacement rate does not satisfy compliance directives before their preferred alternatives are considered.").

[141] SPP TOs Rehearing Request at 14-15.

[142] *See infra* P 74 (summarizing arguments that the Commission departed from this precedent without adequate explanation).

[143] Indicated PJM TOs Rehearing Request at 17-18 (arguing that "[t]he statutory structure of the FPA requires the Commission give preference to the proposal submitted on compliance by public utilities" and the Commission "cannot simply choose the one it likes best" (citing *United Gas Pipe Line Co. v. Mobile Gas Serv. Corp.*, 350 U.S. 332, 340-41 (1956))); *see id.* at 20 ("This preference for the public utility's proposal is the only interpretation that conforms with the statutory text of the FPA.").

are initially established by the utility, such that the Commission must give preference to compliance proposals by public utilities over those by other entities.[144]

43. Indicated PJM TOs also assert that Order No. 1920-A "did not prescribe a specific replacement rate," instead maintaining a "light touch" and providing flexibility to transmission providers as to their compliance filings on cost allocation, and therefore "forwent its opportunity to establish a specific replacement rate pursuant to section 206."[145] Indicated PJM TOs further maintain that the Commission's approach in Order Nos. 1920 and 1920-A is inconsistent with FPA section 206, which Indicated PJM TOs state requires that the replacement be "fixed by rule or by a later order on compliance, but not by both."[146] As a result, Indicated PJM TOs claim that "any later filing made by the public utility to ensure that the public utility is compliant with the Commission's rules is made pursuant to section 205"[147] such that the Commission's "only recourse is to consider whether the rate submitted by the public utility on compliance is just and reasonable."[148] WIRES similarly argues that the Commission did

[144] *See id.* at 17.

[145] *Id.* at 27-28.

[146] *Id.* at 27 n.102 (citing 16 U.S.C. 824e(a); *Indep. Energy Producers Ass'n v. Cal. Indep. Sys. Operator Corp.*, 128 FERC ¶ 61,165, at PP 21-26 (2009)).

[147] *Id.* at 27-28 n.102.

[148] *Id.* at 28; *see also, e.g.*, *id.* at 3-4 ("Unless the Commission prescribes the specific replacement rate, the Commission must accept the utility's filing if it is just and reasonable, even if the Commission prefers a different rate."); *id.* at 5, 7-8.

not "take the initiative in setting the replacement rates" but instead directed transmission providers on compliance to submit just and reasonable cost allocation methods consistent with the requirements of Order No. 1920, such that "the public utility need only propose a just and reasonable replacement rate in compliance with the Commission order."[149]

44. SPP TOs argue that certain Commission precedent cited in Order No. 1920-A[150] does not support—and, in fact, undermines—the requirement that transmission providers submit Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process with transmission providers' compliance filings.[151]

ii. Commission Determination

45. For the reasons below and those stated in Order No. 1920-A, we sustain the Commission's determination in Order No. 1920-A requiring transmission providers to include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process resulting from the Engagement Period, and associated information provided to transmission providers regarding the state

[149] WIRES Rehearing Request at 10-11.

[150] Order No. 1920-A, 189 FERC ¶ 61,126 at P 658 & n.1657 (citing *PJM Interconnection, L.L.C.*, 173 FERC ¶ 61,134 at P 117 n.175; *PJM Interconnection, L.L.C.*, 119 FERC ¶ 61,318 at P 115; *ANR Pipeline Co.*, 110 FERC ¶ 61,069 at P 49) (reflecting that the Commission typically does not consider alternative proposals on compliance).

[151] *See* SPP TOs Rehearing Request at 16-17 & n.43 (arguing that these cases involved acceptance of and/or giving greater weight to transmission providers' compliance filings or settlement proposals).

negotiations during the Engagement Period, in transmission providers' transmittal or as an attachment to their Order No. 1920 regional transmission planning and cost allocation compliance filings.[152] We further sustain the Commission's determination that, pursuant to its FPA section 206 authority, it will consider the entire record—including any agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and the transmission providers' proposal—when setting the replacement rate.[153]

(a) The Statutory Text and Structure, and Applicable Precedent, Support the Commission's Order No. 1920-A Approach

46. Order No. 1920-A requires that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and associated information in the transmittal or as an attachment to their Order No. 1920 compliance filings and provides for the Commission's consideration of the entire record, which includes proposals from transmission providers and attachments to transmission providers' filings, when finalizing the replacement rate. The challenges raised on rehearing to both of these aspects of Order No. 1920-A incorrectly treat filings to comply with Order Nos. 1920 and

[152] Order No. 1920-A, 189 FERC ¶ 61,126 at PP 651, 654-655.

[153] *Id.* P 659. As discussed further below, pursuant to FPA section 205, transmission providers retain their discretion over whether to make and the contents of any future FPA section 205 filings, and Order No. 1920-A's requirements do not affect that discretion. *See infra* PP 69, 118.

1920-A as arising under or implicating FPA section 205, which sets forth public utilities' filing rights and obligations. Rather, these aspects of Order No. 1920-A arise from FPA section 206, which sets forth the Commission's authority to determine and fix by order a replacement rate after appropriate findings.[154] The compliance filings required by Order Nos. 1920 and 1920-A are a tool to implement the Commission's authority under FPA section 206, and do not implicate public utilities' rights and obligations under FPA section 205. Thus, we address at the outset the statutory text and structure of the FPA, as well as relevant Commission and judicial decisions, in addressing these arguments.

47. Order Nos. 1920 and 1920-A were issued pursuant to Commission-initiated proceedings under FPA section 206.[155] As the Commission stated in Order No. 1920-A, having determined that the Commission's existing regional transmission planning and cost allocation requirements are unjust, unreasonable, and unduly discriminatory or preferential under FPA section 206, "[t]he Commission thus had both the authority and responsibility to 'determine the just and reasonable . . . practice . . . to be thereafter observed and in force.'"[156] The Commission required the submission of compliance filings to assist in effectuating the Commission's authority under FPA section 206,

[154] 16 U.S.C. 824d (setting forth public utility filing rights and obligations); 16 U.S.C. 824e (setting forth power of Commission to fix rates and charges).

[155] *See Bldg. for the Future Through Elec. Reg'l Transmission Plan. & Cost Allocation & Generator Interconnection*, 179 FERC ¶ 61,028, at P 1 (2022) (NOPR); Order No. 1920, 187 FERC ¶ 61,068 at P 1; Order No. 1920-A, 189 FERC ¶ 61,126 at PP 1, 652.

[156] Order No. 1920-A, 189 FERC ¶ 61,126 at P 652 (quoting 16 U.S.C. 824e(a)).

explaining in Order No. 1920-A that "[t]his compliance filing submitted pursuant to FPA section 206 is not an FPA section 205 filing."[157]

48. While FPA sections 205 and 206 embody a complementary structure for regulating the rates and practices of public utilities, they are distinct provisions which assign rights and responsibilities to different entities under different circumstances. FPA section 205 requires that the public utility, subject to Commission oversight, "file with the Commission . . . schedules showing all rates and charges for any transmission or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges."[158] FPA section 206(a), by contrast, delineates the authority of the Commission—the subject of the provision—to modify public utilities' existing rates on appropriate findings and, itself, determine and fix by order the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be observed and in force.[159]

49. The express text of FPA section 206 does not provide public utilities with statutory filing rights with respect to the just and reasonable replacement rate following a

[157] *Id.* (citing *ISO New England Inc.*, 173 FERC ¶ 61,204 at P 8).

[158] 16 U.S.C. 824d(c); *cf. id.* 824d(a) (requiring that "[a]ll rates and charges made, demanded, or received by any public utility for or in connection with the transmission or sale of electric energy subject to the jurisdiction of the Commission, and all rules and regulations affecting or pertaining to such rates or charges shall be just and reasonable, and any such rate or charge that is not just and reasonable is hereby declared to be unlawful").

[159] 16 U.S.C. 824e(a) (providing that "the Commission shall determine" the replacement rate and "shall fix the same by order").

finding that existing rates are unjust, unreasonable, or unduly discriminatory or preferential. Rather, the authority to "determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force" is vested in the Commission, and—in Commission-initiated proceedings under FPA section 206—the Commission must find that the replacement rate it determines and fixes meets the statutory criteria.[160] To implement this authority the Commission frequently requires public utilities to submit compliance filings, as it did in Order Nos. 1920 and 1920-A, which the Commission will review and address in further orders.[161]

50. As the D.C. Circuit held in discussing what it means to "'fix' a rate within the meaning of [FPA section 206]," when the Commission determines that an existing rate is

[160] *Id.*; *see E. Tenn. Nat. Gas Co. v. FERC*, 863 F.2d 932, 937 (D.C. Cir. 1988) (explaining that, under the parallel provisions of the NGA, "[w]hen review of existing rates is initiated by the Commission, . . . the burden of proving that the existing rates are unjust or unreasonable, and that those it orders in replacement are just and reasonable, rests with [the Commission]"); *ISO New England Inc.*, 153 FERC ¶ 61,224, at P 24 (2015) ("The Commission did not place the burden on Connecticut and Rhode Island to prove that the dynamic de-list bid threshold [proposed in a compliance filing] was unreasonable. Rather, the Commission affirmatively found the dynamic de-list bid threshold to be just and reasonable.").

[161] *See, e.g.*, *Improvements to Generator Interconnection Procs. & Agreements*, Order No. 2023, 184 FERC ¶ 61,054, at P 1762, *order on reh'g*, 185 FERC ¶ 61,063 (2023), *order on reh'g*, Order No. 2023-A, 186 FERC ¶ 61,199, *errata notice*, 188 FERC ¶ 61,134 (2024); *Participation of Distributed Energy Res. Aggregations in Mkts. Operated by Reg'l Transmission Orgs. & Indep. Sys. Operators*, Order No. 2222, 172 FERC ¶ 61,247, at P 360 (2020), *order on reh'g*, Order No. 2222-A, 174 FERC ¶ 61,197 (2021). This particular compliance process, however, is not prescribed by the statute and by no means required. *See Elec. Dist. No. 1 v. FERC*, 774 F.2d 490, 494 (D.C. Cir. 1985) (*Electrical District*) (explaining that the Commission may instead "complete the process itself and fix the rates in its initial order").

unjust and unreasonable, it is not "inevitable that the Commission has the obligation to end an unlawful rate from the moment it finds unlawfulness."[162] The court therefore rejected the Commission's argument that a replacement rate necessarily must go into effect as of the date the Commission finds that an existing rate is not lawful under the FPA, rather than the effective date provided when the Commission determines and fixes the replacement rate on compliance.[163] This decision underscores that the Commission's authority and responsibility under FPA section 206 to fix the replacement rate continued, in the Order Nos. 1920 and 1920-A context, from the point at which the Commission determines that existing rates are unlawful and requires compliance filings until the Commission fixes the replacement rate by order.[164] The submission and Commission

[162] *Electrical District*, 774 F.2d at 492. The D.C. Circuit later explained how this decision could be reconciled with *Pub. Serv. Co. of New Hampshire v. FERC*, 600 F.2d 944 (D.C. Cir. 1979), which applied a seemingly lower standard with respect to the necessary notice required under the FPA as to certain types of rates. *See Transwestern Pipeline Co. v. FERC*, 897 F.2d 570, 577-78 (D.C. Cir. 1990). The reconciliation of these cases does not affect the relevance of the analysis from the D.C. Circuit discussed herein regarding the Commission's ongoing FPA section 206 authority.

[163] *See Electrical District*, 774 F.2d at 492 ("Or to use a more remote analogy, it is not the case that once a court has concluded that a particular action challenged before it is unlawful it must immediately issue an injunction, instead of taking time for further deliberations necessary to determine what the precise terms of that injunction should be."); *see also Kern River Gas Transmission Co.*, 133 FERC ¶ 61,162, at P 22 (2010) (*Kern River*) ("Since *Electrical District*, the Commission's general practice in determining the effective date of rate changes ordered pursuant to NGA section 5 has been to follow the approach suggested by the court in that case.").

[164] *See Electrical District*, 774 F.2d at 492 (citing FPA section 206(a), 16 U.S.C. 824e(a), as establishing "the procedures that the statute establishes for adjusting unlawful rates" and finding that these procedures for the Commission to follow in fixing the replacement rate by order, pursuant to the statutory text are "not at all ambiguous").

consideration of compliance filings pursuant to those orders, and the Commission's subsequent determination of the replacement rate, are thus later stages occurring as part of a continuing process under FPA section 206, not under FPA section 205.[165] Accordingly, the Commission has distinguished compliance filings that assist the Commission's exercise of its authority under FPA section 206 from other filings made by public utilities under the distinct rights afforded to them under FPA section 205.[166]

51. FPA section 206 does not prevent the Commission, after having found an existing rate unjust and unreasonable, from choosing in a specific rulemaking proceeding to

[165] *See id.* Similarly, *Entergy* recognizes that the Commission may select the just and reasonable rate in an FPA section 206 proceeding and that its authority to do so remains intact throughout the compliance process. 40 F.4th at 701-02. This stands in contrast to FPA section 205 proposals where the Commission's role is passive and reactive. *See City of Winnfield, La. v. FERC*, 744 F.2d 871, 876 (D.C. Cir. 1984) (*City of Winnfield*); *NRG Power Mktg.*, 862 F.3d at 114.

[166] *See, e.g.*, *ISO New England Inc.*, 173 FERC ¶ 61,204 at P 8 (explaining that a filing from ISO-NE would be considered as a new FPA section 205 filing, rather than a compliance filing related to an FPA section 206 investigation, because the Commission "did not make a finding that ISO-NE's tariff was unjust and unreasonable without such revisions, a necessary precursor to the Commission considering ISO-NE's tariff revisions as a compliance filing setting forth a proposed replacement rate"); *N.Y. Indep. Sys. Operator, Inc.*, 131 FERC ¶ 61,242 at P 32 (stating that "the Commission has always treated compliance filings differently than a company-initiated rate change application filed pursuant to section 205 of the FPA," including that they are not subject to the 60-day prior notice requirement under section 205(d) of the FPA); *Ameren Servs. Co. v. Midwest Indep. Transmission Sys. Operator, Inc.*, 132 FERC ¶ 61,186, at P 28 (2010) (finding that aspects of a filing exceeded the scope of compliance and should, instead, have been submitted under FPA section 205); *PJM Interconnection, L.L.C.*, 85 FERC ¶ 61,111 at 61,413 ("Although PJM purported to file its market monitoring plan in part pursuant to Section 205 of the FPA, it was in fact a filing in compliance with Ordering Paragraph V of the November 25 Order. Such compliance filings are pursuant to a Commission directive and are not subject to the procedures of Section 205(d)."") (cleaned up).

consider the approaches of entities other than the public utility to inform the Commission's determination of the replacement rate;[167] rather, it states that "the Commission shall determine the just and reasonable rate" to be thereafter observed and in force.[168] It also does not preclude the Commission from requiring that transmission providers submit Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process with transmission providers' compliance filings.[169] Neither does FPA section 205, which governs the distinct process of a public utility filing its own rates in the first instance, subject to Commission oversight,[170] rather than the determination of a replacement rate by the Commission after appropriate findings under FPA section 206. Moreover, that a public utility is the entity that submits a compliance filing does not transform that

[167] As discussed below, Order No. 1920-A's approach to considering compliance filings on cost allocation represents a limited departure, in these particular circumstances, from the Commission's typical approach of adopting public utilities' proposals in compliance filings if they are compliant with the requirements of the final rule. *See infra* PP 86-87.

[168] 16 U.S.C. 824e(a).

[169] *See* 16 U.S.C. 824e(a), (b) (setting forth certain procedural requirements relating to proceedings under FPA section 206, which do not include such restrictions); *see also Interstate Nat. Gas Ass'n of Am. v. FERC*, 285 F.3d 18, 38–39 (D.C. Cir. 2002) (*INGAA*) (holding under parallel provisions of the NGA that "the Commission has authority under [NGA section] 5 to order hearings to determine whether a given pipeline is in compliance with FERC's rules . . . and under [NGA sections] 10 and 14 to require pipelines to submit needed information for making its [NGA section] 5 decisions"); 16 U.S.C. 825c(a), 825f(a), 825h.

[170] *See* 16 U.S.C. 824d.

submission into an FPA section 205 filing, subject to the requirements of that provision.[171] A contrary conclusion would fail to recognize and give effect to the distinct and express statutory authority afforded to the Commission in FPA section 206, which arises pursuant to specific statutory findings and which, once triggered, is subject to different requirements than FPA section 205 filings.

52. We agree with rehearing petitioners that FPA section 205 expressly provides public utilities with statutory filing rights. But when considered in the correct statutory context, the arguments on rehearing that the Commission has intruded on those public utilities' FPA section 205 filing rights by: (1) requiring that public utilities attach to their compliance filings Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and associated information; or (2) considering, and potentially adopting, Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in determining the replacement rate, are not persuasive.[172] These aspects of Order No. 1920-A were adopted pursuant to FPA section 206, to assist in building the record for the Commission's exercise of its own authority to determine and fix the just and reasonable rate, as well as in monitoring compliance with the requirements related to the Engagement Period and efficiently considering the views of

[171] *See supra* P 50 & note 166 (discussing cases distinguishing compliance filings made by public utilities, which the Commission and courts consistently and correctly treated as made under FPA section 206, from FPA section 205 filings).

[172] *See supra* PP 30-31.

both Relevant State Entities and transmission providers. FPA section 205 is not implicated by these aspects of Order No. 1920-A and arguments to the contrary conflate compliance filings to assist the Commission in implementing its authority under FPA section 206 with public utilities' rate filings under FPA section 205.

53. Efforts to connect public utilities' FPA section 205 rights to this distinct FPA section 206 process by appealing to the structure of FPA sections 205 and 206[173] are misplaced for similar reasons; these arguments incorrectly blur the line between the separate authorities assigned in FPA sections 205 and 206. As the petitioners seeking rehearing observe, public utilities have the statutory right under FPA section 205 to file proposals to set and revise their rates of their own initiative in the first instance, and under that section, the Commission plays an essentially passive role in reviewing—and then accepting or rejecting—those proposals based on their consistency with the statutory requirements.[174] And as discussed below, public utilities retain their discretion as to whether to file—or not file—those proposals using this FPA section 205 authority.[175] But as to existing, Commission-approved rates, the FPA separately assigns to the Commission under FPA section 206 the authority to review those rates of its own

[173] *See supra* P 32.

[174] *See, e.g.*, EEI Rehearing Request at 13; Indicated PJM TOs Rehearing Request at 2-4; MISO TOs Rehearing Request at 5-6; SPP TOs Rehearing Request at 3, 5-6; WIRES Rehearing Request at 8.

[175] *See infra* P 118.

initiative or in response to a complaint.[176] Upon appropriate findings, the Commission—not the public utility—has the authority itself to determine and fix the replacement rate,[177] including determining such rate through the use of compliance filings.[178] Subsequently, public utilities may seek to revise that Commission-determined replacement rate through the exercise of their FPA section 205 rights.[179] FPA sections 205 and 206 are thus complementary provisions under a coherent statutory structure, but they embody a statutorily-imposed division of rights and responsibilities between public utilities under FPA section 205 and the Commission under FPA section 206.[180]

---

[176] 16 U.S.C. 824e(a).

[177] *Id.*; *see also FirstEnergy Serv. Co. v. FERC*, 758 F.3d 346, 353 (D.C. Cir. 2014) (stating that, under FPA section 206, "[i]t is the Commission's job—not the petitioner's—to find a just and reasonable rate." (internal quotations omitted)).

[178] Arguments on rehearing attempting to conflate compliance filings under FPA section 206 with public utilities' filings under FPA section 205 because both are evaluated based on a just and reasonable standard, *see, e.g.*, WIRES Rehearing Request at 14-15, incorrectly blur the lines between these two distinct statutory provisions.

[179] *See, e.g.*, *PJM Power Providers Grp. v. FERC*, 88 F.4th at 270 n.122 (describing the statutory structure and stating that public utilities may seek, through FPA section 205 filings, to modify rates set by the Commission under FPA section 206).

[180] *See, e.g.*, *Emera Maine*, 854 F.3d at 24 (describing this division, where FPA section 205 is intended for the benefit of the utility, but FPA section 206 has a "quite different" purpose of empowering the Commission to modify rates upon complaint or its own initiative, with "entirely different" and "stricter" procedures, such as the burden of proof and required two-step findings under FPA section 206 (quotation marks and citations omitted)).

54. Nor does the precedent that the rehearing requests rely on[181] to claim that Order No. 1920-A unlawfully intrudes on public utilities' FPA section 205 filing rights support this argument.[182] These cases do not address the context—applicable here—of how the Commission may exercise its authority, under FPA section 206, to determine the just and reasonable replacement rate, including how or from whom it obtains views concerning the replacement rate or which replacement rate it may determine and fix. Rather, they arise in proceedings under different statutory provisions—particularly including FPA section 205 and the parallel context of NGA section 4[183]—as discussed in greater detail below. As a result, none of these cases support the conclusion that the Commission intrudes on FPA section 205 when it exercises its authority under FPA section 206 by requiring that public utilities attach to their compliance filings Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and associated information or by potentially adopting that agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in determining the replacement rate.

[181] *See, e.g.*, *Atlantic City I*, 295 F.3d at 9-11; *Atlantic City II*, 329 F.3d at 858-59; *NRG Power Mktg.*, 862 F.3d at 114; *Western Resources*, 9 F.3d at 1578; *Massachusetts Department of Public Utilities*, 729 F.2d at 886-88.

[182] *See supra* P 33 (summarizing the arguments by rehearing petitioners asserting that Order No. 1920-A is contrary to judicial precedent relating to public utilities' FPA section 205 filing rights).

[183] 15 U.S.C. 717c.

55. *Atlantic City I* provides a straightforward example of this distinction. The D.C. Circuit there rebuffed a Commission attempt, under FPA section 205,[184] to require that public utilities cede to an ISO their FPA section 205 right to make unilateral changes in rate design, terms or conditions of service such that "only the ISO could propose changes in rate design."[185] The court held that the Commission "lacks the authority to require the petitioners to cede their right under [FPA] section 205 . . . to file changes in rate design with the Commission,"[186] explaining that the Commission was "attempting to deny the utility petitioners the very statutory rights given to them by Congress."[187] Here, by contrast, public utilities retain all of their rights to file proposed rate changes under FPA section 205. Order No. 1920-A's approach to cost allocation in compliance filings, under which transmission providers must attach or include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and associated material in transmission providers' compliance filings and the Commission may consider and adopt Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process, is

[184] 16 U.S.C. 824d.

[185] *Atlantic City I*, 295 F.3d at 7; *see id.* at 9 ("FERC disapproved this sharing arrangement and directed the utility petitioners to give up all authority to make unilateral changes to rate design.").

[186] *Id.* at 11.

[187] *Id.* at 9.

pursuant to the Commission's authority to set a replacement rate in FPA section 206 proceedings.[188]

56. Other cases that the rehearing requests rely on are similarly inapposite because they rejected attempts by the Commission or its predecessor, the Federal Power Commission (FPC), to modify public utilities' FPA section 205 filings or natural gas companies' NGA section 4 filings, without first exercising its authority and carrying its burden under FPA section 206 or NGA section 5, as appropriate.[189] Also distinguishable are cases involving Commission attempts—in NGA section 4 proceedings—to require that natural gas companies refile their rates at regular intervals, rather than the

[188] *Atlantic City II* is inapposite for the same reason, as that decision involved a petition to enforce the mandate of *Atlantic City I* where the Commission "rather than simply vacating the offending portions of its prior order . . . commanded the utilities comprising the ISO to relitigate before it the very issues upon which they had theretofore prevailed before th[e] court." *Atlantic City II*, 329 F.3d at 858; *see also id.* at 859 ("[W]e reaffirm and clarify our prior decision that [the Commission] has no jurisdiction to enter limitations requiring utilities to surrender their rights under [section] 205 of the FPA to make filings to initiate rate changes.").

[189] *See NRG Power Mktg.*, 862 F.3d at 110, 114-17 & n.2 (explaining that, in FPA section 205 proceedings, the Commission may not unilaterally impose a new rate scheme of its own making without the consent of the utility, but that it "may unilaterally impose a new rate scheme on a utility or [RTO] only under a different provision of the Act[,][FPA section 206,]" which was not "the basis for [the Commission's] decision in this case"); *Western Resources*, 9 F.3d at 1577-79 ("After careful consideration of the statutory framework, we cannot accept the Commission's argument that [NGA section] 4 permits it to approve any rate, no matter how materially different from that proposed by the pipeline, so long as it can be viewed as a 'part' of the original request."); *Louisiana v. FPC*, 503 F.2d at 861-62 ("The difficulty is this: FPC approved the interim four-level plan as 'just and reasonable,' and in the next breath it ordered a new, three-level plan to take its place.").

Commission employing its NGA section 5[190] authority to review existing rates.[191] Again, none of these cases address the circumstances presented here, where the Commission has invoked its FPA section 206 authority, made findings that existing practices do not meet the statutory standard, and then further exercised its authority to determine and fix the replacement rate.

57. *Massachusetts Department of Public Utilities* also does not support rehearing petitioners' arguments. In that case, the D.C. Circuit held that the Commission correctly concluded that Massachusetts could not compel a public utility to exercise its FPA section 205 rights to change its Commission-jurisdictional rates.[192] The court there described the "procedural dichotomy" reflected in FPA sections 205 and 206.[193] It explained that Massachusetts's argument that it could compel a public utility to make FPA section 205 rate changes "would prevent the utility from choosing among reasonable rate-practice alternatives."[194] By contrast, the Commission's view was "more consistent with the purposes of the entire procedural scheme" in that it allows the utility's filed rate to remain in effect absent a finding that the rate is unjust, unreasonable, or unduly

[190] 15 U.S.C. 717d.

[191] *See, e.g.*, *Consumers Energy Co. v. FERC*, 226 F.3d 777, 780–81 (6th Cir. 2000); *NYPSC*, 866 F.2d 487, 488–92 (D.C. Cir. 1989).

[192] *Massachusetts Department of Public Utilities*, 729 F.2d at 886-87.

[193] *Id.* at 886-88.

[194] *Id.* at 888.

discriminatory or preferential and allows the utility to change its rate so long as the utility can prove the proposed change is reasonable.[195] This same "procedural dichotomy" supports the lawfulness of Order No. 1920-A; public utilities are not exercising (or being compelled to exercise) their FPA section 205 filing rights. Rather, the Commission has made the requisite findings to support the exercise of its own authority under FPA section 206—a posture that the court in *Massachusetts Department of Public Utilities* differentiated[196]—and the compliance filings that Order Nos. 1920 and 1920-A require and the subsequent fixing of the replacement rate by order occurs under that authority, not FPA section 205.

(b) Inclusion of Relevant State Entities' Agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in Transmission Providers' Compliance Filings

58. As explained above, Order No. 1920-A's compliance process with respect to cost allocation does not infringe on or encumber transmission providers' FPA section 205 filing rights, as a matter of statutory text, structure, and applicable precedent.

---

[195] *Id.*; *see id.* (explaining further that "the net effect of accepting Massachusetts' argument is to allow a state to do what FERC itself cannot, namely, to change an *inter*state rate practice that FERC has not found unreasonable" and also identifying pragmatic considerations relating to the availability of refunds under FPA section 205 and concerns of "confusion, possibly chaos" that could result if states attempted to require conflicting changes); 16 U.S.C. 824e(a).

[196] *Massachusetts Department of Public Utilities*, 729 F.2d at 866-88 (contrasting the two procedural "tracks" under which rates are regulated in FPA sections 205 and 206).

Specifically, the compliance process requirement that transmission providers include in their transmittals or attach to their Order No. 1920 regional transmission planning and cost allocation compliance filings Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process does not infringe or encumber transmission providers' FPA section 205 filing rights. We address in additional detail here certain of the arguments raised on rehearing challenging this requirement.

59. We disagree with rehearing petitioners' claims that requiring transmission providers to include or attach these materials in transmission providers' FPA section 206 compliance filings in response to Order Nos. 1920 and 1920-A constitutes a "filing" requirement under FPA section 205, requires transmission providers to "cede" FPA section 205 filing rights or encumbers those rights, or grants such filing rights to Relevant State Entities. The Commission required only that transmission providers include this material in their FPA section 206 compliance filings, either in the transmittal or an attachment thereto.[197] The Commission did not require transmission providers to independently characterize this material.[198] The Commission was further clear that "the transmission providers decide what to submit as their actual Order No. 1920 compliance proposal, including relevant tariff language and supporting evidence or arguments."[199]

[197] Order No. 1920-A, 189 FERC ¶ 61,126 at P 651.

[198] *Id.* P 655.

[199] *Id.* P 654 n.1651 ("The requirement to include Relevant State Entities' Long-Term Regional Transmission Cost Allocation Method and/or State Agreement

Put in practical terms, in Order No. 1920-A, the Commission requires nothing more from transmission providers than attaching one or more additional documents, produced by parties other than transmission providers, to a compliance filing made under FPA section 206, to assist in building the record for the Commission's exercise of its own authority to determine and fix the just and reasonable rate under that statutory provision, as well as monitoring compliance with the requirements related to the Engagement Period and efficiently considering the views of both Relevant State Entities and transmission providers.[200] Furthermore, this is a one-time filing requirement associated with this FPA section 206 proceeding—not an ongoing obligation affecting any future filings by

---

Process as an addition to the compliance filing does not constitute a 'proposal' from the transmission provider.").

[200] FPA section 206 does not mandate a specific process through which the Commission chooses to build the record to determine and fix the replacement rate; rather, FPA section 206 merely requires a hearing prior to finding the existing rate unjust and reasonable, and then empowers the Commission to determine and fix the replacement rate by order. *See* 16 U.S.C. 824e; *see also Pension Ben. Guar. Corp. v. LTV Corp.*, 496 U.S. 633, 653, 655-56 (1990) (holding that when the Due Process Clause is not implicated and an agency's governing statute contains no specific procedural mandates, the APA establishes the maximum procedural requirements a reviewing court may impose on agencies); *Vermont Yankee Nuclear Power Corp. v. Nat. Res. Def. Council, Inc.*, 435 U.S. 519, 524 (1978) ("Even apart from the [APA,] this Court has for more than four decades emphasized that the formulation of procedures was basically to be left within the discretion of the agencies to which Congress had confided the responsibility for substantive judgments."); *FPC v. Transcont'l Gas Pipe Line Corp.*, 423 U.S. 326, 333 (1976); *Towns of Concord, Norwood, & Wellesley, Mass. v. FERC*, No. 90–1179, 1991 WL 17224, at *3 (D.C. Cir. 1991) (noting "the Commission's broad authority to establish its own rules of procedure and structure its own methods of inquiry"); 5 U.S.C. 706(2)(D) (permitting courts to hold unlawful and set aside action found to be "without observance of procedure *required by law*" (emphasis added)).

transmission providers under section 205 or any other section of the FPA.[201] And where transmission providers' FPA section 205 rights are at stake, Order No. 1920-A does not include these same requirements.[202]

60. Arguments asserting that the Commission has offered only a "hollow" explanation for this requirement, resting on "empty formalisms,"[203] wrongly conflate the two distinct procedural postures and authorities set forth in FPA sections 205 and 206. The fact that a "compliance filing submitted pursuant to FPA section 206 [as required by Order Nos. 1920 and 1920-A] is not an FPA section 205 filing"[204] carries legal consequences. Moreover, as the Commission explained, the requirement to include materials from Relevant State Entities in the context of this FPA section 206 compliance filing "does not constitute a 'proposal' from the transmission provider"[205] and transmission providers remain free to present whatever proposal they desire (and believe is compliant with the requirements of Order Nos. 1920 and 1920-A). Furthermore, transmission providers retain their full and exclusive discretion as to whether to file—or not file—proposed changes to Long-Term Regional Transmission Cost Allocation Method(s) and/or State

[201] Order No. 1920-A, 189 FERC ¶ 61,126 at P 651.

[202] *See infra* P 118.

[203] MISO TOs Rehearing Request at 19-20; *see also* WIRES Rehearing Request at 13; SPP TOs Rehearing Request at 4-5; EEI Rehearing Request at 8-9.

[204] Order No. 1920-A, 189 FERC ¶ 61,126 at P 652.

[205] *Id.* P 654 n.1651

Agreement Process under FPA section 205. Transmission providers continue to be able to fully participate in the FPA section 206 compliance process, their FPA section 205 rights are not implicated in this process, and FPA section 206 does not constrain the Commission, as it effectuates its own authority under that section, from requiring transmission providers to include information from Relevant State Entities in transmission providers' compliance filings to assist the Commission in setting the just and reasonable rate.

61. SPP TOs' argument that "[t]he Commission previously rejected attempts to use compliance filings to bypass the FPA's filing requirements" and cannot "'circumvent the notice and filing requirements of FPA sections 205 and 206'"[206] is immaterial because Order No. 1920-A does not have these effects—no notice and filing requirements are "bypassed," and no filings under FPA section 205 are required at all. Rather, Order No. 1920-A's approach to cost allocation in the required compliance filings is a proper exercise of the Commission's authority under FPA section 206. For the same reason, we disagree with SPP TOs' assertion that Order No. 1920-A raises a "major question" because it attempts to weaken FPA sections 205 and 206's statutory constraints:[207] Order No. 1920-A is a clear and unequivocal application of the Commission's authority under FPA section 206.

[206] SPP TOs Rehearing Request at 15 & nn.37-38 (quoting *PJM Interconnection, L.L.C.*, 178 FERC ¶ 61,083 at P 29).

[207] *Id.* at 17-18.

62. We similarly disagree with SPP TOs' claim that Order No. 1920-A sets a precedent in which, "in a future section 206 complaint proceeding, the Commission could authorize states or other favored parties to include their preferred alternative remedies in other parties' compliance filings without first having to make the first step showings under FPA section 206 that are normally required."[208] The Commission considers compliance filings in FPA section 206 rulemaking proceedings only after it makes a first-step determination that existing rates are unjust, unreasonable, or unduly discriminatory or preferential,[209] as it did in Order No. 1920. Once such a finding is made, the Commission determines and fixes the replacement rate, including through the use of compliance filings.[210]

63. Indicated PJM TOs claim that Order No. 1920-A intrudes into transmission providers' decision making processes by requiring that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation

[208] *Id.* at 15.

[209] 16 U.S.C. 824e(a); *see, e.g.*, *Emera Maine*, 854 F.3d at 24 (holding that "unlike section 205, section 206 mandates a two-step procedure that requires FERC to make an explicit finding that the existing rate is unlawful before setting a new rate").

[210] In a complaint proceeding under FPA section 206, the burden of proof to make this first prong showing is on the complainant, *see id.* 824e(b), but once that showing is made, the replacement rate is determined and fixed by the Commission, *see id.* 824e(a); *see also supra* PP 51 (discussing that the Commission is not, under the FPA, constrained to consider proposals only from particular entities in receiving compliance filings); *infra* PP 86-87 (discussing the Commission's ordinary practice of accepting the compliant, just and reasonable proposal of the public utility and its reasons for taking a different approach with respect to cost allocation under Order No. 1920-A).

Method(s) and/or State Agreement Process in transmission providers' compliance filings.[211] We disagree, however, with the factual premise of this argument—that the requirement to include the Relevant State Entities' Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in transmission providers' compliance filings changes transmission providers' decision-making process as to what proposal transmission providers choose to make in their compliance filing.[212] Regardless of Order No. 1920-A's filing requirement, transmission providers will need to decide whether to adopt Relevant State Entities' Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process, or file a different proposal. And if transmission providers decide to file a different proposal, the requirement to simply include or attach, without characterization, Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and associated information received from Relevant State Entities need not involve deliberation. In short, the Commission is not regulating transmission providers' decision as to what proposal they make on compliance.[213]

---

[211] Indicated PJM TOs Rehearing Request at 12-15.

[212] *See id.* at 12-13.

[213] For this reason, Indicated PJM TOs' discussion of the applicability of precedent relating to RTO governance, *see* Indicated PJM TOs Rehearing Request at 15 & n.50, is mistaken and beside the point. We further find that the Commission's regulation of cost allocation methods for Long-Term Regional Transmission Facilities as practices directly affecting Commission-jurisdictional rates falls well within its authority pursuant to *EPSA*, 577 U.S. at 278. Moreover, *CAISO*, in which the court found that a Commission attempt to order a public utility to replace its governing board exceeded the Commission's authority, 372 F.3d at 398, 403, bears no resemblance whatsoever to the facts before us

64. Indicated PJM TOs' argument is also incorrect for other reasons. This argument is further premised on an alleged intrusion on public utilities' "internal decisions on whether to submit a filing *under section 205 of the FPA* and the content of that filing."[214] But, as discussed above, compliance filings are not submitted under FPA section 205. The compliance filing at issue here is a one-time requirement under FPA section 206. So the premise of this argument is also mistaken as a matter of law and fact.

65. EEI, SPP TOs, and WIRES each argue that there are other avenues (e.g., protests) for parties to be heard with respect to cost allocation, such that allegedly infringing on transmission providers' FPA section 205 rights by requiring inclusion of Relevant State Entities' materials in transmission provider's compliance filings is not necessary or justified.[215] For the most part, these arguments appear to be claims that the Commission's decision on this point was arbitrary and capricious or that the Commission should have adopted a different approach.[216] At times, however, rehearing petitioners

---

here, given that the Commission is in no way regulating transmission providers decision-making process or governance structure. Indeed, we note that Indicated PJM TOs' argument proves too much: every time the Commission directs a public utility to make a compliance filing, it requires that the utility make decisions as to what proposal to adopt.

[214] Indicated PJM TOs Rehearing Request at 6-7 (emphasis added); *see also id.* at 2-3; *id.* at 14 (citing *Atlantic City I*, which addressed FPA section 205 rights, and referring to the "passive" role of the Commission, which pertains under FPA section 205).

[215] *See* EEI Rehearing Request at 9-10, 12; SPP TOs Rehearing Request at 15-18; WIRES Rehearing Request at 14.

[216] *See infra* PP 78-80 (addressing these arguments).

link these arguments to their claims that the Commission has afforded Relevant State Entities rights not found in the FPA.[217] We reject these arguments as inconsistent with the statutory text and structure, as well as applicable precedent. Although protests are one way that other entities can be heard, the FPA does not limit the Commission's ability to determine how to build the record when determining and fixing an appropriate replacement rate under FPA section 206.[218]

(c) Commission Consideration of Relevant State Entities' Agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process

66. The above discussion of the statutory text, structure, and precedent rebuts the core of the challenges to the Commission's determination that it will "consider the entire record—including the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process and the transmission providers' proposal—when setting the replacement rate."[219] We address in

[217] *See, e.g.*, EEI Rehearing Request at 9 (arguing that the Commission "goes beyond its authority under the FPA" and that the proper method for submitting an alternative to a replacement rate proposed by a public utility on compliance is to file a protest); SPP TOs Rehearing Request at 17-18 ("The fact that states 'are unable to file cost allocation methods themselves' and must instead either comment on transmission providers' proposals or file section 206 complaints is exactly what the FPA requires." (quoting Order No. 1920-A, 189 FERC ¶ 61,126 at P 645)); WIRES Rehearing Request at 11, 14 (advancing this argument in contending the Commission does not have statutory authority to require a public utility to file another entity's rate proposal).

[218] *See supra* PP 51-52, 59.

[219] Order No. 1920-A, 189 FERC ¶ 61,126 at P 659.

additional detail certain of the specific arguments raised on rehearing challenging Order No. 1920-A in this respect.

67. We continue to conclude that "the Commission need only select a replacement rate that complies with the final rule and that is adequately supported in the record, and then intelligibly explain the reasons for its choice."[220] Claims that Order No. 1920-A distorts the statutory scheme by "elevating" Relevant State Entities to the equivalent of public utilities by requiring that their agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process be included in the compliance filing, which will be assessed under the same just and reasonable standard as articulated in FPA section 205,[221] are unpersuasive. As discussed above, FPA section 206 does not specify that the Commission may only consider public utilities' proposals for a replacement rate; rather, FPA section 206 merely requires a hearing prior to finding the existing rate unjust and reasonable, and then empowers the Commission to determine and fix the replacement rate by order.[222] In fact, the D.C. Circuit has explained that the Commission is not required to await public utilities' proposals on compliance at all but may instead determine and fix the replacement rate coincident with the finding under the first prong of FPA section 206 that the existing rate is unjust and unreasonable.[223] And

---

[220] *Id*. P 658 (citing *Entergy*, 40 F.4th at 701-02).

[221] *See, e.g.*, SPP TOs Rehearing Request at 13-14.

[222] *See supra* P 51.

[223] *See Electrical District*, 774 F.2d at 494; *Kern River Gas Transmission Co.*, 133 FERC ¶ 61,162 at PP 21-22 ("[A]s an alternative to waiting for the pipeline to

while the Commission has typically adopted public utilities' compliant just and reasonable proposals for the replacement rate without considering alternate proposals by other entities, FPA section 206 does not prevent the Commission from taking a different approach in a specific rulemaking proceeding. Rather, and as discussed further below,[224] where the Commission has adopted transmission providers' proposals on compliance where it finds them compliant with the requirements of the final rule, it has done so based on pragmatic considerations and pursuant to its authority and discretion to determine and fix a just and reasonable rate.[225]

68. Relatedly, MISO TOs misunderstand Order No. 1920-A in contending that the Commission has ascribed "heightened importance" to state-developed cost allocation methods in the context of planning to meet Long-Term Transmission Needs, such that the Commission will be particularly likely to accept Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement

---

calculate the rates in a compliance filing, the Commission may calculate and fix the rate itself in the initial order.").

[224] *See infra* PP 71, 86-87.

[225] *See, e.g.*, *Entergy*, 40 F.4th at 701–02 ("[A]t bottom, Petitioners simply argue that, in its view, a better method exists. But [the Commission] is not required to choose the best solution, only a reasonable one." (quotation marks and citation omitted)); *Duke Energy Trading & Mktg., L.L.C. v. FERC*, 315 F.3d 377, 382 (D.C. Cir. 2003) ("[T]here may be a number of different potential rates all of which are just and reasonable."); *Kern River*, 142 FERC ¶ 61,132 at P 37 ("Here, the Commission is acting under NGA section 5, not section 4. However, just as there may be several just and reasonable rates, terms, or conditions which a pipeline may propose in a section 4 proceeding, there may be several just and reasonable rates, terms or conditions which the Commission may adopt as a just and reasonable remedy in a section 5 proceeding.").

Process rather than those of transmission providers.[226] Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Methods and State Agreement Processes take on heightened importance in relation to other commenters' views, not in relation to transmission providers' proposals for a replacement rate in transmission providers' compliance filings. Further, MISO TOs' argument disregards the Commission's explanation that "the Commission will consider the entire record—including the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process and the transmission provider's proposal—when setting the replacement rate."[227] The Commission did not state that it was adopting any generic or *per se* preference for Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process. Rather, the Commission provided that it will make determinations as to the appropriate replacement rate on a case-by-case basis, based on the entire record and consistent with the Commission's statutory authority and discretion to determine and fix the replacement rate.[228] And, consistent with the

[226] *See, e.g.*, MISO TOs Rehearing Request at 24-25, 33-37 (citing Order No. 1920-A, 189 FERC ¶ 61,126 at P 659).

[227] Order No. 1920-A, 189 FERC ¶ 61,126 at P 659; *see also id.* (explaining that the Commission was "not required to accept a cost allocation proposal from a transmission provider simply because it may comply with Order No. 1920" but could, instead, "adopt any cost allocation method proposed by Relevant State Entities and submitted on compliance so long as it complies with Order No. 1920").

[228] *See id*. P 658 (explaining how the Commission will consider replacement rate proposals) (citing 16 U.S.C. 824e, 825*l*(b)).

discussion herein, nothing prevents the Commission from determining and fixing the replacement rate of its choosing, including choosing the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process, pursuant to FPA section 206, so long as it is consistent with the final rule, adequately supported in the record, and the Commission adequately explains the reason for its choice.

69. MISO TOs claim that "[i]f the Commission accepts the Relevant State Entities' Cost Allocation Method over the transmission provider's method . . . the Commission has subverted future FPA section 205 filings related to that rate scheme in a manner that disfavors the transmission provider's FPA section 205 proposals."[229] Although MISO TOs do not sufficiently explain this specific argument,[230] namely by indicating how they believe the Commission is "subverting" future FPA section 205 filings, this argument again appears to ascribe effects to Order No. 1920-A that it does not have, which we have already addressed. Irrespective of the replacement rate that the Commission sets under FPA section 206, the Commission will assess transmission providers' future FPA section 205 filings according to the statutory standard prescribed by the FPA for such filings. Nothing in Order No. 1920-A "disfavors" or "subvert[s]" those hypothetical

[229] MISO TOs Rehearing Request at 24-25.

[230] A rehearing request must set forth with specificity the grounds on which the request is based. 16 U.S.C. 825*l*(a); 18 CFR 385.713(c)(2) (2024); *see ZEP Grand Prairie Wind, LLC*, 183 FERC ¶ 61,150, at P 10 (2023); *Ind. Util. Regul. Comm'n v. FERC*, 668 F.3d 735, 738-40 (D.C. Cir. 2012).

future filings.[231] Moreover, any challenges related to the Commission's treatment of such future FPA section 205 filings can be raised when those filings are made.

70. We find unpersuasive Indicated PJM TOs' and SPP TOs' arguments that *Entergy* is inapposite to Order No. 1920-A because the Commission in that case first rejected MISO's compliance filing before selecting a different replacement rate.[232] First, the Commission's determination that it may, in compliance proceedings, consider and set as the replacement rate Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process is consistent with both the text and structure of the FPA, for the reasons already discussed.[233] Second, *Entergy* supports this conclusion because it reflects that the Commission, when addressing compliance filings in FPA section 206 proceedings, is not required to adopt a replacement rate proposed by public utilities,[234] but instead may determine and fix any

[231] Challenges to the Commission's treatment of those potential filings are not before us at this time.

[232] *See* Indicated PJM TOs Rehearing Request at 22-23; SPP TOs Rehearing Request at 18-19 n.49.

[233] *See supra* PP 48-53.

[234] In other words, if compliance filings were subject to the requirements of FPA section 205, under which the Commission plays a passive role, once the Commission rejected MISO's proposal in *Entergy* it would not have been empowered to itself fashion a different rate. *Entergy* reflects that this is not the case, as the Commission itself fashioned the replacement rate and the court upheld this result. *See Entergy*, 40 F.4th at 701-02.

just and reasonable replacement rate of its choosing.[235] Third, Indicated PJM TOs and SPP TOs misconstrue *Entergy* as reflecting a requirement that the Commission must first reject a public utility's proposal on compliance before adopting a different replacement rate. That the Commission in that case elected to first consider and reject MISO's proposal[236] before selecting a different replacement rate does not demonstrate that it was legally required to do so—and nothing in *Entergy* holds to the contrary.[237]

71. We are also not convinced by Indicated PJM TOs' contention that the statutory structure of FPA sections 205 and 206 mandates a preference for the public utility's proposal on compliance.[238] Although the Commission has historically identified prudential and policy reasons for adopting public utilities' proposals in compliance

[235] *See id.* (noting that the Commission "is not required to choose the best solution, only a reasonable one" (citations omitted)).

[236] The approach in *Entergy* was consistent with the Commission's general practice with respect to compliance filings under FPA section 206 by public utilities, but, as we have explained above, this practice is not a statutory or legal requirement under FPA section 206.

[237] Contrary to SPP TOs' contention that the Commission erroneously relied on certain cases that do not support its approach, *see* SPP TOs Rehearing Request at 16-17, the Commission cited these cases in "recogni[tion]" of the Commission's typical practice that it "generally does not consider alternate compliance proposals other than those filed by the relevant public utility (here, the transmission provider)," before then explaining why it was not adopting that practice in Order No. 1920-A with respect to these cost allocation proposals. Order No. 1920-A, 189 FERC ¶ 61,126 at P 659; *see F.C.C. v. Fox Television Stations, Inc.*, 556 U.S. at 515 ("To be sure, the requirement that an agency provide reasoned explanation for its action would ordinarily demand that it display awareness that it *is* changing position." (emphasis in original)).

[238] *See* Indicated PJM TOs Rehearing Request at 17-18, 20.

filings if they are compliant with the requirements of a final rule issued pursuant to FPA section 206,[239] these prudential and policy reasons are not statutory commands.[240] Interpreting the FPA as Indicated PJM TOs urge renders meaningless this aspect of the statutory divide of FPA sections 205 and section 206 and would impermissibly convert the Commission's statutory authority to determine the replacement rate into a substantive statutory right for the public utilities.

72. Indicated PJM TOs and WIRES are similarly incorrect in arguing that the Commission is limited to considering whether the rate submitted by the public utility on compliance is just and reasonable because the Commission failed to prescribe a specific replacement rate in Order No. 1920-A.[241] Consistent with the D.C. Circuit's holding in

[239] *See, e.g.*, *Kern River*, 142 FERC ¶ 61,132 at P 37 (noting that "[i]f the pipeline supports one such just and reasonable remedy, the Commission finds that adopting the pipeline's remedy, in preference to other possible remedies, properly recognizes the NGA's policy of giving pipelines the primary initiative to establish their rates, terms, and conditions of service" but also recognizing that "there may be several just and reasonable rates, terms or conditions which the Commission may adopt as a just and reasonable remedy in [an NGA] section 5 proceeding"); *PJM Interconnection, L.L.C.*, 173 FERC ¶ 61,134 at P 117 n.175 ("Because PJM may make a section 205 filing to revise these [OATT] provisions, we find it reasonable to accept PJM's proposal over alternatives if PJM's proposal is just and reasonable.").

[240] *See* 16 U.S.C. 824e(a); *Electrical District*, 774 F.2d at 492. Reinforcing this conclusion, the D.C. Circuit has explained that the Commission is not required to await public utilities' proposals on compliance at all but may instead set the replacement rate. *See Electrical District*, 774 F.2d at 494; *Kern River Gas Transmission Co.*, 133 FERC ¶ 61,162 at PP 21-22 ("[A]s an alternative to waiting for the pipeline to calculate the rates in a compliance filing, the Commission may calculate and fix the rate itself in the initial order.").

[241] Indicated PJM TOs Rehearing Request at 28; *see also, e.g.*, *id.* at 3-4, 5, 7-8; WIRES Rehearing Request at 10-11.

Electrical District, the Commission is not "obligat[ed] to end an unlawful rate from the moment it finds unlawfulness" but rather may "tak[e] time for further deliberations necessary to determine what the precise terms of [the replacement rate] should be."[242] The "not at all ambiguous" procedures set forth in FPA section 206 establish that after finding existing rates are unjust, unreasonable, or unduly discriminatory or preferential "'the Commission shall determine the just and reasonable rate . . . *to be thereafter observed and in force, and shall fix the same by order*.'"[243] Claims that the Commission somehow in Order No. 1920 or 1920-A forfeited to transmission providers the responsibility—assigned to the Commission by the statute's plain text— to fix the replacement rate, consistent with the requirements of those orders, are not grounded in the statutory text or structure, and are contrary to precedent.[244]

---

[242] *Electrical District*, 774 F.2d at 492; *see also Entergy*, 40 F.4th at 701-02 (affirming order in which the Commission, after rejecting MISO's compliance filings, subsequently determined the replacement rate on its own initiative, under FPA section 206).

[243] *Electrical District*, 774 F.2d at 492 (quoting FPA section 206(a), 16 U.S.C. 824e(a); emphasis in original).

[244] Contrary to Indicated PJM TOs' argument, *see* Indicated PJM TOs Rehearing Request at 27 n.102, the Commission's decision in *Indep. Energy Producers Ass'n v. Cal. Indep. Sys. Operator Corp.*, 128 FERC ¶ 61,165 (2009) does not suggest that the Commission forwent the opportunity to establish a specific replacement rate. Rather, the discussion in that case addressed the point at which a sufficient degree of specificity has been provided such that a rate can be deemed fixed for purposes of a particular effective date, *id.* PP 21-26, and—in fact—is consistent with viewing the Commission's authority under FPA section 206 as part of an ongoing process until the replacement rate is fixed.

b. Compliance with the APA

i. Rehearing Requests

73. Several petitioners argue that the Commission failed to engage in reasoned decision-making as required by the Administrative Procedure Act (APA) in adopting the requirement that transmission providers include in the transmittal or as an attachment to their compliance filings any Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process agreed to by Relevant State Entities as well as any and all supporting evidence and/or justification related to such method(s) and/or process.[245] MISO TOs, Indicated PJM TOs, SPP TOs, and EEI argue that the Commission failed to explain why states did not already have adequate opportunities to provide input to cost allocation through previously existing processes—generally connecting these arguments to their view that the compliance filing requirements in Order No. 1920-A are inconsistent with FPA section 205.[246] MISO TOs and SPP TOs argue

[245] Indicated PJM TOs Rehearing Request at 8 (citing *Mayor of Balt. v. Azar*, 973 F.3d 258, 275 (4th Cir. 2020) (other citations omitted)); MISO TOs Rehearing Request at 20-21 (citing 5 U.S.C. § 706 (other citations omitted)); SPP TOs Rehearing Request at 2 (citing 5 U.S.C. § 706(2)).

[246] MISO TOs Rehearing Request at 8-9, 20-22 (arguing that the Commission provides notice and comment review of compliance filings, through Commission Rules of Practice and Procedure 211 and 214, which is "reasonable and more statutorily aligned" than the approach adopted in Order No. 1920-A); Indicated PJM TOs Rehearing Request at 8 ("The Commission made no finding and there is no substantial evidence that the Commission would not have been able to consider those proposals or that the [Relevant State Entities] would not have been able to submit their proposals to the Commission or were in any way impeded from doing so."); *id.* at 12 n.35, 32-33; SPP TOs Rehearing Request at 29 (arguing that the importance the Commission ascribes to state perspectives reflects that state views would be taken seriously if presented through other means, such that there is no need for additional avenues for state participation

that Order No. 1920-A's compliance filing requirements are inconsistent with the Commission's determination that transmission providers have the obligation, subject to Commission oversight, to engage in transmission planning and cost allocation.[247] WIRES argues that the approach the Commission selected in Order No. 1920-A is adversarial, leading to delay and litigation, and that "the record demonstrates that there are other less intrusive means by which states can meaningfully participate in the development of Long-Term Regional [Transmission] Cost Allocation [M]ethods and State Agreement Processes."[248] EEI argues that the Commission's stated justification for requiring transmission providers to include in their compliance filings the preferred approach of Relevant State Entities to cost allocation (i.e., the unique role of Relevant State Entities) does not relate to cost allocation and does not justify infringing on utilities'

through "preferential filing privileges that are not contemplated by the FPA"); EEI Rehearing Request at 9-10 ("After all, state commissions are already afforded special treatment under the Commission's procedural rules because they can intervene in rate proceedings as a matter of right.").

[247] MISO TOs Rehearing Request at 22-23 (citing Order No. 1920-A, 189 FERC ¶ 61,126 at P 661) ("The Commission fails to explain how it maintains this 'tariff obligation' if it requires transmission providers to subordinate their interests and preferences those of state entities."); SPP TOs Rehearing Request at 14, 29 (similar).

[248] WIRES Rehearing Request at 14, 16-17 (asserting that the same set of facts relied on in Order No. 1920 were used to justify the requirements of Order No. 1920-A, such that "there seems little connection between what are essentially the same facts and the choices made"). WIRES here challenges both the compliance filing requirements, discussed above, and certain consultation requirements set forth by Order No. 1920-A, *see infra* Consultation with Relevant State Entities After the Engagement Period section, as arbitrary and capricious for the same reasons.

FPA filing rights.[249] EEI further argues that the requirement to include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in transmission providers' compliance filings could confuse stakeholders as to which material to provide feedback on—that of the transmission provider or of the Relevant State Entities—and result in stakeholder feedback that is not focused on the transmission provider's proposal.[250]

74. MISO TOs, Indicated PJM TOs, SPP TOs, and EEI all argue that the Commission has departed—without sufficient basis or explanation—from its precedent establishing a preference for accepting the compliant just and reasonable compliance proposals of public utilities (or, in the context of the NGA, natural-gas companies), rather than competing proposals.[251] They assert that this preference is justified (as recognized by

[249] EEI Rehearing Request at 12.

[250] *Id*. at 10.

[251] *See* MISO TOs Rehearing Request at 33-38 (arguing that the Commission failed to provide adequate reasoning to support this decision); Indicated PJM TOs Rehearing Request at 18-20; *id.* at 21 (arguing that "the Commission does not explain how these considerations [that it identified as supporting its approach in Order No. 1920-A] are any different in the planning process under Order No. 1920 and 1920-A than they are in the planning processes under other prior rule changes" such as Order No. 1000); SPP TOs Rehearing Request at 16-17; *id.* at 30 (arguing that this departure from the Commission's approach in other contexts is arbitrary and capricious); EEI Rehearing Request at 10-11. These petitioners cite several Commission decisions reflecting this preference, *see, e.g.*, *PJM Interconnection, L.L.C.*, 119 FERC ¶ 61,318 at P 115 n.124; *Midwest Indep. Transmission Sys. Operator, Inc.*, 122 FERC ¶ 61,084, at P 21 n.18 (2008); *PJM Interconnection, L.L.C.*, 117 FERC ¶ 61,331, at P 85 (2006); *Kern River Gas Transmission Co.*, Opinion No. 486-F, 142 FERC ¶ 61,132 at P 37 & n.50 ; *ANR Pipeline Co.*, 109 FERC ¶ 61,138, at P 28 (2004), *order on reh'g*, 111 FERC ¶ 61,113, at P 19 (2005), as well as certain judicial decisions, *see, e.g.*, *Emera Maine*, 854 F.3d at 674; *Pub. Serv. Comm'n of N.Y. v. FERC*, 642 F.2d 1335, 1343-44 (D.C. Cir.

Commission precedent) because public utilities have the primary initiative to set their rates, terms, and conditions of service and because, should the Commission adopt a compliance proposal from an entity other than the public utility, the public utility could immediately refile its own proposal under FPA section 205.[252]

75. SPP TOs contend that the Commission improperly imposed different requirements on compliance proposals addressing cost allocation for Relevant State Entities versus transmission providers.[253] Specifically, SPP TOs state that compliance filings by transmission providers must comply with five of Order No. 1000's six regional cost allocation principles, but Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process must merely comply with the cost-causation principle and any other legal requirements for cost allocation.[254] SPP TOs aver that it is unclear how the Commission will choose between competing replacement rate proposals given that they are subject to different criteria, and assert that the Commission will struggle to explain a decision to adopt, as the

1980); *ANR Pipeline Co. v. FERC*, 771 F.2d 507, 514 (D.C. Cir. 1985); *Consol. Edison Co. v. FERC*, 165 F.3d 992, 1000 (D.C. Cir. 1999).

[252] *See, e.g.*, MISO TOs Rehearing Request at 33-35; *id.* at 37-38 (arguing that Order No. 1920-A creates a layer of bureaucratic delay); Indicated PJM TOs Rehearing Request at 18-21.

[253] *See* SPP TOs Rehearing Request at 20-21.

[254] *See id.*; *see also id.* at 7 (arguing that Order No. 1920-A violates the structure of FPA sections 205 and 206 because it imposes on transmission providers a higher burden than on Relevant State Entities).

replacement rate, Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process.[255]

ii. Commission Determination

76. We disagree with arguments raised on rehearing that the Commission failed to comply with the APA in adopting the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and associated information in their Order No. 1920 regional transmission planning and cost allocation compliance filings.

77. Under the APA, agency action must be upheld unless it is arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with the law.[256] In *South Carolina*, the D.C. Circuit set forth the standard that the Commission must meet in issuing a rule for the court to find that the Commission met its obligations under the APA:

> The Commission must examine the relevant data and articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made. The Commission's factual findings are conclusive if supported by substantial evidence. Substantial evidence is such relevant evidence as a reasonable mind might accept as adequate to support a conclusion, and requires more than a scintilla but less than a preponderance of evidence. When applied to rulemaking proceedings, the substantial evidence test is identical to the familiar arbitrary and capricious standard, which requires the Commission to specify the

[255] *See id*.

[256] 5 U.S.C § 706(2)(A).

> evidence on which it relied and to explain how that evidence supports the conclusion it reached.[257]

78. We disagree with the rehearing petitioners who argue that the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings fails to satisfy these requirements. Specifically, we disagree with the arguments by MISO TOs, Indicated PJM TOs, SPP TOs, and EEI that the Commission failed to explain why states did not already have adequate opportunities to provide input on regional transmission cost allocation issues through previously existing processes. Recognizing the increased importance of state engagement regarding cost allocation for Long-Term Regional Transmission Facilities, the Commission in Order No. 1920 established the Engagement Period and required transmission providers on compliance to explain how they complied with the requirement to provide a forum for negotiation of a Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process that enables meaningful participation by Relevant State Entities.[258] In Order No. 1920-A, the Commission reiterated that it is critical to the success of the Long-Term Regional Transmission Planning reforms that states have an opportunity to have a

[257] *South Carolina*, 762 F.3d at 54 (quotation marks omitted) (citing *Motor Vehicle Mfrs. Ass'n of U.S., Inc. v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 43 (1983); 16 U.S.C. 825*l*(b); *Murray Energy Corp. v. FERC*, 629 F.3d 231, 235 (D.C. Cir. 2011); *Fla. Gas Transmission Co. v. FERC*, 604 F.3d 636, 645 (D.C. Cir. 2010); *Wis. Gas Co. v. FERC*, 770 F.2d 1144, 1156 (D.C. Cir. 1985)).

[258] Order No. 1920, 187 FERC ¶ 61,068 at PP 126, 1354, 1357.

significant role in the establishment of just and reasonable Long-Term Regional Transmission Cost Allocation Methods and State Agreement Processes.[259] Consistent with these findings, when the Commission adopted the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process, and any information relevant thereto, in their compliance filings, the Commission found that the additional requirement would allow it to better evaluate whether transmission providers have complied with Order No. 1920's requirement to provide a forum for negotiations that enables meaningful participation by Relevant State Entities during the Engagement Period.[260] The Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process agreed upon by Relevant State Entities during the Engagement Period are thus evidence for compliance purposes that will assist the Commission as it determines and fixes the replacement rate.

79. Moreover, receiving Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process, and any information relevant thereto, in tandem with transmission providers' compliance filings is procedurally consistent with the Commission's intention, as stated in Order No. 1920-A, to review the entire record in determining and fixing a replacement rate. We further conclude that, in these circumstances, there is significant administrative efficiency in

[259] Order No. 1920-A, 189 FERC ¶ 61,126 at PP 649, 654-657.

[260] *Id.*

receiving these materials together, as—for instance—it will allow interested stakeholders to comment simultaneously on both transmission providers' proposal and Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process. We anticipate that this process will provide the Commission with a more comprehensive, better-developed record for the exercise of its FPA section 206 authority to determine and fix the replacement rate.[261]

80. Rehearing petitioners argue that there are other avenues available for Relevant State Entities to present their views, such as through protests.[262] But the availability of such alternative approaches, and rehearing petitioners' view that they are adequate or preferable, does not render Order No. 1920-A's requirements unjust and unreasonable or arbitrary and capricious.[263] The Commission has adequately explained and supported the approach that it adopted in Order No. 1920-A.

81. We also disagree with MISO TOs' and SPP TOs' arguments that Order No. 1920-A's compliance filing requirements are inconsistent with the Commission's

[261] *Id.* P 659.

[262] *See, e.g.*, EEI Rehearing Request at 9-10; SPP TOs Rehearing Request at 17-18, 29; WIRES Rehearing Request at 14.

[263] *See, e.g.*, *EPSA*, 577 U.S. at 292 ("A court is not to ask whether a regulatory decision is the best one possible or even whether it is better than the alternatives. Rather, the court must uphold a rule if the agency has 'examine[d] the relevant [considerations] and articulate[d] a satisfactory explanation for its action[,] including a rational connection between the facts found and the choice made.'" (alterations in original) (quoting *State Farm*, 463 U.S. at 43)); *Entergy*, 40 F.4th at 701–02 ("[A]t bottom, Petitioners simply argue that, in its view, a better method exists. But [the Commission] is not required to choose the best solution, only a reasonable one." (quotation marks and citation omitted)).

determination that transmission providers have the obligation, subject to Commission oversight, to engage in transmission planning and cost allocation. Order No. 1920-A is clear that, as in Order No. 1920, transmission providers decide what to submit as their actual Order No. 1920 compliance proposal, including relevant tariff language and supporting evidence or arguments, whether they decide to propose the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process or a different Long-Term Regional Transmission Cost Allocation Method.[264] This requirement therefore does not diminish transmission providers' role in transmission planning and cost allocation matters. Further, Order No. 1920-A retains the Commission's oversight of transmission providers' transmission planning and cost allocation, as the Commission will exercise its authority under FPA section 206 to determine the replacement rate on compliance.[265]

82. We disagree with WIRES that Order No. 1920-A is arbitrary and capricious because, in WIRES' opinion, Order No. 1920-A "adopts an adversarial approach" that is "likely to engender years of costly litigation that would cast a cloud over successfully siting and developing critically needed transmission in a timely manner."[266] To begin

[264] Order No. 1920-A, 189 FERC ¶ 61,126 at P 654 n.1651 ("The requirement to include Relevant State Entities' Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process as an addition to the compliance filing does not constitute a 'proposal' from the transmission provider.").

[265] *Id.* P 659.

[266] WIRES Rehearing Request at 14.

with, as rehearing petitioners recognize,[267] absent Order No. 1920-A's requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings, Relevant State Entities would be able to submit their agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in comments in opposition to transmission providers' compliance filings. Therefore, were a transmission provider to choose not to propose Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process on compliance, the proceedings related to the transmission provider's compliance filing could still result in disagreement between the transmission provider and Relevant State Entities, regardless of whether the Commission required transmission providers to include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings. However, as discussed above, the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings, as well as any information that Relevant State Entities provide to them regarding the state negotiations during the Engagement Period, will allow the Commission to better evaluate whether transmission providers have complied with Order

[267] *See, e.g.*, EEI Rehearing Request at 9-10; SPP TOs Rehearing Request at 17-18, 29; WIRES Rehearing Request at 14.

No. 1920's requirement to provide a forum for negotiations that enables meaningful participation by Relevant State Entities during the Engagement Period.[268] Moreover, we believe that ensuring that such a forum exists—and verifying compliance with this requirement—is likely to reduce the prospect of disputes over cost allocation methods by ensuring Relevant State Entities' views are considered by transmission providers and therefore that their participation is meaningful.[269] Therefore, on balance, the Commission reasonably required that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings.

83. We also disagree with WIRES' argument that the Commission's adoption of Order No. 1920-A's "compliance mandates" is arbitrary and capricious because the Commission in Order No. 1920-A "defend[ed] its amendments by using the same justification relied upon in Order No. 1920."[270] In Order No. 1920-A, the Commission "weighed [the] competing views" presented by rehearing petitioners and, based upon the substantial evidence it identified in Order No. 1920, concluded that the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional

[268] We note that no rehearing petitioners challenge the requirements of Order Nos. 1920 and 1920-A regarding the Engagement Period.

[269] *E.g.*, Order No. 1920, 187 FERC ¶ 61,068 at P 124 ("As the Commission discussed in the NOPR and we continue to find in this final rule, facilitating state regulatory involvement in the cost allocation process could minimize delays and additional costs associated with state and local siting proceedings.").

[270] WIRES Rehearing Request at 15.

Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings is just and reasonable.[271] The Commission further concluded that this and other requirements adopted in Order No. 1920-A strike a reasonable balance between, on the one hand, recognizing the rights and responsibilities of the Commission and transmission providers over regional transmission planning and, on the other, the states' critical interests in the resulting Long-Term Regional Transmission Facilities and how the costs associated with those facilities will be allocated.[272] Therefore, the Commission's decision-making in this regard satisfies the APA.

84. We also are not persuaded by EEI's argument that the unique role of Relevant State Entities does not relate to cost allocation or justify the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings.[273] In Order No. 1920-A, the Commission reiterated that states play a

[271] *See Entergy*, 40 F.4th at 701-02 ("It is not our job to determine that 'FERC made the better call,' rather, our 'important but limited role is to ensure that the Commission engaged in reasoned decisionmaking.'" (quoting *EPSA*, 577 U.S. at 295)). *See also* Order No. 1920-A, 189 FERC ¶ 61,126 at P 649 ("As the Commission recognized in Order No. 1920, and we reiterate in this order, it is critical to the success of the Long-Term Regional Transmission Planning reforms that states have an opportunity to have a significant role in the establishment of just and reasonable Long-Term Regional Transmission Cost Allocation Methods and State Agreement Processes." (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1415)); *id.* P 659 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 124, 126, 268, 1293, 1362-1364, 1404, 1407, 1410-1411, 1415, 1477, 1515).

[272] Order No. 1920-A, 189 FERC ¶ 61,126 at P 660.

[273] *See* EEI Rehearing Request at 12.

unique role in Long-Term Regional Transmission Planning, as their laws, regulations, and policies drive the need for Long-Term Regional Transmission Facilities, and they typically will have responsibility to consider and approve the siting, permitting, and construction of Long-Term Regional Transmission Facilities selected in a regional transmission plan.[274] As such, states affect whether Long-Term Regional Transmission Facilities are timely, efficiently, and cost-effectively developed such that customers actually receive the benefits associated with the selection of more efficient or cost-effective transmission solutions.[275] The effect of Relevant State Entities' decisions on such timely, efficient, and cost-effective development of Long-Term Regional Transmission Facilities directly relates to the allocation of costs for those facilities. It is therefore reasonable to require that transmission providers provide the Commission with any Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process that Relevant State Entities have agreed upon.

85. Further, we disagree with EEI that stakeholders are likely to be confused as to whether they should provide feedback on the transmission provider's proposal or the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process that Relevant State Entities have agreed upon.[276] As the Commission clarified in

[274] Order No. 1920-A, 189 FERC ¶ 61,126 at P 659.

[275] *Id.* (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 124, 126, 268, 1293, 1362-1364, 1404, 1407, 1410-1411, 1415, 1477, 1515).

[276] *See* EEI Rehearing Request at 10.

Order No. 1920-A, any Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process agreed upon by Relevant State Entities and included in a transmission provider's transmittal or as an attachment to its compliance filing does not constitute a proposal from the transmission provider. Furthermore, commenters may provide their support for, or feedback on, either or both the transmission provider's proposal and any Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process agreed upon by Relevant State Entities.

86. We disagree with MISO TOs, Indicated PJM TOs, SPP TOs, and EEI that the Commission departed—without sufficient basis or explanation—from its precedent establishing a preference for accepting compliant, just and reasonable compliance proposals of public utilities rather than competing proposals.[277] The Supreme Court has held that "agency action representing a policy change [need not] be justified by reasons more substantial than those required to adopt a policy in the first instance."[278] Rather, where an agency changes its position, "it suffices that the new policy is permissible under the statute, that there are good reasons for it, and that the agency *believes* it to be better, which the conscious change of course adequately indicates."[279]

[277] *See* MISO TOs Rehearing Request at 33-38; Indicated PJM TOs Rehearing Request at 18-21; SPP TOs Rehearing Request at 16-17, 30; EEI Rehearing Request at 10-11.

[278] *FCC v. Fox Television Stations, Inc.*, 556 U.S. at 514.

[279] *Id.* at 515.

87. Order No. 1920-A satisfies these requirements. First, as explained above,[280] the Commission's typical practice of accepting compliant just and reasonable compliance proposals of public utilities rather than competing proposals is just that: a practice, not a requirement of the FPA. Next, in Order No. 1920-A, the Commission recognized that, while it generally does not consider alternate compliance proposals other than those filed by the relevant public utility,[281] there are "good reasons" for considering Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in addition to transmission providers' proposals here.[282] Specifically, and as discussed: (1) states play a unique role in Long-Term Regional Transmission Planning;[283] (2) states affect whether Long-Term Regional Transmission Facilities are timely, efficiently, and cost-effectively developed;[284] and (3) given the inherent uncertainty involved in planning to meet Long-Term Transmission Needs, state-developed cost allocation methods and State Agreement Processes take on

[280] *See supra* Requirements Concerning Relevant State Entities' Agreed-upon Cost Allocation Methods, Statutory Filing Rights Under the FPA section.

[281] Order No. 1920-A, 189 FERC ¶ 61,126 at P 659 (citing *PJM Interconnection, L.L.C.*, 173 FERC ¶ 61,134 at P 117 n.175; *PJM Interconnection, L.L.C.*, 119 FERC ¶ 61,318 at P 115; *ANR Pipeline Co.*, 110 FERC ¶ 61,069 at P 49).

[282] *Id.* P 659.

[283] *Id.*; *supra* P 84.

[284] Order No. 1920-A, 189 FERC ¶ 61,126 at P 659 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 124, 126, 268, 1293, 1362-1364, 1404, 1407, 1410-1411, 1415, 1477, 1515); *supra* P 84.

heightened importance.[285] The Commission thus adequately explained its belief, based on these "good reasons," that considering Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process along with the transmission provider's proposal is not simply warranted, but "better" than considering the transmission provider's proposal alone and to the exclusion of alternatives.[286]

88. We recognize that, even if the Commission adopts Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process as the replacement rate under FPA section 206, transmission providers may subsequently file an FPA section 205 proposal seeking to implement their preferred approach to cost allocation.[287] Nonetheless, we sustain Order No. 1920-A's determination that the Commission will consider the entire record on compliance in selecting the replacement rate and may permissibly adopt Relevant State Entities' agreed-upon approach. While transmission providers' ability to submit an FPA section 205 filing of their own initiative proposing a set of preferred rates is a consideration the Commission has identified as relevant to our typical approach to

[285] Order No. 1920-A, 189 FERC ¶ 61,126 at P 659 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 227).

[286] *FCC v. Fox Television Stations, Inc.*, 556 U.S. at 514-15.

[287] *See* MISO TOs Rehearing Request at 35, 37-38; Indicated PJM TOs Rehearing Request at 20-21.

assessing compliance filings,[288] this consideration—standing alone—cannot render it inherently arbitrary and capricious for the Commission to require, in FPA section 206 proceedings, a replacement rate other than the one proposed by the transmission provider. A contrary conclusion would effectively amend FPA section 206, removing the Commission as the entity that "determine[s] the just and reasonable rate . . . to be thereafter observed and in force."[289] As discussed above, this is not the design Congress enacted.[290]

89. We disagree with SPP TOs' argument that the Commission improperly imposed different requirements on Long-Term Regional Transmission Cost Allocation Methods agreed upon by Relevant State Entities—which need not comply with any of the Order No. 1000 regional cost allocation principles—and Long-Term Regional Transmission Cost Allocation Methods to which Relevant State Entities do not agree—which must comply with Order No. 1000 regional cost allocation principles (1) through (5).[291] We reiterate that all cost allocation methods must comply with the cost causation principle, as

[288] *See PJM Interconnection, L.L.C.*, 173 FERC ¶ 61,134 at P 117 n.175 ("Because PJM may make a section 205 filing to revise these Tariff provisions, we find it reasonable to accept PJM's proposal over alternatives if PJM's proposal is just and reasonable.").

[289] 16 U.S.C. 824e(a).

[290] *See supra* Requirements Concerning Relevant State Entities' Agreed-upon Cost Allocation Methods, Statutory Filing Rights Under the FPA section.

[291] *See* SPP TOs Rehearing Request at 7, 20-21.

required by the FPA.[292] We also continue to find that although there are different requirements for cost allocation methods resulting from a State Agreement Process or Long-Term Regional Transmission Cost Allocation Method that Relevant State Entities indicate that they have agreed to and have asked transmission providers to file, as compared to Long-Term Regional Transmission Cost Allocation Methods to which states do not agree, this distinction is appropriate to afford flexibility in order to encourage their use of these methods, which are likely to facilitate agreement over development of such Long-Term Regional Transmission Facilities and thus facilitate the selection of more efficient or cost-effective Long-Term Regional Transmission Facilities.[293] We further find speculative and disagree with SPP TOs' assertion that the Commission will struggle to explain a decision to adopt Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process as the replacement rate. If the Commission fixes Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process as the replacement rate, the Commission will necessarily and intelligibly explain why that method(s) and/or process complies with the final rule based on support in the record.[294]

c. Cooperative Federalism

i. Rehearing Requests

90. SPP TOs argue that Order No. 1920-A is contrary to the FPA's structure of cooperative federalism because "[t]here is a very real possibility that a proposal could be added to a compliance filing despite one or more of the Relevant State Entities' opposition."[295] In this respect, SPP TOs differentiate Order No. 1920-A from the Commission action at issue in the Supreme Court's decision in *EPSA*, asserting that the Court there upheld the Commission's "treatment of demand response resources in wholesale markets [because it] did not 'negate state decisions' regarding retail demand response programs on the basis that there was a 'veto power . . . granted to the States.'"[296]

ii. Commission Determination

91. We are not persuaded by SPP TOs' argument invoking cooperative federalism principles. The Supreme Court in *EPSA* addressed arguments that the Commission's regulation of demand response, pursuant to the Commission's authority over wholesale markets, allegedly intruded on a particular area of reserved state authority over retail

[295] SPP TOs Rehearing Request at 30-31 ("[U]nder Order No. 1920-A, some state policies could be imposed, not only on the transmission provider, but on dissenting states if the Commission used its claimed power to accept favored compliance filings reached through any means other than unanimity."); *see also id.* at 31 ("When the outcome of the Engagement Period process was merely advisory as the Commission originally ordered in Order No. 1920, the methodology developed during the Engagement Period could only be filed with the Commission on compliance if adopted by the transmission provider *as its own*.").

[296] *Id.* (quoting *EPSA*, 577 U.S. at 288).

rates.[297] SPP TOs do not point to a similar alleged intrusion on a particular area of reserved state authority here. Moreover, even in that context where reserved state authority was implicated, *EPSA* did not describe the state veto power afforded in the Commission's order on demand response as "dispositive" as SPP TOs contend,[298] but rather as a "finishing blow . . . [that] removes any conceivable doubt as to [the order's] compliance with [FPA section 201(b)]'s allocation of federal and state authority."[299] In other words, the Court treated the state "veto power" in that case as confirming the Commission's compliance with principles of cooperative federalism, having already discussed at length why the Commission, regulating within the areas of its jurisdiction, was not intruding on state prerogatives.[300] We further note that, in Order No. 1920-A, the Commission explained that it would defer to the Relevant State Entities themselves to determine what constitutes "agreement" on a Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process.[301] Accordingly, we continue to

[297] *See EPSA*, 577 U.S. at 281-82.

[298] SPP TOs Rehearing Request at 31.

[299] *EPSA*, 577 U.S. at 287-88.

[300] *See id.* at 281-87 (concluding the Commission's order was consistent with FPA section 201(b) notwithstanding that it "affects—even substantially—the quantity or terms of retail sales" because it "addresses—and addresses only—transactions occurring on the wholesale market" that are within the Commission's jurisdiction, and the Commission's regulatory justification "are all about, and only about, improving the wholesale market").

[301] Order No. 1920-A, 189 FERC ¶ 61,126 at P 654 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1360).

find that the Commission's approach in Order No. 1920-A is consistent with the division of responsibility set forth in the FPA, consistent with our discussion in Order No. 1920-A.[302]

d. Sub-Delegation

i. Rehearing Requests

92. MISO TOs and SPP TOs assert that the Commission in Order No. 1920-A impermissibly sub-delegated its authority to Relevant State Entities.[303] MISO TOs argue that the Commission is giving Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process "heightened importance" over those of transmission providers, with the effect of permitting Relevant State Entities to set interstate transmission rates.[304] MISO TOs state that statutory authority to determine whether transmission rates are unwarranted or excessive lies with the Commission, under the FPA, and cannot be sub-delegated to state commissions.[305] SPP TOs assert that the Commission "effectively purports to delegate the right to file

[302] *Id.* PP 135-165.

[303] *See* MISO TOs Rehearing Request at 8, 9-10, 38-41; SPP TOs Rehearing Request at 32-34.

[304] MISO TOs Rehearing Request at 38-41 (arguing that the "most reasonable way to interpret the rule is that the Commission is empowering states with such new 'authority,' permitting Relevant State Entities to dictate transmission cost allocation, critically, over the objection of the filing utility itself").

[305] *Id.* at 39-41 (citing Order No. 1920-A, 189 FERC ¶ 61,126 (Christie, Comm'r, concurring at P 3)).

compliance filings—which [is] granted to public utilities under the FPA—to the states," which is impermissible under *Atlantic City I* and other cases, but also not within the set of circumstances in which federal agencies may sub-delegate matters to the states.[306] SPP TOs also assert that under Order No. 1920-A "the Commission will, in practice, show a high degree of deference to alternative state proposals that would be tantamount to a sub-delegation of Commission authority to the states."[307]

ii. Commission Determination

93. We find arguments that the Commission has unlawfully sub-delegated its authority[308] are incorrect because there is no sub-delegation, impermissible or otherwise, of Commission authority here.[309] Contrary to MISO TOs' and SPP TOs' claims, the Commission has not sub-delegated to states its FPA section 206 authority to determine the replacement rate: the Commission has expressly stated that it will consider the entire

[306] SPP TOs Rehearing Request at 32-33 (citing *U.S. Telecom Ass'n v. FCC*, 359 F.3d 554, 565, 567-68 (D.C. Cir. 2004) (*U.S. Telecom*)).

[307] *Id.* at 33-34.

[308] *See* MISO TOs Rehearing Request at 8, 9-10, 38-41; SPP TOs Rehearing Request at 32-34.

[309] *U.S. Telecom* does not support MISO TOs' or SPP TOs' arguments. There, the FCC had extensively sub-delegated its authority over unbundling of mass market switches to state commissions—indeed, there was no dispute that such a sub-delegation had occurred, with the FCC arguing instead that the sub-delegation was permissible. *See U.S. Telecom*, 359 F.3d at 564-68. Here, by contrast, the compliance process set forth in Order No. 1920-A as to cost allocation provides a vehicle for the receipt of Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and the Commission retains all decision-making authority under FPA section 206 to determine the replacement rate.

record before it and, itself, determine the replacement rate.[310] That the Commission will entertain on compliance Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process, *in addition* to any proposals made by transmission providers, and may fix one of those as the replacement rate does not suggest that the Commission has abdicated to states the Commission's clear and exclusive authority to determine and fix the replacement rate under FPA section 206. SPP TOs' argument that the Commission has unlawfully sub-delegated to states the right to make compliance filings, which—SPP TOs claim—is granted solely to public utilities, is also mistaken. As explained above, the compliance process assists the Commission in determining the replacement rate, under FPA section 206. Order No. 1920-A requires that transmission providers—not states—make compliance filings, and sets out the information that transmission providers must include in those filings. Arguments that Order No. 1920-A intrudes on public utilities' rights or unlawfully assigns those rights to Relevant State Entities are incorrect.[311]

[310] Order No. 1920-A, 189 FERC ¶ 61,126 at P 659; *see also supra* P 68 (explaining that the Commission expects to determine the replacement rate on a case-by-case basis, consistent with its authority and discretion to select from the range of just and reasonable replacement rates).

[311] *See supra* Requirements Concerning Relevant State Entities' Agreed-upon Cost Allocation Methods, Statutory Filing Rights Under the FPA section.

e. First Amendment

i. Rehearing Requests

94. Indicated PJM TOs argue that the requirement to include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in transmission providers' compliance filings is governmentally compelled speech that violates the First Amendment to the Constitution.[312] Indicated PJM TOs assert that the First Amendment protects the right to petition the government, including through filings with courts and administrative agencies.[313] Indicated PJM TOs contend that the compliance filing requirement violates their rights not to speak by mandating that a public utility present views with which it disagrees when filing its own proposal.[314] Indicated PJM TOs state that the Supreme Court has held that "the government may not require that an entity present views with which it disagrees when it

[312] Indicated PJM TOs Rehearing Request at 29-34 (citing, *inter alia*, *Pac. Gas & Elec. Co. v. Pub. Util. Comm'n of Cal.*, 475 U.S. 1, 12-14 (1986) (*PG&E*)); *cf.* SPP TOs Rehearing Request at 13-14 (arguing that requiring a transmission provider to include Relevant State Entities' information with its own commandeers the transmission provider's compliance filing, citing *PG&E*, 475 U.S. 1).

[313] Indicated PJM TOs Rehearing Request at 29 (citing U.S. Const. amend. I; *E. R.R. Presidents Conf. v. Noerr Motor Freight, Inc.*, 365 U.S. 127, 138 (1961); *Cal. Motor Transp. Co. v. Trucking Unlimited*, 404 U.S. 508, 510 (1972); *White v. Lee*, 227 F.3d 1214, 1231 (9th Cir. 2000)).

[314] *Id.* at 30-32 (citing *PG&E*, 475 U.S. at 12-14; *Moody v. Netchoice, LLC*, 603 U.S. 707, 726-33 (2024); *Wooley v. Maynard*, 430 U.S. 705, 714 (1977); *United States v. United Foods, Inc.*, 533 U.S. 405, 409-10 (2001)).

engages in expressive speech."[315] They compare this case to the Supreme Court's decision in *PG&E*, which overturned a state regulation requiring a utility to include material from a consumer advocacy group in a newsletter regularly included in the utility's billing envelopes expressing the utility's views of energy policy.[316]

95. Indicated PJM TOs state that the Order No. 1920-A compliance filing requirement at issue here would not meet the strict scrutiny standard under the First Amendment, asserting that it is not content neutral because it is "intended to give more weight to the views of [Relevant State Entities] in the Order No. 1920 context than it normally would give in other proceedings" and that there is no compelling government interest justifying the requirement.[317] Indicated PJM TOs also argue that the compliance filing requirement would not survive the intermediate scrutiny standard, stating that it is not narrowly tailored to achieve the Commission's stated interest, and burdens substantially more of transmission providers' First Amendment petitioning right than necessary to advance that interest.[318]

96. Indicated PJM TOs assert that the limitations the Commission imposed on the compliance filing requirement—that transmission providers do not need to separately

[315] *Id.* at 30 (citing *Moody,* 603 U.S. at 726-33).

[316] *See id.* (discussing *PG&E*, 475 U.S. at 12-14).

[317] *Id.* at 31-32.

[318] *Id.* at 32-33 (arguing that states have other opportunities to make their views known, rendering the requirement unnecessary).

characterize or justify Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process—do not obviate this alleged First Amendment violation.[319] They also state that it is "inconsequential that the Commission knows and understands that the [Relevant State Entities'] proposal is not the public utility transmission provider's proposal."[320] Indicated PJM TOs assert specifically that the state-generated information at issue is not relevant to the transmission provider's rate proposal, but rather the compliance filing requirement mandates that transmission providers submit information that "undermines the public utility transmission provider's own advocacy."[321]

ii. Commission Determination

97. We disagree with the arguments raised on rehearing by Indicated PJM TOs that the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their Order No. 1920 regional transmission planning and cost allocation compliance filings violates the First Amendment.[322] We agree as a general matter that

[319] *See id.* at 33.

[320] *Id.* at 33-34 (citing *Moody*, 603 U.S. at 739-40; *Turner Broad. Sys., Inc. v. FCC*, 512 U.S. 622, 655 (1994)).

[321] *Id.* at 34.

[322] *See id.* at 29-34; *cf.* SPP TOs Rehearing Request at 13-14.

transmission providers have First Amendment rights.[323] However, Order No. 1920-A does not implicate those rights. Order No. 1920-A imposes no actual burden or limitation on transmission providers' speech, but instead requires nothing more than the attachment of one or more files, containing the information provided by Relevant State Entities, to transmission providers' compliance proposals under FPA section 206.

98. As explained, given states' unique role in Long-Term Regional Transmission Planning and the heightened importance of state-developed cost allocation methods and State Agreement Processes, the Commission will consider the entire record—including the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process and the transmission provider's proposal—when setting the replacement rate.[324] The requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings assists the Commission in monitoring compliance with the requirements related to the Engagement Period, allows the Commission to efficiently consider the views of both Relevant State Entities and transmission providers, and helps ensure that the Commission has a sufficient record on compliance to set a just and

[323] *PG&E*, 475 U.S. at 8.

[324] Order No. 1920-A, 189 FERC ¶ 61,126 at P 659; *supra* P 29.

reasonable replacement rate.[325] Correctly viewed in this light, the compliance requirements of Order No. 1920-A do not compel speech in violation of the First Amendment. Indeed, a myriad of Commission orders have similarly directed public utilities, following a finding that an existing rate is unjust, unreasonable, and unduly discriminatory, to submit information they otherwise would not submit that is necessary for the Commission to determine whether they have met the relevant orders' requirements.[326] Considering the critical importance of Relevant State Entities' views as to how the costs of Long-Term Regional Transmission Facilities will be allocated,[327] the requirement that transmission providers include information concerning those views in their compliance filings is akin to any other "informational requirement[ ] that public

[325] *See supra* Requirements Concerning Relevant State Entities' Agreed-upon Cost Allocation Methods, Statutory Filing Rights Under the FPA section.

[326] For example, transmission providers' First Amendment rights were not implicated by Order No. 1000's directive that transmission providers propose on compliance an *ex ante* method(s) for allocating the costs of new transmission facilities selected in the regional transmission plan for purposes of cost allocation and show on compliance (i.e., provide record evidence) that this proposed method(s) is just and reasonable and not unduly discriminatory by, *inter alia*, demonstrating that it satisfies the regional cost allocation principles. Order No. 1000, 136 FERC ¶ 61,051 at PP 558, 603. As in Order No. 1000, Order No. 1920-A requires that transmission providers provide the necessary record evidence—which, given the importance of states' views on cost allocation, necessarily includes those views—for the Commission to act on transmission providers' compliance filings.

[327] Order No. 1920-A, 189 FERC ¶ 61,126 at P 649.

utilities must follow to support their filings"[328] and, therefore, does not implicate any First Amendment concerns.[329]

99. Further, we disagree with Indicated PJM TOs' contention that "the Commission is not requiring the transmission provider to file state-generated information that is relevant to the Commission's decision on the *transmission provider's rate proposal*."[330] Given the importance of Relevant State Entities' views as to how the costs of Long-Term Regional Transmission Facilities will be allocated, we find that those views—and any

[328] Indicated PJM TOs Rehearing Request at 29. *See also* Order No. 1920-A, 189 FERC ¶ 61,126 at P 657 ("[W]e direct these facilitation and informational requirements on compliance pursuant to the Commission's authority under FPA section 206."); *supra* The Statutory Text and Structure, and Applicable Precedent, Support the Commission's Order No. 1920-A Approach section.

[329] *Full Value Advisors, LLC v. SEC*, 633 F.3d 1101, 1108-09 (D.C. Cir. 2011) (holding that required disclosures of information related to the securities over which institutional managers exercise control "are indistinguishable from other underlying and oft unnoticed forms of disclosure the Government requires for its 'essential operations.'" (quoting *W. Va. State Bd. of Educ. v. Barnette*, 319 U.S. 624, 645 (1943) (Murphy, J., concurring)); *United States v. Sindel*, 53 F.3d 874, 878 (8th Cir. 1995) (holding that disclosures required by the Internal Revenue Service did not implicate the First Amendment); *Scahill v. District of Columbia*, 909 F.3d 1177, 1185 (D.C. Cir. 2018); *see also Ohralik v. Ohio State Bar Ass'n*, 436 U.S. 447, 456 (1978) ("Numerous examples could be cited of communications that are regulated without offending the First Amendment, such as the exchange of information about securities, corporate proxy statements, the exchange of price and production information among competitors, and employers' threats of retaliation for the labor activities of employees." (citations omitted)).

[330] Indicated PJM TOs Rehearing Request at 34 (emphasis in original). *Cf.* Order No. 1920-A, 189 FERC ¶ 61,126 at P 659 ("[T]he Commission will consider the entire record – including the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method and/or State Agreement Process and the transmission provider's proposal – when setting the replacement rate.").

agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process—are relevant to the Commission's decision on the transmission provider's rate proposal.[331] Moreover, even if this material were not relevant to the assessment of transmission providers' proposals, this would not alter our conclusion that Order No. 1920-A's requirements do not impinge on transmission providers' First Amendment rights, as discussed below.[332]

---

[331] *See* Order No. 1920-A, 189 FERC ¶ 61,126 at P 657 ("We find that these additional requirements will allow the Commission to better evaluate whether transmission providers have complied with Order No. 1920's requirement to provide a forum for negotiation that enables meaningful participation by Relevant State Entities during the Engagement Period." (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1357)).

[332] We further note that the Commission regularly requires public utilities to submit information relevant to other entities' proposals or positions on issues. *See, e.g.*, *pro forma* Large Generator Interconnection Procedures, § 11.3 (Execution and Filing) (requiring, when an interconnection customer determines that negotiations with the transmission provider on the terms of the Large Generator Interconnection Agreement (LGIA) are at an impasse and requests that the transmission provider submit the unexecuted LGIA to the Commission, that the transmission provider "shall file the LGIA with FERC, together with its explanation of any matters as to which Interconnection Customer and Transmission Provider disagree"); *Wholesale Competition in Regions with Organized Elec. Mkts.*, Order No. 719, 73 FR 64100 (Oct. 28, 2008), 125 FERC ¶ 61,071, at P 274 (2008), *order on reh'g*, Order No. 719-A, 74 FR 37776 (Jul. 29, 2009), 128 FERC ¶ 61,059, *order on reh'g*, Order No. 719-B, 129 FERC ¶ 61,252 (2009) (requiring RTOs/ISOs to submit a compliance filing identifying any significant minority views as to remaining barriers to comparable treatment of jurisdictional demand response resources); *Allegheny Elec. Coop., Inc. v. PJM Interconnection, L.L.C*, 119 FERC ¶ 61,165, at P 14, app., attach. (Data and Document Request to PJM Interconnection, L.L.C) (2007) (directing PJM, in response to a complaint alleging tariff violations by PJM related to actions taken by PJM management with respect to the submission of reports by the PJM Market Monitoring Unit (MMU), to provide "[c]omplete details of any communications . . . with any MMU personnel regarding suggested alterations to the State of the Market Report . . . [and] [a]ny and all documents made in connection with such communication(s)").

100. Turning to Indicated PJM TOs' specific First Amendment claims, as a preliminary matter it is unclear which rights protected by the First Amendment Indicated PJM TOs believe are implicated by Order No. 1920-A. The First Amendment protects against government action abridging both "the freedom of speech" and the right "to petition the government for a redress of grievances."[333] Although the Supreme Court has described these two rights as "cognate rights,"[334] the Court has also explained that courts "should not presume there is always an essential equivalence in the two Clauses or that Speech Clause precedents necessarily and in every case resolve Petition Clause claims."[335] We assume that Indicated PJM TOs' position is that Order No. 1920-A violates both transmission providers' freedom of speech and their right to petition the government,[336] and we therefore address these claims separately.[337]

101. As to the First Amendment right to petition, we disagree with Indicated PJM TOs that the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State

[333] U.S. Const. amend. I.

[334] *Thomas v. Collins*, 323 U.S. 516, 530 (1945).

[335] *Borough of Duryea v. Guarnieri*, 564 U.S 379, 388 (2011).

[336] *See* Indicated PJM TOs Rehearing Request at 29-30 (arguing that Order No. 1920-A "compel[s] speech in violation of the First Amendment" and "violat[es] First Amendment petitioning rights").

[337] *Borough of Duryea*, 564 U.S at 388 (there is not a presumption of "essential equivalence" in the speech and petition clauses negating the need to address them individually).

Agreement Process in their compliance filings violates transmission providers' "First Amendment petitioning rights."[338] The Supreme Court has described the First Amendment right to petition as "allow[ing] citizens to express their ideas, hopes, and concerns to their government," and a petition as "convey[ing] the special concerns of its author to the government and, in its usual form, request[ing] action by the government to address those concerns."[339] Assuming, *arguendo*, that transmission providers' filings made in compliance with the requirements of Order Nos. 1920 and 1920-A—or filings made in compliance with the requirements of any Commission order for that matter[340]—constitute petitions under the First Amendment,[341] we find that the

[338] Indicated PJM TOs Rehearing Request at 30.

[339] *Borough of Duryea*, 564 U.S at 388-89 (citing *Sure-Tan, Inc. v. NLRB*, 467 U.S. 883, 896-97 (1984)).

[340] *S. Co. Svcs.*, 61 FERC at 62,328-29 (1992) ("A compliance filing is not a change initiated by a utility, but rather is a change expressly directed by the Commission . . . which the utility is merely implementing or carrying out."); *id.* at 62,330 ("A public utility submits compliance filings in response to Commission directives. The Commission issues these directives under its authority to fix a rate by order.").

[341] Indicated PJM TOs contend that "a public utility's right to present its rates and charges and proposals that affect such rates and charges with the Commission are protected speech under the First Amendment" based on the general observation that "[m]aking a submission or filing with a governmental body is First Amendment protected petitioning." Indicated PJM TOs Rehearing Request at 29 (citing *Noerr Motor Freight, Inc.*, 365 U.S. at 138; *Trucking Unlimited*, 404 U.S. at 510; *White v. Lee*, 227 F.3d at 1231). However, we find no relevant parallels between, on the one hand, the compliance requirements adopted in Order No. 1920-A and, on the other, the "publicity campaign designed to influence the passage of state laws" in *Noerr Motor Freight, Inc.*, 365 U.S. at 131, the alleged conspiracy "to institute state and federal proceedings to resist and defeat applications . . . to acquire [highway carrier] operating rights or to transfer or

requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings does not infringe on transmission providers' right to petition. Order No. 1920-A does not prevent transmission providers from "express[ing] their ideas" to the Commission or "request[ing] action by the [Commission] to address [their] concerns."[342] Rather, Order No. 1920-A makes clear that "transmission providers decide what to submit as their actual Order No. 1920 compliance proposal, including relevant tariff language and supporting evidence or arguments, whether they decide to propose the Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process or a different Long-Term Regional Transmission Cost Allocation Method."[343]

102. As to the First Amendment guarantee of freedom of speech, we find that the line of cases Indicated PJM TOs rely on in support of their argument that the compliance requirements of Order No. 1920-A violate transmission providers' right not to speak are inapposite. In both *PG&E* and *Moody*, the Supreme Court reviewed government action regulating the communication of *political* messages to and amongst the *public*.[344] In

---

register those rights" in *Trucking Unlimited*, 404 U.S. at 509, or the opposition to a zoning permit in *White v. Lee*.

[342] *See Borough of Duryea*, 564 U.S at 388-89.

[343] Order No. 1920-A, 189 FERC ¶ 61,126 at P 654 n.1651.

[344] *PG&E* concerned an order issued by the California Public Utilities Commission requiring PG&E to include third-party political editorials in its monthly billing statements to its customers. *PG&E*, 475 U.S. at 5-6, 12 (describing the audience of these editorials

contrast with the political discourse at issue in *PG&E* and *Moody*, the Supreme Court has held that under the standard articulated in *Central Hudson Gas & Electric Corp. v. Public Service Commission of New York*,[345] commercial speech—"that is, expression related solely to the economic interests of the speaker and its audience"[346]—is entitled to a "limited measure of protection, commensurate with its subordinate position in the scale of First Amendment values."[347] Further, courts have held that the First Amendment is not violated when agencies require the disclosure of information, not to influence public debate, but instead as a means to fulfilling the agencies' statutory mandates.[348] Given

---

as the "public at large"). In *Moody*, the Supreme Court reviewed a Texas law banning censorship on social-media platforms with over 50 million monthly active users, which officials justified on the basis that those platforms "skewed against politically conservative voices." *Moody*, 603 U.S. at 718-19, 721.

[345] 447 U.S. 557 (1980) (*Central Hudson*).

[346] *Id.* at 561; *see also Md. Shall Issue, Inc. v. Anne Arundel Cnty.*, 91 F.4th 238, 248 (4th Cir. 2024) (rejecting the argument that "commercial speech" is limited to speech that "propose[s] a commercial transaction" and describing that argument as "understand[ing] 'commercial' far too narrowly").

[347] *See Bd. of Trs. of State Univ. of N.Y. v. Fox,* 492 U.S. 469, 477 (1989) ("Our jurisprudence has emphasized that 'commercial speech' . . . is subject to 'modes of regulation that might be impermissible in the realm of noncommercial expression.'" (quoting *Ohralik*, 436 U.S. at 456)); *Central Hudson*, 447 U.S. at 563 ("The Constitution therefore accords a lesser protection to commercial speech than to other constitutionally guaranteed expression."); *Bolger v. Youngs Drug Prods. Corp.*, 463 U.S. 60, 64-65 (1983). *See also Rubin v. Coors Brewing Co.*, 514 U.S. 476, 492 (1995) (Stevens, J., concurring) ("The First Amendment generally protects the right not to speak as well as the right to speak. In the commercial context, however, government . . . often requires affirmative disclosures that the speaker might not make voluntarily." (internal citations omitted)).

[348] *See Full Value Advisors, LLC*, 633 F.3d at 1108-09 ("Here the Commission—not the public—is [the regulated entity's] only audience. The

that Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process relate "solely to the economic interests"[349] of those who will be allocated the costs of Long-Term Regional Transmission Facilities, and that disclosure of this information is made to the Commission so that it may ensure compliance with its directives,[350] we find Indicated PJM TOs' reliance on *PG&E* and *Moody* misplaced.[351]

[Dodd–Frank Wall Street Reform and Consumer Protection] Act is an effort to regulate complex securities markets, inspire confidence in those markets, and protect proprietary information in the process. It is not a veiled attempt to 'suppress unpopular ideas or information or manipulate the public debate through coercion rather than persuasion'" (citing *Turner Broad. Sys., Inc.*, 512 U.S. at 641)); *Sindel*, 53 F.3d at 878 ("There is no right to refrain from speaking when 'essential operations of government may require it for the preservation of an orderly society,—as in the case of compulsion to give evidence in court.' The IRS summons requires [appellant] only to provide the government with information which his clients have given him voluntarily, not to disseminate publicly a message with which he disagrees." (quoting *West Va. State Bd. of Educ. v. Barnette*, 319 U.S. at 645 (Murphy, J., concurring))).

[349] *See Central Hudson*, 447 U.S. at 561; *Md. Shall Issue, Inc.*, 91 F.4th at 248.

[350] *S. Co. Svcs.*, 61 FERC at 62,330. *See also* Order No. 1920, 187 FERC ¶ 61,068 at P 1768 (requiring each transmission provider to submit a compliance filing "as necessary to demonstrate that it meets all of the requirements adopted in [Order No. 1920]").

[351] Indicated PJM TOs cite to, but do not discuss, several additional Supreme Court decisions in stating that "the Commission's desire to receive the views of the [Relevant State Entities] on cost allocation does not justify mandating that the public utility present those views when filing its own proposal." Indicated PJM TOs Rehearing Request at 31 (citing *Turner Broad. Sys., Inc.*, 512 U.S. at 647; *Hurley v. Irish-Am. Gay, Lesbian, & Bisexual Grp. of Bos., Inc.*, 515 U.S. 557, 570 (1995); *Mia. Herald Publ'g Co. v. Tornillo*, 418 U.S. 241, 256-58 (1974)). These cases are distinguishable on the facts from Order No. 1920-A. *Hurley* and *Tornillo*, like *PG&E* and *Moody*, concerned expression in the public sphere on matters beyond those of a purely commercial nature. *See Hurley*, 515 U.S. at 561-62, 570 (discussing whether a public accommodations law prohibiting discrimination on the basis of sexual orientation compelled organizers of

103. Even assuming for the sake of argument that the compliance requirements of Order No. 1920-A implicate transmission providers' freedom of speech under the First Amendment, we disagree with Indicated PJM TOs' contention that any infringement on transmission providers' rights should be judged under strict scrutiny or the form of intermediate scrutiny described by Indicated PJM TOs.[352] In arguing that strict scrutiny should apply because the compliance requirements of Order No. 1920-A are not content-neutral,[353] Indicated PJM TOs ignore that the Supreme Court "has consistently applied intermediate scrutiny to commercial speech restrictions, even those that were content- and speaker-based."[354] We find, assuming Order No. 1920-A's compliance

---

Boston's St. Patrick's Day parade to allow a group of openly gay, lesbian, and bisexual descendants of Irish immigrants to march in the parade in violation of organizers' First Amendment rights); *Tornillo*, 418 U.S. at 243 (reviewing a statute "granting a political candidate a right to equal space to reply to criticism and attacks on his record by a newspaper"). Further, the portion of *Turner* cited by Indicated PJM TOs merely discusses why the requirements at issue there were "unrelated to the content of speech" (i.e., content-neutral), and does not explore the appropriate standard of review for regulations concerning a particular category of speech, such as commercial speech. *Turner Broad. Sys., Inc.*, 512 U.S. at 647.

[352] Indicated PJM TOs Rehearing Request at 31.

[353] *Id.* at 31 n.116 ("Here, the requirement to file the [Relevant State Entities'] proposal is applied only when the transmission provider disagrees with the content of the [Relevant State Entities'] proposal." (citing *Reed v. Town of Gilbert*, 576 U.S. 155, 171 (2015); *Turner Broad. Sys., Inc.*, 512 U.S. at 642)).

[354] *Greater Phila. Chamber of Com. v. Philadelphia*, 949 F.3d 116, 138 (3rd Cir. 2020). *See also Sorrell v. IMS Health Inc.*, 564 U.S. 552, 571-72 (2011) (applying *Central Hudson* intermediate scrutiny to a law imposing a "targeted, content-based burden"). The Supreme Court has described a content-based regulation as being "targeted at specific subject matter . . . even if it does not discriminate among viewpoints within that subject matter. *Reed*, 576 U.S. at 169. While content-based regulations of noncommercial speech are typically subject to strict scrutiny, content-based regulations

requirements implicate transmission providers' First Amendment rights at all, the less demanding standard applied to commercial speech set forth in *Central Hudson*, should apply to the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings given that these requirements "relate[ ] solely to [transmission providers'] economic interests."[355] Furthermore, we find that this requirement satisfies *Central Hudson*. Under *Central Hudson*, the Supreme Court undertakes a four-part analysis to determine whether a regulation that infringes on an entity's First Amendment rights is unconstitutional:

> At the outset, we must determine whether the expression is protected by the First Amendment. For commercial speech to come within that provision, it at least must concern lawful activity and not be misleading. Next, we ask whether the asserted governmental interest is substantial. If both inquiries yield positive answers, we must determine whether the regulation directly advances the governmental interest

---

of commercial speech are not. *See, e.g.*, *SEC v. AT&T, Inc.*, 626 F. Supp. 3d 703, 743 (S.D.N.Y 2022) ("[D]efendants' suggestion that all content-based regulations must satisfy strict scrutiny overlooks the significant body of decisions involving laws and regulations mandating affirmative disclosures of information . . . . These disclosure provisions are explicitly content based.").

[355] *Central Hudson*, 447 U.S. at 561; *Recht v. Morrisey*, 32 F.4th 398, 409 (4th Cir. 2022) ("To be clear: Commercial speech regulations are analyzed under *Central Hudson.*"); *Stuart v. Camnitz*, 774 F.3d 238, 244 (4th Cir. 2014). *See also Ohralik*, 436 U.S. at 456 ("To require a parity of constitutional protection for commercial and noncommercial speech alike could invite dilution, simply by a leveling process, of the force of the Amendment's guarantee with respect to the latter kind of speech.").

> asserted, and whether it is not more extensive than is necessary to serve that interest.[356]

104. First, the Commission has a substantial interest in monitoring transmission providers' compliance with the requirements concerning the Engagement Period, being able to efficiently consider the views of both Relevant State Entities and transmission providers, and ensuring that when setting the replacement rate on compliance, the record before it includes Relevant State Entities' views concerning how the cost of Long-Term Regional Transmission Facilities will be allocated,[357] and the Commission directly and materially advances that substantial interest by requiring that transmission providers document those views in their compliance filings.[358] Additionally, Order No. 1920-A is not more extensive than is necessary to serve the Commission's substantial interest because it requires only the attachment of one or more files, containing the information provided by Relevant State Entities, to transmission providers' proposal and does not require that transmission providers separately characterize any of this information.[359]

---

[356] *Central Hudson*, 447 U.S. at 566. Courts have described the *Central Hudson* analysis as a type of intermediate scrutiny. *See Recht v. Morrisey*, 32 F.4th at 408.

[357] *Central Hudson*, 447 U.S. at 569 ("The State's concern that rates be fair and efficient represents a clear and substantial governmental interest."); Order No. 1920-A, 189 FERC ¶ 61,126 at PP 649, 659.

[358] *Edenfield v. Fane*, 507 U.S. 761, 767 (1993).

[359] Contrary to Indicated PJM TOs' contention, the fact that Relevant State Entities could alternatively submit their agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in comments in response to transmission providers' compliance filings is immaterial under intermediate scrutiny. Indicated PJM TOs Rehearing Request at 32-33. Under intermediate scrutiny, both for content-neutral regulations of noncommercial speech and for commercial speech,

B. Consultation with Relevant State Entities After the Engagement Period

1. Order Nos. 1920 and 1920-A

105. In Order No. 1920, the Commission declined to require future Engagement Periods but noted that transmission providers may hold future Engagement Periods if they believe that such periods would be beneficial.[360]

106. In Order No. 1920-A, the Commission set aside Order No. 1920, in part, and required that, as part of transmission providers' obligations with respect to transmission planning and cost allocation, transmission providers shall consult with Relevant State Entities: (1) prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process; or (2) if Relevant State Entities seek, consistent with their chosen method to reach agreement, for the transmission provider to amend that method(s) or process.[361] The Commission found that the consultation requirement will provide a mechanism through which transmission providers and Relevant State Entities can engage with each other regarding possible future FPA

---

regulations need not be the least restrictive means of achieving the government's substantial interest. *Recht v. Morrisey*, 32 F.4th at 409; *Bd. of Trs. of State Univ. of N.Y.*, 492 U.S. at 477 ("The ample scope of regulatory authority [with respect to commercial speech] would be illusory if it were subject to a least-restrictive means requirement, which imposes a heavy burden on the State."); *Turner Broad. Sys., Inc.*, 520 U.S. at 217-18 ("Our precedents establish that when evaluating a content-neutral regulation which incidentally burdens speech, we will not invalidate the preferred remedial scheme because some alternative solution is marginally less intrusive on a speaker's First Amendment interests.").

[360] Order No. 1920, 187 FERC ¶ 61,068 at P 1368.

[361] Order No. 1920-A, 189 FERC ¶ 61,126 at P 691.

section 205 filings that seek to change cost allocation methods accepted by the Commission in compliance with Order No. 1920.[362] The Commission further required transmission providers to include in their OATTs a description of how they will consult with Relevant State Entities in these circumstances. Additionally, for a consultation initiated by a transmission provider, the Commission required the transmission provider to document publicly on their OASIS or other public website the results of their consultation with Relevant State Entities prior to filing their amendment. For a consultation initiated by Relevant State Entities, if the transmission provider chooses not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process preferred by Relevant State Entities during the required consultation, the Commission also required the transmission provider to document publicly on their OASIS or other public website the results of their consultation with Relevant State Entities, including an explanation for why they have chosen not to propose any amendments.[363]

107. The Commission found that these requirements will ensure that states have the opportunity to be involved in establishing cost allocation methods for Long-Term Regional Transmission Facilities subsequent to the Commission's acceptance of

[362] *Id.* The Commission clarified that this consultation requirement neither requires transmission providers to submit, nor prohibits transmission providers from submitting, FPA section 205 filings to modify cost allocation methods accepted in compliance with Order No. 1920, and transmission providers therefore retain their currently effective FPA section 205 rights. *Id.* P 691 n.1747.

[363] *Id.*

transmission providers' filings made in compliance with Order No. 1920, which has the potential to minimize additional costs and delays in the siting process and to facilitate the development of Long-Term Regional Transmission Facilities.[364] The Commission noted that, while it provided transmission providers with flexibility as to the form and duration of their required consultation with Relevant State Entities, one way transmission providers could satisfy the requirement to consult with Relevant State Entities is by revising their OATTs to include a process under which the transmission provider must present to the Commission, in addition to its own FPA section 205 proposal, an alternative cost allocation method proposed by Relevant State Entities for evaluation by the Commission on equal footing.[365] The Commission noted that transmission providers could also satisfy the requirement to consult with Relevant State Entities by revising their OATTs to include mechanisms similar to those used in SPP[366] and MISO.[367]

2. Challenges to Order No. 1920-A

a. Statutory Filing Rights Under the FPA

i. Rehearing Requests

108. Several rehearing petitioners argue that the consultation requirement unlawfully impinges on transmission providers' FPA section 205 filing rights by conditioning the exercise of those rights on consultation with Relevant State Entities before filing a proposed tariff amendment.[368] They argue that FPA section 205 is intended for the benefit of the public utilities, that this provision provides public utilities with the unilateral and exclusive right to make filings setting their rates (subject to Commission approval), and that the Commission cannot encumber this right by conditioning it on such consultation.[369] In support, some rehearing petitioners cite *Atlantic City I* as reflecting that the Commission cannot abridge the statutory rights afforded to public utilities by Congress.[370] MISO TOs, SPP TOs, and WIRES also rely on a statement in *City of*

[368] *See* MISO TOs Rehearing Request at 5-9, 27-31; Indicated PJM TOs Rehearing Request at 3, 7; SPP TOs Rehearing Request at 2, 7, 10-12; EEI Rehearing Request at 7, 11-12; WIRES Rehearing Request at 5-9.

[369] *See, e.g.*, MISO TOs Rehearing Request at 29-31 (citing *Atlantic City I*, 295 F.3d at 9-10; *Emera Maine*, 854 F.3d at 24; *Vistra Corp. v. FERC*, 80 F.4th 302, 318 (D.C. Cir. 2023); *MISO Transmission Owners v. FERC*, 45 F.4th 248, 253 (D.C. Cir. 2022); EEI Rehearing Request at 13-14 ("In seeking to create such a condition, the Commission seeks to fundamentally and unlawfully alter its role, as well as transmission providers' and public utilities' rights, under section 205."); WIRES Rehearing Request at 7-8.

[370] *See, e.g.*, MISO TOs Rehearing Request at 27-28; EEI Rehearing Request at 13-14; WIRES Rehearing Request at 7-8; SPP TOs Rehearing Request at 11 (also

Cleveland v. Federal Power Commission that a public utility "may, without negotiation or consultation with anyone, set the rates it will charge prospective customers, and change them at will, so long as they have not been set aside by the Commission on grounds of inconsistency with the [FPA]."[371]

109. MISO TOs argue that the requirement that transmission providers consult with Relevant State Entities prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process "encumbers the transmission providers' ability to exercise their FPA section 205 rights to amend their tariffs 'at any time.'"[372] SPP TOs similarly argue that the Commission cannot "impos[e] pre-conditions that could delay section 205 filings, potentially for an indefinite time."[373] WIRES argues that this requirement is a pre-condition to transmission providers exercising their filing

[373] SPP TOs Rehearing Request at 11 (citing *NRG Power Mktg.*, 862 F.3d at 115; *Western Resources*, 9 F.3d at 1578; *Midwest Indep. Transmission Sys. Operator, Inc.*, 133 FERC ¶ 61,221 (2010), *order on reh'g*, 137 FERC ¶ 61,074, at P 187 (2011), *vacated in part sub nom. Ill. Com. Comm'n v. FERC*, 721 F.3d 764 (7th Cir. 2013)).

rights that is not contemplated under the statute which could, "[i]n the extreme, . . . serve as a prohibition to a public utility's ability to file revisions under FPA section 205," in contrast to the intent of the FPA to allow public utilities to act quickly and without obstacles.[374]

110. EEI asserts that the consultation requirement impermissibly changes the Commission's role from passively considering rate proposals to actively infringing upon public utilities' exclusive power under FPA section 205 to initiate rate changes.[375] EEI contends that the structure of the consultation requirement implicitly shows that the Commission recognizes that it cannot reject a tariff filing by a public utility for failing to consult a Relevant State Entity.[376]

111. A number of the rehearing requests also argue that decisions by public utilities to adopt a similar consultation mechanism in certain circumstances, allow greater state participation in regional transmission planning or cost allocation, or otherwise cede their FPA section 205 filing rights to other entities do not support the Commission's decision here because those decisions were voluntary, rather than compelled by the Commission.[377] EEI recommends that the Commission reconsider the consultation

requirement, averring that uncoerced, voluntary agreements, such as when transmission owners in the MISO region voluntarily ceded certain rights to the Organization of MISO States in 2013, offer a lawful and more appropriate means of ensuring engagement between transmission providers and Relevant State Entities.[378]

112. MISO TOs, Indicated PJM TOs, and SPP TOs contend that Order No. 1920-A is also inconsistent with the FPA in requiring, in certain circumstances, that transmission providers publicly document the results of their consultations with Relevant State Entities on transmission providers' OASIS or other public website.[379] In particular, SPP TOs assert that the Commission may not "require a public utility to justify a decision *not* to make a section 205 filing when the filing decision is wholly voluntary under the FPA."[380] Indicated PJM TOs argue, citing *Atlantic City I*, that "inherent in a public utility's right to file to change its own rates under section 205 is its right to *not* change its own just and reasonable rates" and that "nothing in section 205 requires a utility to explain why it is not changing a just and reasonable rate."[381]

[381] Indicated PJM TOs Rehearing Request at 16; *id.* at 16-17 (arguing that the statutory vehicle for Relevant State Entities to attempt to change a Commission-approved cost allocation method is a complaint pursuant to FPA section 206).

ii. Commission Determination

113. We disagree with the arguments that Order No. 1920-A's cost allocation consultation requirement is unlawful because it infringes on or abridges transmission providers' FPA section 205 filing rights. The consultation requirement does not regulate transmission providers' filing rights under FPA section 205, but rather addresses the practices through which cost allocation methods for Long-Term Regional Transmission Facilities are developed, which is integrally tied to the likelihood of the construction of those facilities and their associated costs.[382]

114. In Order No. 1000, the Commission required—and the D.C. Circuit upheld—that transmission providers' transmission planning processes "have a method for allocating *ex ante* among beneficiaries the costs of new transmission facilities in the regional transmission plan, and the method must satisfy six regional cost allocation principles."[383] In doing so, the Commission regulated not only the substantive content of such cost allocation methods (i.e., consistency with the six regional cost allocation principles), but also the very practice of developing cost allocation methods by "[r]eforming the practice[ ] of failing to engage in . . . *ex ante* cost allocation."[384] Order No. 1920-A's

[382] *South Carolina*, 762 F.3d at 48; *see id.* at 82-83 (discussing how "the lack of methods that ascertain the beneficiaries of new and improved transmission facilities and allocate costs to entities that benefit" creates risks to transmission providers and results in misaligned incentives).

[383] *Id.* at 48.

[384] *Id.* at 57 (holding that this reform was within the Commission's jurisdiction to regulate); *see also id.* at 84-87.

consultation requirement, similarly, aims to ensure the development and application of cost allocation methods that will themselves facilitate the timely, efficient development of Long-Term Regional Transmission Facilities, through states' critical role in that process.

115. In Order No. 1920-A, the Commission determined—and we here sustain—that requiring transmission providers to consult with Relevant State Entities will provide an opportunity for state input, which "has the potential to minimize additional costs and delays in the siting process and to facilitate the development of Long-Term Regional Transmission Facilities."[385] As the Commission explained in the NOPR, Long-Term Regional Transmission Planning "may entail a more complex set of considerations compared to existing regional transmission planning requirements, which, in turn, may increase the importance of ensuring that the cost allocations method for projects identified and developed through these processes are perceived as fair."[386] "As

[385] Order No. 1920-A, 189 FERC ¶ 61,126 at P 692 ("We find that these requirements will ensure that states have the opportunity to be involved in establishing cost allocation methods for Long-Term Regional Transmission Facilities subsequent to the Commission's acceptance of transmission providers' filings made in compliance with Order No. 1920.").

[386] NOPR, 179 FERC ¶ 61,028 at P 54 (proposing to "address these concerns in part through greater state involvement, particularly in the development of cost allocation methods"); *see id.* P 244; *id.* PP 297-300 (discussing the challenges associated with developing cost allocation methods perceived as fair, especially in multi-state transmission planning regions, and how this may undermine the development of more efficient or cost-effective regional transmission facilities; discussing the critical role of states in such processes); *id.* P 301 ("We believe that providing an opportunity for state involvement in regional transmission planning cost allocation processes is becoming more important as states take a more active role in shaping the resource mix and demand, which, in turn, means that those state actions are increasingly affecting the long-term

such, . . . state entities charged with siting transmission facilities within their state may, at least in certain circumstances, take a more skeptical approach to evaluating applications to site Long-Term Regional Transmission Facilities."[387] To address this problem, the Commission proposed that providing opportunities for state involvement in establishing a cost allocation method "would help to address any such concerns on the part of state regulators, increasing the likelihood that Long-Term Regional Transmission Facilities are actually developed, and without delay."[388]

116. Order No. 1920 sustained these preliminary findings from the NOPR, which provide the foundation for the expanded opportunities for state participation in cost allocation adopted in that order and in Order No. 1920-A.[389] The Commission in Order

---

transmission needs for which we are proposing to require public utility transmission providers to plan in this NOPR.").

[387] *Id.* P 317; *see also id.* P 314 (discussing how additional state involvement in cost allocation may "decrease the controversy over development of such facilities," and thereby "reduce instances in which a Long-Term Regional Transmission Facility is selected, has an established *ex ante* cost allocation method that applies to it, but nevertheless fails to be developed because it cannot receive a necessary state regulatory approval. After all, states retain siting authority over transmission facilities and will review whether Long-Term Regional Transmission Facilities are consistent with the public interest and state siting regulations."); *cf. id.* P 321 ("Moreover, state siting proceedings may proceed more efficiently if states have better information about the costs and benefits of such regional transmission facilities.").

[388] *Id.* P 317.

[389] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 124 ("As the Commission discussed in the NOPR and we continue to find in this final rule, facilitating state regulatory involvement in the cost allocation process could minimize delays and additional costs associated with state and local siting proceedings."); *id.* P 126 (concluding that ensuring a dedicated process through which states have an opportunity to participate in the development of regional cost allocation "is particularly relevant to

No. 1920-A recognized that such concerns over inadequate state participation—and the Commission's findings as to how increased state involvement in cost allocation can help ensure that the benefits of Long-Term Regional Transmission Planning are realized—will also arise in the future, as transmission providers consider whether changes are warranted to the cost allocation process.[390] Likewise, the same dynamic may occur where Relevant State Entities have identified an alternative approach to the existing cost allocation mechanism; consulting with the Relevant State Entities regarding alternative approaches may increase Relevant State Entities' confidence in Long-Term Regional Transmission

---

Long-Term Regional Transmission Planning, given: (1) the lengthy planning horizon . . . ; (2) the resultant increased uncertainty for Long-Term Regional Transmission Facilities; and (3) accordingly, the increased importance for state engagement regarding cost allocation to increase the likelihood such facilities obtain needed siting approvals from the states and are thus timely and cost-effectively developed"); *id.* PP 1293, 1295, 1362, 1404, 1411; Order No. 1920-A, 189 FERC ¶ 61,126 at P 659 ("[G]iven the inherent uncertainty involved in planning to meet Long-Term Transmission Needs, state-developed cost allocation methods and State Agreement Process take on heightened importance."); *id.* PP 10, 59; 632, 671-673, 677-678.

[390] *See* Order No. 1920-A, 189 FERC ¶ 61,126 at P 692 ("We find that these requirements will ensure that states have the opportunity to be involved in establishing cost allocation methods for Long-Term Regional Transmission Facilities subsequent to the Commission's acceptance of transmission providers' filings made in compliance with Order No. 1920, which has the potential to minimize additional costs and delays in the siting process and to facilitate the development of Long-Term Regional Transmission Facilities."); *see also id.* P 688 (summarizing NESCOE's argument that "a transmission provider could undo the efforts of Relevant State Entities in agreeing to a Long-Term Regional Transmission Cost Allocation Method during the initial Engagement Period by filing a new Long-Term Regional Transmission Cost Allocation Method without consulting with Relevant State Entities"); *id.* P 691 ("We are persuaded by NARUC's and NESCOE's arguments raised on rehearing.").

Planning processes, thereby minimizing delays, disputes, and costs associated with those processes.

117. The Commission in Order No. 1920-A therefore addressed transmission providers' processes for developing cost allocation methods for Long-Term Regional Transmission Facilities by requiring that transmission providers engage in consultation with Relevant State Entities on cost allocation to receive input from these key stakeholders.[391] Specifically, it required the adoption of the consultation mechanisms discussed above, and required "transmission providers to include in their OATTs a description of how they will consult with Relevant State Entities in these circumstances."[392] These consultation practices occur prior to any FPA section 205 filing that transmission providers might make addressing cost allocation and are directed toward transmission providers' communications with Relevant State Entities regarding cost allocation, rather than any such FPA section 205 filing.[393]

---

[391] Order No. 1920-A also provided examples of how transmission providers could satisfy these consultation requirements, including revising their OATTs to adopt mechanisms similar to those used in SPP and MISO, *id.* P 692, but it did not rely on the voluntary decision of RTOs/ISOs to adopt such mechanisms as support for establishing these requirements. Thus, arguments on rehearing that such voluntary decisions are distinguishable from a Commission-imposed consultation requirement, *see* MISO TOs Rehearing Request at 29; SPP TOs Rehearing Request at 5-6; EEI Rehearing Request at 14-15, are beside the point.

[392] Order No. 1920-A, 189 FERC ¶ 61,126 at P 691.

[393] Indeed, there may not be any FPA section 205 filing associated with any such consultation, as the transmission provider has full discretion on whether or not to proceed with any FPA section 205 filing.

118. We agree with rehearing petitioners that FPA section 205 expressly grants rights to transmission providers. But contrary to the arguments raised on rehearing,[394] regulation of these consultation practices does not infringe on those rights.[395] Transmission providers retain their full and exclusive discretion as to whether to file—or not file—proposed changes to Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process under FPA section 205. Transmission providers likewise retain their full and exclusive discretion to determine the content of any such proposal, notwithstanding that transmission providers are required to engage in this consultation process. Transmission providers also control the timing of when they choose to make any such filing, including, to reiterate, *whether to make such a filing at all*.[396] Under this framework, the Commission demonstrably retains its passive and reactive role of reviewing the transmission providers' FPA section 205 filings.[397] As a result, FPA section 205 continues to function to the benefit of the transmission providers

[394] *See supra* P 108.

[395] Order No. 1920-A, 189 FERC ¶ 61,126 at P 691 n.1747 ("We clarify that this consultation requirement neither requires transmission providers to submit, nor prohibits transmission providers from submitting, FPA section 205 filings to modify cost allocation methods accepted in compliance with Order No. 1920, and transmission providers therefore retain their currently effective FPA section 205 rights.").

[396] The Commission also afforded "transmission providers flexibility as to the form and duration of their required consultation with Relevant State Entities." *Id.* P 692.

[397] *Emera Maine*, 854 F.3d at 24.

in allowing them, subject to Commission review and approval, to propose to set and change their own rates.[398]

119. Thus, the precedent relied on by rehearing petitioners challenging these requirements is inapposite. As discussed in greater detail above, the court in *Atlantic City I*[399] was not addressing a Commission regulation akin to the regulation of transmission providers' consultation practices relating to cost allocation for Long-Term Regional Transmission Facilities.[400] Rather, the court there overturned a Commission order requiring that public utilities clearly cede to an ISO their FPA section 205 rights, such that only the ISO could propose changes in rate design. Here, by contrast, transmission providers retain the full scope of their FPA section 205 filing rights. For similar reasons, this consultation requirement does not contravene *Massachusetts Department of Public Utilities*[401] because transmission providers retain their full authority to file only the FPA section 205 proposals of their own choosing, as well as the right to file nothing at all.[402]

---

[398] *See, e.g.*, *id.* (contrasting FPA sections 205 and 206, noting that FPA section 205 is intended for the benefit of the utility, allowing it to propose to change its own rates, subject to the Commission's passive and reactive oversight); *Vistra Corp.*, 80 F.4th at 318; *MISO Transmission Owners*, 45 F.4th at 253.

[399] 295 F.3d at 9-11.

[400] *See supra* P 55 (discussing the facts and holding of *Atlantic City I*).

[401] 729 F.2d at 886-87.

[402] *See supra* P 57 (discussing the facts and holding of *Massachusetts Department of Public Utilities*). For similar reasons, we are not persuaded by Indicated PJM TOs' suggestion of a tension between this consultation requirement and the availability of a

120. We are also not persuaded by challenges to this consultation requirement relying on *City of Cleveland*.[403] In that case, the court considered "whether the Federal Power Commission erred in adopting a rate structure specified in a schedule filed by a public electric utility without resolving its municipal customer's contention that the schedule contravenes a preexisting agreement between the parties."[404] The court held that where a public utility has actually agreed to particular rates, by contract, the Commission cannot overlook that agreement and approve different rates.[405] While the court in that case stated that a utility "may, without negotiation or consultation with anyone, set the rates it will charge prospective customers, and change them at will, so long as they have not been set aside by the Commission on grounds of inconsistency with the [FPA],"[406] the court was

---

complaint under FPA section 206 as a mechanism to compel a change to a transmission provider's cost allocation method. *See* Indicated PJM TOs Rehearing Request at 16-17. The consultation requirement does not allow Relevant State Entities to compel a transmission provider to change or not change its cost allocation method.

[403] *See* MISO TOs Rehearing Request at 30-31; SPP TOs Rehearing Request at 7; WIRES Rehearing Request at 6, 8.

[404] *See City of Cleveland*, 525 F.2d at 846, 853-54.

[405] *See id.* at 855 (explaining that the petitioner's "thesis is that . . . it had reached agreement with CEI as to the rates to be charged for the proposed load transfer service, and that a racheting of contract demand was not a part of the bargain" such that a "rachet clause" included in the public utility's proposed rate schedule had been impermissibly included); *id.* at 855-56 ("[A] utility is no more at liberty to alter an agreed rate as yet unfiled than it is to depart from one that has been filed.").

[406] *Id.* at 855; *see also United Gas Pipe Line Co.*, 350 U.S. at 343 ("The obvious implication is that, except as specifically limited by the Act, the rate-making powers of natural gas companies were to be no different from those they would possess in the

not called upon to address the Commission's authority, under FPA section 206, to regulate transmission providers' practices for developing cost allocation methods.[407] Moreover, that decision substantially pre-dates the Supreme Court and D.C. Circuit's precedent affirming the Commission's authority over the practices of public utilities that directly affect the areas subject to the Commission's jurisdiction.[408] Regardless, under Order No. 1920-A, transmission providers are still entitled, subject to Commission review and approval, "without negotiation or consultation with anyone, [to] *set* the rates [they] will charge prospective customers, and *change* them at will,"[409] including as to cost allocation. Despite Order No. 1920-A's regulation of their pre-filing practices, transmission providers' filing rights as set forth by FPA section 205[410] remain wholly intact and unchanged; any FPA section 205 filing that transmission providers make seeking to set or change their rates does not need to reflect a compromise proposal resulting from negotiation or consultation.

---

absence of the Act: to establish ex parte, and change at will, the rates offered to prospective customers . . . .").

[407] *See City of Cleveland*, 525 F.2d at 851-57.

[408] *See EPSA*, 577 U.S. at 288; *South Carolina*, 762 F.3d at 48; *cf. CAISO*, 372 F.3d at 403 (overturning Commission order, finding that it did not meet the "directly affects" test).

[409] *City of Cleveland*, 525 F.2d at 855 (emphasis added).

[410] *See* 16 U.S.C. 824d(c) (providing that "every public utility shall file with the Commission . . . schedules showing all rates and charges for any transmission or sale subject to the jurisdiction of the Commission, and the classifications, practices, and regulations affecting such rates and charges").

121. MISO TOs, SPP TOs, and WIRES assert that the requirement that transmission providers consult with Relevant State Entities prior to an FPA section 205 filing unlawfully limits their ability to propose to change their rates at any time.[411] We disagree. Order No. 1920-A's regulation of transmission provider practices in this respect may result in practical considerations affecting the timing of transmission providers' FPA section 205 filings, which transmission providers must plan for in order to file their proposal at their preferred time, but it does not amount to a curtailment of transmission providers' filing rights. Indeed, the same challenge could be leveled at essentially *any* Commission order that imposes a requirement on a public utility that may affect the contents of a FPA section 205 filing, because meeting this requirement could impose a practical constraint on the timing of that filing.[412] We note that transmission providers must follow any applicable stakeholder processes to that effect under their currently effective governing documents, and we view those to be functionally similar to the consultation requirement.[413]

---

[411] *See supra* P 109.

[412] For instance, where the Commission imposes a requirement on a public utility to consider a certain issue (e.g., a category of factors affecting Long-Term Transmission Needs) in support of ensuring just and reasonable rates, doing so could delay the utility's ability to make an FPA section 205 filing as compared to a situation without that requirement.

[413] *See, e.g.*, PJM Interconnection, L.L.C., Intra-PJM Tariffs, OA, § 18.6(a) (requiring the support of PJM stakeholders for certain FPA section 205 filings to amend PJM's Operating Agreement).

122. None of the precedent cited by MISO TOs, SPP TOs, or WIRES holds to the contrary. While *Atlantic City I* states that under FPA section 205(d) "a public utility may file changes to rates, charges, classification, or service at any time upon 60 days notice,"[414] it does not suggest that a Commission regulation that might, as a practical matter, affect the timing of such filings is unlawful as an intrusion on public utilities' filing rights.[415] Neither do the cases on which SPP TOs rely,[416] which addressed Commission attempts to modify a FPA section 205 filing made by a public utility[417] or explained that, where a filing is made under FPA section 205, the Commission has "a statutory obligation to process the filing in a timely manner."[418]

123. Challenges to Order No. 1920-A's requirements that transmission providers publicly document the results of their consultation with Relevant State Entities[419] do not change our analysis. Here, too, these documentation requirements do not impinge on or

---

[414] 295 F.3d at 9; *see* MISO TOs Rehearing Request at 28.

[415] *See* 295 F.3d at 9-11; *see supra* P 55 (discussing the holding of *Atlantic City I*).

[416] *See* SPP TOs Rehearing Request at 11 (citing *NRG Power Mktg*., 862 F.3d at 115; *City of Winnfield*, 774 F.2d at 876; *Western Resources*, 9 F.3d at 1578; *Midwest Indep. Transmission Sys. Operator, Inc*., 137 FERC ¶ 61,074 at P 187).

[417] *See NRG Power Mktg.*, 862 F.3d at 115; *City of Winnfield*, 774 F.2d at 876; *Western Resources*, 9 F.3d at 1578. That these cases discuss notice requirements under FPA section 205 does not support SPP TOs' suggestion that a Commission regulation is invalid as abridging FPA section 205 filing rights if it may, as a practical matter, require greater planning on a public utilities' part to make their filing at a desired time.

[418] *Midwest Indep. Transmission Sys. Operator, Inc*., 137 FERC ¶ 61,074 at P 187.

[419] *See* MISO TOs Rehearing Request at 5; Indicated PJM TOs Rehearing Request at 7, 15-17; SPP TOs Rehearing Request at 2, 7, 10-11.

alter transmission providers' FPA section 205 filing rights, as transmission providers retain their full, exclusive, and unilateral right to file, or not file,[420] FPA section 205 proposals of their own choosing. This aspect of Order No. 1920-A regulates only transmission providers' practices around publicly documenting their consultation with Relevant State Entities, pursuant to the Commission's authority under FPA section 206. The Commission has often introduced documentation requirements aimed at increasing transparency.[421] Nothing in FPA section 205 precludes the Commission from exercising

[420] *See* Indicated PJM TOs Rehearing Request at 16 (arguing that inherent in a public utility's right to change its own rates under FPA section 205 is the right not to seek to change its rates under that provision); SPP TOs Rehearing Request at 11 (arguing that the filing decision is wholly voluntary under FPA section 205).

[421] *See, e.g.*, Order No. 1920, 187 FERC ¶ 61,068 at P 1753 (requiring transmission providers to publicly document certain information, including Long-Term Transmission Needs discussed in interregional transmission coordination meetings); *id.* PP 1625-1630 (establishing documentation and transparency requirements for local transmission planning processes); Order No. 2023, 184 FERC ¶ 61,054 at PP 135-137 (requiring transmission providers to publicly post available generator interconnection information); Order No. 1000, 136 FERC ¶ 61,051 at P 458 (directing transmission providers "to maintain a website or e-mail list for the communication of information related to interregional transmission coordination procedures" to stakeholders); *id.* PP 668-669 (requiring that "cost allocation methods and their corresponding data requirements for determining benefits and beneficiaries [of regional and interregional transmission facilities] must be open and transparent" in order to "ensure[] that such methods are just and reasonable and not unduly discriminatory or preferential"); *Reform of Generator Interconnection Procs. & Agreements*, Order No. 845, 163 FERC ¶ 61,043, at PP 305, 307 (requiring transmission providers to post interconnection study metrics, in order to "increase the transparency of interconnection study completion timeframes"), *order on reh'g*, Order No. 845-A, 166 FERC ¶ 61,137 (2018), *order on reh'g*, Order No. 845-B, 168 FERC ¶ 61,092 (2019); *Uplift Cost Allocation & Transparency in Mkts. Operated by Reg'l Transmission Orgs. & Indep. Sys. Operators*, Order No. 844, 163 FERC ¶ 61,041, at PP 27, 30-34 (2018) (finding that certain RTO/ISO reporting practices were insufficiently transparent, resulting in unjust and unreasonable rates, and establishing four public reporting requirements).

that FPA section 206 authority to require documentation of these discussions, including in scenarios where the transmission provider elects not to file an FPA section 205 proposal to change its approach to cost allocation.

124. Moreover, the Commission has authority under the FPA to require the disclosure of information as necessary or appropriate to assist the Commission in the administration of its duties under the FPA, in the "manner or form" as the Commission may prescribe and providing "specific answers to all questions upon which the Commission may need information."[422] Order No. 1920-A's requirements that transmission providers publicly document the results of their consultation with Relevant State Entities fall comfortably within this broad authority.[423]

b. Compliance with the APA

i. Rehearing Requests

125. MISO TOs, SPP TOs, and WIRES assert that Order No. 1920-A's consultation requirement is inconsistent with the objectives of Order No. 1920 and insufficiently

[422] 16 U.S.C. 825c(a) ("[E]very public utility shall file with the Commission such annual and other periodic or special reports as the Commission may by rules and regulations or order prescribe as necessary or appropriate to assist the Commission in the proper administration of this chapter"); *see also id.* 825f(a), 825h; *INGAA,* 285 F.3d at 39; *PJM Interconnection* ¶ 61,224, at P 26 (2015) ("Court and Commission precedent recognize that the Commission retains the ability to require informational filings without exceeding its authority under section 205. The Commission's authority to prescribe informational filings and require informational reports, moreover, is statutory."); *PJM Interconnection, L.L.C.*, 123 FERC ¶ 61,037, at P 12 (2008); *supra* note 421 (public documentation requirements issued pursuant to FPA section 206).

[423] For instance, these requirements will help ensure that consultations with Relevant State Entities are occurring consistent with transmission providers' tariffs.

supported and is therefore arbitrary and capricious under the APA.[424] MISO TOs argue that the requirement contravenes the stated purpose of Order No. 1920 of promoting efficiency and cost-effectiveness of transmission solutions stating that "when the Commission places roadblocks, such as additional consultations and detailed explanations of decisions, in the way of reaching appropriate [c]ost [a]llocation [m]ethods, it belies the purpose of the reforms, does not demonstrate a clear path of reasoning, and is, thus, arbitrary and capricious."[425] SPP TOs broadly challenge Order No. 1920-A's consultation requirement as insufficiently supported by the Commission's explanation that states have a unique role and voice in regional transmission planning, given that states have other avenues to be heard and transmission providers have every incentive to consult voluntarily with Relevant State Entities.[426] WIRES argues that "[b]ecause the record demonstrates that there are other less intrusive means by which

Cir. 2019)); SPP TOs Rehearing Request at 28 (citing *State Farm*, 463 U.S. at 43); WIRES Rehearing Request at 15 (citing 5 U.S.C. 706(2)(A); *Am. Gas Ass'n v. FERC*, 593 F.3d 14, 19 (D.C. Cir. 2010); *Rio Grande Pipeline Co. v. FERC*, 178 F.3d 533, 541 (D.C. Cir. 1999)).

[425] MISO TOs Rehearing Request at 32-33; *see also id.* at 27.

[426] SPP TOs Rehearing Request at 28-29 (arguing that there is no need to "create preferential filing privileges" not contemplated by the FPA and "that statutory limits exist and may frustrate some parties cannot be a reasoned basis for evading those limits"); *see also id.* at 11-12 (arguing that the Commission's explanation for the consultation requirements cannot support infringing on transmission providers' FPA section 205 filing rights, and that "public utilities will continue to have every incentive to *voluntarily* consult with Relevant State Entities and to consider their input before making section 205 filings").

states can meaningfully participate in the development of Long-Term Regional [Transmission] Cost Allocation [M]ethods and State Agreement Processes, the Commission's revisions are arbitrary and capricious."[427]

ii. Commission Determination

126. We disagree with the arguments raised on rehearing that the Commission failed to comply with the APA in adopting the requirement that transmission providers consult with Relevant State Entities prior to amending the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process.[428] First, MISO TOs mischaracterize the consultation requirement in calling it a "roadblock[ ] . . . in the way of reaching appropriate [c]ost [a]llocation [m]ethods,"[429] as Order No. 1920-A provides transmission providers flexibility as to both the form and duration of the required consultation.[430] Moreover, Order No. 1920-A does not require that transmission

[427] WIRES Rehearing Request at 16-17 (asserting that the same set of facts relied on in Order No. 1920 were used to justify the requirements of Order No. 1920-A, such that "there seems little connection between what are essentially the same facts and the choices made."). WIRES here challenges both the consultation requirements and the compliance filing requirements adopted in Order No. 1920-A, discussed above, *see supra* Requirements Concerning Relevant State Entities' Agreed-upon Cost Allocation Methods section, as arbitrary and capricious for the same reasons.

[428] *See* MISO TOs Rehearing Request at 32-33; SPP TOs Rehearing Request at 28; WIRES Rehearing Request at 15.

[429] MISO TOs Rehearing Request at 33.

[430] Order No. 1920-A, 189 FERC ¶ 61,126 at P 692.

providers post any detail beyond the results of any consultation,[431] and for consultations initiated by Relevant State Entities, Order No. 1920-A requires only an explanation for why the transmission provider has chosen not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process preferred by Relevant State Entities during the required consultation.[432] Contrary to MISO TOs' contention that the consultation requirement contravenes the purpose of Order No. 1920, we find that the consultation requirement directly furthers the essential purpose of Long-Term Regional Transmission Planning to develop more efficient or cost-effective regional transmission facilities.[433] The consultation requirement, in ensuring that states have the opportunity to be involved in development of cost allocation methods for Long-Term Regional Transmission Facilities subsequent to the Commission's acceptance of transmission providers' filings made in compliance with Order No. 1920, has the potential to minimize additional costs and delays in the siting process and to facilitate the development of Long-Term Regional Transmission Facilities.[434] Therefore, on balance, we find that the consultation requirement adopted in

[431] *See* MISO TOs Rehearing Request at 33 (asserting that that this requirement obligates transmission providers to provide "detailed explanations of decisions").

[432] Order No. 1920-A, 189 FERC ¶ 61,126 at P 691.

[433] Order No. 1920, 187 FERC ¶ 61,068 at P 125.

[434] Order No. 1920-A, 189 FERC ¶ 61,126 at P 692.

Order No. 1920-A is an appropriate, tailored means of furthering Order No. 1920's essential purpose.

127. We also disagree with SPP TOs' and WIRES' arguments that the Commission's adoption of the consultation requirement is arbitrary or capricious because Relevant State Entities have other means of participating in the development of Long-Term Regional Transmission Cost Allocation Methods and/or State Agreement Process, or because transmission providers would otherwise be incented to consult with Relevant State Entities and consider their input before making FPA section 205 filings.[435] In Order No. 1920-A, the Commission found that the consultation requirement will ensure that states have the opportunity to be involved in developing cost allocation methods for Long-Term Regional Transmission Facilities subsequent to the Commission's acceptance of transmission providers' filings made in compliance with Order No. 1920.[436] Transmission providers may already have an incentive to provide states with an opportunity to be involved in establishing cost allocation methods for Long-Term Regional Transmission Facilities subsequent to the Commission's acceptance of transmission providers' filings made in compliance with Order No. 1920—given such involvement has the potential to minimize additional costs and delays in the siting process and to facilitate the development of Long-Term Regional Transmission

[435] *See* SPP TOs Rehearing Request at 28-29; WIRES Rehearing Request at 16-17.

[436] Order No. 1920-A, 189 FERC ¶ 61,126 at P 692.

Facilities.[437] However, the consultation requirement adopted in Order No. 1920-A *ensures* that Relevant State Entities have such an opportunity.

c. First Amendment

i. Rehearing Requests

128. Indicated PJM TOs argue that the requirement that transmission providers explain why they have chosen not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process preferred by Relevant State Entities during the required consultation violates the First Amendment to the United States Constitution.[438] Indicated PJM TOs contend that the First Amendment protects transmission providers' right to speak as well as their right not to speak, and that this requirement constitutes governmentally compelled speech that the Commission cannot require.[439]

ii. Commission Determination

129. Above, we address Indicated PJM TOs' argument that transmission providers' First Amendment rights are violated by Order No. 1920-A's requirement that transmission providers include in the transmittal or as an attachment to their Order No. 1920 regional transmission planning and cost allocation compliance filing the

[437] *Id.* P 692 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 124, 126).

[438] Indicated PJM TOs Rehearing Request at 29.

[439] *Id.* at 29-30, 33-34 (citing *Wooley*, 430 U.S. at 714; *United Foods, Inc.*, 533 U.S. at 409-10; *PG&E*, 475 U.S. at 10-19; *Central Hudson*, 447 U.S. 557).

Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process agreed to by Relevant State Entities during the Engagement Period.[440] For similar reasons, we find that the requirement that transmission providers explain why they have chosen not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process preferred by Relevant State Entities during the required consultation does not implicate transmission providers' rights under the First Amendment. As discussed above,[441] the requirement that transmission providers explain why they have chosen not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process preferred by Relevant State Entities during the required consultation is a regulation of the practices surrounding cost allocation to ensure the development of cost allocation methods that will facilitate the timely, efficient development of Long-Term Regional Transmission Facilities, given the critical role of states in that process. This requirement is not a "veiled attempt to . . . 'manipulate the public debate through coercion'"[442] but rather an integral component in Order No. 1920's

[440] *See supra* Requirements Concerning Relevant State Entities' Agreed-upon Cost Allocation Methods section.

[441] Consultation with Relevant State Entities After the Engagement Period, Statutory Filing Rights Under the FPA section.

[442] *Full Value Advisors, LLC*, 633 F.3d at 1108-09 (rejecting a First Amendment challenge to a statute "indistinguishable from other underlying and oft unnoticed forms of disclosure the Government requires for its 'essential operations'" (first quoting *Turner Broad. Sys., Inc.*, 512 U.S. at 641; then quoting *W. Va. State Bd. of Educ. v. Barnette,* 319

reforms facilitating the timely, efficient development of Long-Term Regional Transmission Facilities, and thus ensuring just and reasonable Commission-jurisdictional rates. We therefore find no difference for the purposes of the First Amendment between this requirement and Order No. 1000's reform, necessary to ensure just and reasonable Commission-jurisdictional rates, of the "practices of failing to engage in . . . *ex ante* cost allocation for development of new regional transmission facilities."[443]

130. As with Indicated PJM TOs' First Amendment arguments with respect to the requirement that transmission providers include Relevant State Entities' agreed-upon Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process in their compliance filings, we find that Indicated PJM TOs' reliance on cases concerning compelled expression of political and ideological messages such as *Wooley* and *PG&E* is misplaced. The Supreme Court has consistently held that "expression related solely to the economic interests of the speaker and its audience"[444] is entitled to only a "limited measure of protection, commensurate with its subordinate position in the scale of First Amendment values."[445] The requirement that transmission providers

---

U.S. at 645)). *See also Sindel*, 53 F.3d at 878; *Scahill v. District of Columbia*, 909 F.3d at 1185.

[443] *South Carolina*, 762 F.3d at 57 (describing this Order No. 1000 reform as "involv[ing] a core reason underlying Congress' instruction in [FPA] Section 206").

[444] *Central Hudson*, 447 U.S. at 561; *see also Md. Shall Issue, Inc.*, 91 F.4th at 248.

[445] *See Bd. of Trs. of State Univ. of N.Y.*, 492 U.S. 469; *see supra* Requirements Concerning Relevant State Entities' Agreed-upon Cost Allocation Methods section.

explain why they have chosen not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process preferred by Relevant State Entities during the required consultation does not compel transmission providers to utter phrases "repugnant to their moral, religious, and political beliefs,"[446] but instead simply requires that they explain their disagreement with Relevant State Entities as to the economic matter of how the cost of Long-Term Regional Transmission Facilities ought to be allocated.[447] Therefore, at most, the requirement that transmission providers explain why they have chosen not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process preferred by Relevant State Entities during the required consultation should be judged under the *Central Hudson* standard applied to regulations on commercial speech.[448] We find that this requirement satisfies *Central Hudson*, as it

[446] *Wooley*, 430 U.S. at 707.

[447] *Md. Shall Issue*, *Inc.*, 91 F.4th at 248.

[448] *Recht*, 32 F.4th at 409. While Indicated PJM TOs argue that either strict or intermediate scrutiny should apply to the requirement that transmission providers include in their compliance filings the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process agreed upon by Relevant State Entities, Indicated PJM TOs do not specify the level of constitutional scrutiny they believe should apply to the requirement that transmission providers explain why they have chosen not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process preferred by Relevant State Entities during the required consultation. Indicated PJM TOs Rehearing Request at 31-33. For the avoidance of doubt, we find that strict scrutiny is inapplicable to the requirement that transmission providers explain why they have chosen not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State

directly advances the Commission's substantial interest in ensuring that states have the opportunity to be involved in establishing cost allocation methods for Long-Term Regional Transmission Facilities subsequent to the Commission's acceptance of transmission providers' filings made in compliance with Order No. 1920, which has the potential to minimize additional costs and delays in the siting process and to facilitate the development of Long-Term Regional Transmission Facilities,[449] and is "in proportion to" and not more extensive than is necessary to serve the Commission's substantial interest.[450]

C. Definition of Relevant State Entities

1. Order Nos. 1920 and 1920-A

131. In Order No. 1920, the Commission defined a "Relevant State Entity" as "any state entity responsible for electric utility regulation or siting electric transmission

---

Agreement Process preferred by Relevant State Entities during the required consultation after the Engagement Period.

[449] Order No. 1920-A, 189 FERC ¶ 61,126 at P 692 (citing Order No. 1920, 187 FERC ¶ 61,068 at PP 124, 126).

[450] *See Bd. of Trs. of State Univ. of N.Y.*, 492 U.S. at 480 (quoting *In re R.M.J.*, 455 U.S. 191, 203 (1982)). As discussed above at note 359, regulations on commercial speech such as the requirement that transmission providers explain why they have chosen not to propose any amendments to the Long-Term Regional Transmission Cost Allocation Method(s) and/or State Agreement Process preferred by Relevant State Entities during the required consultation need not be the least restrictive means of achieving the government's substantial interest. *Id.* Thus, the fact that Relevant State Entities could alternatively "file their own proposal under FPA section 206" has no bearing on the constitutionality of this requirement. Indicated PJM TOs Rehearing Request at 33.

facilities within the state or portion of a state located in the transmission planning region, including any state entity as may be designated for that purpose by the law of such state."[451] In response to comments on the NOPR, the Commission declined to expand the definition of Relevant State Entities to include additional entities, including electric cooperatives, and explained that providing state regulators with a formal opportunity to develop cost allocation methods in Long-Term Regional Transmission Planning could increase state support for Long-Term Regional Transmission Facilities that transmission providers select and that this may increase the likelihood that such facilities are sited and ultimately developed with fewer costly delays and better ensure just and reasonable Commission-jurisdictional rates.[452] The Commission made clear, however, that nothing in Order No. 1920 diminishes the role of stakeholders that are not Relevant State Entities nor absolves transmission providers of any existing obligations that they may have to provide opportunities for stakeholder input.[453]

132. Order No. 1920 provided opportunities for Relevant State Entities to participate in Long-Term Regional Transmission Planning, including, but not limited to, the requirements that transmission providers in each transmission planning region:

(1) consult with and seek support from Relevant State Entities regarding the evaluation

[451] Order No. 1920, 187 FERC ¶ 61,068 at PP 44, 1355; *see also* Order No. 1920-A, 189 FERC ¶ 61,126 at P 701.

[452] Order No. 1920, 187 FERC ¶ 61,068 at P 1364.

[453] *Id.* P 1000.

process, including selection criteria, that transmission providers propose to use to identify and evaluate Long-Term Regional Transmission Facilities for selection;[454] (2) include in their OATTs a process to provide Relevant State Entities and interconnection customers with the opportunity to voluntarily fund the cost of, or a portion of the cost of, a Long-Term Regional Transmission Facility that otherwise would not meet the transmission providers' selection criteria;[455] and (3) provide a forum for negotiation of a Long-Term Regional Transmission Cost Allocation Method(s) and/or a State Agreement Process that enables meaningful participation by Relevant State Entities.[456] The Commission declined to expand participation in the Engagement Period beyond Relevant State Entities but stated that other participants beyond Relevant State Entities may participate in the State Agreement Process, if agreed to by Relevant State Entities.[457]

133. In Order No. 1920-A, the Commission recognized the valuable insight that municipal electric regulatory bodies and non-public utilities provide as stakeholders in Commission-sanctioned processes but declined requests to expand the definition of Relevant State Entity to encompass other entities.[458] In support of its decision, the Commission emphasized that state entities responsible for electric utility regulation or

---

[454] *Id.* P 994.

[455] *Id.* P 1012.

[456] *Id.* P 1354.

[457] *Id.* PP 1364 & n.2914, 1402, 1416, 1421.

[458] Order No. 1920-A, 189 FERC ¶ 61,126 at PP 700-701.

siting electric transmission facilities are uniquely situated to influence whether or not a Long-Term Regional Transmission Facility reaches completion.[459] The Commission continued to find that "regional transmission facilities face significant uncertainty and risk of not reaching construction if certain stakeholders—in particular, a state regulator responsible for permitting transmission facilities—do not perceive the regional transmission facilities' value as commensurate with their costs."[460] However, the Commission did not make a determination on whether an individual state's laws, regulations, and/or policies, or inclusion in a larger association of regulators, deem any particular entity to be a Relevant State Entity, though the Commission noted that state law may be a persuasive or dispositive factor in such determinations.[461]

2. Rehearing Requests

134. NRECA requests that the Commission modify the definition of Relevant State Entity to include any entity that establishes or regulates electric rates under state law, in light of Order No. 1920-A's modifications to the roles played by Relevant State Entities.[462] NRECA states that Order No. 1920-A substantially changes the final rule by creating expanded and additional opportunities for Relevant State Entities to influence and determine Long-Term Regional Transmission Planning and associated cost allocation

[459] *Id.* P 701 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1364).

[460] *Id.* P 700 (citing Order No. 1920, 187 FERC ¶ 61,068 at P 1364).

[461] *Id.* P 703.

[462] NRECA Rehearing Request at 12.

methods, such as requiring incorporation of input from Relevant State Entities in developing Long-Term Scenarios and requiring compliance filings to include any Long-Term Regional Transmission Cost Allocation Method or State Agreement Process agreed upon by Relevant State Entities.[463]

135. NRECA argues that Order No. 1920-A's modifications to the final rule are incomplete, and the Commission's goal of giving the entities that represent electric consumers under state law a greater voice in transmission planning and cost allocation decisions is not met, because the order does not ensure comparable representation of all electric consumers in a state.[464] NRECA points out that many state public utility commissions do not regulate the rates of all electric utilities in their respective states and that often electric cooperatives establish their rates independently of their state's utility commission. NRECA asserts that the Commission arbitrarily and without explanation excluded or allowed transmission planning regions to exclude the representatives of some electric consumers from the more robust process created by Order No. 1920-A.[465] NRECA states that the Commission's definition of Relevant State Entity in Order Nos. 1920 and 1920-A is not bound by statute or prior regulations, as the Commission crafted this definition for the purpose of Order Nos. 1920 and 1920-A.[466]

---

[463] *Id.* at 5-8.

[464] *Id.* at 9.

[465] *Id.* at 10.

[466] *Id.* at 11-12 (citing Order No. 1920-A, 189 FERC ¶ 61,126 at P 704).

136. NRECA argues that the FPA's prohibition on undue discrimination or preference extends to practices affecting jurisdictional rates as well as the rates themselves.[467] Accordingly, NRECA claims that Order No. 1920-A is arbitrary, capricious, not in accordance with law, and not the product of reasoned decision-making, as it does not require transmission providers to provide the expanded opportunities for participation in transmission planning and cost allocation decision-making processes on a nondiscriminatory and non-preferential basis to all entities "responsible for electric utility regulation" under state law.[468]

137. Finally, NRECA argues that the Commission should clarify or modify Order No. 1920-A to require transmission providers to demonstrate in their compliance filings how they are ensuring that all entities that establish or regulate electric rates under state law will be treated without undue discrimination or preference.[469]

3. Commission Determination

138. We are not persuaded by NRECA's request to expand the definition of Relevant State Entity to include any entity that establishes or regulates electric rates under state law.[470] As discussed in Order No. 1920-A, while we recognize the important role that many stakeholders, including municipal electric regulatory bodies and non-public utility

[467] *Id.* at 13.

[468] *Id.* at 4, 13-14.

[469] *Id.* at 15.

[470] *Id.* at 12.

entities, play in Commission-sanctioned processes, we continue to find that the definition of Relevant State Entities should encompass only state entities responsible for electric utility regulation or siting electric transmission facilities within the state or portion of a state located in the transmission planning region, including any state entity as may be designated for that purpose by the law of such state.[471]

139. In Order No. 1920-A, the Commission reaffirmed and enhanced the important role of states in the Long-Term Regional Transmission Planning process by recognizing that meaningful engagement with states is critical to the success of the Long-Term Regional Transmission Planning reforms established in Order No. 1920.[472] Specifically, the Commission in Order No. 1920-A better integrated states' input into regional transmission planning and cost allocation processes, both in the transmission providers' development of Order No. 1920 compliance filings and the ongoing implementation of these reforms in the future.

140. Importantly, however, this strengthened role of Relevant State Entities does not limit or inhibit other entities from engaging robustly via the Commission's or state's standard procedures for public participation. We also reiterate that Order No. 1920 allows other participants, including the municipal electric regulatory bodies and non-public utility entities mentioned above that do not otherwise meet the definition of a Relevant State Entity, to participate in a State Agreement Process, if agreed to by

[471] Order No. 1920-A, 189 FERC ¶ 61,126 at P 701.

[472] *Id.* P 3.

Relevant State Entities.[473] Further, we emphasize that nothing in Order No. 1920 or Order No. 1920-A prevents transmission providers generally from consulting or working closely with stakeholders in addition to Relevant State Entities to ensure the success of Long-Term Regional Transmission Planning. Indeed, we welcome such collaboration.

141. We disagree with NRECA's argument that the definition of Relevant State Entity allows for unduly discriminatory and preferential transmission planning and cost allocation practices by not expressly encompassing any entity that establishes or regulates electric rates under state law.[474] As discussed in Order No. 1920, allowing Relevant State Entities to better realize Long-Term Regional Transmission Facilities' value through an enhanced role in the regional transmission planning process greatly increases the likelihood of their support for those facilities. Relevant State Entities play a unique role in that they retain a variety of authorities that are integral to the success of Long-Term Regional Transmission Planning.[475] Therefore, the support of Relevant State Entities may increase the likelihood that those facilities are sited and ultimately developed with fewer costly delays, and thus better ensures just and reasonable Commission-jurisdictional rates.[476] Additionally, we reiterate that we are not excluding

[473] Order No. 1920, 187 FERC ¶ 61,068 at PP 1364 n.2914, 1402; Order No. 1920-A, 189 FERC ¶ 61,126 at P 701.

[474] NRECA Rehearing Request at 13.

[475] Order No. 1920, 187 FERC ¶ 61,068 at P 1000.

[476] *Id.* P 1364.

any specific entities from this process; instead, we make no findings regarding whether any individual municipal electric regulatory body or non-public utility entity meets the definition of a Relevant State Entity, as those determinations properly rest with entities in a state, based upon their interpretation of their state laws.[477]

142. We further are not persuaded by NRECA's request for a requirement that transmission providers demonstrate in their compliance filings how they are ensuring that all entities that establish or regulate electric rates under state law will be treated without undue discrimination or preference.[478] Nothing in Order No. 1920 diminishes the role of stakeholders that are not Relevant State Entities, nor absolves transmission providers of any existing obligations that they may have to provide opportunities for stakeholder input.[479]

D. Other Cost Allocation Issues

1. Order Nos. 1920 and 1920-A

143. In Order No. 1920, the Commission found that there is substantial evidence to support the determination that sufficiently long-term, forward-looking, and comprehensive regional transmission planning and cost allocation to meet Long-Term Transmission Needs is not occurring on a consistent and sufficient basis, and that the absence of such processes is resulting in piecemeal transmission expansion to address

[477] Order No. 1920-A, 189 FERC ¶ 61,126 at P 703.

[478] NRECA Rehearing Request at 15.

[479] *See* Order No. 1920, 187 FERC ¶ 61,068 at P 1000.

relatively near-term transmission needs. The Commission found that the status quo approach results in transmission providers undertaking investments in relatively inefficient or less cost-effective transmission infrastructure, the costs of which are ultimately recovered through Commission-jurisdictional rates.[480]

144. The Commission concluded that revisions to the Commission's regional transmission planning and cost allocation requirements are necessary to ensure that Commission-jurisdictional rates, terms, and conditions are just, reasonable, and not unduly discriminatory or preferential. The Commission found that, absent the reforms instituted by Order No. 1920, regional transmission planning processes will continue to fail to identify, evaluate, and select regional transmission facilities that can more efficiently or cost-effectively meet Long-Term Transmission Needs, requiring customers to pay for relatively inefficient or less cost-effective transmission development.[481]

145. The Commission therefore concluded, based on the record in the proceeding, that there is substantial evidence to support the conclusion that deficiencies in the Commission's existing regional transmission planning and cost allocation requirements are resulting in Commission-jurisdictional rates that are unjust, unreasonable, and unduly discriminatory or preferential.

146. As relevant here, the Commission specifically found that the Commission's current cost allocation requirements, which were designed and established in the context

[480] *Id.* P 112.

[481] *Id.* P 113.

of existing Order No. 1000 regional transmission planning processes, are insufficient to appropriately allocate costs associated with regional transmission facilities that are selected in accordance with the new Long-Term Regional Transmission Planning requirements that the Commission established in Order No. 1920. Accordingly, the Commission found that it is both necessary and appropriate to establish specific cost allocation requirements that are tailored to the Long-Term Regional Transmission Planning reforms in Order No. 1920.[482]

147. In Order No. 1920-A, the Commission responded to rehearing requests that argued that the Commission had failed to satisfy its FPA section 206 burden to demonstrate that existing Order No. 1000 regional transmission planning and cost allocation processes are unjust, unreasonable, or unduly discriminatory or preferential[483] and sustained its Order No. 1920 determinations as to its action under the first prong of FPA section 206.[484] As relevant here, the Commission continued to find that the Commission made adequate findings and marshalled substantial evidence under the first prong of FPA section 206, and that it found rehearing petitioners' arguments to the contrary to be unpersuasive. The Commission concluded that the evidence on which it relied—both empirical and generic

[482] *Id.* P 126.

[483] *See* Order No. 1920-A, 189 FERC ¶ 61,126 at PP 70-71 (describing rehearing requests received from Designated Retail Regulators, Undersigned States, Arizona Commission, and Industrial Customers challenging the sufficiency under the first prong of FPA section 206 of the evidence relied upon by the Commission in Order No. 1920).

[484] *Id.* P 72.

factual predictions—was more than sufficient to meet its evidentiary burden under FPA section 206.[485]

2. Rehearing Requests

148. Indicated PJM TOs and SPP TOs argue that the Commission failed to make an adequate finding under the first prong of FPA section 206 that substantial evidence supports the determination that existing regional cost allocation methods are unjust and unreasonable.[486] Indicated PJM TOs state that FPA section 206 requires the Commission to prove that each rate or practice affecting such rate that it seeks to change is unlawful based on substantial evidence.[487] Indicated PJM TOs assert that "[t]he Commission makes several findings that *the existing regional planning process* is unjust and unreasonable but makes no findings that the existing *regional cost allocation method[]* is unjust and unreasonable."[488] Indicated PJM TOs aver that the findings in Order Nos. 1920 and 1920-A that an existing rate is unjust and unreasonable are confined to the transmission planning process, and that the Commission "simply assume[d]" that existing

[485] *Id.* PP 72-83.

[487] Indicated PJM TOs Rehearing Request at 24-25 (citing 16 U.S.C. 825*l*(b); *Emera Maine*, 854 F.3d at 24; *South Carolina*, 762 F.3d at 56-69).

[488] *Id.* at 5; *see id.* at 7 (emphasis in original).

regional cost allocation methods are unjust and unreasonable on the basis of evidence that existing regional transmission planning processes are unjust and unreasonable.[489]

149. Indicated PJM TOs argue that the Commission justified its decision by stating that existing cost allocation methods do not properly reflect the benefits to be considered in the new Order No. 1920 long-term transmission planning requirements and that there is no process to engage states in the development of regional cost allocation methods, but there is not substantial evidence in the record or analysis supporting these determinations.[490] Indicated PJM TOs argue that the Commission acknowledged that it may be just and reasonable to continue to apply existing regional cost allocation methods, that the Commission cannot conclude that a rate is unjust and unreasonable simply because it differs from the rate the Commission seeks to impose, and that the Commission has shifted the burden onto public utilities to demonstrate their cost allocation methods are consistent with the requirements of Order No. 1920.[491] Indicated PJM TOs contend that because the Commission has not carried its burden under the first prong of FPA section 206 with respect to the cost allocation methods for Long-Term

[489] *Id.* at 24 (citing Order No. 1920-A, 189 FERC ¶ 61,126 at PP 47 & n.80, 52 & n.92).

[490] *Id.* at 25 (arguing that the Commission failed to consider the example of whether PJM's cost allocation method for multi-driver projects would be appropriate under Order No. 1920 or whether PJM's existing State Agreement Approach provided sufficient state involvement in cost allocation processes).

[491] *See id.* at 26 (citing *Emera Maine*, 854 F.3d at 22-26; Order No. 1920-A, 189 FERC ¶ 61,126 at P 714).

Regional Transmission Facilities, any proposals related to such cost allocation methods must be made and considered under FPA section 205 and approved if just and reasonable.[492]

150. SPP TOs assert that Order Nos. 1920 and 1920-A do not present substantial evidence establishing a causal link between the Commission's changes to its transmission planning requirements and the need for replacement rates on cost allocation.[493] SPP TOs acknowledge that the Commission made such findings in Order Nos. 1920 and 1920-A but contend that these findings fall short of statutory requirements.[494] Specifically, they argue that "[t]he creation of new benefits in the transmission planning process does not support the Commission's conclusion that a new transmission cost allocation scheme is also needed" because costs need not be allocated with exacting precision and there is more than one just and reasonable rate, such that existing rates may still be just and reasonable.[495] Further, SPP TOs contend that the Commission disavowed in Order No. 1920 any causal link between the benefits required to be used and measured for planning purposes and the proposed replacement rate such that an acceptable cost allocation method need not include a mechanism for allocating the costs of Long-Term

[492] *Id.* at 26-27 (citing 16 U.S.C. 824d(e); *Sw. Power Pool, Inc.*, 189 FERC ¶ 61,128, at P 60 n.230 (2024)).

[495] *Id.* at 23-24.

Regional Transmission Facilities in line with the measurement of benefits. Therefore, SPP TOs argue, the Commission was required to make additional factual findings, such as showing that Order No. 1920's transmission planning requirements would cause existing cost allocation methods to fail to meet the cost causation principle.[496]

151. SPP TOs assert that the holding in *South Carolina* that "'substantial evidence' is not limited to empirical evidence and may include generic factual predictions"[497] does not support the Commission's decision because "the Commission fails to show any support for 'generic factual predictions' related to supposed cost allocation deficiencies."[498] SPP TOs further contend that the Commission's discussion of the need for reform in Order Nos. 1920 and 1920-A does not support a finding under the first prong of FPA section 206 as to cost allocation, because the relevant material in the record addresses the need for improved transmission planning, not cost allocation.[499] In addition, SPP TOs argue that the Commission does not cite any record evidence that existing cost allocation methods fail to adequately consider the views of states, does not support the need for a dedicated process through which states have the opportunity to participate in regional

cost allocation methods, and does not show that existing methods are insufficient to appropriately allocate costs in this context.[500]

3. Commission Determination

152. FPA section 313(a) provides that a party aggrieved by an order issued by the Commission "may apply for a rehearing within thirty days after the issuance of such order."[501] That provision further requires that "[t]he application for rehearing shall set forth specifically the ground or grounds upon which such application is based."[502] An aggrieved party is entitled to one opportunity to ask the Commission to reconsider a decision.[503] Arguments that are not made at the first opportunity cannot be made later unless there is reasonable ground for failure to do so.[504] Successive rehearing requests

[500] *Id.* at 27-28 (citing Order No. 1920-A, 189 FERC ¶ 61,126 at P 83; Order No. 1920, 187 FERC ¶ 61,068 at P 126).

[501] 16 U.S.C. 825*l*(a); *see also* 18 CFR 385.713(b) (rehearing request must be filed not later than 30 days after issuance of a final decision or order).

[502] 16 U.S.C. 825*l*(a).

[503] *See Tenn. Gas Pipeline Co. v. FERC*, 871 F.2d 1099, 1110 n.18 (D.C. Cir. 1989) ("[I]f a party does not raise an argument *that it could have raised* in its first petition for review of a Commission action, it cannot preserve that argument for judicial review simply by filing a second petition for rehearing from a subsequent Commission order which implicates the same action." (emphasis in original)); *Smith Lake Improvement & Stakeholders Ass'n*, 809 F.3d at 58 (holding that, when a Commission rehearing order does not alter an aspect of the underlying order, seeking further rehearing as to that unchanged aspect does not toll the 60-day period for requesting judicial review).

are only proper when the order on rehearing modifies the result reached in the original order in a manner that gives rise to a "wholly new objection."[505]

153. Here, Indicated PJM TOs did not request rehearing of this aspect of Order No. 1920,[506] and SPP TOs did not request rehearing of Order No. 1920. Nor have Indicated PJM TOs or SPP TOs provided a reasonable ground for their failure to timely raise their objections to Order No. 1920's findings under the first prong of FPA section 206. Nevertheless, the concerns they raise regarding the Commission's findings under the first prong of FPA section 206 and sufficiency of evidence to support its exercise of authority in Order No. 1920[507] were thoroughly addressed in Order No. 1920-A,[508] which sustained Order No. 1920's outcome on this issue.[509] The

[505] *Appalachian Power Co.*, 149 FERC ¶ 61,137 at P 8 (citing, *inter alia*, *S. Nat. Gas Co. v. FERC*, 877 F.2d 1066, 1073 (D.C. Cir. 1989)); *see also Smith Lake Improvement & Stakeholders Ass'n* , 809 F.3d at 58 (finding, in a case "where the result did not change on first rehearing and petitioner sought a second rehearing nonetheless," that "there can be no dispute that [precedent] precludes judicial review of an untimely petition").

Florida Reliability Coordinating Council, Inc.
3001 North Rocky Point Dr East
Suite 410
Tampa, FL 33607

CC: Florida Power & Light, Duke Energy Florida, and Tampa Electric Company (collectively, the "Transmission Providers")

RE: Stakeholder Comments on FRCC Proposed Order No. 1920 Project Selection Tariff Language

The Environmental Defense Fund (EDF) and Southern Alliance for Clean Energy (SACE) (collectively, "the Stakeholders") offer the following comments on the Benefits Evaluation and Project Selection process proposed by the Transmission Providers in response to Federal Energy Regulatory Commission (FERC) Order No. 1920. We thank the Transmission Providers and the Florida Reliability Coordinating Council (FRCC) for sharing the proposed tariff language, and we appreciate the Transmission Providers engaging in a constructive dialogue with us during the February 17th meeting. We look forward to continued discussions to help ensure that the tariff complies with and upholds the purpose of Order No. 1920 and is in the best interest of Florida's utility customers.

The Stakeholders have numerous questions and concerns regarding this proposed tariff language. Some were raised during the most recent meeting and are reiterated below. Others we did not have time to address. Our primary concerns are that the draft language has the unintended effect of restricting participation in the project submission process, and that it will not result in a fair calculation of transmission solution benefits.

The 30-day submission window, restricted production cost modeling data, and vaguely defined selection criteria are likely to limit participation in the process from all but the incumbent utilities. With this tight turnaround and limited available data about system conditions, non-incumbent transmission developers will find it difficult to design Long-Term Regional Transmission Facilities that optimally address reliability and economic needs, will face increased risk of submitting projects that do not satisfy the stringent (and somewhat ambiguous) selection criteria, and have diminished confidence in proposing projects in the first place. The barrier is even higher when considering that their projects will be evaluated by the incumbent utilities with which they are competing, and which determine how the selection criteria are applied when there is any ambiguity. The proposed process will therefore lead to an uneven playing field by discouraging non-incumbent transmission developers' participation. It also fails to meet FERC (hereinafter, "the Commission") requirements regarding transparency and data sharing in the transmission planning process, as we will detail in the next section.

Moreover, calculating benefits over the minimum allowable time horizon (which is less than half of the anticipated operating life of a transmission project), while using the highest allowable Benefit-to-Cost Ratio (BCR) and considering secondary benefits only *after* the BCR has been established, will likely yield an incomplete assessment of the project's overall value and higher costs for end-use customers. This approach may exacerbate the concerns raised by the

Commission regarding current transmission planning procedures, as it can result in the continued prioritization of local reliability projects that offer limited benefits and higher relative costs, even when more cost-effective regional solutions are available. The Commission found that this is leading to unjust and unreasonable rates to consumers. As a result, a process that does not ultimately lead to greater consideration of transmission benefits is almost certainly unjust and unreasonable, and not in compliance with the Order.

We are also concerned that the tariff does not articulate a formal process for stakeholder engagement and feedback during the Long-Term Regional Transmission Planning cycle. Order No. 1920 requires at least three publicly-noticed stakeholder meetings per regional transmission planning cycle concerning the local transmission planning process of each transmission provider that is a member of the region. These meetings are to occur *before* each transmission provider's local transmission plan can be incorporated into the region's planning models. The Order clarifies that these shall include an **Assumptions Meeting** to review the criteria, assumptions, and models related to each transmission provider's local transmission planning; a **Needs Meeting** to review identified reliability criteria violations and other transmission needs that call for local transmission facilities; and a **Solutions Meeting** to review potential solutions to reliability criteria violations and other transmission needs. The Order requires that stakeholders have opportunities before and after each meeting to submit comments, and requires transmission providers to respond to stakeholder questions or comments to ensure their meaningful participation in these meetings[1]. Thus far, the FRCC and Transmission Providers have not confirmed they will offer these meetings or how they will be arranged. We request they confirm the cadence, structure, and content of these meetings.

More broadly, the proposed Long-Term Regional Transmission Planning process provides very few references to stakeholder engagement. The process does not provide stakeholders with opportunities to discuss key decisions with Transmission Providers, to give feedback on those decisions, or to have their feedback considered. As discussed below, there are numerous elements of the planning process that today are not clearly defined and therefore left to Transmission Providers' discretion. We are concerned that the process lacks accountability because the Transmission Providers have not committed to share sufficient data or seek input from stakeholders – despite the Commission's intent to have meaningful stakeholder involvement in long-term regional transmission planning.[2]

We appreciate the FRCC extending the upcoming April 20th meeting from two to six hours, and the Transmission Providers' stated commitment to transparency and meaningful engagement with Stakeholders as is required under Order No. 1920.[3] We hope this will lead to an even more fruitful discussion. To that end, we look forward to reviewing the responses from the Transmission Providers to the comments and questions we submitted in November and December 2025 on the Scenario Development and Needs Analysis language. Receipt of those responses prior to the April 20th meeting will ensure that our engagement is as constructive as possible.

[1] *Bldg. for the Future Through Elec. Reg'l Transmission Planning & Cost Allocation*, Order No. 1920, 89 FR 49280 (June 11, 2024), 187 FERC ¶ 61,068 at 1626-1628 (hereinafter Order No. 1920).
[2] *See e.g., Id.* at 1645 ("Overall, we encourage transmission providers to be as responsive as possible to stakeholder comments and questions.").
[3] *Id*. at 529.

The Stakeholders offer the following comments on the draft tariff language:

Section 8: Proposals of Long-Term Regional Transmission Facilities

Proposed Tariff Language:

> "Any entity that satisfies the Project Developer Qualification Criteria set forth in Appendix 3 of Attachment [__] is eligible to submit a proposed project for consideration as a potential Long-Term Regional Transmission Facility. Such entity must submit qualification materials in accordance with Section 1.2.11 Project Developer Qualifications Review.
>
> Proposals for potential Long-Term Regional Transmission Facilities must include the following:
>
> 1. Transmission project technical information:
> a) Description of the transmission facilities being proposed (e.g., criteria required to be eligible to qualify as a Long-Term Regional Transmission Facility);
> b) Path of the transmission lines; and
> c) Description of detailed integration into the existing transmission system (e.g., substation design, facility ratings (FERC Order 881), breaker configuration, electrical facility design and specifications).
>
> 2. Load flow analysis that demonstrates adequate North American Electric Reliability Corporation ("NERC") Reliability Standards performance utilizing the FRCC load flow model;
> 3. Proposed in-service date and alignment with timing of Long-Term Transmission Need(s) the proposed project is intended to address;
> 4. Detailed engineering-level cost in future dollars;
> 5. Description of how the proposed project satisfies the requirements of Section [9].
>
> A deposit of $100,000 shall be submitted with the proposal, which will be used for the costs for the analysis of the proposed project and any out-of-pocket expenses such as the fee of independent consultants to analyze the proposed Long-Term Regional Transmission Facility (unexpended amounts shall be refunded, with interest, to the entity submitting the proposal). The actual costs incurred to analyze the proposed project will be borne by the entity submitting the proposal, and the deposit will be trued up based on the documented cost of the analysis.
>
> Project proposals made pursuant to this section must be submitted no later than thirty (30) calendar days after the Long-Term Transmission Needs have been posted to Transmission Provider's OASIS.
>
> If an entity wishes to propose multiple potential Long-Term Regional Transmission Facilities within the same planning cycle, each proposal must be materially different."

Stakeholder Comments:

- Please confirm whether a third-party, non-Transmission Owner transmission developer can submit projects for consideration in the Long-Term Regional Transmission Planning process.

- Please confirm whether the process for proposing a Long-Term Regional Transmission Facility will be the same for third-party (i.e., non-incumbent) transmission developers and the current Transmission Providers.

- Please confirm what models and data the FRCC and Transmission Providers will supply to non-incumbent transmission developers to help developers to design and submit Long-Term Regional Transmission Facilities that cost-effectively meet the identified Long-Term Regional Transmission Needs.

    - Will the power flow cases used for identifying the transmission need be available to test whether solutions resolve the identified violations and potentially others? If so, when will the models be posted and what requirements will there be for non-incumbent transmission developers to access the models?
    - During the meeting, Transmission Providers mentioned they would share their power flow cases with developers, which is a beneficial step.
    - However, Transmission Providers indicated that they would not provide any production cost modeling data for non-incumbent transmission developers to use for developing the most cost-effective regional upgrades. This is inconsistent with the requirements of Order No. 1920. Under the requirements of the Order, the FRCC and Transmission Providers must share their cost modeling data with stakeholders.
    - In the Order, the Commission reiterated that Transmission Providers already have a transparency requirement for transmission planning established in Order No. 890. Footnote 1169 in Order No. 1920 reiterates this, requiring "transmission providers to provide customers and other stakeholders with the opportunity to participate fully in the transmission planning process. The transmission planning process must provide for the timely and meaningful input and participation of customers and other stakeholders regarding the development of transmission plans, allowing customers and other stakeholders to participate in the early stages of development."[4]
    - The Commission also found that even with these requirements, "local transmission planning processes lack adequate provisions for transparency and meaningful input from stakeholders" and that "when engaging in the regional transmission planning process, stakeholders lack sufficient information about underlying local transmission needs and potential solutions that is necessary to ensure that the more efficient or cost-effective regional transmission solutions are identified, evaluated, and selected".[5]
    - The Commission highlights that where "certain generator dispatch and economic information" is not made available to stakeholders "it becomes difficult or impossible to conduct meaningful load flow studies for some transmission planning

[4] *Id*. at 539 n. 1169 (quoting Order No. 890, 118 FERC ¶ 61,119 at 451-454).
[5] *See also Preventing Undue Discrimination and Preference in Transmission Service*, Order No. 890, 118 FERC ¶ 61,119 at 454, 488, 557 (Feb. 16, 2007*); Transmission Planning and Cost Allocation by Transmission Owning and Operating Public Utilities*, Order No. 1000, 136 FERC ¶ 61,051 (July 21, 2011).

purposes, and the competitive playing field is tilted toward those who have this information and away from those who do not."[6]

- Noting the "critical role that stakeholders serve in effective transmission planning," the Commission in Order No. 1920 enhanced the transparency requirement, including the "disclosure of the methodology, criteria, assumptions, data and other information that underlie transmission plans"[7] and requiring that "transmission providers' evaluation of transmission facilities must culminate in a determination that is sufficiently detailed for stakeholders to understand why a particular Long-Term Regional Transmission Facility (or portfolio of such Facilities) was selected or not selected."[8] The Commission acknowledges that some data might elicit confidentiality concerns but "reiterate[s] that information must be disclosed, under applicable confidentiality provisions, if the information is needed to participate in the transmission planning process and to replicate transmission planning studies, which necessarily includes access to the models that underlie transmission planning processes."[9]
- As Stakeholders stated in the meeting, other planning regions already share this data with developers upon execution of a non-disclosure agreement (NDA)[10]. For example, the non-RTO west across the Western Electricity Coordinating Council (WECC) maintains a public database known as the Anchor Data Set (ADS) for running production cost models.[11] A similar simulation model can be developed for FRCC members to support the development and evaluation of regional transmission projects. Therefore, consistent with the Order's requirements, **Transmission Providers must include a provision that allows for the sharing of the production cost simulation data**. This will help to ensure that non-incumbent transmission developers are not discriminated against and produce the most economically beneficial project proposals for evaluation.

- Please explain how Transmission Providers determined the $100,000 deposit amount. The FRCC and Transmission Providers should clarify whether this deposit is intended to reimburse them for the work they must undergo to evaluate each submission, or if it is intended to be used to deter speculative submissions. Please clarify who the deposit will be held by, and whether it is refundable in the case that a proposal is not selected or a transmission developer withdraws their submission. Please provide any additional pertinent information regarding the criteria and process the deposit holder will use to determine whether a deposit will be refunded.

- Stakeholders do not agree that the 30-day window to submit a Long-Term Regional Transmission Facility is sufficient, nor do we find it consistent with the open and transparent process that Order No. 1920 requires. We understand that the provided time frame is based on Transmission Providers' experience developing transmission projects within their own service territories, of which they have extensive inside knowledge and

[6] Order No. 1920 at 641.
[7] *Id*. at 641.
[8] *Id*. at 954.
[9] *Id*. at 1643.

[11] See here for WECC Anchor Data Set.

development experience. However, the same cannot be said of non-incumbent transmission developers who would be less familiar with Transmission Providers' systems and for which a 30-day timeline would present a very tight turnaround to deliver a robust design for a complex infrastructure project.

As discussed above, Order No. 1920 is intended to be a meaningful reform to existing transmission planning practices to ensure that transmission is planned in an open and transparent manner, and that it results in the most cost-effective transmission solutions for customers. While the Commission does not provide a specific minimum amount of time that must be allocated for project submission, it must be a timeframe that could reasonably elicit submission from non-incumbent transmission developers for these more complex regional transmission projects. As a result, Transmission Providers should be able to demonstrate that the chosen timeframe does not act as a barrier for participation by non-incumbent transmission developers, which could otherwise lead to less cost-effective projects being developed.

The amount of time necessary to prepare a complete submission also depends on how the Transmission Providers will evaluate the submissions. The current lack of clarity on the selection criteria (discussed in detail below) creates uncertainties for non-incumbent transmission developers about the level of detail necessary to include in their submissions and how long is necessary to meet the minimum threshold to qualify as a Long-Term Regional Transmission Facility. For example, if Transmission Providers will disqualify project submissions if in their view the non-incumbent transmission developer is unable to secure a permit, then non-incumbent transmission developers will need more time to study the transmission route and permitting requirements. Thus, the tariff requirements for the submission time window must provide sufficient time for a non-incumbent transmission developer to meet the minimum requirements listed in the selection criteria.

Moreover, Transmission Providers themselves may find that in practice, the development of Long-Term Regional Transmission Facility proposals is more complex and time-consuming than developing local or Order No. 1000 project proposals, as they have not yet had to work under Order No. 1920 requirements.

We recognize that Transmission Providers have three years to make project selection decisions once the planning cycle starts, and that they strive to be efficient in their execution of the planning process. However, if there is insufficient time to receive the fullest range of project submissions then the whole process will be for naught. It is therefore important to design a process that will produce the highest-quality results possible and facilitate the greatest number of viable project submissions. Allowing more time for developers to submit projects is likely to result in higher-quality projects that produce greater benefits relative to their costs. It is critical to get it right from the outset because the Order No. 1920 planning cycle only occurs once every *five* years, under the Transmission Providers' proposed plan.

Significantly longer submission windows are available in other planning regions. For example, PJM provides 4-6 months for developers to respond.[12] We note Transmission Providers' feedback during the meeting that a six-month submission window would be unworkable. Given the substantial amount of information that transmission developers must review during the planning phase to fine-tune a Long-Term Regional Transmission Facility proposal that meets the comprehensive requirements and selection criteria that Transmission Providers have laid out, **a 120-day submission period is a reasonable timeframe**. This duration provides transmission developers with sufficient opportunity to evaluate their interest in applying, to develop cost-effective Long-Term Regional Transmission Facility proposals that meet the selection criteria, and to prepare all necessary documentation for submission. Other planning regions such as PJM have similarly concluded that because long-term transmission planning projects are more complex, their submission windows should be longer than those required by Order 1000.[13]

Section 9: Eligibility Criteria for Long-Term Regional Transmission Facilities

Proposed Tariff Language:

"A Long-Term Regional Transmission Facility is a proposed transmission facility that meets the following criteria:

- A transmission line 230 kV or higher and 15 miles or longer;
- The facility is proposed to cross two or more county lines;
- The facility is proposed to be sited in the service territory of two or more Transmission Providers;
- The facility must comply with all applicable NERC reliability standards and shall not introduce additional risk to the Bulk Electric System;
- The facility must address one or more Long-Term Regional Transmission Needs as identified through the Long-Term Regional Transmission Planning process; and
- The facility must be capable of being permitted, financed, and constructed prior to the date that the earliest applicable Long-Term Transmission Need arises.

Stakeholder Comments:

- Please explain your justification for requiring a Long-Term Regional Transmission Facility to be at least 15 miles in length.
    - **Stakeholders recommend that this requirement be removed**. We are concerned that this minimum length will artificially restrict the range of regional transmission solutions that can be considered, regardless of their potential benefits. It is not

[12] PJM Interconnection, L.L.C., *Order Nos. 1920, 1920-A, And 1920-B Compliance Filing of PJM Interconnection, L.L.C. And Request For Extension Of Comment Period*, Docket No. ER26-751-000 at 82 (filed Sept. 5, 2025), https://www.pjm.com/pjmfiles/directory/etariff/FercDockets/9298/20251212-er26-751-000.pdf (PJM 1920 Filing).

[13] PJM 1920 Filing at 82 ("PJM expects that competitive windows to solicit solutions to Long-Term Transmission Needs will be significantly longer than the competitive windows currently used in PJM's existing Order No. 1000 planning processes due to the inherent complexity of long-term planning.").

clear how a transmission project impacting multiple service providers is a regional project if it is 15 miles long, but not a regional project if it is 14 miles long.

This minimum length may also restrict consideration of alternative transmission technologies as a regional transmission solution, which Order No. 1920 requires Transmission Providers to do. For example, dynamic line rating (DLR) devices and advanced power flow controllers (APFCs) have no physical length in and of themselves. It is possible they could be applied to lines that are less than 15 miles long and still produce a regional benefit that meets the Benefit-to-Cost threshold. However, Transmission Providers will not be able to determine this if they set a 15-mile length requirement that excludes such projects from consideration.

- Please explain your justification for requiring a Long-Term Regional Transmission Facility to cross county lines.
    - **Stakeholders recommend that this requirement be removed**. As in our comment above, we are concerned that this threshold will unnecessarily restrict the range of regional transmission solutions that can be considered. Because there are multiple counties in Florida served by more than one transmission provider, it is similarly unclear why a transmission project that impacts multiple service providers is not a regional project simply because it is contained within one county.

      While we recognize that these eligibility criteria are listed in the FRCC's Order No. 1000 planning process, we do not agree that reason is sufficient for retaining these criteria for the Order No. 1920 process as a) it does not capture the full scope of regional transmission projects that can be developed, and b) the Commission found that Order No. 1000 processes are not sufficient in achieving just and reasonable rates.

- Please clarify how the 230 kV threshold will be reconciled with the Order No. 1920 requirement with respect to right-sizing.
    - In Order No. 1920, the Commission requires that transmission providers evaluate whether transmission facilities (1) operating above a specified kV threshold and (2) that are anticipated to be replaced in-kind during the next 10 years can be "right-sized" to more efficiently or cost-effectively address a Long-Term Transmission Need. On the "specified kV threshold," the Commission noted that transmission providers must propose a threshold that does not exceed 200 kV[14]. This means Transmission Providers would need to look at existing facilities that are *less than* 230 kV when determining whether any facility could be right-sized as part of the Long-Term Regional Transmission Plan. We ask Transmission Providers to clarify that the 230 kV threshold for Long-Term Regional Transmission Facilities will not exclude lower-voltage lines from consideration for right-sizing, if it presents a more efficient or cost-effective solution.

[14] Order No. 1920 at 1677.

- Stakeholders respectfully submit that transmission projects located in only one provider's service area *could* be regional in nature, if they open up capacity between Transmission Providers' systems and thereby provide regional benefits. Please confirm whether you see that as a possibility and will take this into account in the final eligibility criteria.

- With respect to the statement that a proposed Long-Term Regional Transmission Facility "shall not introduce additional risk to the Bulk Electric System," please clarify your definition of "additional risk".

- Please confirm when and how alternative transmission technologies (ATTs) will be evaluated during Project Selection.

    - There is no mention of ATTs in the proposed tariff language. However, Order No. 1920 requires transmission providers to measure the benefits of a regional transmission facility that incorporates, or solely consists of, ATTs and use that measurement to determine if such project would more efficiently or cost-effectively address Long-Term Transmission Needs[15].

- Please confirm whether the Long-Term Transmission Need must show up in multiple scenarios or in just one, to be considered a need that a Long-Term Regional Transmission Facility can address.

- Please confirm how Transmission Providers will determine whether a submission is "capable of being permitted, financed, and constructed prior to the date that the earliest applicable Long-Term Transmission Need arises."

Section 10: Benefits Analysis

Proposed Tariff Language:

"The Transmission Provider shall establish total estimated costs for the proposed facility, including third-party impacts, and measure the following benefits ("Benefits") for each Long-Term Regional Transmission Facility under each Long-Term Scenario as part of Long-Term Regional Transmission Planning process. A Long-Term Regional Transmission Facility's benefits shall be measured for 20 years from the Long-Term Regional Transmission Facility's estimated in-service date. The Transmission Provider shall evaluate facilities for potential selection into the Long-Term Regional Transmission Plan using the required Benefits and may not double count any benefits".

Stakeholder Comments:

- Please explain your decision to calculate transmission benefits over 20 years from the estimated in-service date, as opposed to a longer timeframe.

    - Order No. 1920 requires that transmission providers propose evaluation processes, including selection criteria, that "seek to maximize benefits accounting for costs

[15] *Id*. at 1199.

over time without over-building transmission facilities."[16] As a result, the FRCC and Transmission Providers must demonstrate how their language, including the time horizon for calculating benefits, would maximize the amount of benefits that would come from development of the Long-Term Regional Transmission Facility.

- Transmission assets typically have lifetimes that exceed 20 years, often 40 years or more. As such, they can continue to deliver benefits to transmission providers and ratepayers for longer than 20 years. This is in part why the Commission in Order No. 1920 established a *minimum* 20-year horizon for calculating the benefits of Long-Term Regional Transmission Facilities[17]. During development of the Order, commenters provided the rationale for why a longer time horizon is appropriate. MISO noted that "the benefits determined over this [20-year] time horizon represent the minimum benefits that a regional transmission facility provides and that the analysis should recognize that additional benefits would be realized over the life of the investment even if changing system conditions create uncertainty as to the precise value of those benefits.[18] ACEG noted that "standard regulatory practice for a benefit-cost analysis is typically the life of the asset," while PIOs noted that "calculating the benefits and costs of a transmission project over a shorter timespan can understate the benefit-cost ratio because benefits tend to grow over time, while transmission revenue requirements will decline over time as the asset is depreciated."[19]
- Hence it is common for other planning regions to calculate benefits over a horizon greater than 20 years. By limiting benefits calculation to the 20-year minimum, Transmission Providers risk short-changing their Benefit-Cost analyses and missing out on cost-effective projects. The proposed tariff language assumes that the submitted projects will provide zero benefits beyond the 20-year timeframe, which is an unreasonable assumption and will result in underinvestment in long-term regional transmission.
- During the meeting, Transmission Providers stated that their decision to limit benefits calculation to 20 years is due to uncertainty in what future will occur. Stakeholders recognize that there is always a degree of uncertainty involved in long-term planning, but it can be mitigated by a rigorous approach to scenario development, and by selecting projects based on their benefits in each scenario in a way that minimizes risk – but which does not rely on a single Benefit-to-Cost metric. The Commission emphasized that "the uncertainty associated with forecasting future transmission needs over a long-term transmission planning horizon can be mitigated through the use of multiple Long-Term Scenarios and sensitivities."[20]
- **Stakeholders recommend that Transmission Providers choose a longer horizon over which to calculate benefits** of Long-Term Regional Transmission Facilities. The modified time horizon should more closely reflect the life of proposed transmission assets. If Transmission Providers remain concerned about the impact of uncertainty on any calculations beyond 20 years, then we recommend they use an inflator to simplify the calculation. For example, the Southwest Power Pool (SPP)

[16] *Id*. at 964.
[17] *Id*. at 859.
[18] *Id*. at 846.
[19] *Id*. at 847.
[20] *Id*. at 860.

estimates production cost savings for two future modeled years. For long-term benefits beyond the modeled years, SPP assumes that estimated benefits from the last year modeled remain constant in real dollars for the remaining 40-year life of the project.[21]

- Please confirm whether Transmission Providers or FRCC will provide more details outside of the tariff (e.g., in their Business Practice Manuals) on their approach to quantifying benefits or cost savings.
    - For example, as part of the MVST process in the Carolinas, Duke Energy issued a benefits analysis whitepaper that further explained its analytical approach for quantifying benefits.[22]
- Please describe the process by which Transmission Providers will "establish total estimated costs for the proposed facility," including the costs that will be considered, including construction-related capital costs and ongoing costs, such as operations and maintenance costs, property taxes, and income taxes. Please confirm whether costs incurred or recovered over a period longer than 20 years will be included in the analysis. Please explain whether and how the projected annual revenue requirements for the proposed projects will be considered in the benefit-cost analysis.
- During the meeting, Stakeholders asked what discount rate the Transmission Providers would use to establish costs and benefits. The FRCC and Transmission Providers stated that determination of a discount rate would be the job of an economic consultant.
    - The decision of which approach and value to use to determine the present-day value of future costs and benefits is an important one. Implementation of an unnecessarily high discount rate could paint a distorted picture of a project by undervaluing its long-term value. That would be an unrealistic outcome that could drive down the BCR below the selection criteria threshold, despite the existence of substantial and long-ranging benefits. We therefore urge the FRCC and Transmission Providers to work closely with their consultant to ensure that the approach used will, consistent with Order No. 1920's core requirements, "maximize benefits accounting for costs over time."[23]

---

[21] Southwest Power Pool, *2025 Integrated Transmission Planning Assessment Report* at 219 (Nov. 25, 2025) ("To calculate benefits over the expected 40-year life of the projects, SPP staff analyzed two years, 2029 and 2034. SPP staff calculated APC savings accordingly for these years, and then extrapolated the benefits for the initial five-year period based on the slope between the two points. After that, the benefits are assumed to grow at an inflation rate of 2.0% per year. SPP staff then discounted each year's benefit to 2029 dollars using an 8% discount rate, and a 2.0% inflation rate from 2029 dollars back to 2025 dollars. The sum of all discounted benefits was presented as the PV benefit. SPP staff performed this calculation for every zone."), https://www.spp.org/media/2429/2025-itp-report-v10.pdf.

[22] Carolinas Transmission Planning Collaborative, *Multi-Value Strategic Transmission (MVST) Cost-Benefit Analysis Whitepaper* (Feb. 2026), https://carolinastpc.org/media/reference/2026/02/19/MVST_Benefits_Whitepaper_-_rev_3_Clean_02052026.pdf.

[23] Order No. 1920 at 964.

- Stakeholders suggest that the FRCC and Transmission Providers use a Social Discount Rate (SDR) as defined by the Office of Management and Budget (OMB) in Circular No. A-4.[24] This application recognizes the opportunity costs to the public and helps preserve the mathematical value of long-term benefits from transmission. Applying a discount rate that accurately reflects the fact that consumers ultimately finance the infrastructure ensures that the Benefit-to-Cost Ratio (BCR) is calculated to "maximize benefits" while appropriately accounting for associated costs. Typically, the SDR is calculated at between 2-3%.

- In addition to the above, please describe how Transmission Providers would utilize the aforementioned consultant within the Long-Term Regional Transmission Planning process.

    - What specific activities would the consultant be engaged to perform?
    - How would the consultant's relationship with Transmission Provider staff be structured?
    - How would the consultant be selected? Would there be a competitive procurement process?
    - Please provide a list of consultants that Transmission Providers are considering using at present.

Benefit 1: Avoided or Deferred Reliability Transmission Facilities and Aging Infrastructure Replacement

Proposed Tariff Language:

"Benefit 1 is defined as the reduced costs due to avoided or delayed transmission investment otherwise required to address reliability needs or replace aging transmission facilities.

Benefit 1 will measure the investment cost of the avoided or deferred reliability transmission facilities and aging transmission infrastructure replacement compared to the investment cost of the Long-Term Regional Transmission Facility(ies) that could be implemented to avoid or defer those avoided or deferred investments."

Stakeholder Comments:

- Please confirm whether the Transmission Providers will supply a list of aging infrastructure that could be avoided along with the Long-Term Needs over the 20 or more years of the benefits analysis, so that developers can target areas of high-value need and identify the highest-value solutions.

    - Please confirm whether Transmission Providers will maintain a list of the ages of all their transmission assets (or at minimum, all assets above their threshold for Long-

[24] Office of Mgmt. & Budget, Exec. Office of the President, OMB Circular A-4, *Regulatory Analysis* (Nov. 9, 2023), https://www.reginfo.gov/public/jsp/EO/fedRegReview/CircularA4.pdf. *See also* Office of Mgmt. & Budget, Exec. Office of the President, Circular A-94 (Nov. 9, 2023), https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-94.pdf.

Term Regional Transmission Facility eligibility) so they can proactively determine whether and when assets must be replaced. This mechanism would help Transmission Providers to see in advance whether any Long-Term Regional Transmission Facility would avoid the need for a replacement.

- Please confirm the point in each Long-Term Regional Transmission Planning cycle at which Transmission Providers will submit their in-kind replacement estimates as required by Order No. 1920.[25]

- Please confirm whether the Transmission Providers will give guidance on which local reliability projects (based on 10-year reliability studies) can be avoided or deferred by the Long-Term Regional Transmission Facilities.

- If the Long-Term planning reliability models (20 years from the date of the planning study) identify reliability violations that are not considered a *Long-Term* Need, can Long-Term Regional Transmission Facility proposals that avoid such reliability violations include these avoided costs in the benefit-cost analysis? Will the Transmission Providers provide the cost estimate of the avoided long-term reliability projects?

Benefit 2(a): Reduced Loss of Load Probability, and Benefit 2(b): Reduced Planning Reserve Margin

Proposed Tariff Language:

"Benefit 2(a) is defined as: the reduced frequency of loss of load events by providing additional pathways for connecting generation resources with load in regions that can be constrained by weather events and unplanned outages (if the planning reserve margin is not changed despite lower loss of load events), as well as improved physical reliability benefits by reducing the likelihood of load shed events.

Benefit 2(a) will measure the reduction in capital costs or avoided costs needed to meet a loss of load probability target consistent with the target provided to the Florida Public Service Commission with and without a Long-Term Regional Transmission Facility(ies).

Benefit 2(b) is defined as: the reduction in capital costs of generation needed to meet resource adequacy requirements (i.e., planning reserve margins) while holding loss of load probability constant.

Benefit 2(b) will measure the reduction in capital costs or avoided costs needed to meet the planning reserve margin established and approved by the Florida Public Service Commission, with and without a Long-Term Regional Transmission Facility(ies).

The Transmission Provider will determine which of Benefit 2(a) and Benefit 2(b) will be measured at the start of each Long-Term Regional Transmission Planning Cycle, and such determination will be posted to Transmission Provider's OASIS when Transmission Provider posts the Long-Term Transmission Needs."

[25] Order No. 1920 at 1681.

Stakeholder Comments:

- For Benefit 2(a), please confirm whether the Transmission Providers will include Value of Lost Load (VOLL) in their calculation of the benefit. Stakeholders recommend they do so.
    - If yes, how will the VOLL be calculated? Will it be made available to stakeholders, and will stakeholders get to provide feedback on the VOLL calculation for Transmission Providers to consider?
    - If yes, will one region-wide VOLL be used or will each Transmission Provider use its own?

- Please confirm whether Transmission Providers will model loss of load probability by using a change case and a reference case, where the change case has more transmission headroom (and therefore more benefits) relative to the reference case.

- Stakeholders recommend that the Transmission Providers update the first paragraph describing Benefit 2(a) to clarify the meaning of this benefit. As written, "the reduced frequency of loss of load events by providing additional pathways for connecting generation resources with load **in regions that can be constrained by weather events and unplanned outages**" (emphasis added) is not clearly distinguished from the calculation of Benefit 6. In addition, the "physical reliability benefits" (of reduced likelihood of load shed events) are not clearly defined.

- Stakeholders recommend that the Transmission Providers update the second paragraph describing Benefit 2(a) to clarify how it will be measured. We recommend reviewing the approach offered by the Southeastern Regional Transmission Planning (SERTP) Sponsors, which propose to measure Benefit 2(a) by determining the reduction in expected unserved energy between the base case without the Long-Term Regional Transmission Facility and the change case that includes it, determining the Value of Lost Load, and then multiplying these two values to obtain the monetary benefit for the project in question.

- As written, the measurement of Benefits 2(a) and 2(b) will both consider "the reduction in capital costs or avoided costs needed" to meet the specific metric in question. Will the Transmission Providers measure both capital costs *and* avoided costs, or only one or the other?
    - Please clarify the difference between "capital costs" and "avoided costs" for both Benefits 2(a) and 2(b), and how these costs will be calculated.

- For Benefit 2(b), please confirm whether you will perform an 8760 analysis of resource adequacy and if so, what software will be used.

- Although the proposed tariff language states that Transmission Providers "will determine which of Benefit 2(a) and Benefit 2(b) will be measured **at the start of** each Long-Term Regional Transmission Planning Cycle" (emphasis added), during the meeting Transmission Providers stated that both Benefits 2(a) and 2(b) would be measured **before** they determine which one to use for Benefit-Cost analysis. **Please confirm whether this is correct**.

- Please confirm *how* Transmission Providers will decide whether to choose 2(a) or 2(b). Will it be based on which benefit is larger, or will other factors be considered?

Benefit 3: Production Cost Savings

Proposed Tariff Language:

"Benefit 3 is defined as savings in fuel and other variable operating costs of power generation that are realized when transmission facilities allow for displacement of higher-cost supplies through the increased dispatch of suppliers that have lower incremental costs of production, as well as a reduction in market prices as lower-cost suppliers set market clearing prices.

Benefit 3 will be measured using production cost modeling simulations individually studied by each Transmission Provider to compare production costs with and without a Long-Term Regional Transmission Facility(ies)."

Stakeholder Comments:

- Will Transmission Providers post the base case (without new transmission solutions) at the time that the Long-Term Needs are specified?

- Please explain why production cost savings will be studied by individual Transmission Providers, and not on a region-wide basis.

    - Please clarify whether each Transmission Provider will run a region-wide model that incorporates its own proprietary system data, or whether it will only model its own system and exclude all others.
    - Will the Transmission Providers share results of their models to ensure consistency in the congestion identified in each of their simulation models? How will inconsistent results in terms of congestion on regional interfaces be resolved?
    - Stakeholders are concerned that by not running a region-wide model, the analysis of Benefit 3 may miss aggregate benefits that impact multiple service territories. Please explain how the approach of utilizing each Transmission Provider's model will provide an accurate estimate of project benefits.
    - Will each Transmission Provider's model include the systems of Florida's non-FERC jurisdictional transmission providers (i.e., municipal utilities and rural electric cooperatives) that they serve?

- Will each Transmission Provider use the same software and assumptions for production cost modeling? What software will each Transmission Provider use?

    - Will Transmission Providers share their modeling assumptions with stakeholders and consider stakeholder feedback on these assumptions?

- Please confirm whether the FRCC will validate the production cost models before the Transmission Providers use them, to demonstrate how well these models capture the real-world operation of the FRCC system.

  - If not, please explain how the Transmission Providers will ensure that the models accurately reflect real-world market conditions.

- Because the Transmission Providers do not economically dispatch as a *region*, how will their models handle hurdle rates or transmission service rates between balancing authorities?

  - Will participants in the Southeast Energy Exchange Market (SEEM) be treated differently in the model?
  - Will production costs be determined on a zonal or nodal basis? If zonal, please explain how this approach will be adapted to ensure accuracy of results and whether a nodal approach will be considered in the future.
  - Would this include the topology within sponsors, or only between sponsors?

Benefit 4: Reduced Transmission Energy Losses

Proposed Tariff Language:

"Benefit 4 is defined as the reduced total energy necessary to meet demand stemming from reduced energy losses incurred in transmittal of power from generation to loads.

Benefit 4 will measure transmission energy losses incurred in the delivery of power to the load with and without a Long-Term Regional Transmission Facility(ies)."

Stakeholder Comments:

- Please describe how Transmission Providers will estimate these losses.

- Please confirm whether transmission energy losses will be calculated on an 8760 basis.

Benefit 5: Reduced Congestion Due to Transmission Outages

Proposed Tariff Language:

"Benefit 5 is defined as reduced production costs resulting from avoided congestion during transmission outages.

Benefit 5 will be measured using the sum of the individual production cost modeling simulations studied by each Transmission Provider to compare congestion costs during outage conditions with and without a Long-Term Regional Transmission Facility(ies). The sum of the individual production cost modeling simulations represents the regional benefit."

Stakeholder Comments:

- Please explain how Transmission Providers will determine which transmission outages to study to ensure that the outages included in the production cost simulation models reflect outages that occur in the real-world power system.

- As explained in our comments for Benefit 3, Stakeholders are concerned that basing the calculation of Benefit 5 on production cost models specific to each Transmission Provider rather than a single region-wide model will risk missing some of the benefits that accrue to a proposed Long-Term Regional Transmission Facility, especially where benefits occur across service area boundaries.

Benefit 6: Mitigation of Extreme Weather Events and Unexpected System Conditions

Proposed Tariff Language:

"Benefit 6 is described as reduced production costs and reduced loss of load (or emergency procurements necessary to support the system), including due to increased Interregional Transfer Capability, during extreme weather events and unexpected system conditions, such as unusual weather conditions or fuel shortages that result in multiple concurrent and sustained generation and/or transmission outages.

Benefit 6 will be measured using the sum of the individual production costs studied by each Transmission Provider and loss of load to account for extreme weather events and unexpected system conditions and Interregional Transfer Capability during extreme weather events and unexpected system conditions resulting in outages with and without a Long-Term Regional Transmission Facility(ies)."

Stakeholder Comments:

- As discussed in our comments on Benefits 3 and 5, Stakeholders again express concern that calculating Benefit 6 based on Transmission Provider-specific modeling rather than a single region-wide model will risk missing some benefits. This would result in a less robust accounting of total benefits that hinders a project's ability to be selected.

- Please explain how Transmission Providers will model extreme weather events and unexpected conditions.

    - Will the model(s) be based on historical data or will they be predictive?
    - What types of extreme events or outages will be included in quantifying Benefit 6?

        - Will Transmission Providers analyze a single extreme weather sensitivity, or will they consider multiple types?
        - Will they analyze conditions in both summer and winter?
        - Will the events analyzed match the sensitivity (or sensitivities) included in the Long-Term Scenarios, or will Transmission Providers consider additional sensitivities here?
        - Will both generation *and* transmission outage profiles be included, or just one type?
        - Will disruptions to fuel supply of the state's gas generation fleet be included in your modeling of extreme weather?

- What type(s) of extreme weather do Transmission Providers see as the highest priority to model, if applicable?

- Please confirm whether stakeholders will have the opportunity to provide input on how these sensitivities are crafted.

- We recommend that Transmission Providers revise the second paragraph describing how Benefit 6 will be measured, to improve clarity and remove redundancy. First, "the sum of the individual production costs studied by each Transmission Provider and loss of load" leaves unclear as to whether the loss of load component will also be calculated per Transmission Provider or region-wide, as well as how this component will be measured. Second, Interregional Transfer Capability is mentioned without explaining how it will be measured in the benefit calculation.

Benefit 7: Capacity Cost Benefits from Reduced Peak Energy Losses

Proposed Tariff Language:

"Benefit 7 is defined as reduced generation capacity investment needed to meet peak load.

Benefit 7 will measure the reduced resource capacity costs resulting from the reduction in peak energy losses with and without a Long-Term Regional Transmission Facility(ies)."

Stakeholder Comments:

- Please explain how Transmission Providers will estimate these losses.

Section 11: Selection Criteria

Proposed Tariff Language:

"Transmission Provider may consider the following criteria when determining whether to select a Long-Term Regional Transmission Facility that more efficiently or cost-effectively addresses Long-Term Transmission Needs for purposes of regional cost allocation:

1. **Benefit-to-Cost Ratio**, which must be 1.25 at a minimum, and which is determined based on the Benefits calculated Section [__] and the costs of the Long-Term Regional Transmission Facility as estimated by Transmission Provider. Transmission Provider may elect to use a weighted average Benefit-to-Cost Ratio, wherein probabilities have been assigned to each Scenario based on their likelihood of occurrence.
2. **Effectiveness**: The degree to which the Long-Term Regional Transmission Facility resolves the identified Long-Term Transmission Needs, including elimination of projected SOL/IROL violations and reduction of non-economic dispatch.
3. **Efficiency**: Comparative cost-effectiveness relative to alternative solutions, including consideration of lifecycle costs, scalability, and adaptability.
4. **Resilience**: Contribution to system resilience and flexibility under low-frequency, high-impact events identified in Scenario sensitivity analyses, including extreme weather and other stressed system conditions.

5. **Feasibility and Constructability**: Feasibility of project development and capability of proposed project to be permitted, financed, and constructed prior to the date that the earliest applicable Long-Term Transmission Need arises.
6. **Robustness**: The robustness of the proposal.
7. **Secondary Benefits**: The extent to which the proposal would have secondary benefits such as addressing additional or other system reliability, operational performance, or economic efficiency needs.
8. **Public Policy Alignment**: Extent to which the facility supports federal, federally-recognized Tribal, state, and local public policy requirements."

Stakeholder Comments:

- Please confirm whether the Transmission Providers will share their preliminary and final cost and benefit calculations with stakeholders, and whether stakeholders will be allowed to provide feedback on those calculations for Transmission Providers to consider.

- Please explain Transmission Providers' decision to establish a minimum **Benefit-to-Cost Ratio** (BCR) of 1.25.

    - Stakeholders are concerned that a BCR of 1.25 is unnecessarily high and will exclude projects that provide a strong return on investment. In Order No. 1920, the Commission established a 1.25 ratio as the *maximum* floor that Transmission Providers could set. The Commission did not endorse 1.25 as more prudent than another threshold. Its decision to establish a maximum can be seen as encouraging transmission providers to consider a lower BCR so long as it still produces greater benefit than cost to ratepayers. The high BCR threshold when combined with the use of just 20 years of benefits creates an unreasonably conservative approach to long-term planning that will lead to underinvestment in the regional system and result in higher costs and risks for end-use customers.

      Stakeholders recommend that if the Transmission Providers wish to set a BCR threshold, then it should be lower. We respectfully remind Transmission Providers that any project that exceeds a BCR of 1 produces cost savings over the long term, which translates to more just and reasonable rates to ratepayers. Setting a threshold of 1.25 risks excluding a significant number of transmission projects that would produce more affordable long-term rates. It could also limit the potential scale of regional transmission projects and limit their impact on flexibility and efficiency of power system operation. Failure to consider such projects for selection would hinder Transmission Providers' ability to provide least-cost service to ratepayers.

      During the meeting, Transmission Providers stated that they chose a BCR of 1.25 due to uncertainty over future system conditions, such that a higher minimum BCR makes it more likely that cost savings materialize. We respectfully submit that Transmission Providers can sufficiently address uncertainty through other avenues in the long-term planning process, specifically when developing Long-Term Scenarios and when selecting projects based on their benefits across multiple scenarios, in ways that minimize the risk of any negative deviation in the accrual of

future benefits. This relieves Transmission Providers from having to rely on a simple BCR threshold to account for uncertainty at the Project Selection stage.

If Transmission Providers do not agree to consider selecting Long-Term Regional Transmission Facilities with a BCR below 1.25, then they should explain why they believe this threshold achieves the Commission's directive to maximize benefits accounting for costs over time.

- Please explain Transmission Providers' planned process for weighting the Long-Term Scenarios, and the benefits that accrue under each scenario.
    - The above language states that Transmission Providers *may* elect to use a weighted average BCR. The Commission has provided two accepted methods for comparing BCRs, least-regrets and weighted-benefits, although the Commission does not foreclose the possibility of other approaches being used. Please explain why Transmission Providers reached the conclusion to specifically allow for weighted-benefits but not least-regrets, and whether Transmission Providers *may* also use any other methods and if so, what other approaches would be permissible.
    - Please confirm whether stakeholders will have an opportunity to provide input to this weighting process for Transmission Providers to consider.
    - Stakeholders suggest that the FRCC and Transmission Providers propose the "weight" to use for each future scenario, and then solicit stakeholder feedback on those proposed "weights" prior to running the scenarios.
    - Will Transmission Providers consider adjusting the weighting of scenarios during the planning cycle, if the likelihood of a particular scenario changes?
    - Will the economic consultant that is being hired to determine the discount rate be involved in determining the weights for the purposes of weighting benefits?

- During the meeting, Transmission Providers explained that some of the selection criteria will be used to consider whether or not a Long-Term Regional Transmission Facility cost-effectively addresses a Long-Term Transmission Need and some of the selection criteria will be used to compare alternative proposals that have been determined to cost-effectively address the same Long-Term Transmission Need. Please provide further explanation of how the listed criteria will be used for approving any project versus comparing alternatives that meet an identified need.

- During the meeting, Transmission Providers clarified that the main difference between the proposed **Effectiveness** and **Robustness** metrics is whether a single project is being analyzed or multiple projects are being compared. To avoid confusion, we propose removing **Robustness** as its own metric and updating the **Effectiveness** metric to clarify the difference in considering how well a single project resolves Long-Term Need(s) vs. how well multiple projects do at resolving the same Long-Term Need(s).

- Please explain how evaluating a proposed Long-Term Regional Transmission Facility on the **Efficiency** metric would differ from comparing its costs in relation to its benefits.

- Please clarify the "alternative solutions" to which the project would be compared. Are these other Long-Term Regional Transmission Facilities that address the same need(s)? Or local reliability projects? Or ATTs?
- Please define "scalability" and "adaptability" in the context of this metric.
- Transmission Providers state that this metric would consider "lifecycle costs". Do they plan to calculate the costs over the entire lifetime of the proposed asset?

    - If so, this would conflict with Order No. 1920. The Commission requires that "to the extent that transmission providers estimate the costs of Long-Term Regional Transmission Facilities beyond the in-service date of the transmission facilities, they must estimate those future costs over the same time horizon as the estimated benefits."[26] Transmission Providers have proposed to only measure a project's benefits over 20 years, while the typical lifetime of a transmission asset is much longer. This inconsistency would also make it harder for cost-effective projects to be selected.
    - The **Efficiency** metric should not include any costs that are not part of calculating the Benefit-to-Cost Ratio, and any assessment performed under this metric *must* consider net benefits to ratepayers and not value projects on their cost alone.

- Please explain how evaluating a proposed Long-Term Regional Transmission Facility on the **Resilience** metric would differ from calculating its performance under Benefit 6.

    - Please explain how a project's "contribution to system resilience and flexibility under low-frequency, high-impact events" is different from the project's benefit in reducing costs, loss of load, or emergency procurements during extreme weather events and unexpected system conditions as calculated in Benefit 6.
    - Does this mean Transmission Providers will afford additional weight to Benefit 6 in the selection process?

- For the **Feasibility and Constructability** metric, please clarify how Transmission Providers will determine the "feasibility of project development" and the "capability of proposed project to be permitted, financed, and constructed." As noted above, the short timeframe proposed for submitting proposals will limit the ability of transmission developers to de-risk project proposals prior to their submission.

- Please clarify the benefits that Transmission Providers are open to considering under the **Secondary Benefits** metric.

    - Such benefits should be made clear to potential transmission developers so that developers can incorporate them, to the greatest extent possible, into their Long-Term Regional Transmission Facility proposals.
    - In general, how would secondary benefits be calculated during the selection process? Would stakeholders or the transmission developer be able to provide input to the calculation?

[26] *Id*. at 859.

  - If a project does not meet the BCR threshold before calculating secondary benefits, but would meet it by adding secondary benefits, would this make the project eligible for selection?

- Under the **Public Policy Alignment** metric, please clarify how Transmission Providers would determine the "extent to which the facility supports federal, federally-recognized Tribal, state, and local public policy requirements".

- Missing from the tariff language is a provision discussing how the FRCC and Transmission Providers will provide for entities to voluntarily fund the cost of, or portions of the cost of, a transmission facility that would otherwise not meet Transmission Providers' selection criteria. Should the Voluntary Funding language be incorporated into the upcoming Cost Allocation tariff, we welcome the opportunity to review the language and share our feedback.

Proposed Tariff Language:

"After making the determination, Transmission Provider will post on a password-protected portion of its OASIS its determination of whether or which Long-Term Regional Transmission Facility(ies) are selected for inclusion in the Long-Term Transmission Regional Plan for purposes of cost allocation in sufficient detail to allow stakeholders to understand why a Long-Term Regional Transmission Facility was or was not selected. This determination will include the estimated costs and measured benefits of each alternative Long-Term Regional Transmission Facility evaluated by the Transmission Provider, regardless of whether or not the Long-Term Regional Transmission Facility is selected.

Once Transmission Provider makes a selection decision, Transmission Provider will make available, on a password-protected portion of its OASIS, a breakdown of how the estimated costs will be allocated, by Enrolled Entity, and a quantification of those estimated benefits as imputed to each Enrolled Entity, as such benefits can be reasonably estimated."

Stakeholder Comments:

- Please confirm whether stakeholders will be granted access to the password-protected section of the OASIS, as we do not have access today. If not, how will stakeholders obtain the results of project evaluation and selection?
- Please confirm whether stakeholders will be able to provide feedback on the results for Transmission Providers to consider.
- Will final simulation models that include the proposed projects be posted for transmission developers to review?

<u>Section 12: Reevaluation of Selected Long-Term Regional Transmission Facilities</u>

Proposed Tariff Language:

"The Transmission Provider shall reevaluate any selected Long-Term Regional Transmission Facility upon the occurrence of any of the following circumstances:

(a) Reliability-Jeopardizing Delays: Delays in the development of a previously selected Long-Term Regional Transmission Facility would jeopardize the Transmission Provider's ability to meet its reliability needs or reliability-related service obligations.
(b) Significant Cost Overruns: The actual or projected costs of a previously selected Long-Term Regional Transmission Facility significantly exceed the cost estimates that were used in the selection of such Long-Term Regional Transmission Facility; or
(c) Material Regulatory Changes: Significant changes in federal, federally-recognized Tribal, state, or local laws or regulations cause reasonable concern that a previously selected Long-Term Regional Transmission Facility may no longer meet the Transmission Provider's selection criteria.

Periodic Reevaluation: In addition to the triggering events specified in subsections (a) through (c) above, the Transmission Provider may conduct a comprehensive reevaluation of each selected Long-Term Regional Transmission Facility every five (5) years to ensure that such facility continues to satisfy the requirements set forth in subsections (a) through (c)."

Stakeholder Comments:

- Please clarify how Transmission Providers will determine that a "reliability-jeopardizing delay" has occurred. There should be a defined threshold for such a delay, so that potential transmission developers have a clear understanding of the circumstances in which their project could be cancelled and give them more certainty to participate in the process.

- What would qualify as a "significant" cost overrun?

- Order No. 1920 requires Transmission Providers to "designate a point after which all selected Long-Term Regional Transmission Facilities will no longer be subject to reevaluation, such that the transmission developer … has adequate certainty to make investment decisions"[27]. Transmission Providers' proposal for "Periodic Reevaluation" does not appear to conform to this requirement because it does not say they will stop reevaluating selected projects. We request the Transmission Providers to update the tariff language to specify when a selected project will no longer be subject to reevaluation.

- Will stakeholders be able to provide feedback on Transmission Providers' reevaluations of selected projects?

Conclusion

Combined, the Benefits Evaluation and Project Selection tariff language is unreasonably exclusionary, restricting participation by both transmission developers and stakeholders as well as restricting what might qualify as a viable transmission project solution. Vaguely defined selection criteria, limited access to data, and a short submission window combined could limit the number of transmission developers that would be interested and willing to engage in the project submission process. Moreover, because the tariff considers benefits only within a 20-year time horizon, sets the BCR at the maximum permitted threshold, omits additional recognized benefits from the BCR

[27] *Id*. at 1050.

calculation, does not adequately clarify the methodology for assessing the seven required benefits, and provides no explanation of how Transmission Providers will review Advanced Transmission Technologies, there is a very real possibility that the Project Selection process will not result in selection of the most cost-effective and beneficial transmission solutions.

The tariff also does not include a formalized process for stakeholder participation during the planning process. This creates an unfortunate and unnecessary silo in the planning process, one that the Commission expressly seeks to avoid. A common refrain from the Commission in Order No. 1920 is that the seven core principles expressed in Orders No. 890 and 1000 must be upheld in the Order No. 1920 planning process. This includes the principles of Openness, Transparency and Information Exchange.[28] Throughout Order No. 1920, the Commission takes time to mention the need for stakeholder engagement leading up to development of the tariff and throughout the planning process. Implicit in this is the understanding that interested stakeholders may have information and perspectives that can help to shape the process for the better. But to allow proper engagement from stakeholders, there must be a clear understanding of the process, what is expected, and what information will be provided. As a result, the FRCC and Transmission Providers should make clear how they intend to involve stakeholders in the planning process and, as pertains to the Project Selection language, during the evaluation and selection process.

Stakeholders also request that the FRCC and Transmission Providers share their responses to our comments on Scenario Development, Needs Analysis, and Project Selection – and any resulting updates to the tariff language – in advance of the next stakeholder meeting on Cost Allocation. Receiving these responses in a timely manner may offer Stakeholders valuable insights into outstanding questions related to the tariff language and implementation of Order No. 1920. This information will help us to better understand the perspectives of Transmission Providers and facilitate a more informed and collaborative discussion during the April meeting. We are happy to provide any clarification or additional explanation to the FRCC and Transmission Providers should they need it.

In addition, we reiterate that time should be allowed during the next meeting to ask any remaining questions and raise any remaining concerns we have from the Scenario Development, Needs Analysis, and Project Selection phases of the Order No. 1920 compliance process.

We look forward to additional discussion with the Transmission Providers, and our continued mutual effort to shape a robust compliance filing to be submitted by the June 2026 deadline.

Sincerely,

CC: Florida Power & Light, Duke Energy Florida, and Tampa Electric Company (collectively, the "Transmission Providers")

RE: Stakeholder Comments on FRCC Proposed Order No. 1920 Needs Analysis Tariff Language

The Environmental Defense Fund (EDF) and Southern Alliance for Clean Energy (SACE) (collectively, "the Stakeholders") thank the Florida Reliability Coordinating Council (FRCC) and Transmission Providers for sharing the tariff language that describes how they propose to adopt the Needs Analysis requirements of Federal Energy Regulatory Commission (FERC) Order No. 1920. The Stakeholders appreciate the discussion held during the engagement meeting on December 4th and following stakeholder presentations on December 8th that illuminated how the Transmission Providers are defining the scope of Long-Term Transmission Needs, particularly the economic drivers.

The Stakeholders recognize our difference in perspective from that of Transmission Providers with respect to identifying economic drivers of Long-Term Transmission Needs. Though our perspective is informed by experience with needs analysis in regional transmission planning processes elsewhere, we do not find that Florida's electric power system is sufficiently different from other regions in terms of its future needs, regulatory structure, or market design to preclude consideration of economic analysis tools adopted in those peer regions. As currently proposed, we are concerned that the Transmission Providers' proposed approach to economic needs will prevent them from identifying the full range of opportunities to reduce costs to ratepayers. We respectfully request that the Transmission Providers reconsider our proposal.

The Stakeholders offer the following comments on the draft tariff language:

<u>Section 4: Identification of Long-Term Transmission Needs</u>

Proposed Tariff Language:

> "Following the development and publication of the Long-Term Scenarios, Transmission Provider will identify and characterize Long-Term Transmission Needs that emerge from the Long-Term Scenarios. The identification of Long-Term Transmission Needs will consider both reliability and economic drivers, as well as the unique characteristics and goals reflected in each Long-Term Scenario.
> Transmission Provider will conduct studies to identify Long-Term Transmission Needs. The studies will be performed by removing individual bulk electric system ("BES") branches from service and determining the impact on the remainder of the transmission grid for each of the developed Long-Term Scenarios. The studies will assess the performance of the transmission system and will account for known future additions and/or upgrades and any previously selected Long-Term Regional Transmission Facilities.
>
> The identification of Long-Term Transmission Needs will specifically focus on reliability and economic drivers as follows:
>
> Reliability Drivers: Identifying areas where the existing or planned transmission system is projected to violate NERC System Operating Limit ("SOL")/Interconnection Reliability Operating Limit ("IROL") criteria under the conditions of each Long-Term Scenario.
>
> - Economic Drivers: Identifying opportunities for the transmission system to provide economic benefits. This will include an analysis of the extent to which a Long-Term Scenario creates a non-economic dispatch across the region."

Stakeholder Comments:

Transmission Providers' proposal does not satisfy the purpose or the requirement of Order No. 1920.

FERC promulgated Order No. 1920 because it found that despite decades of reforms, transmission planning still led to the establishment of unjust, unreasonable, discriminatory, and preferential transmission rates.[1] The Commission found that the existing local and regional planning processes failed to "appropriately evaluate the benefits of transmission infrastructure," which resulted in "piecemeal transmission expansion to address relatively near-term

[1] *Bldg. for the Future Through Elec. Reg'l Transmission Planning & Cost Allocation*, Order No. 1920, 89 FR 49280 (June 11, 2024), 187 FERC ¶ 61,068 at PP 47, 85. *See also Bldg. for the Future Through Elec. Reg'l Transmission Planning & Cost Allocation & Generator Interconnection,* NOPR, 179 FERC ¶ 61,028 at P 24.

transmission needs."[2] The Commission concluded that this status-quo piecemeal transmission planning is insufficient to consider the full suite of transmission benefits and is unable to meet Long-Term Transmission Needs, which ultimately "imposes real costs on customers."[3] Because FERC found that the existing regional planning processes led to unjust and unreasonable rates, it was required to establish a replacement process that it found would lead to just and reasonable rates.

To do this, in Order No. 1920 FERC established a new Long-Term Regional Planning process which looks further out (20 years) and evalutes a broader set of transmission benefits. This new process is a fundamental change to the status quo of regional transmission planning. The Order imposes a series of process requirements on transmission providers that, in the Commission's estimation, will help them consider a broad set of transmission benefits, which will then be reflected in the types of transmission projects that are built and who pays for them. While FERC found that some transmission providers had processes in place that were similar to Order No. 1920, no transmission provider at the time was entirely compliant. As a result, every transmission provider is required to create new tariffs that can demonstrate compliance with the new planning process. While Order No. 1000 regional planning was not eliminated, because the Commission found that that process on its own contributed to unjust and unreasonable rates, tariffs that largely resemble Order No. 1000 or that engage in a process substantially similar to Order No. 1000 would not comply with Order No. 1920.

FERC in Order No. 1920 provides a roadmap for transmission providers to comply with the new Long-Term Regional Planning rule, requiring them to, (1) develop future forecasts of what the system supply and demand might look like in 20 years (Long-Term Scenarios), (2) based on those scenarios, transmission planners identify the transmission needs for those 20-

[2] Order No. 1920 at P 85.

[3] *Id.* at P 87.

year outlooks (Long-Term Transmission Needs), and (3) determine which transmission solutions will meet those needs while providing the most significant benefits commensurate with the cost (Long-Term Regional Transmission Facilities).

Initially in Order No. 1920, the Commission asked transmission providers to use a set of seven benefits (the same that the Commission requires transmission providers to use when evaluating transmission solutions) for identifying long-term needs. These include: (1) Avoided or deferred reliability transmission facilities and aging infrastructure replacement; (2) a benefit that can be characterized and measured as either reduced loss of load probability *or* reduced planning reserve margin; (3) production cost savings; (4) reduced transmission energy losses; (5) reduced congestion due to transmission outages; (6) mitigation of extreme weather events and unexpected system conditions; and (7) capacity cost benefits from reduced peak energy losses.[4] The seven benefits from Order No. 1920 reflect a suite of both reliability and economic needs.

However, in Order No. 1920-A the Commission removed the requirement to use *each* of the seven benefits to determine Long-Term Transmission Needs. Nevertheless, FERC maintained and "emphasized" that both economic and reliability "drivers" must be considered in evaluating transmission needs.[5] Scattered throughout Order No. 1920 and Order No. 1920-A is the Commission's reference to the seven categories of factors as "drivers" of transmission needs. According to the Commission these "drivers" of transmission needs are the seven categories of factors used in scenario development, stating that "Long-Term Regional Transmission Planning is . . . focused on evaluating the Long-Term Regional Transmission Facilities that will reliably and cost-effectively deliver the power needed to serve the load that is

[4] *Id.* at P 720.

[5] *Id.* at P 223.

expected given [the seven categories of factors] (and other) drivers of transmission needs."[6] FERC also illustrates how information from the seven categories of factors can inform specific "reliability concerns giving rise to Long-Term Transmission Needs."[7] According to the Commission this can "include, among other things, the increasing frequency of high-impact extreme weather events, the increasing reliance by transmission system operators on regional integration and coordination to reliably serve load, the operational challenges created by the increasing share of variable resources entering the resource mix, and changes in electric demand patterns such as shifts in load profiles caused by, for example, the emergence of large loads associated with evolving industrial and commercial needs such as the growth in data centers, and increased electrification of energy end uses."[8]

The Stakeholders are concerned that the language that FRCC and the Florida Transmission Providers use in Section 4, Paragraph 1 of the proposed tariff to describe the process for determining Long-Term Transmission Needs introduces a separate analytic process

[6] *Bldg. for the Future Through Elec. Reg'l Transmission Planning & Cost Allocation & Generator Interconnection*, Order No. 1920-A, 90 FR 17692 (April 28, 2025), 189 FERC ¶ 61,126 at P 163. *See also id*. at P 139 ("The Commission identified these categories of factors because they provide information about the drivers of Long-Term Transmission Needs, including changes in reliability needs, demand, and supply (such as the generation resource mix) that, in turn, affect what transmission facilities will be required going forward."); *id*. at P 237 ("As the Commission explained in Order No. 1920, a transmission planning horizon of less than 20 years would fail to sufficiently capture Long-Term Transmission Needs given that drivers of such needs can extend up to 20 years into the future, such as state laws that include requirements to be met 15 to 20 years in the future."); *id*. at P 257 ("In Order No. 1920, the Commission addressed the pace at which transmission drivers are changing, finding that transmission providers must reassess and revise their Long-Term Scenarios at least once every five years to ensure that the Long-Term Scenarios accurately reflect factors that may change over the five-year time span, such as changes in technology, load forecasts, or federal, federally-recognized Tribal, state, or local laws."); *id*. at P 267 ("The Commission found that incorporating these categories of factors in the development of Long-Term Scenarios is necessary because these categories are essential to identifying Long-Term Transmission Needs, and that incorporating them will ensure that transmission providers are accounting for known and identifiable drivers of Long-Term Transmission Needs."); *id*. at P 279 ("The Commission found that it is necessary to prohibit the discounting of factors in the first three categories of factors because they are more certain drivers of Long-Term Transmission Needs, relative to factors in other Factor Categories."). *C.f.* Order No. 1920 at P 299 ("the drivers of transmission needs are diverse and include, but are not limited to, evolving reliability concerns, changes in the resource mix, and changes in demand.").

[7] Order No. 1920 at P 299.

[8] *Id.*

from that which Order No. 1920 contemplates. FRCC and Florida Transmission Providers state that "the identification of Long-Term Transmission Needs will consider both reliability and economic drivers, as well as the unique characteristics and goals reflected in each Long-Term Scenario." This language, separating "drivers" from "Long-Term Scenarios" suggests that additional information, beyond the seven categories of factors, will also be evaluated.

The use of the phrase "studies" in Section 4, Paragraph 2 increases Stakeholders concern as it suggests that Transmission Providers will conduct an additional analytic step with these "drivers." The Stakeholders read Section 4, Paragraph 2 to mean that once the Transmission Providers have modeled the scenarios and obtained results, they will perform *additional* analysis to identify their Long-Term Transmission Needs. FERC clearly intended that Long-Term Transmission Needs should be identified *directly* from the results of Long-Term Scenario modeling. This is because, as discussed above, the factors (as incorporated during Scenario Development) are what drive the Long-Term Transmission Needs. In Order No. 1920-A, the Commission found "that Order No. 1920's Long-Term Regional Transmission Planning requirements, including the requirements to develop Long-Term Scenarios using the minimum required Factor Categories, to use the minimum required transmission planning horizon, and to develop Long-Term Scenarios that are plausible and diverse, taken together, will ensure that transmission providers identify Long-Term Transmission Needs."[9] The factors included in the scenarios should contain all information required to assess the performance of the transmission system, account for future additions and/or upgrades and any previously selected Long-Term Regional Transmission Facilities, and reveal Long-Term Transmission Needs over the 20-year planning horizon. Not only are no additional steps needed, but any additional steps would undermine the process that FERC and the Commission's expert staff determined would result in just and reasonable rates. The Stakeholders therefore ask for greater clarity as to what FRCC

[9] Order No. 1920-A at P 224.

and Florida Transmission Providers mean by "studies" and how this will be consistent with Order No. 1920.

If the Stakeholders have misunderstood the proposed tariff language, and Transmission Providers do not intend to perform separate studies beyond modeling the Long-Term Scenarios, then we request that Transmission Providers revise the tariff language to make clear that they will identify Long-Term Transmission Needs based directly and only on the results of Long-Term Scenario modeling. Transmission Providers should clarify that "studies" will be performed as a component of Long-Term Scenario modeling to identify long-term regional transmission needs.

FRCC and Florida Transmission Providers' proposal also fails to demonstrate *how* Transmission Providers will determine the reliability and economic needs of the system consistent with the requirements of Order No. 1920. The tariff language at Section 4, Paragraph 3 on the identification of transmission needs states that it involves:

- "Identifying areas where the existing or planned transmission system is projected to violate NERC System Operating Limit ("SOL")/Interconnection Reliability Operating Limit ("IROL") criteria under the conditions of each Long-Term Scenario.
- Identifying opportunities for the transmission system to provide economic benefits. This will include an analysis of the extent to which a Long-Term Scenario creates a non-economic dispatch across the region."

While the Stakeholders appreciate that the proposal includes some clarity for how FRCC intends to determine the reliability needs of the future system under the Long-Term Scenarios, the tariff language does not provide any detail for how Transmission Providers will determine *economic* transmission needs. Transmission Providers' written explanation is too vague to comply with either the substance or the purpose of Order No. 1920.

Transmission Providers' statements during recent stakeholder meetings did not provide clarity on the proposed approach to identifying economic needs. From what we understand, they explained during the December 4th stakeholder call how they plan to identify "a non-economic dispatch across the region" based on the results of their power flow studies by identifying instances in which re-dispatching resources in two regions can resolve a reliability

violations. This approach remains unclear to the Stakeholders because power flow models do not include any cost assumptions and do not calculate the costs of a "non-economic dispatch across the region." Therefore, while a power flow model can provide an indication as to whether there would be economic benefits for new or upgraded transmission facilities in places of congestion, it does not put a dollar value on it. In addition, the proposed approach does not indicate how the Transmission Providers will evaluate the cost of the non-economic dispatch to ratepayers over the course of a year or several years, including during market conditions that are not captured in the snapshot analysis covered by power flow studies. The absence of cost metrics means that Transmission Providers would be unable to determine the extent of the economic need for transmission.

Moreover, during the stakeholder meeting, Transmission Providers indicated that economic needs will only be looked at once they determine that there is a reliability need (i.e., reliability violation). This means that the only economic needs that could be identified are those that also have reliability violations. Such a process could unnecessarily limit the identification of economic needs of the system – and if some needs are not identified, could restrict the calculation of transmission benefits and contribute to the development of transmission facilities with unnecessarily higher costs. If this is in fact how Transmission Providers and the FRCC intend to evaluate Long-Term Transmission Needs, then the Stakeholders respectfully submit that it is inconsistent with Order No. 1920. As discussed above, economic drivers and reliability drivers must *both* be evaluated independently of one another and considered simultaneously to identify transmission needs. One cannot act as a gate keeper for the other. While we understand that each Transmission Provider optimizes for reliability and cost *within* each service territory, they may be able to serve their customers at lower cost by using the regional transmission system to purchase power through the bilateral market as an alternative to relying solely on its own network resources. Such opportunities for regional optimization would be missed under the proposed approach.

This is a conclusion that was also reached in a recent report from the Energy Systems Integration Group (ESIG), whose membership includes both NextEra Energy and Duke Energy.[10] The ESIG report concludes that "The use of uncoordinated modeling tools compounds this disconnect" and "without reform, transmission planning runs the risk of continuing to produce piecemeal fixes that leave assets undersized or stranded...The result is higher costs, slower delivery, and elevated risk to reliability and resilience."[11] Elaborating on this point the ESIG report added that "When studies are linked through shared data and iterative workflows, planning teams can identify upgrade portfolios that address multiple system needs—thus reducing duplication, enhancing value, and enabling more effective cost allocation. Integrated portfolios can deliver greater system value, but weak alignment across processes can delay projects and leave significant benefits unrealized."[12]

The ESIG report recommends the use of "multi-need design":

> "Planners will need to scope projects and portfolios to meet multiple system needs from the outset and only then value the benefits. Evaluating benefits after a transmission concept exists is not a substitute for purposefully designing projects that simultaneously address reliability, congestion, policy, resilience, and load growth. To unlock the full potential of a multi-benefit evaluation framework, study teams can prioritize multi-need planning—a process that explicitly identifies, layers, and integrates multiple system needs during project development."[13]

We therefore ask that Transmission Providers provide additional clarity, either in the tariff language or in the business practices manual, as to how they plan to implement Order No. 1920 requirements to ensure they adequately consider long-term economic needs. Absent additional clarity, Transmission Providers' Order No. 1920 Long-Term Regional Transmission Planning

[10] Energy Systems Integration Group*, Modernizing Transmission Planning: Integrating Silos to Deliver Multi-Driver, Multi-Value Outcomes* (2025), https://www.esig.energy/integrating-transmission-silos ("ESIG report").

[12] *Id.* at 25.

[13] Energy Systems Integration Group*, Modernizing Transmission Planning: Integrating Silos to Deliver Multi-Driver, Multi-Value Outcomes*, Executive Summary at 6 (2025), https://www.esig.energy/wp-content/uploads/2025/12/ESIG-Integrating-Transmission-Silos-ES-2025.pdf.

process may be inconsistent with the requirements and purpose of the regulation and may ultimately result in unjust and unreasonable transmission rates. The Stakeholders request that at minimum, the following be addressed:

- Please explain which cases (such as seasons, load conditions, etc.) the Transmission Providers plan on using for its power flow studies and other reliability studies to identify reliability needs?

- Please clarify whether planned transmission facilities will be included in the power flow studies. If so, which planned facilities.

- Please define “NERC System Operating Limit (SOL)” and “Interconnection Reliability Operating Limit (IROL)” criteria referenced under “Reliability Drivers” in Section 4. Are these the same criteria as used in Transmission Providers’ local transmission planning processes, and if not, in what manner do they differ?

- Please confirm that FRCC Transmission Providers agree that they need to identify both (1) reliability issues of the long-term scenarios and (2) opportunities to reduce the total costs of serving load, including transmission and generation costs, over the long-term. If the Transmission Providers agree, please explain how the proposed approach to identifying economic needs will support the Transmission Providers in reducing the total costs of serving load, including transmission and generation costs.

- Please provide a written response to explain how Transmission Providers will identify economic needs based on their power flow studies. Specifically, please describe the steps Transmission Providers will take to analyze “the extent to which a Long-Term Scenario creates a non-economic dispatch across the region.”

- In the case in which a “non-economic dispatch across the region” is identified, please explain how Transmission Providers will estimate the costs of the non-economic dispatch identified in their power flow studies to the region’s ratepayers.

- Because power flow studies only evaluate a particular system condition and contingencies related to that system condition, how will Transmission Providers calculate the costs of the non-economic dispatch over a longer period of time, such as over the course of a year or several years?

- Will Transmission Providers identify all non-economic dispatches identified based on its power flow study cases and contingencies as an “economic driver” or will they apply a threshold for consideration in the Long-Term Regional Planning process?

- Transmission Provider representatives stated during the stakeholder meeting that production cost modeling is “not applicable” in the FRCC region.

    - Please explain why production cost modeling is not applicable in the FRCC region.

    - Please confirm whether the Transmission Providers in FRCC transact with each other in order to reduce the costs of serving its native load.

  - Please provide high-level information to the Stakeholders about the frequency of transactions within FRCC and key drivers of those transactions over the past 2-3 years.

  - How do the FRCC Transmission Providers plan on assessing whether cost-effective transactions amongst Transmission Providers can occur in the future and whether those transactions will be limited by insufficient regional transmission capacity?

- Transmission Provider representatives indicated during the stakeholder meeting that, if transparency of marginal cost information is a barrier to achieving evaluation of economic needs, that publicly-filed hourly system lambda data would not be a good stand-in. Please describe the transparency issues that make marginal cost information confidential, citing the relevant state or federal laws and regulations, and describe in detail why system lambda cannot be used as an estimate of marginal costs of energy to serve load in each service territory.

- Please explain how Transmission Providers achieve least-cost planning, including how they balance between utilizing resources in their own systems and external resources delivered over the regional transmission system.

Regarding identification of Long-Term Transmission Needs, stakeholders make the following recommendation.

Order No. 1920-A requires transmission providers to use both reliability and economic (e.g., congestion) metrics when identifying Long-Term Transmission Needs. We recommend that FRCC align with best practices across the industry of identifying economic drivers of regional transmission needs by completing hourly (8760) production cost modeling for Year 10 and Year 20 for its footprint and identify the top 10-20 regional constraints that result in non-economic dispatch. FRCC Transmission Providers would identify non-economic dispatch in the production cost models when the thermal or contingency limits on regional transmission facilities bind and result in a difference in the marginal cost of energy on either side of the constraint.

<u>Section 5: Characterization of Long-Term Transmission Needs</u>

Proposed Tariff Language:

> “Transmission Provider will develop a characterization for each identified Long-Term Transmission Need. This characterization will address the location, magnitude, drivers,

and timing of the identified Long-Term Transmission Need and potential impact if the Long-Term Transmission Need is not addressed."

Stakeholder Comments:

The Stakeholders request that Transmission Providers clarify what they mean by "drivers" in Section 5. As discussed above in our comment response to the language in Section 4, "drivers" under Order No. 1920 describe the seven categories of factors that form the future transmission scenarios which "drive" transmission needs. In that section, Transmission Providers appear to use the term "drivers" to describe a separate set of inputs which Stakeholders contend are outside of the scope of Order No. 1920. Please explain whether in Section 5, "drivers" are synonymous with or inclusive of the seven categories of factors, or whether it contemplates something separate.

Please also clarify how the Transmission Providers will identify the magnitude of the economic needs and how they will quantify the cost impacts of those economic needs on ratepayers over the period of the long-term study.

Section 6: Publication of Long-Term Transmission Needs Determination

Proposed Tariff Language:

"Following identification and characterization of the Long-Term Transmission Needs, Transmission Provider will publish on the public portion of its OASIS, following CEII protocols, the following:

- A list and characterization of all identified Long-Term Transmission Needs.
- The results of the studies used to identify the Long-Term Transmission Needs.

The identification and characterization of Long-Term Transmission Needs will form the foundation for the subsequent project evaluation and selection phases of the Long-Term Regional Transmission Planning process, ensuring that selected transmission solutions effectively address future Long-Term Transmission Needs of the FRCC Region."

Stakeholder Comments:

The Stakeholders recommend that the FRCC publish all identified Long-Term Transmission Needs, and the results of all studies used to identify such Long-Term Transmission Needs, on the FRCC website in addition to the public portion of each Transmission Provider's OASIS website. This will enhance public access to a comprehensive list of identified Long-Term Transmission Needs.

We also request that the FRCC and Transmission Providers share the models they are using to obtain the results. This should include all inputs and constraints entered into the model, to the extent such information is not CEII. This will ensure transparency regarding how the Long-Term Scenarios are translated into model inputs. Transmission Providers would share this information at the same time and in the same manner that they publish the Long-Term Transmission Needs.

We request that FRCC publicly disclose all information that does not require CEII designation consistent with other regional planners. For example, detailed results have been posted for reliability and economic regional transmission needs analysis in MISO,[14] PJM,[15] and CAISO[16] that have not contained CEII information. If FRCC is unable to publicly post its needs analysis at a similar level of detail as these regions, please explain why.

We further recommend that the FRCC establish a stakeholder-led Transmission Advisory Group (TAG) to review published Long-Term Transmission Needs. TAG membership

[14] MISO, MTEP24 Report (2024), https://cdn.misoenergy.org/MTEP24720395.zip.

[15] PJM, 2025 RTEP Reliability Analysis Update (2025), https://www.pjm.com/-/media/DotCom/committees-groups/committees/teac/2025/20251104/20251104-item-14---reliability-analysis-update.pdf.

[16] CAISO, 2025-2026 Transmission Planning Process (Sep. 2025), https://stakeholdercenter.caiso.com/InitiativeDocuments/Presentation-2025-2026-Transmission-Planning-Process-Sep-24-2025.pdf; CAISO, 2025-2026 Transmission Planning Process - Policy & Economic Preliminary Assessment and Study Updates (Nov. 2025), https://stakeholdercenter.caiso.com/InitiativeDocuments/Presentation-2025-2026-Transmission-planning-process-policy-and-Economic-Preliminary-Assessment-and-Study-updates-Nov-19-25.pdf.

should include representatives of public interest organizations, third-party energy developers, public regulators (including the Florida Public Service Commission and Office of Public Counsel), and customer associations.

Lastly, we recommend that the FRCC and Transmission Providers hold a public meeting with stakeholders to review all identified Long-Term Transmission Needs. A meeting announcement should be posted on the FRCC website 30 days prior to the date of the meeting, and all meeting materials should be posted on the FRCC website 15 days prior to the meeting. Stakeholders will have 15 calendar days after the meeting to file comments. The FRCC will post all stakeholder comments within 15 calendar days and Transmission Providers will make a concerted effort to respond to each comment in a timely manner.

Conclusion

The Stakeholders request that the FRCC and Transmission Providers share their responses to our comments, and any resulting updates to the Needs Analysis tariff language, in advance of the next stakeholder meeting on Project Selection. In the interim we are happy to provide any clarification or additional explanation to the FRCC and Transmission Providers should they need it. We also propose allowing time at the start of the next meeting to ask questions about those responses and/or updates. This will help integrate the Needs Analysis process into the Project Selection discussion, which is essential considering that the quality of proposed projects is directly linked to the robustness of identified needs.

We appreciate the Transmission Providers engaging in candid dialogue on these issues, and we look forward to more constructive discussion. The development of a compliant framework for Order No. 1920 is a complex task, but as FERC noted it serves a critical purpose. The Stakeholders will continue to provide insights that help the Transmission Providers, and all

Florida electric utilities, to achieve a transmission planning process that maintains system reliability while delivering the lowest-cost service to customers region-wide.

Sincerely,

1. Introduction & Summary

1.1 Synopsis of Report Contents

EQ Research was engaged to conduct a three-phase study of fuel cost impacts and management across Florida's major investor-owned utilities (IOUs): Florida Power and Light (FPL)[1], Duke Energy Florida (DEF) and the Tampa Electric Company (TECO).[2] This report comprises Phase One of this larger study, which is focused on developing a picture of how fuel costs have varied over time, their relative role as components of residential retail rates, the sources and magnitude of customer rate volatility, and how this may change in the future. Given the IOUs' collective high reliance on natural gas generation, the report devotes specific attention to natural gas costs. The specific topics explored in this report are listed below:

- The changes in IOU generation mixes over time, with a specific focus on natural gas generation.
- The historical impact of fuel costs on residential customer bills, as represented by the proportion of customers' bills that are attributable to fuel costs.
- Trends in natural gas prices in comparison to trends in fuel cost charges on customers' electric bills.
- A projection of the future impacts of fuel costs on customer bills based on variations in projected amounts of natural gas generation and natural gas prices.

The analysis provided in this report is supported by monthly data on: (i) each individual component of residential customer rates, and (ii) the IOUs' estimated and actual determinants of natural gas generation costs (e.g., natural gas prices, heat rates). Both monthly datasets use a time horizon starting in January 2016 through May 2025 although some presentations of the data only extend through the end of 2024 because a partial 2025 year is not comparable to a full calendar year due to seasonal variations. Unless otherwise stated, all dollar amounts and rates in this report are specified in nominal terms.

1.2 Key Findings

The key findings from this evaluation are as follows:

1. The generation supply mix of Florida's major IOUs has as a whole become moderately more concentrated in natural gas generation since 2016, increasing from roughly 66.0% in 2016 to 75.3% in 2024. On an individual utility level DEF and TECO show significant

[1] This includes FPL's Northwest Florida division, which was served by Gulf Power prior to the purchase of Gulf Power by FPL's parent company NextEra Energy in 2019. The former Gulf Power territory was fully consolidated into FPL operations in January 2022. In a historic context, we sometimes refer to FPL and Gulf Power separately, or to the two utilities combined (FPL/Gulf Power) depending on the context. On a forward-looking basis, we refer to the merged utilities as FPL.

[2] Florida Public Utilities, a small IOU has not been included in this analysis.

increases (27% and 32%, respectively) while natural gas by FPL/Gulf Power collectively has remained fairly flat.

2. All of the IOUs project declining amounts of natural gas generation starting in the mid- to late-2020s, but the trajectory of those declines varies as well, with DEF and TECO lagging substantially behind FPL.
3. Higher reliance on natural gas as a generation fuel is associated with higher fuel costs and increased fuel rate volatility. For instance, in recent years DEF and TECO have become relatively more reliant on gas generation than FPL, and their fuel rates have also become noticeably more volatile. In other words, even though natural gas price volatility is relatively uniform across all utilities, higher reliance on natural gas generation exposes a greater portion of the overall fuel rate to that price volatility.
4. Storm damage costs are an additional source of rate volatility and tend to exacerbate overall rate volatility because the recovery of storm damage costs sometimes coincides with periods of higher fuel rates brought on principally by volatility in natural gas prices. The average year-over-year (YOY) change in fuel rates and storm recovery charges combined ranged from 11% - 58% higher than the average YOY change in fuel rates alone depending on the utility in question.
5. The combination of heavy reliance on natural gas generation and Florida's high vulnerability to major storm costs from tropical systems makes Florida electric customers uniquely vulnerable to rate volatility.
6. Because their present resource planning filings show significantly higher reliance on natural gas generation during the next decade, rate volatility for customers of DEF and TECO is likely to continue to be significantly higher than for customers of FPL in future years.
7. Under a future scenario with high natural gas prices, the incremental costs to ratepayers from 2025-2034 could approach, or even exceed $21 billion. Under the High Price natural gas price scenario the incremental cost for a typical residential customer that uses 1,000 kWh/month averages roughly $9/month for FPL customers and $11/month for DEF and TECO customers compared to a Base Case natural gas price scenario.

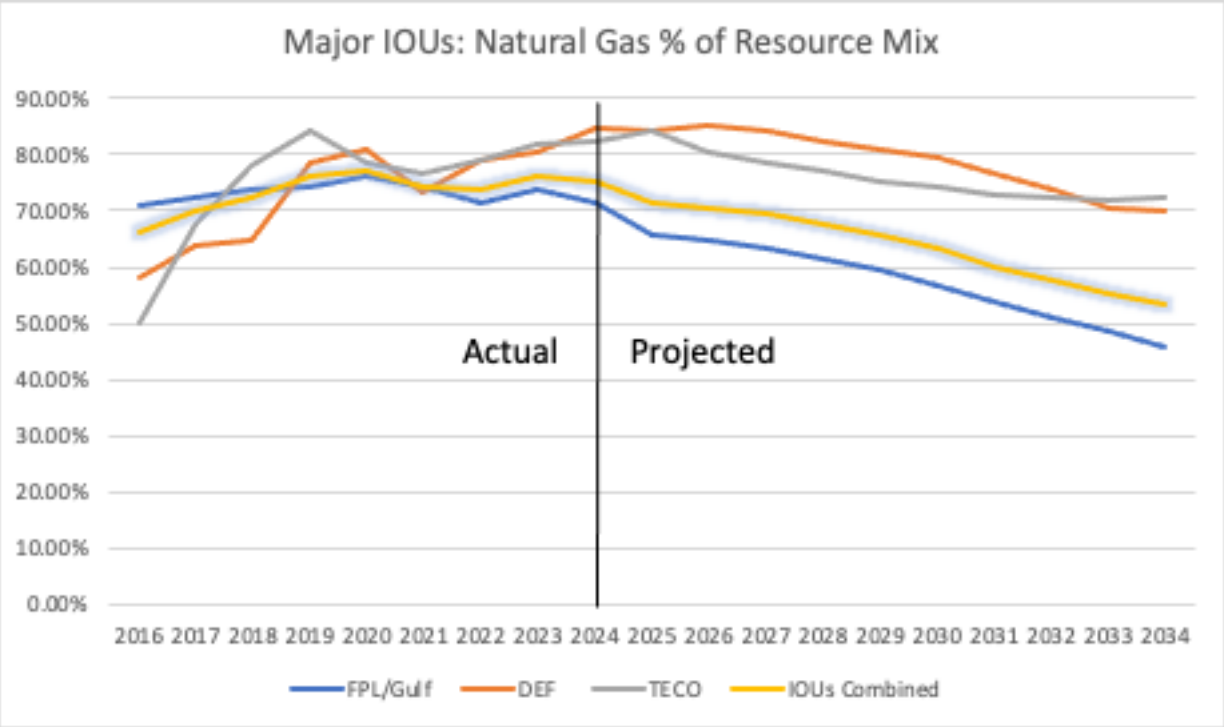
2. Background on Energy Supply and Fuel Rates

2.1 Generation Mix Over Time & Relevance for Fuel Costs

Resource mix is a central driver of a utility's fuel costs since it determines what portion of overall fuel costs are sensitive to changes in the price of any given fuel. All of the major IOUs are presently highly reliant on natural gas generation although the historic and future trajectories differ somewhat by utility. Figure 1 shows the historic changes in natural gas penetration in each major IOU's resource mix from 2016 to 2024, and projected reliance on natural gas through 2034 based on the IOUs' 2025 Ten-Year Site Plans filed with the Florida Public Service

Commission (FPSC).[3] [4] The highlighted line in Figure 1 reflects a combined statewide summation of the major IOUs, which tends to be driven by FPL/Gulf Power because FPL/Gulf Power has a significantly larger footprint than DEF and TECO combined.

Figure 1: Florida's Natural Gas Generation Reliance Over Time



As illustrated in Figure 1, both DEF and TECO increased their natural gas reliance considerably from 2016 to 2024, and both projected continued higher reliance on natural gas over the next decade than FPL. The historic changes were driven primarily by retirements of coal units that were balanced largely by additions of natural gas generation capacity, which carries into forward resource mix projections because significant portions of their natural gas generation portfolios are new units. On the other hand, FPL differs in several respects:

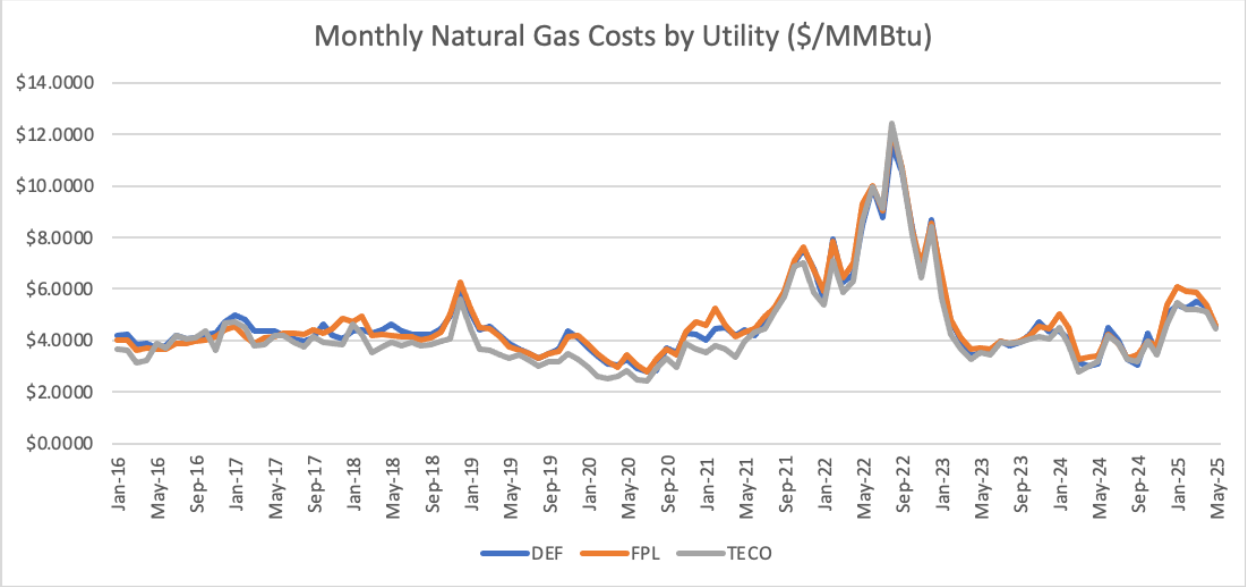
- FPL (even combined with Gulf Power) was historically less reliant on coal generation so coal retirements affected its resource mix to a lesser degree.
- FPL was historically relatively more reliant on natural gas generation, so its natural gas generation fleet is generally older.

[3] FPSC. Ten-Year Site Plans. https://www.psc.state.fl.us/ten-year-site-plans. The Ten-Year Site Plans are similar to integrated resource plans (IRPs), but have a number of key differences (e.g., informational only, less extensive, etc.).
[4] Note that Figure 1 shows FPL and Gulf Power as a single entity for the entire time horizon even though they did not fully consolidate operations until 2022. In practice, the consolidation did not significantly affect FPL's resource mix because FPL was roughly 13 times larger than Gulf Power in terms of system energy generation at the time of the consolidation.

- FPL has a significant amount of nuclear generation (roughly 20% of its resource mix on average) whereas DEF and TECO have none.
- On a forward-looking basis, FPL has a more aggressive plan for solar deployment than either DEF or TECO, although FPL's solar penetration as a percentage of the generation energy mix lagged TECO's in 2024 and was only slightly higher than DEF's.[5]

The concentration of energy supply in natural gas generation results in fuel rates that are highly tethered to natural gas prices, which are notoriously volatile. Figure 2 illustrates this volatility in the form of each utility's actual monthly cost of natural gas from January 2016 - May 2025.

Figure 2: Actual Natural Gas Prices Over Time



Since all of the utilities are dependent on the same regional market for natural gas, the prices they pay are nearly identical, with only small differences attributable to transportation costs and their specific fuel purchasing practices.[6] However, since DEF and TECO are more reliant on gas generation than FPL, their fuel rates are driven by natural gas prices to a relatively greater extent than FPL's are at present, or are likely to be in the future based on the utilities' respective 2025 Ten-Year Site Plan projections.[7]

[5] It is worth noting here that the 2025 Ten-Year Site Plans pre-date changes to federal tax credits for solar associated with 2025 H.R. 1. Those changes, which include an overall phase-out but also contain elements that could stimulate a rush for construction of new projects, will undoubtedly affect utility planning for solar deployment going forward.

[6] Appendix A provides further background information on differences in the full delivered prices that individual IOUs pay for natural gas.

[7] Total natural gas costs are also influenced by the relative efficiency of a utility's natural gas generation portfolio, commonly known as the heat rate measured in Btu/kWh. The heat rate is primarily a product of the breakdown of natural gas generation between different types of units (e.g., combined cycle vs. simple cycle turbines) and the respective ages of individual units (i.e., older units are typically less efficient).

2.2 Summary of Fuel Cost Rate Recovery in Florida

The IOUs' fuel costs are recovered through a rate rider outside of their base rates. Fuel costs are a full pass-through cost, meaning that utilities recover the full amount of their actual costs from ratepayers without earning a margin or return. No matter how fuel costs change, or how they differ from prior projections, utilities are entitled to recover the full amount of their actual fuel costs from ratepayers. In other words, the full pass-through character places 100% of fuel price risk on ratepayers (and zero risk on the utility).

The FPSC establishes an annual docket to update fuel charges. As a default, fuel rates are updated on an annual calendar year basis in order to reflect: (i) projected fuel costs for the upcoming calendar year, and (ii) a true-up of actual fuel costs vs. fuel cost revenue for the prior rate period (i.e., an under- or over-recovered balance). However, within this general annual cadence is a mechanism under which utilities may seek a Mid-Course Correction to the annually established rates in order to update fuel rates during the middle of a calendar year. Under the Mid-Course Correction rules, a utility must notify the FPSC if its under- or over-recovered balance based on current fuel rates exceeds 10% of the adopted fuel cost revenue requirement. When they make this notice, they must request a change to their fuel rate or provide an explanation of why implementing a correction would be impractical (e.g., insufficient time to establish an update before the next scheduled update). Utilities are also permitted to request a Mid-Course Correction even if the imbalance has not yet reached the 10% threshold.

The Mid-Course Correction mechanism mitigates volatility in fuel rates to some degree by limiting the growth of cost recovery imbalances (i.e., projected vs. actual costs), which principally stem from errors in a utility's natural gas price forecast. The result is the potential for more frequent, but smaller, incremental rate changes, as opposed to the wider swings that could occur under a strict annual update schedule.[8] Nevertheless, despite the Mid-Course Correction feature of fuel cost ratemaking in Florida, fuel rates charged to customers generally tend to lag the pattern of incurrence of actual fuel costs, such that customers only see the impacts of changes in natural gas prices on their bills after the time during which those costs were incurred.[9] Figures 3 and 4 below illustrate this lag for DEF and TECO.

[8] The Mid-Course Correction mechanism may also provide a more accurate price signal to customers of the cost of their energy usage by reducing the lag between when persistent changes in fuel prices are reflected in fuel rates (e.g., signaling them to reduce usage due to high costs).

[9] This refers to the combination of natural gas price forecasting ($/MMBtu) and natural gas generation heat rate forecasting (Btu/kWh), which in combination translate to the natural gas generation cost ($/kWh).

Figure 3: DEF Fuel Rate Lag Illustration

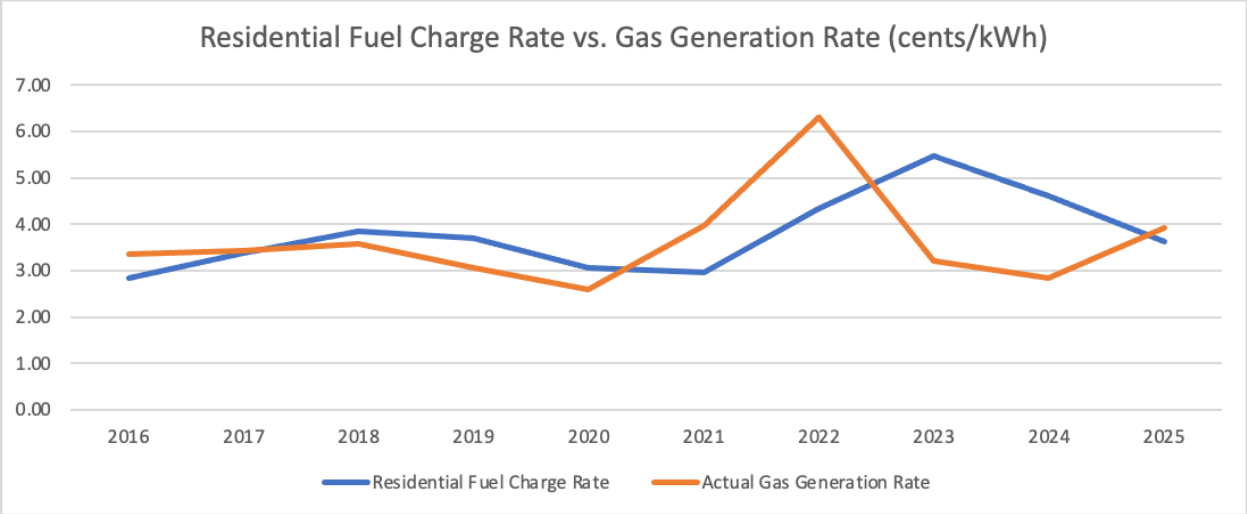


Figure 4: TECO Fuel Rate Lag Illustration

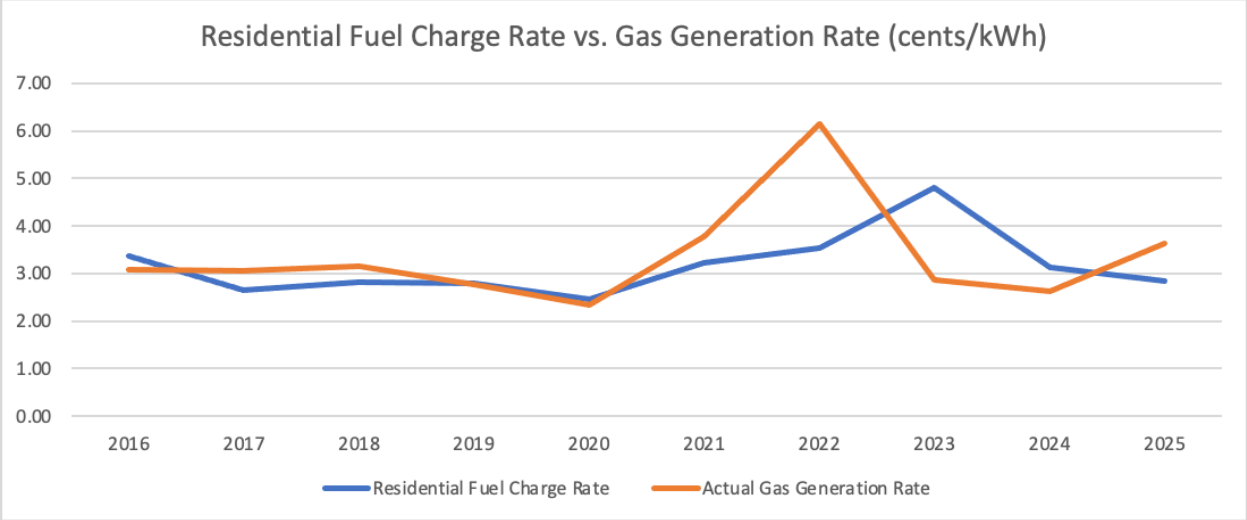


On an historical annual basis, this lagging effect is more visible for DEF and TECO than FPL, which appears likely to be due to FPL's: (i) modestly lower reliance on natural gas generation in recent years, (ii) more efficient gas generation portfolio, and (iii) generally more accurate reflection of the costs of natural gas generation in rates, on average, during the time frame of natural gas price volatility from 2021-2023. In other words, FPL is less exposed to high natural gas prices, and appears to have better anticipated the spike in natural gas prices in forecasting its estimated costs and seeking fuel charge rate changes to reflect refreshed cost estimates in rates closer to the timing of cost changes.[10]

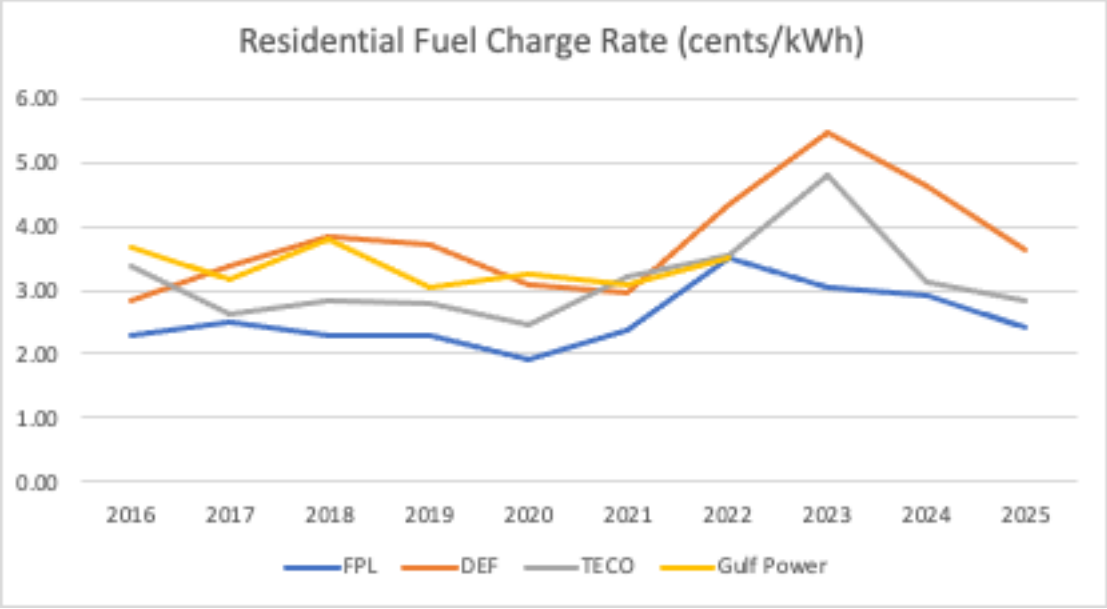
[10] This is not to say that FPL is necessarily better at natural gas price and cost forecasting in an overall sense. Rather, it only means that during the 2021-2023 time frame, it managed to achieve a smoother trajectory in fuel

3. Customer Rates & Rate Volatility

3.1 Fuel Costs & Residential Bill Impacts

Fuel costs constitute a significant portion of residential electricity bills. The specific proportion (%) during any given month or year varies based primarily on three factors: (i) a utility's resource mix in relation to prices for different fuels, (ii) the timing of rate changes in response to differences between forecasted and actual fuel costs (e.g., the lagging effect discussed in the prior section of this report), and (iii) the amount and timing of changes in other rate components that tend to have a relatively lumpy character (e.g., base rate changes and storm cost recovery charges). In the long run, during which the timing aspects of ratemaking tend to smooth out, changes in fuel rates ultimately tend to fluctuate in proportion to the price of the dominant fuel resource. In the case of the major Florida IOUs, the dominant fuel source for generation is natural gas, so fuel rates tend to track changes in natural gas prices in rough proportion to a utility's relative dependence on natural gas. Figure 5 below shows a history of the average annual residential fuel charge from January 2016 through May 2025 by utility.[11]

Figure 5: IOU Fuel Rates Over Time



rates. In general, FPL better anticipated the price spike in late 2021 and decline in 2023 than DEF or TECO. Again, part of this outcome also stems from relatively less exposure to high natural gas prices in the first place. It is also possible that the consolidation of rates between FPL with Gulf Power in January 2022 introduced an exogenous artifact into the data that disguised the most pronounced lagging effect that is visible for DEF and TECO during the 2022-2023 time frame.

[11] The fuel charge rate for Gulf Power becomes identical to the FPL rate in 2022, as shown by the convergence of the yellow and blue lines. The specific rates used are for the lower tier of residential fuel rates that applies to usage up to 1,000 kWh during a monthly billing period.

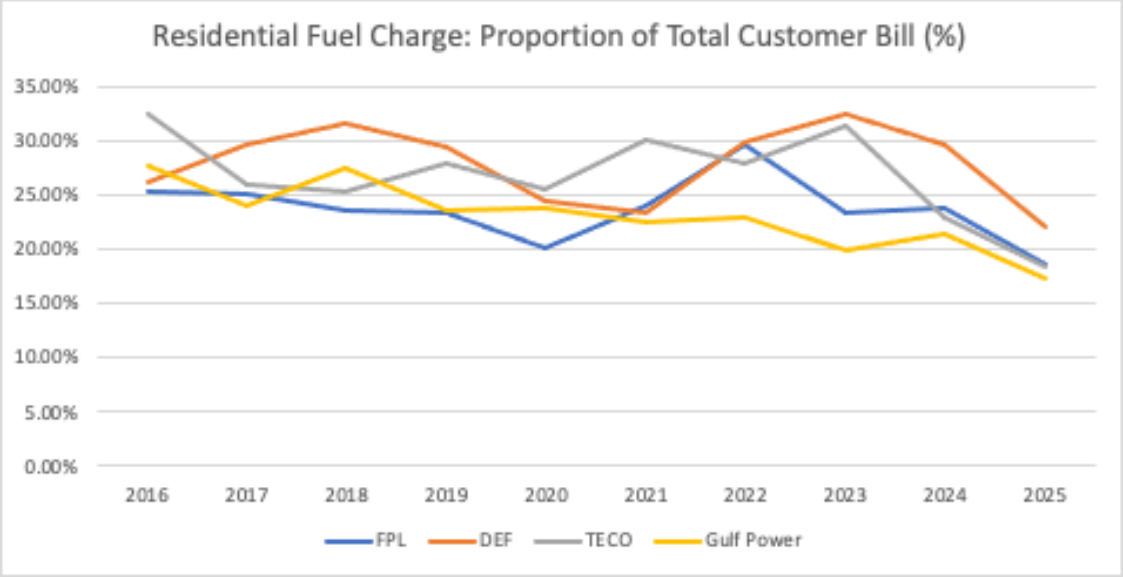
Table 1 shows this level of fuel rate variability numerically in the form of the average, maximum, minimum, and range (maximum minus minimum) of average fuel rates by year since 2016. A higher range in particular is indicative of greater rate volatility. Furthermore, annual averaging has a diluting effect on the range in relation to monthly rates for DEF and TECO which are higher at 3.28 cents/kWh (DEF) and 2.62 cents/kWh (TECO). For FPL and Gulf Power, the monthly range is essentially identical to the annual range.

Table 1: Fuel Rate Summary Statistics (2016-2025)

Year	FPL	DEF	TECO	Gulf Power
Average	2.55	3.78	3.16	3.19
Maximum	3.49	5.47	4.81	3.81
Minimum	1.90	2.85	2.46	2.42
Max-Min Range	**1.59**	**2.62**	**2.35**	**1.39**

Figure 6 shows what these fuel charges translate to as a percentage of the overall monthly bill for a residential customer that uses 1,000 kWh/month.[12]

Figure 6: Effects of Fuel Costs on Customer Bills



One noticeable difference in the shape of the lines between Figures 5 and 6 is that the considerable spike in fuel charge rates in Figure 5 that is visible in 2023 is more muted when translated to a percentage of a customer's average monthly bill in Figure 6. This difference is

[12] The percentages reflected in Figure 6 are similar, but not identical to the percentage arrived at by dividing the volumetric ($/kWh) rate by the total volumetric rate. However, they differ from that result to a small degree due to the impact of fixed charges.

reflective of changes in other rate components, most specifically storm cost recovery, that overlapped changes in the fuel charge rate and muted the overall percentage change in relation to total rates. Similarly, during the first part of 2025, the fuel charge percentages of a customer's total monthly bill are lower than any point since the start of 2016, even though the fuel charge rate itself is generally similar to or slightly higher than fuel charge rates during 2016 and 2017. That is, the percentage of total bill metric during 2025 is not lower because fuel rates are lower, it is lower because other charges are higher.[13]

One other notable detail that is visible in Figures 5 and 6 is that DEF's and TECO's fuel charge rates, and to a lesser extent the fuel charge percentage of bill metric, spiked during 2023 and have fallen precipitously since then. This change in fuel costs is associated with a spike in natural gas prices that began in late 2021 and continued through 2022. By contrast, the collective FPL/Gulf fuel rate spiked in 2022 at a lower magnitude, then fell more gradually during 2024 and the first part of 2025. This difference is attributable to factors that were previously noted regarding FPL's relatively lower exposure to high natural gas prices and relatively more accurate reflection of natural gas costs in rates during the 2021-2023 time period. Both factors collectively helped FPL avoid the delayed spike in fuel rates that occurred for DEF and TECO during 2023.

3.2 Impacts of Storm Cost Recovery Charges

In addition to the analysis described above, EQ Research also investigated the degree to which charges for storm cost recovery might influence, and possibly disguise, the pattern of changes in the percentage of a customer's total bill attributable to fuel rates. This area was chosen for additional analysis because the incurrence of storm costs is inherently unpredictable, Florida is uniquely vulnerable to damage from tropical systems, and accumulated storm damage amounts can become extreme due to high impact storms and multiple storms that occur in quick succession (or a combination of both).

Consequently, charges for storm damage recovery can significantly impact total rates. In any given month since 2016 storm recovery charges have ranged from zero in many months up to more than 3 cents/kWh in some cases, equivalent to up to nearly 19% of a customer's monthly bill in that instance. On an annual calendar year average basis, the range is lower because storm recovery charges tend to be set for 12-month periods that do not align with calendar months, resulting in some months of a given year having a zero charge. Nevertheless, the annual range is still significant, up to nearly 2 cents/kWh and 11% of a residential customer's total monthly bill.

[13] The fuel charge as a percentage of total rates differs between FPL and Gulf Power after 2022 due to the presence of a merger transition credit for historic FPL customers and a transition charge for historic Gulf Power customers in their total rates. So even though all other rate components, including fuel rates, were aligned starting in 2022, the percentage of total bill metric differs due to the difference in the total retail charges attributable to the merger transition mechanism.

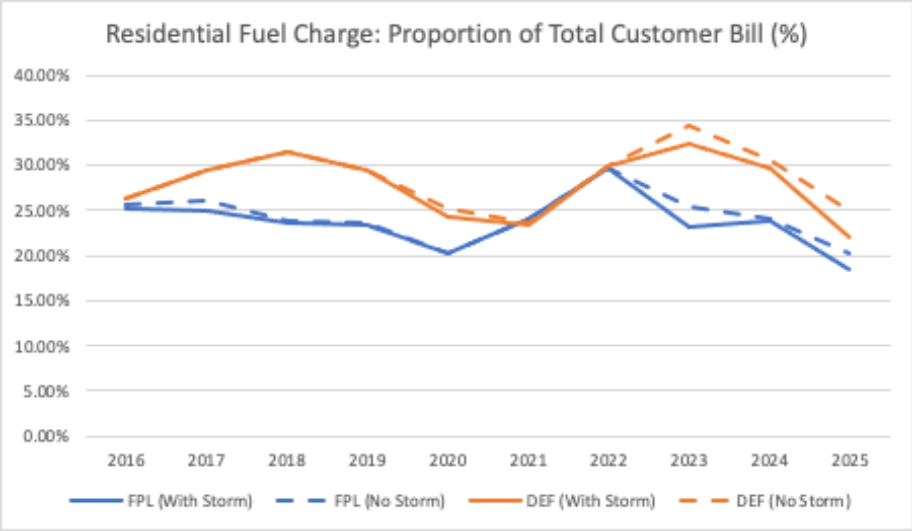
To evaluate how storm recovery charges affect the fuel rate percentage of bill metric, we calculated an alternative set of monthly and annual averages with storm recovery charges excluded from the total customer bill. As long as a utility has had a storm recovery charge for at least part of the reference time period, this shifts the curve upward. The scale of the effect is relatively small because most of the time, the fuel rate is still significantly higher than the storm recovery charge, and both are only a fraction of the customer's total bill. The scale is also likely to be affected by the parameters of ratemaking mechanisms and regulators' decisions, which influence the timing and magnitude of rate changes. The effect of ratemaking adjustments is explored in more detail in Section 3.3 discussing rate volatility.

The effects on the minimum percentage, maximum percentage, and range are inconsistent because they depend on the timing of storm recovery charges in relation to changes in fuel rates and other charges. The minimum percentage is higher in all cases because minimum fuel rate percentages all occur during 2025 at a time when each utility has a storm recovery charge. The maximum percentages are higher for DEF and TECO because the highest fuel rates in relation to total rates coincided with a period where storm recovery charges were present, but remain the same for FPL and Gulf Power because neither had a storm recovery charge at the time when the maximum occurred. Ultimately, excluding storm recovery charges increased the percentage range of fuel costs as a portion of total customer bills for DEF and TECO, while it reduced the range for FPL and Gulf Power. This occurred because the increase in the minimum percentage was smaller than the increase in the maximum percentage for DEF and TECO, while the minimum percentage increased for FPL and Gulf Power but the maximum remained unchanged.

Figure 7 shows the differences between the fuel percentage bill metric with and without storm recovery costs included in the total bill to illustrate comparative effects for FPL and DEF.[14]

[14] The graphic is limited to FPL and DEF to simplify the visualization, but the pattern would be similar in a graphic including Gulf Power and TECO (or comparing them).

Figure 7: Effects of Storm Cost Recovery on Fuel Charge Percentage of Bill Metric



Our analysis indicates that there is a discernible, but relatively small amount, of the annual variation in the fuel rate as a percentage of residential customer bills metric that is caused by storm recovery charges and their timing relative to changes in fuel rates. However, excluding storm recovery charges from the customer's total bill in the calculation of the fuel rate as a percentage of a residential customer's total bill does not significantly change the pattern of annual variations seen in the bill percentage metric, nor does it necessarily make the range in the average annual values either larger or smaller (i.e., create a systematic distortion).

3.3 Discussion of Fuel Rates & Bill Volatility

As previously illustrated, fuel rates for Florida customers are driven by the costs of natural gas given the IOUs' collective relatively high reliance on natural gas generation. Fuel rates in turn can be volatile because natural gas prices are vulnerable to volatility. The Mid-Course Correction aspect of Florida's fuel cost recovery mechanism has a smoothing effect on fuel rate changes in response to fuel cost volatility, allowing for more frequent rate updates that can help prevent cost recovery imbalances from becoming too large. However, the Mid-Course Correction feature has an important limitation. It does not, and cannot, affect the core cause of fuel rate volatility: volatility in natural gas prices. Any prolonged spike in natural gas prices will eventually show up in the fuel rates charged to customers, with the magnitude correlated with a utility's relative reliance on natural gas generation. The ability of the Mid-Course Correction feature to effectively mitigate rate volatility is also dependent to some degree on factors like the timing of imbalances and the accuracy of utility price forecasts.

One way to evaluate fuel rate volatility is to look at the year-over-year (YOY) (or month over month) changes in rates. Figure 5 above showed that FPL's, and collectively FPL/Gulf Power's,

fuel rates have had a considerably narrower range over time largely because they avoided the 2023 fuel rate spike and steeper drop off in the fuel rate in 2024 that occurred for DEF and TECO customers. Table 2 shows the YOY change in the fuel charge using the same average annual fuel rate data, starting with the change from 2016 to 2017.[15] The average in the bottom row is shown as the absolute value of year over year changes. The lower variability of FPL's and Gulf Power's fuel rates is evident in the lower average values as compared to DEF's and TECO's annual variability.

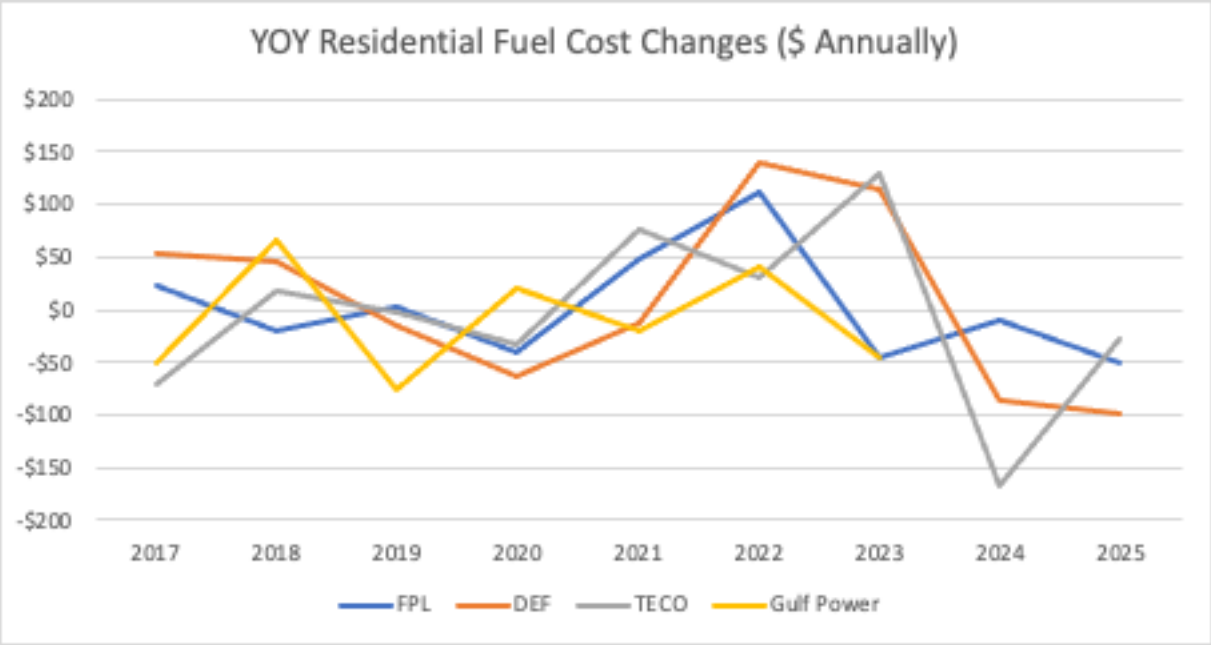
Table 2: YOY Change in Fuel Rates (Cents/kWh)

Year	FPL	Duke	TECO	Gulf Power
2016 - 2017	0.22	0.53	-0.72	-0.52
2017 - 2018	-0.21	0.46	0.18	0.65
2018 - 2019	0.02	-0.14	-0.03	-0.76
2019 - 2020	-0.40	-0.63	-0.33	0.22
2020 - 2021	0.48	-0.12	0.76	-0.19
2021 - 2022	1.11	1.39	0.31	0.42
2022 - 2023	-0.46	1.13	1.28	-0.46
2023 - 2024	-0.11	-0.86	-1.68	-0.11
2024 - 2025	-0.51	-0.98	-0.28	-0.51
Average (Absolute Value)	0.39	0.69	0.62	0.42

Figure 8 depicts these amounts in graphical form, allowing the time signature to be more easily understood, and scaled to reflect the annual fuel cost for a residential customer that uses 1,000 kWh/month. The years shown in Figure 8 refer to the end year, such that 2017 refers to the 2016-2017 change and so forth.

[15] Note that FPL's and Gulf Power's fuel rates were aligned in 2022, but the alignment in terms of YOY changes does not occur until the 2022-2023 time period.

Figure 8: YOY Variation in Residential Fuel Costs[16]



The range of annual variations for FPL and Gulf Power, shown by the blue and yellow lines, is considerably lower than the range for DEF and TECO shown by the orange and gray lines, respectively. The spike in 2022 is not as high for FPL and Gulf Power as it is for DEF and TECO, nor is the fall off in 2023 and 2024 as steep.

A similar pattern is visible if YOY changes are evaluated on a percentage basis, but the magnitude of the YOY percentage change differences is lower because the DEF and TECO have higher fuel rates overall. For instance, the average YOY rate change for DEF is 0.69 cents/kWh compared to 0.39 cents/kWh for FPL, roughly 78% higher. However, DEF's average YOY percentage change is 18.53%, only 17.3% higher than FPL's average YOY percentage change of 15.80%. In other words, the fact that DEF's average fuel rate is roughly 50% higher than FPL's average fuel disguises the difference in volatility if changes are measured in percentage terms.

3.4 Impacts of Storm Cost Recovery Charges on Rate Volatility

Storm cost recovery charges are another potential source of significant volatility in customer rates, since they are highly variable and can be relatively large. However, those characteristics do not necessarily mean that storm cost recovery charges enhance rate volatility because volatility is sensitive to the timing of changes in both fuel rates and storm recovery charges. When storm charges change in the same direction at the same time as fuel rates, volatility is enhanced, while if both sets of charges move in opposite directions during the same time period, the total change

[16] Appendix B includes a version of Figure 8 (Figure B-1) that reflects inflation-adjusted values denominated in 2025 dollars. Applying an inflation adjustment does not affect the conclusions that result from this comparison.

in customer rates is lower than would be the case for either charge in isolation. Furthermore, individual rate change events at different times may display different patterns. For instance, in one year storm recovery charges and fuel rates may move in opposite directions, whereas in another year they move in the same direction.

These timing differences may occur due simply to the timing and magnitude of the "cost events", but typically also reflect intentional and targeted ratemaking decisions by regulators to mitigate overall rate volatility and bill impacts. For example, regulators tend to be inclined to authorize higher storm cost recovery rates during a period of lower fuel rates than they would during a period that coincides with relatively higher fuel rates, such that upward and downward changes offset one another and produce a smoother overall rate trajectory. The central issue here with respect to storm cost recovery rates is the recovery period. Extending the recovery period for a longer duration produces a lower rate, but incurs additional financing costs (i.e., interest on the balance) and longer recovery periods may result in the resultant charge overlapping with other future rate increases, exacerbating bill impacts (at least temporarily).

That said, the history of residential rates in Florida indicates that the general effect of storm cost recovery rates in concert with fuel rates is enhanced volatility in residential customer rates. Table 3 shows the absolute value of YOY changes in fuel rates compared to YOY changes in fuel rates and storm cost recovery rates combined for each major IOU since 2016. Since the average of combined YOY average rate changes is higher than for fuel charges alone, we can conclude that storm costs have historically increased residential rate volatility.

Table 3: Storm Cost Recovery Impacts on YOY Rate Changes

Metric	FPL	DEF	TECO	Gulf Power
Avg. Fuel Rate (YOY Change)	0.39	0.69	0.62	0.42
Avg. Fuel + Storm Cost Rate (YOY Change)	0.60	0.77	0.98	0.52
Difference (cents/kWh)	0.21	0.08	0.36	0.10
Difference (%)	54%	11%	58%	23%

The differences between utilities stem from several sources. First, storm damage costs from individual tropical systems tend to be concentrated in different locations and utility service territories. Certainly, in some cases damage is widespread, but the worst effects generally tend to be relatively geographically concentrated such that one utility may experience major damage from a given storm while another sees little to none. This speaks to the overall magnitude of storm recovery costs that make their way into rates. Second, and related to the first reason, charges for storm recovery differ in their timing in relation to the timing of the major storms that caused that damage as well as exogenous rate factors like fuel costs. Third, as previously noted, regulators have ratemaking tools at their disposal to mitigate overall rate volatility through

strategically managing the timing of rate changes so that rate changes in different directions from different sources offset, rather than enhance one another.[17]

The overall and across the board increase in rate volatility associated with fuel costs and storm recovery costs combined is a reflection of the limitations of ratemaking mechanisms for managing rate volatility associated with unpredictable risks. In other words, ratemaking tools, and the constraints under which they operate, only go so far in the face of factors that are inherently not controllable in the short term. The confluence of these uncontrollable factors: (i) natural gas cost volatility accompanied by very heavy natural gas reliance, and (ii) the risk of major storm damage from tropical systems, makes Florida electric customers uniquely vulnerable to rate volatility.

4. Projection of Future Natural Gas Generation Costs & Rate Impacts

4.1 Background on Forward Natural Gas Price Projections

As previously described, as of their 2025 Ten-Year Site Plan filings made in April 2025, all of the major Florida IOUs project declining levels of reliance on natural gas generation, to varying degrees (see Figure 1). On a broad level, if these projections are borne out, future electric rates would become less exposed to natural gas price volatility. However, this does not necessarily mean that the costs that customers pay for natural gas generation will decrease over time because natural gas prices may also increase over time.[18] Furthermore, there is a reasonable question of whether the declines in reliance on natural gas generation will actually occur consistent with the projections in the 2025 Ten-Year Site Plans. In this section, we evaluate how variations in future natural gas prices and utility reliance on natural gas generation would affect customer bills.

EQ Research developed a projection of future natural gas generation costs from 2025-2034 for each utility based on projections for: (i) natural gas prices, (ii) natural gas generation heat rates, and (iii) natural gas generation as a portion of a utility's energy generation mix. The natural gas price projections are based primarily on two scenarios from the U.S. Energy Information (EIA) 2025 Annual Energy Outlook (AEO), a Base Case scenario and a High Price scenario.[19] The

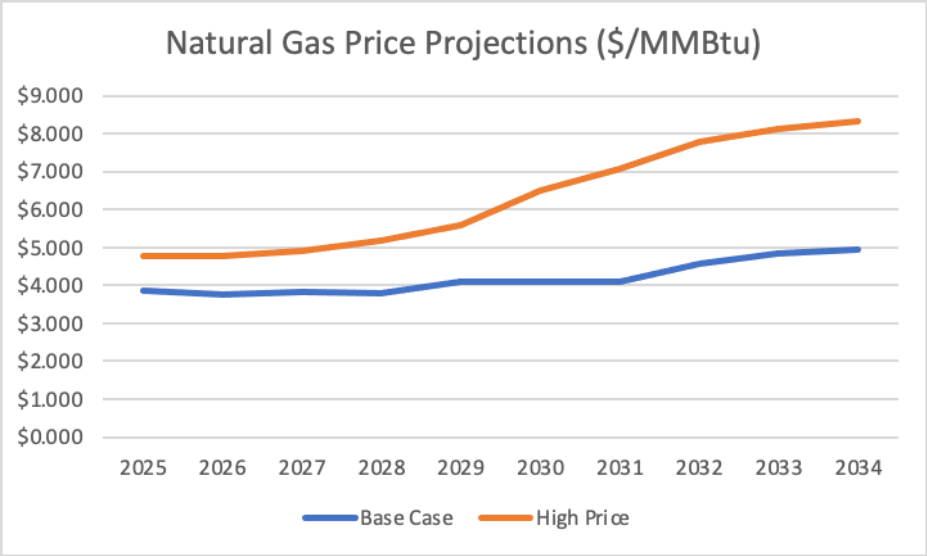
[17] It is also worth noting that the amounts for FPL and Gulf Power are affected by their merger and the timing of rate consolidation. Although the fuel rates for legacy service territories became aligned in January 2022, the storm recovery charges on customers within the two legacy service territories remained different until April 2023. This is a further example of regulator ratemaking discretion as an influence over rate volatility, although in this particular case the circumstances are unique.

[18] Improvements in the heat rate (Btu/kWh) of the natural gas generation fleet over time offset a portion of the upward rate pressure caused by natural gas price increases.

[19] Both scenarios use the AEO's South Atlantic regional projection for delivered natural gas prices for the electric power sector. The Base Case scenario uses the EIA Reference Case, while the High Price scenario uses the Low Oil and Natural Gas Supply Case. The source data tables are available at: https://www.eia.gov/outlooks/aeo/data/browser/#/?id=3-AEO2025&cases=ref2025&sourcekey=0

AEO values were adjusted slightly to reflect utility-specific differences in delivered natural gas costs.[20] Figure 9 shows both forward natural gas price curves.

Figure 9: Future Natural Gas Price Scenarios



Of course, there is considerable uncertainty associated with forward natural gas price projections. Average actual prices will deviate to some degree from any forward projection, and even if the actual average price over the entire reference period is reasonably close, history tells us that it is highly unlikely that the shape of the actual price curve will be as smooth as the projections. That is, even if the Base Case scenario proves to be accurate on average over the long term, prices during some years could be considerably higher, with offsetting lower price periods.

One particular area of uncertainty is to what degree increased electric demand from data centers will affect future natural gas prices. It is well-documented that numerous utilities in the South Atlantic region of the U.S. (e.g., Dominion Virginia, Duke Energy in the Carolinas, and Georgia Power) are projecting dramatic demand increases associated with new data center loads, and in many cases are planning new baseload natural gas generation to serve those new loads. The general dynamics of supply and demand dictate that those increased demands will drive up regional natural gas prices, and it is not clear to us to what degree those increased demands are incorporated into the AEO price projections. Although the 2025 AEO presents a relatively recent

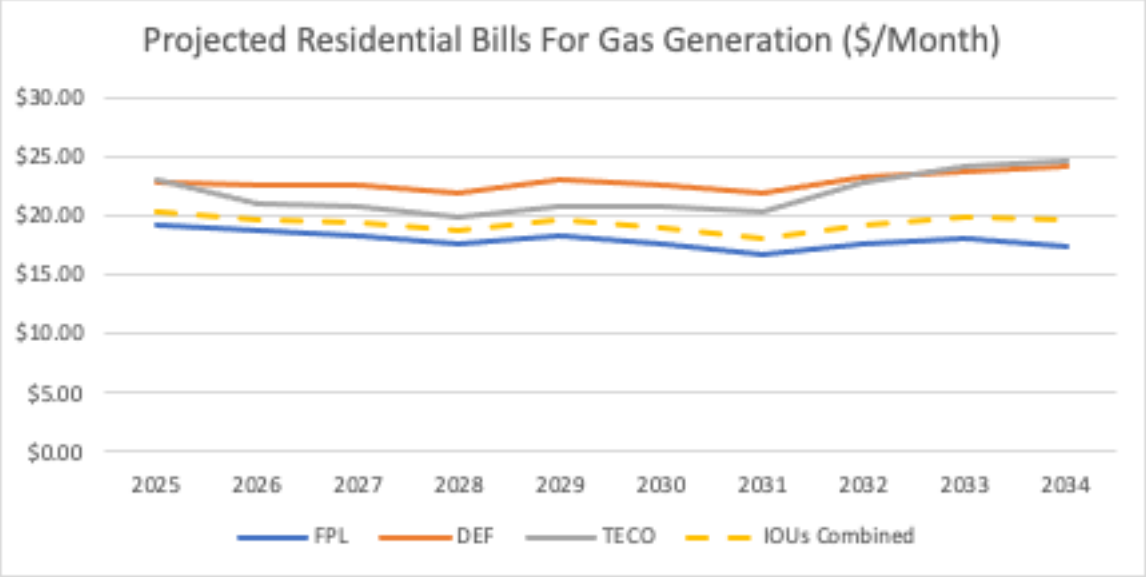
[20] The utility specific cost adjustment factors to the AEO South Atlantic forecast were roughly 1.08 for FPL and 1.01 for both DEF and TECO. The adjustment factors are based on each utility's actual natural gas costs during 2021, 2022, and 2024 compared to the historic average price data for those years reported in the AEO during the following year. Calendar year 2023 was not included because the EIA did not develop a 2024 AEO that reported actual 2023 price data and electric power sector natural gas price data for 2023 was not available from other sources. Appendix A contains further background information on how and why natural gas prices vary somewhat between the Florida IOUs.

projection, the utility resource planning landscape is evolving rapidly, and all signs point to higher expected electricity (and natural gas) demand than would have been apparent even during 2024. For that reason, there is good reason to expect that the 2025 AEO Base Case forecast may understate upward pressure on natural gas prices due to increased demand for natural gas used for electricity generation to serve new data center loads.[21]

4.2 Natural Gas Price Impacts on Customers (2025 Ten-Year Site Plan Scenario)

The 2025 Ten-Year Site Plan Scenario uses the IOUs' projected amounts of natural gas generation through 2034 as a base input for projecting costs and customer rate impacts.[22] Figure 10 shows the results of this forward projection in terms of the average monthly bill by year for a residential customer that uses 1,000 kWh/month for each IOU.[23] The amounts reflected in Figure 10 were developed by first calculating a utility's cost of natural gas generation ($/kWh) and then pro-rating that rate based on the projected percentage of the utility's resource mix sourced from natural gas generation.[24]

Figure 10: Future Residential Bill Impacts (Base Case - Ten-Year Site Plan Scenario)



[21] The 2025 AEO includes a scenario for high economic growth that we have not used in our analysis. However, that forecast scenario is based on Gross Domestic Product (GDP), a very generalized metric that does not necessarily capture the character of how new data center electricity demands could affect natural gas prices.

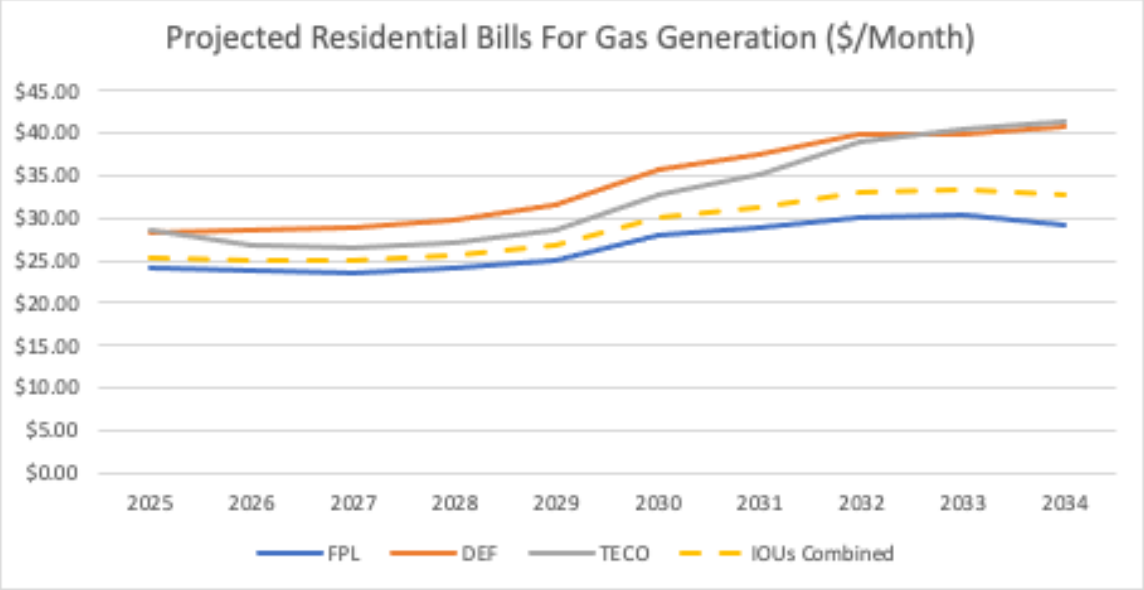
[22] All monetary values are stated in 2024 dollars consistent with how natural gas prices are stated in the 2025 AEO.

[23] This calculation uses the average cost of natural gas generation unadjusted for the tiered structure of the residential fuel charge. This reflects the fact that a customer with average usage of 1,000 kWh per month will have portion of their usage priced at the higher rate that applies to monthly usage greater than 1,000 kWh.

[24] The natural gas generation rate is not equivalent to a utility's fuel rate because natural gas does not make up 100% of a utility's energy mix. Pro-rating the natural gas generation rate by the percentage of generation sourced from natural gas approximates the portion of the fuel rate that is attributable to natural gas generation.

As illustrated in Figure 10, despite projected declines in reliance on natural gas generation over time based on the 2025 Ten-Year Site Plans, the trajectory of costs to customers is largely flat over time because lower amounts of natural gas generation and progressive heat rate improvements are offset by higher prices. Not surprisingly, FPL's lower reliance on natural gas generation at present and, as projected in the future, produces the lowest residential monthly bill. The High Price scenario changes the picture considerably. Figure 11 presents the same information as Figure 10, but uses the High Price natural gas price scenario.

Figure 11: Future Residential Bill Impacts (High Price - Ten-Year Site Plan Scenario)



In Figure 11, high natural gas prices, especially in the further future years (starting in roughly 2028) overshadow the moderate declines in natural gas reliance and modest efficiency improvements in the natural gas generation fleet. Furthermore, even though the upward trend only becomes more pronounced after 2028, monthly costs in the High Price scenario are on average roughly $5/month (25%) higher in 2025 to start with compared to the Base Case scenario.

Relative to the Base Case natural gas price scenario, the monthly bill increases indicated by the High Price scenario under the IOUs' forecasted natural gas generation penetration are as follows:

- FPL: $4.72/month in 2025, increasing to a maximum of $12.53/month in 2032, with slight declines through 2034 and an average of $8.74/month.
- DEF: $5.58/month in 2025, increasing to a maximum of $16.55/month in 2032, and flattening during 2033 and 2034 with an average of $11.28/month.
- TECO: $5.61/month in 2025, increasing to a maximum of $16.68/month in 2034, with an average of $10.84/month.

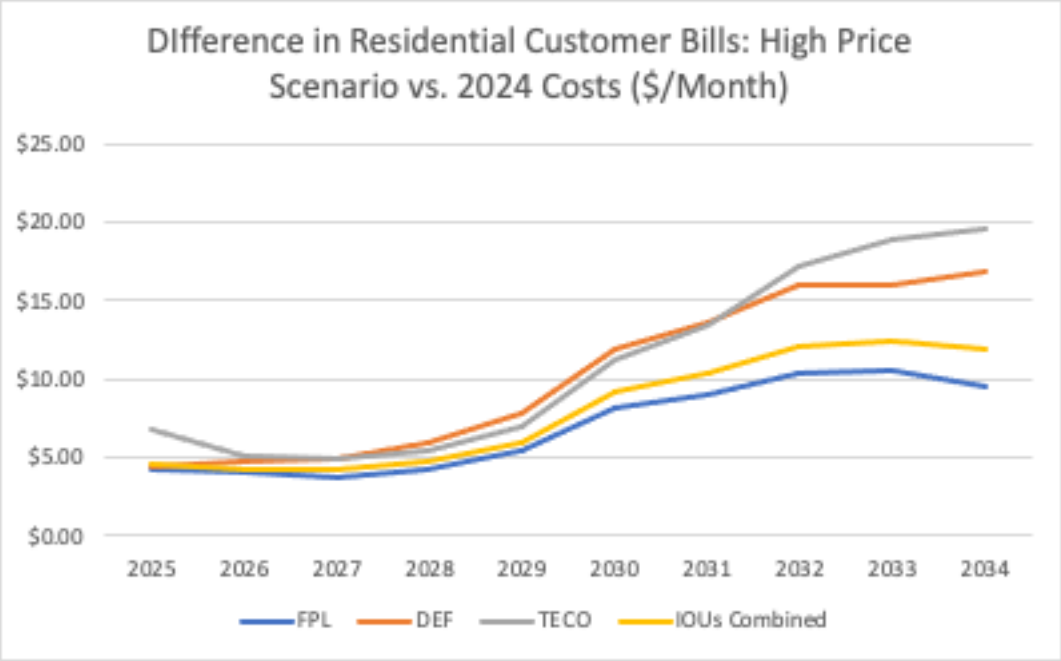
- IOUs Combined: $4.99/month in 2025, increasing to a maximum of $13.71/month in 2032, with slight declines through 2034 and an average of $9.47/month.

The IOUs Combined values related above are driven by FPL because FPL serves a disproportionately large amount of the total IOU load in Florida. The monthly bill impacts on a statewide basis are therefore just a somewhat diluted reflection of FPL/Gulf Power's relatively lower current and future reliance on natural gas generation as a portion of its resource mix.

On a broader level, the High Price scenario results in a roughly $21 billion increase in ratepayer costs from 2025-2034 relative to the Base Case scenario, approximately 50%. Of course, this total increase is not evenly distributed over time. The incremental total costs of the High Price scenario accelerate from approximately $1.05 billion in 2025 to a maximum of approximately $3.05 billion annually during 2032 - 2034. The flattening of the incremental cost curve associated with the High Price scenario from 2032 onward is attributable to a combination of gradual declines in reliance on natural gas in the utilities' generation mix projections and a flattening of the natural gas price differential between the Base Case and High Price gas price scenarios.

The cost impacts of the High Price natural gas price scenario can also be viewed from an alternative vantage point, the difference in costs compared to actual 2024 costs. This perspective, which could be viewed as a comparison to "current costs" (the most recent full calendar year), is shown in Figure 12 below.

Figure 12: High Price Scenario Impacts on Residential Customer Bills



The residential bill impacts of high natural gas prices shown in Figure 12 are fairly similar in magnitude and overall shape to the impacts of the High Price scenario as compared to the Base Case natural gas price scenario. This is because the Base Case scenario has a fairly flat price curve and actual 2024 prices were similar to the Base Case average. However, certain differences are apparent. Relative to a comparison to the Base Case scenario, a comparison using 2024 as a flat "base" produces: (i) lower incremental cost impacts for FPL and DEF on average and nearly all years, and (ii) a mixed result for TECO, with lower incremental cost impacts in most years, but significantly higher impacts from 2032 to 2034. The difference for TECO is caused by TECO's relatively lower 2024 natural gas costs and its flat, rather than downward, trajectory of natural gas reliance from 2031 onward.

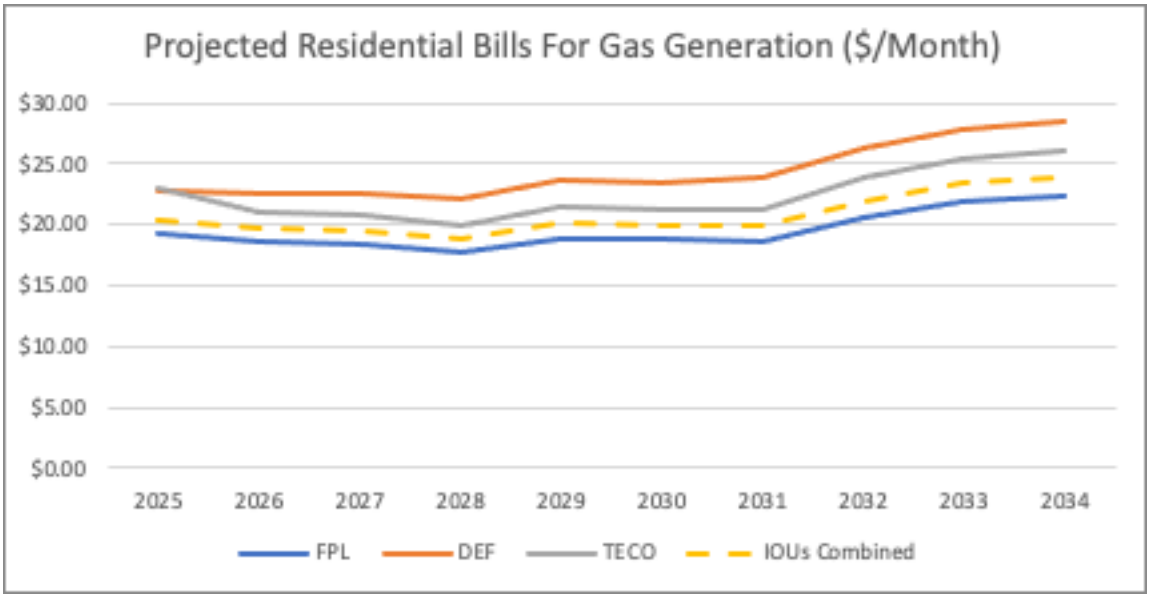
4.3 Natural Gas Price Impacts on Customers (High Gas Reliance Scenario)

In the High Gas Reliance Scenario, we evaluated how costs and rate impacts would differ if the general downward trajectory of natural gas reliance presented is slower over time. In this scenario, the projected amounts of natural gas generation for each utility were shifted higher starting in 2028 by applying a 50% adjustment to the YOY differences in projected natural gas generation (MWh). For instance, if a utility projected a reduction of 100 MWh in gas generation from one year to the next, that amount was reduced to 50 MWh, and if a utility projected an increase in gas generation of 100 MWh, that amount was increased to 150 MWh.[25] Calendar year 2028 was selected as the start year for this adjustment in order to reflect the fact that the near-term resource mix is largely a product of decisions that have already been made and generation projects (e.g., new natural gas and/or solar facilities) that are already underway.

Figure 13 shows the results of this alternative natural gas reliance scenario in terms of the monthly cost of natural gas generation to a residential customer that uses 1,000 kWh/month using the Base Case natural gas price projection. Figure 13 is the equivalent of Figure 10 but with the higher natural gas reliance assumption described above.

[25] Overall natural gas reliance still declines under this scenario for all utilities, just in lesser amounts than those projected in the 2025 Ten-Year Site Plans. In reality, changes in natural gas reliance may be lumpier in character than the smooth character shown by either the Ten-Year Site Plans or the High Gas Reliance Scenario.

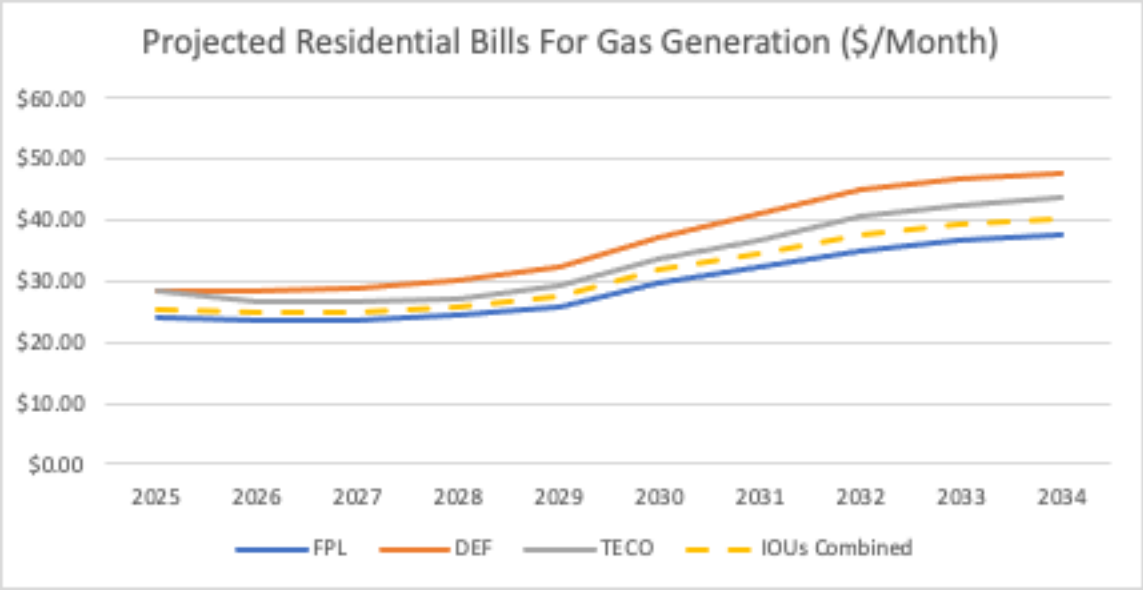
Figure 13: Future Residential Bill Impacts (Base Case - High Gas Reliance Scenario)



In contrast to Figure 10, Figure 13 shows an upward trend in monthly costs for a typical residential customer, as the smaller reduction in natural gas reliance offsets less of the upward cost pressure produced by higher natural gas prices. In 2034, the monthly cost of natural gas generation under the High Gas Reliance Scenario is $4.84 higher for FPL, $4.24 higher for DEF, and $1.50 higher for TECO, with a weighted statewide average of $4.32. FPL shows the largest difference primarily because its 2025 Ten-Year Site Plan plotted the most aggressive reduction in natural gas generation from 2027 onward. Conversely, TECO's plan was the least aggressive, so the effect of the natural gas generation adjustment was lower. In fact, the adjustment method results in DEF and TECO switching places in terms of relative reliance on natural gas in 2034. This result may seem counterintuitive, but it makes sense from the standpoint that DEF's (and FPL's) projections require greater change from the status quo than TECO's. Therefore, there is greater downside risk for FPL and DEF customers should those changes proceed at a slower rate.

Applying the High Price natural gas scenario and the High Gas Reliance scenario together results in higher cost increase than either alone, as shown in Figure 14.

Figure 14: Future Residential Bill Impacts (High Price - High Gas Reliance Scenario)



For the reasons discussed above, the effects are more pronounced for FPL and DEF than TECO. The statewide incremental costs of the High Price and High Gas Reliance scenarios together relative to the Base Case scenarios rises to $3.85 billion in 2034, and totals $23.6 billion for 2025-2034. This amounts to an increase of roughly $0.8 billion in 2034 and $2.6 billion over the entire 2025-2034 period as compared to the High Price scenario and 2025 Ten-Year Site Plan natural gas reliance scenario.

Relative to the Base Case natural gas price and natural gas reliance scenarios, the monthly bill increases indicated by the High Price and High Gas Reliance scenarios together are as follows:

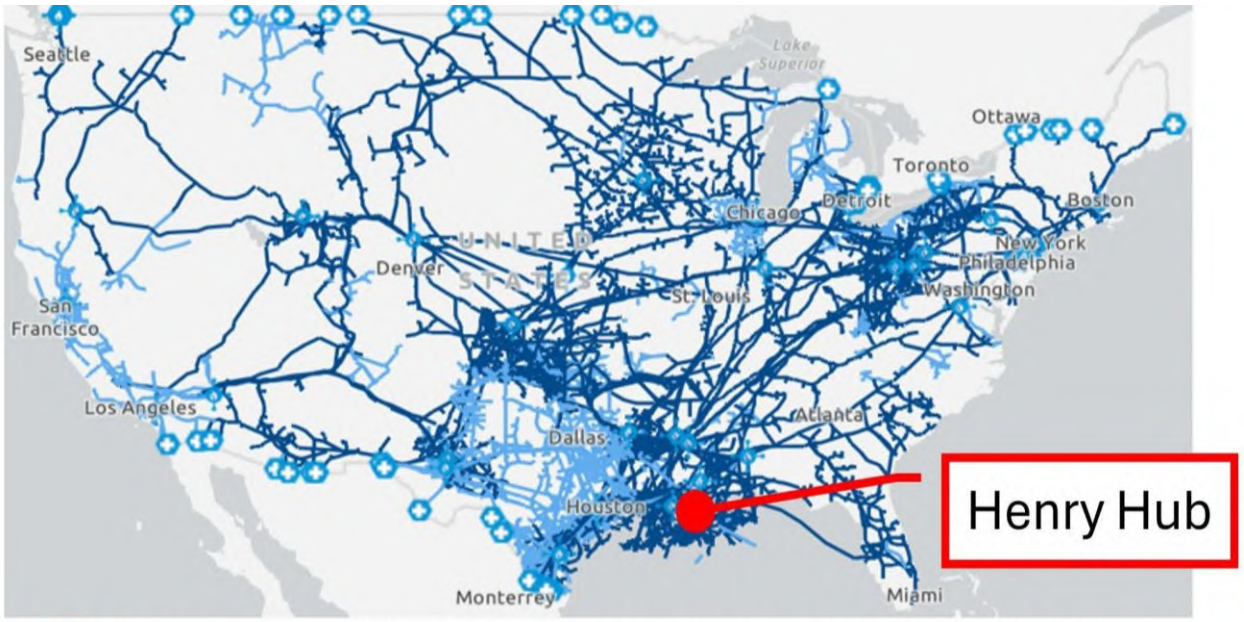
- FPL: A maximum of $18.41/month in 2034, with an average of $11.34/month.
- DEF: A maximum of $23.55/month in 2034, with an average of $13.77/month.
- TECO: A maximum of $19.20/month in 2034, with an average of $11.80/month.
- IOUs Combined: A maximum of $20.51/month in 2034, with an average of $11.86/month.

Appendix A Natural Gas Pricing and Transmission Costs

The commodity portion of natural gas prices is fundamentally the same for all Florida electric utilities because they all have access to the same commodity markets. However, the full price that a given utility pays will differ due to: (i) their contracting practices (e.g., futures, forwards, options, etc.), and (ii)) the transmission and distribution costs associated with the natural gas infrastructure necessary to deliver the fuel to their electric generating facilities, a price factor largely dictated by location

Natural gas prices in North America are based primarily on the Henry Hub price which is for delivery of natural gas at the physical Henry Hub located in Louisiana.[26] The price for retail consumers of natural gas, including electric utilities, includes gas transmission costs charged by interstate pipeline companies as well as gas distribution costs charged by local distribution companies.

Figure A-1: U.S. Natural Gas Pipelines



Source: U.S. Energy Information Administration, U.S. Energy Atlas, January 29, 2024
Note: Light-blue lines are intrastate pipelines, dark-blue lines are interstate pipelines, and + are border crossings.

Florida receives natural gas from the following five interstate pipelines, as shown in Figure A-2.[27]

- Florida Gas Trans Co. - 3,235 MMcfd through Alabama;

[26] The Henry Hub is a physical delivery point for natural gas located near Erath, Louisiana and is the official delivery point for settlement on the New York Mercantile Exchange (NYMEX). *See,* for example: https://www.investopedia.com/terms/h/henry_hub.asp and https://www.cmegroup.com/markets/energy/natural-gas/natural-gas.contractSpecs.html

[27] U.S. EIA. Natural Gas. https://www.eia.gov/naturalgas/data.cfm#pipelines

- Gulf South Pipeline Co. - 190 MMcfd through Alabama;
- Gulfstream Natural Gas System (via the Gulf of Mexico) - 1,435 MMcfd through the Gulf, but classified as through Alabama;
- Sabal Trail - 1,052 MMcfd through Georgia; and
- Southern Natural Gas Co. - 646 MMcfd through Georgia.

Each interstate pipeline has its own FERC-approved tariff and pipeline-specific natural gas transmission costs, which results in differences in delivered natural gas costs at the utility level depending on source of their supply. Those sources are in turn determined by the location of a utility's natural gas generation units in relation to pipelines. Figure A-2 shows the paths of individual gas transmission lines.

Figure A-2: Major Natural Gas Pipelines Serving Florida

Based on this map in relation to utility service territories, it is likely that FPL's Northwest division - formerly Gulf Power - receives natural gas from the Gulf South pipeline while FPL's Southern Florida generating facilities likely receive natural gas via the Sabal Trail and Florida Gas Transmission pipelines. TECO is likely served mostly or entirely by the Gulfstream pipeline, and DEF likely has a mix of natural gas supply from the Gulfstream and Florida Gas Transmission pipelines.

As discussed in the body of this report, EQ Research developed a delivered price differential between the utilities based on the difference between the natural gas prices reported in their monthly fuel reports and the U.S. EIA's reporting of historic annual natural gas prices for electric power generation in the South Atlantic region. This method for establishing utility-differentiated prices was selected in order to align with the use of the U.S. EIA's South Atlantic region natural gas price projections for estimating future natural gas generation costs. The result showed slight premiums over the EIA-reported prices for TECO and DEF, with TECO having the lowest average premium, and a somewhat larger premium for FPL.

One alternative to this approach that was also explored, but ultimately not selected, was basing the differential on the spread between the Henry Hub spot market price and the total delivered natural gas prices as reported by the utilities. This difference represents the interstate transmission costs of natural gas for each electric utility, as well as any variations that may exist between their purchasing practices. Table A-1 shows the results of this comparison from January 2017 to May 2025.

Table A-1: Actual Utility Natural Gas Prices vs. Henry Hub Prices ($/MMBtu)

Pricing Metric	FPL	DEF	TECO
Average Price Premium	$1.60	$1.49	$1.17
Median Price Premium	$1.49	$1.38	$1.06
Standard Deviation	$0.59	$0.62	$0.64

As shown in Table A-1, TECO has the lowest interstate transmission costs, while FPL has the highest. It seems likely that FPL's higher costs stem from its reliance on the Sabal Trail pipeline, which entered service in 2017 and increased its capacity in 2020. That timing coincided with increases in the difference between the Henry Hub price and Florida citygate natural gas prices. The results shown in Table A-1 are mostly consistent with the delivery premiums that were arrived at using a comparison to EIA South Atlantic prices, with the exception that the EIA price comparison placed DEF closer to TECO than FPL in terms of delivered costs. This is likely an artifact of the different time horizons used in each comparison.

Appendix B Additional Figures

Figure B-1 (YOY Variation in Residential Fuel Costs – Inflation Adjusted Variation)

Figure B-1 presents a variation on Figure 8 that shows dollar values adjusted to January 2025 real dollars. The source values for Figure B-1 were developed using monthly Consumer Price Index inflation adjustments applied to each utility's monthly fuel rate, which, as in Figure 8, was scaled to customer usage of 1,000 kWh during a given month. As shown in Figure 8, the yearly oscillations for FPL and Gulf Power have a generally narrower range and lower average annual variation for FPL and Gulf Power as compared to DEF and TECO regardless of whether costs are measured in terms of nominal or real dollars.

Figure B-1: YOY Variation in Residential Fuel Costs (Inflation-Adjusted)

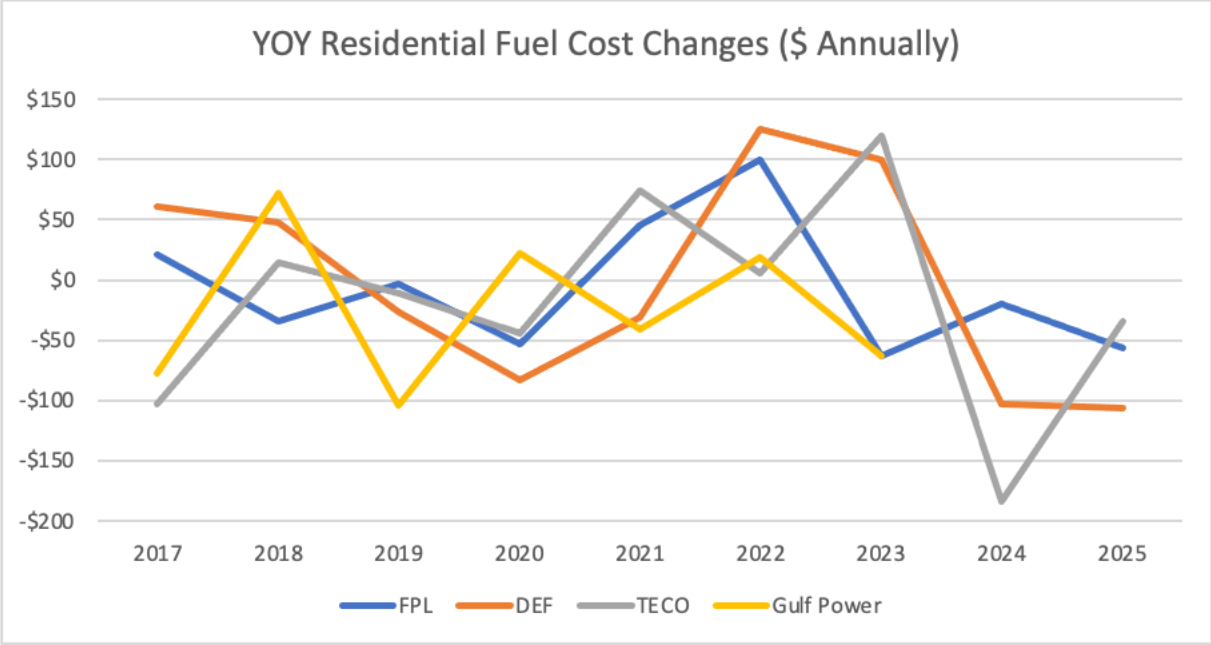


Figure B-2 (Base Case and High Price Percentage Difference)

Figure B-2 shows how the High Price natural gas price scenario affects customer bills as measured by the percentage increase above the Base Case natural gas price scenario, which is identical to the percentage difference between the natural gas price scenarios each year. The percentage increase is a common value across all utilities each year because the High Price scenario changes only the natural gas price input and leaves the remaining inputs unchanged.

Figure B-2: Residential Bill Impacts Under High Price Scenario

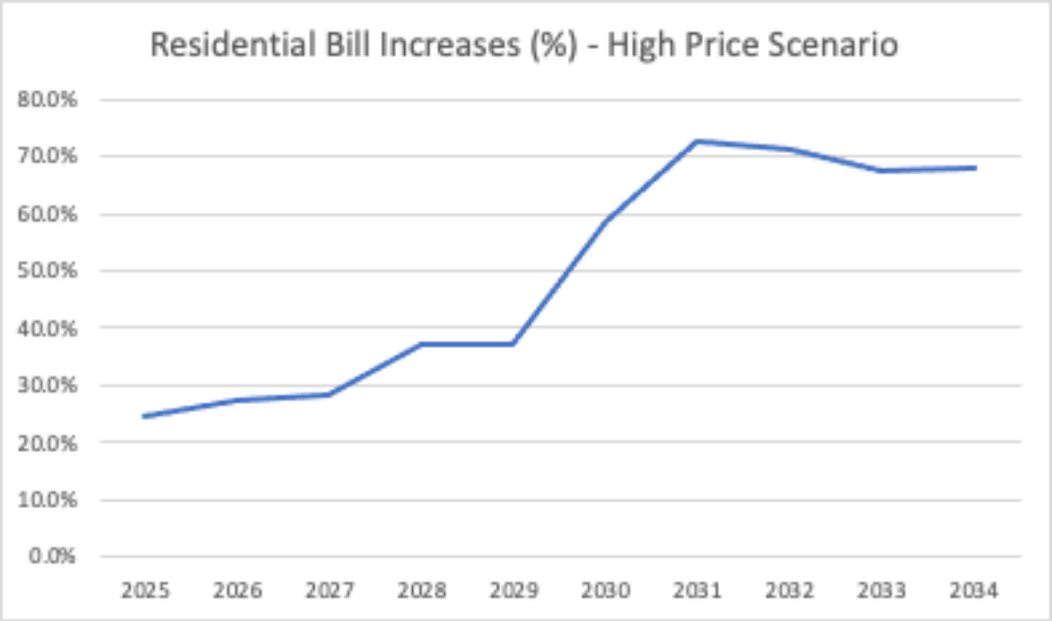

Figure B-3 (Base Case and High Price Cost Comparison – 2025 Ten-Year Site Plan Scenario)
Figure B-3 presents the same data shown in Figures 10 and 11 in a combined graphic. It provides a side-by-side comparison of the monthly costs of natural gas generation under the 2025 Ten-Year Site Plan natural gas reliance scenario for the Base Case and High Price natural gas price scenarios. The 2025 difference in costs is more obvious in Figure B-3 than it is in Figure 11, which shows the High Price scenario by itself.

Figure B-3: Comparison of Base Case & High Price Scenario (2025 Ten-Year Site Plans)

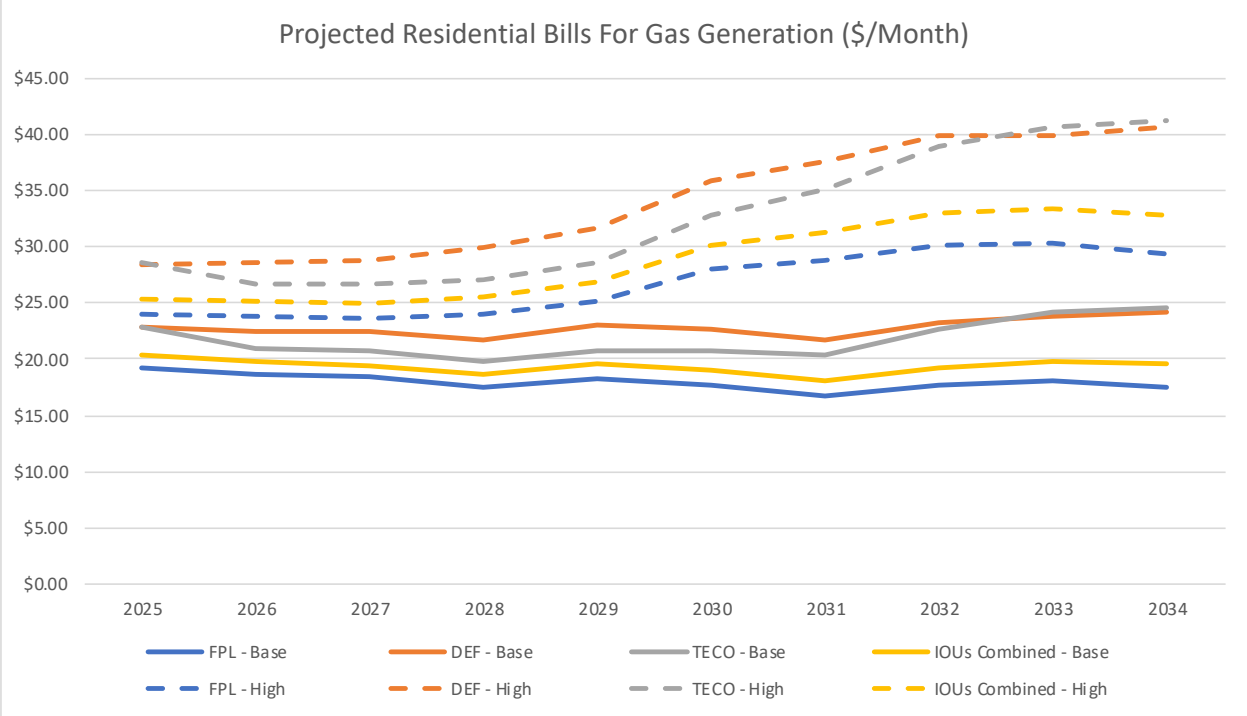

Figure B-4 (Base Case and High Price Cost Comparison – High Gas Reliance Scenario)

Figure B-4 presents the same data shown in Figures 13 and 14 in a combined graphic, providing the same side-by-side comparison shown in Figure B-2 but using the High Gas Reliance scenario rather than the 2025 Ten-Year Site Plan gas reliance scenario. The smoothness of the cost curves in Figure B-4 compared to Figure B-3 is a product of the smoother trajectory of natural gas reliance that results from the method of adjusting future gas reliance projections.

I. INTRODUCTION AND WITNESS IDENTIFICATION

Q: Please state your name, employer, title, and business address.

A: My name is Rao Konidena. I am the President of Rakon Energy LLC, which I own and operate. My business address is Rakon Energy LLC, 2309 Auerbach St, Roseville, MN 55113.

Q: On whose behalf are you testifying in this proceeding?

A: I am testifying on behalf of the Environmental Defense Fund, Inc. and the Citizens Utility Board.

Q: Please describe your current position and provide your educational and professional experience related to this testimony.

A: I have been an independent energy consultant for over five years, primarily focusing on Regional Transmission Organization practices and policy. I worked in Transmission Asset Management at Midcontinent Independent System Operator ("MISO"), from September 2003 to May 2018. I started as an Applications Engineer for Planning, where I ran Loss of Load Expectation ("LOLE") studies, Capacity Benefit Margin ("CBM") calculations, and Load Deliverability analyses for the MISO Transmission Expansion Plan ("MTEP").

I was later promoted to Lead of Resource Forecasting in 2006, where I was responsible for a team of engineers running capacity forecasting. That forecasting work is incorporated in the MTEP non-transmission alternatives section. After a promotion to Manager of Resource Forecasting in 2009, I led Demand Response and Energy Efficiency forecasting for the MTEP.

I worked in compliance, process, and project management for the Transmission Asset Management ("TAM") division as Senior Manager of TAM Operations from 2013

to 2015. In this role, my team and I were responsible for division-wide financial and strategic planning, supporting corporate planning and compliance efforts. I came back to the Policy Studies department in the Principal Policy Advisor role for MISO in 2015, leading the long-term load forecasting project with Purdue University's State Utility Forecasting Group. I also led an iteration of Applied Energy Group's demand response ("DR"), energy efficiency ("EE") and distributed generation ("DG") potential study at MISO. Applied Energy Group was hired by MISO to estimate the amount of DR, EE and DG available in MISO Local Resource Zones for inclusion in MTEP.

Before leaving MISO in 2018, I led policy efforts on energy storage and distributed energy resources within economic transmission planning. I presented to state commissions within the MISO footprint, including the Iowa Utilities Board, the South Dakota Public Utilities Commission, and the Organization of MISO States.

I received a Bachelor of Engineering in Electrical and Electronics Engineering from Bangalore University, a Master of Science in Electrical Engineering from the University of Texas at Arlington, and a Master of Business Administration from the University of Minnesota. My qualifications and experience are further detailed in my resume provided as CUB-EDF Exhibit 1.01.

Q: Have you previously testified before the Illinois Commerce Commission ("Commission") or public utility commissions in other states?

A: Yes, I have previously testified before the Commission in Docket No. 23-0658 regarding the Ameren Illinois Company d/b/a Ameren Illinois and Ameren Transmission Company of Illinois - Joint Petition for a Certificate of Public Convenience and Necessity, pursuant to Section 8-406 of the Illinois Public Utilities Act, Orders pursuant to Section 8-503 of the

Public Utilities Act, and related relief to Construct, Operate and Maintain a High Voltage Electric Service Line and Related Facilities in Jefferson County and Wayne County, Illinois.

Additionally, as an independent consultant, I have submitted direct testimonies on behalf of my clients at the Public Service Commission of Wisconsin (Transmission Line Certificate of Public Convenience & Need docket), Public Utilities Commission of Nevada (Integrated Resource Planning docket), Minnesota Public Utilities Commission (Aggregator of Retail Customer docket), Kansas Corporation Commission (Demand Response Aggregator docket), California Public Utilities Commission (Diablo Canyon Power Plant extension docket and Application of Pacific Gas and Electric Company to Recover in Customer Rates the Costs to Support Extended Operation of Diablo Canyon Power Plant docket), North Carolina Utilities Commission (Duke Energy Carolinas General Rate Case and Duke Energy Carolinas Carbon Plan Integrated Resource Plan), Pennsylvania Public Utilities Commission (Transmission Line rebuild Letter Of Notification docket and First Energy Pennsylvania Base Rate Case), Maryland Public Service Commission (Transmission Line Certification of Public Convenience And Necessity docket), and Massachusetts Department of Public Utilities (Eversource, National Grid and Unitil Energy Storage Tariffs). *See* CUB-EDF Exhibit 1.01.

II. SUMMARY OF TESTIMONY

Q: Please summarize your testimony.

A: My testimony demonstrates the potential for Grid Enhancing Technologies ("GETs") to provide cost-effective increases in transmission capacity in the area served by the Central Illinois Grid Transformation Program. GETs are hardware and software technologies that

increase the capacity and efficiency of existing transmission infrastructure. GETs can be deployed as alternatives to new transmission line segments or in conjunction with new transmission lines proposed as part of the Program. When co-located with existing transmission lines, GETs can provide resiliency benefits and minimize landowner impacts.

My testimony considers the four most widely analyzed GETs: Dynamic Line Ratings, Advanced Power Flow Controllers, Topology Optimization, and Reconductoring. Since the Joint Applicants included reconductoring for existing 345 kV circuits in the Program design, my testimony focuses on reconductoring on existing 138 kV and 161 kV circuits. Finally, my testimony provides illustrative estimates of the costs of these technologies in the context of the Central Illinois Grid Transformation Program.

Q: Are you sponsoring any exhibits with your testimony?

A: Yes, I am sponsoring:

III. PROJECT DESCRIPTION

Q: Please provide a brief description of the Central Illinois Grid Transformation Program.

A: The Central Illinois Grid Transformation Program ("Program") is part of the MISO Long Range Transmission Plan ("LRTP") Tranche 1 Portfolio. Specifically, the Program is the Illinois portion of Tranche 1 "Ameren transmission-owning utilities in Illinois are obligated to implement."[1]

MISO LRTP Tranche 1 Portfolio is the first portfolio of projects approved by the MISO Board in July 2022.[2] There are 4 Tranches in total. Tranches 1 and 2 are focused on the MISO Midwest Subregion. Since Illinois is part of the MISO Midwest Subregion, Illinois has Multi Value Projects ("MVPs") in Tranches 1 and 2.

MISO's MVPs are regional transmission solutions that are eligible for regional/subregional cost sharing and support one or more of the following three goals:

- Reliably and economically enable regional public policy needs
- Provide multiple types of regional economic value
- Provide a combination of regional reliability and economic value.[3]

MISO's Board is scheduled to approve LRTP Tranche 2 Portfolio in December 2024. Tranche 3 is focused on the MISO South region and Tranche 4 is focused on the MISO North-South transmission interface limit.[4]

[1] Ameren Exhibit 3.0 at 33:622-23.
[2] "MISO Board Approves $10.3B in Transmission Projects Tranche 1 Portfolio Focused on Midwest Subregion" July 25, 2022, available at https://www.misoenergy.org/meet-miso/media-center/2022/miso-board-approves-$10.3-in-transmission-projects.
[3] https://www.misoenergy.org/planning/multi-value-projects-mvps/#t=10&p=0&s=Updated&sd=desc.
[4] https://www.misoenergy.org/planning/long-range-transmission-planning/.

Tranche 1 is needed "to help to ensure a reliable, resilient, and cost-effective transmission system as the resource mix continues to change in MISO's footprint over the next 20 years."[5] Tranche 1 Portfolio is comprised of 18 Multi Value Projects that must be considered in "aggregate" not "individually."[6] MISO considers LRTP Tranche 1 Portfolio as "least regrets" suggesting that MISO and MISO Transmission Owners should have the least amount of regret approving and constructing the Multi Value Projects in the Tranche 1 Portfolio because Tranche 1 represents transmission projects "to meet the increasing renewable penetration levels and electrification growth expected within the MISO region in the future."[7]

The Program is proposed by the Ameren Transmission Company of Illinois ("ATXI") and Ameren Illinois Company d/b/a Ameren Illinois, collectively referred to as the "Joint Applicants."[8]

The Program consists of MISO Multi Value Project numbers 11, 13, 14 and 15 in LRTP Tranche 1 because "[t]he Joint Applicants are responsible for implementing portions of MVPs 11, 13, 14, and 15 located in Illinois."[9] The Program consists of 380 miles of upgrades to existing transmission lines, new transmission lines and new substations.[10] It is "broken down into nine transmission line segments that are separated by eight substation projects."[11]

The nine transmission line segments are:[12]

[5] Ameren Exhibit 3.0 at 23:441-42.

3. Mapleridge to Tazewell
4. Tazewell to Radbourn
5. Radbourn to Plackett
6. Plackett (south) to Sidney
7. Plackett (north) to Crossbuck
8. Crossbuck to Illinois/Indiana border (to Morrison Ditch in Indiana)
9. Missouri/Illinois border (from Maywood in Missouri) to Meredosia

The eight substation projects are:[13]

1. Ipava
2. Mapleridge
3. Tazewell
4. Radbourn (new)
5. Plackett (new)
6. Sidney
7. Crossbuck (new)
8. Meredosia

The Program has two corridors.[14] The northern corridor starts at the Iowa/Illinois border (from Skunk River in Iowa) to Ipava and ends at the Crossbuck to Illinois/Indiana

[13] *Id.* at 6:122-7:130.
[14] *Id*. at 14:284-85.

142 border (to Morrison Ditch in Indiana). The southern corridor starts at the Missouri/Illinois
143 border (from Maywood in Missouri) and ends at the Meredosia substation.[15]

144 **Q: Please provide a table showing the number of miles proposed by the Joint Applicants**
145 **in each of the nine transmission line segments.**

146 A: The Joint Applicants state that the total number of miles in the Program is 380. However,
147 according to my analysis based on Mr. Johnson's direct testimony, I only have a total of
148 356.4 miles, as seen below.

149 ***Table 1 - Number of Miles in each Transmission Line Segment***

Transmission Line Segment	Miles
1. Iowa/Illinois border (from Skunk River in Iowa) to Ipava	65
2. Ipava to Mapleridge	40.3
3. Mapleridge to Tazewell	14.5
4. Tazewell to Radbourn	48.2
5. Radbourn to Plackett	45
6. Plackett (south) to Sidney	33
7. Plackett (north) to Crossbuck	21.1
8. Crossbuck to Illinois/Indiana border (to Morrison Ditch in Indiana)	28.3
9. Missouri/Illinois border (from Maywood in Missouri) to Meredosia	61
Total	356.4

150 **Q: Why are the Joint Applicants proposing this Program?**

151 A: The Joint Applicants are proposing this Program because of MISO's LRTP Tranche 1
152 Portfolio, which seeks to add transmission capacity to the grid in Illinois to meet the
153 renewable energy goals of states and utilities in the MISO Midwest Subregion. "MISO
154 determined that the LRTP Tranche 1 Portfolio prevents numerous thermal and voltage
155 reliability issues arising under Future 1 so that the MISO transmission grid can continue to
156 reliably deliver energy from current and future generation resources to future load under a

[15] *Id.* at 14:285-15:303.

range of projected system conditions associated with Future 1 in the 10-year and 20-year time horizons..[16] MISO's LRTP Tranche 1 Portfolio is based on MISO's Future 1 model, which assumes "emissions decline as an outcome of utility plans and load growth consistent with trends and includes a 40% carbon emissions reduction target from 2005 baseline by 2040."[17]

Q: Please describe MISO's Future 1 model.

A: MISO is a Federal Energy Regulatory Commission (FERC) approved Regional Transmission Organization (RTO). As part of the RTO responsibilities, MISO must put together a comprehensive transmission expansion plan. This transmission expansion plan includes both MISO directed regional plans and MISO Transmission Owner directed local plans. MISO LRTP Tranches 1 through 4 fall under the regional plan category.

MISO's Future 1 model serves as the basis for LRTP Tranche 1 Portfolio. MISO has three models: Future 1, Future 2 and Future 3. Since MISO cannot predict the future in terms of load growth, generator retirements and additions, MISO takes this Future model approach towards long term (20-years: 2020-2040) transmission planning.

MISO built these Future 1, 2 and 3 models to analyze the amount of transmission portfolio of projects needed to meet MISO utility member plans and MISO state renewable portfolio standards and carbon goals. For example, MISO varied the generator retirements and additions in Futures 1 through 3. Future 1 had modeled 121 GWs of generator additions and 77 GWs of retirements. Future 2 progressed to 170 GWs of generator additions and 80

[16] Ameren Exhibit 3.0 at 26:476-80.
[17] *Id.* at 17:339-41.

GWs of retirements. Finally, Future 3 models 306 GWs of generator additions and 112 GWs of retirements.[18]

The Compound Annual Growth Rate assumed for energy is 0.5% in Future 1, 1.1% in Future 2 and 1.7% in Future 3. Future 1 is the basis for the Tranche 1 Portfolio because MISO is aiming for the "least regrets" regional transmission expansion plan. At a minimum, MISO expects 0.5% annual energy growth rate and 121 GWs of generator additions and 77 GWs of retirements leading to MISO footprint wide carbon reduction of 40% by 2040.[19] In Futures 2 and 3, the footprint wide carbon reductions are 60% and 80% respectively.[20]

Q: How much will this Program cost?

A: According to the Joint Applicants estimate, the total cost of the Program is $1.291 Billion.[21] The Joint Applicants state that since the Program is part of the regional transmission expansion plan, approximately 8.87% of $1.291 Billion, $114,511,700, is paid by Illinois customers and customers across the MISO Midwest Subregion pay the remainder.[22]

Q: How much renewable generation capacity does the Program support in Illinois?

A: Mr. Dodd states that "[o]f the capacity supported by the LRTP Tranche 1 Portfolio, 3,034 MW is in Illinois and the surrounding region, MISO's Local Resource Zone 4."[23] In response to a data request, both MISO and the Joint Applicants state that this renewable generation capacity is not tied to MISO's Generator Interconnection Queue.[24,25] If Illinois

[18] CUB-EDF Exhibit 1.03 at 4.
[19] *Id.* at 4.
[20] *Id.* at 5-6.
[21] Ameren Exhibit 1.0 at 17:344-45.
[22] *Id.* at 17:354-57.
[23] Ameren Exhibit 3.0 at 27:493-95.
[24] Joint Applicant's Response to CUB-EDF Data Request 1.02.
[25] MISO Response to CUB/EDF-MISO Data Request 1.2.

is paying $114,511,700 in transmission costs for integrating 3,034 MW of renewable generation capacity, then the cost per MW is $37,742.81. On a per kW basis, this transmission interconnection cost is $38, which is reasonable because the average interconnection cost for completed renewable projects at MISO was $102/kW from 2019 to 2022.[26]

For comparison, while GETs could not replace the entire Project, even if the Joint Applicants deployed grid enhancing technologies at a total cost estimate of $19,047,336 (8.87% of $214.738 Million) on existing transmission lines as I suggest later in my testimony, the estimated cost per kW of integrating 3,034 MW of renewable generation capacity to Illinois customers is $6/kW. But it is unlikely that all of the grid enhancing technologies need to be deployed. Hence, the cost would be less than $6/kW, suggesting that where GETs could be deployed, they could result in cost savings. A cost comparison for individual technologies including battery energy storage systems is shown below:

Table 2 - Estimated Costs of deploying GETs and BESS for integrating 3,034 MW of Renewables

Cost Estimates	Total Costs	Total Cost/kW	Costs to IL	Costs to IL/kW
Dynamic Line Ratings	$4,545,400	$1	$403,177	$0
Advanced Power Flow Controllers	$6,779,655	$2	$601,355	$0
Reconductoring	$202,800,000	$67	$17,988,360	$6
Topology Optimization	$1,500,000	$0	$133,050	$0
Total Grid Enhancing Technology Estimate	$215,625,055	$71	$19,125,942	$6
Battery Energy Storage System	906,912,000	$299	$80,443,094	$27
Central Illinois Grid Transformation Program	$1,291,000,000	$426	$114,511,700	$38

[26] CUB-EDF Exhibit 1.04 at 1 ("Costs averaged $102/kW for complete projects from 2019 through 2021.").

Q: Do you agree with the Joint Applicants' position on the reliability need of the Program?

A: I agree that there is a need to upgrade existing transmission lines and build new ones to support the renewable energy goals of states and utilities in the MISO Midwest Subregion. However, Joint Applicants have not demonstrated that they or MISO have thoroughly considered non-transmission alternatives, such as battery energy storage systems or grid-enhancing technologies like dynamic line ratings. While the reliability need for the Program is evident, the Joint Applicants have not established that this Program offers the most cost-effective or least-cost solution to meet that need.

Q: How did the Joint Applicants respond to your efforts to understand the basis for the Program?

A: The Joint Applicants state that the "Central Illinois Grid Transformation Program resulted from MISO-driven, rather than Ameren-driven, planning initiatives."[27]

Since one of the requirements for MVP designation is that "the project must address at least one transmission issue associated with a projected violation of a NERC or regional entity standard," the Joint Applicants were asked to show "the referenced projected violation of a NERC or regional entity standard for each transmission line in the 'Program.'"[28,29] The Joint Applicants' response stated that they understood that "MISO studied the Multi-Value Projects comprising the LRTP Tranche 1 portfolio, and the portfolio, as a whole."[30]

[27] CUB-EDF Exhibit 1.02 at 1 (Joint Applicants Response to CUB-EDF 1.05).
[28] Ameren Exhibit 3.0 at 31:578-79.
[29] CUB-EDF's Data Request 1.04.
[30] *Id*.

The Joint Applicants were asked under which of MISO's models were potential transmission solutions studied "that would reduce loadings compared to MISO's initially proposed transmission expansion plan."[31] The Joint Applicants responded that they "relied on Load Flow and Economic models that were published by MISO and made available to stakeholders during the LRTP Tranche 1 planning processes generally described by Mr. Davies in Ameren Exhibit 5.0."[32]

Finally, to support the Program's needs, the Joint Applicants shared the confidential and proprietary list of proposed solutions submitted to MISO.[33]

Q: How does the MISO LRTP Tranche 1 Portfolio provide reliability benefits to the Midwest Subregion?

A: According to MISO, Tranche 1 Portfolio addresses the following reliability issues in the Midwest Subregion:

- MISO conducted a reliability analysis without the LRTP Tranche 1 Portfolio for Future 1 10-year out and 20-year out models and found "numerous thermal and voltage violations throughout the Midwest Subregion."[34] With the addition of LRTP projects, MISO mitigated those thermal and voltage violations.
- MISO conducted a transfer analysis "to assess transfer capability and identify limiting constraints to be addressed to assess effectiveness of projects under broader future assumptions."[35] MISO found improvements in transfer

[35] *Id*.

capability throughout the Midwest Subregion with the addition of the LRTP Tranche 1 Portfolio.

Q: How does the MISO LRTP Tranche 1 Portfolio provide economic benefits to the Midwest Subregion?

A: According to MISO, LRTP Tranche 1 Portfolio provides the following economic benefits to the Midwest Subregion:

1. Congestion and Fuel cost savings: The LRTP Tranche 1 Portfolio provides access to low fuel cost resources such as renewables and reduces transmission congestion. MISO estimates this benefit to be between $13.1 Billion and $19.8 Billion, depending on a 20-year Present Value or a 40-year Present Value, at a 6.9% discount rate.[36]

2. Avoided capital costs of local resource investment: The LRTP Tranche 1 Portfolio optimizes the location of renewable resources across the region instead of each utility. MISO estimates this benefit is $17.5 Billion.

3. Avoided future transmission investment: The LRTP Tranche 1 Portfolio "provides a regional solution to addressing the future energy needs rather than an incremental approach to reliability planning."[37] MISO estimates this benefit between $1.3 Billion and $1.9 Billion.[38]

4. Reduced resource adequacy requirements: The LRTP Tranche 1 Portfolio provides reduced resource adequacy requirements through increased transfer capability and reduced need for local capacity within each resource adequacy zone

[36] *Id.* at 50.
[37] *Id*. 54.
[38] *Id.* at 55.

(called Local Resource Zone). MISO estimates this benefit between $624 and $893 Million.[39]

5. Avoided risk of load shedding: The LRTP Tranche 1 Portfolio reduces the risk of loss of load during extreme weather events and provides resiliency, which is the ability of the transmission system to bounce back from an outage. MISO estimates this benefit to be between $1.2 Billion and $11.6 Billion.[40] MISO states that this benefit estimate range is wider because it estimates the Value of Lost Load (VOLL), which is how much the customer is willing to pay without losing power, at $3,500 per MWh, but the Independent Market Monitor estimates VOLL at $23,000 per MWh.[41]

6. Decarbonization: The LRTP Tranche 1 Portfolio promotes higher penetration of renewables, which reduces carbon dioxide emissions. MISO estimates this benefit between $3.5 Billion and $17.364 Billion.[42] MISO states that this benefit estimate range is wider because, on the lower end, MISO calculated this estimate based on the Minnesota Public Utilities Commission (MPUC) carbon price of $12.55 per metric ton in 2022 dollars.[43] On the higher end, MISO went with a Federal carbon price of $47.80 per metric ton in 2022 dollars.[44]

[43] *Id*. at 65.
[44] *Id.* at 66.

Q: How does the MISO LRTP Tranche 1 Portfolio provide economic benefits to Illinois?

A: According to MISO, LRTP Tranche 1 Portfolio provides the following economic benefits to the Local Resource Zone 4:[45]

- Congestion and Fuel cost savings: $1.352 - $4.133 Billion.
- Avoided capital costs of local resource investment: $1.707 - $1.798 Billion.
- Avoided future transmission investment: $305 - $865 Million.
- Reduced resource adequacy requirements: MISO did not calculate this benefit.
- Avoided risk of load shedding: $121 Million - $2.058 Billion.
- Decarbonization: $339 Million - $2.877 Billion.

Q: What are the possible reliability benefits to Illinois from the Program?

A: Specific to Illinois, the Joint Applicants state that there are four benefits of the Program. They are:

1. Thermal issues resolution.[46]
2. System performance enhancement.[47]
3. Overall voltage profile enhancement that allows for greater transfer limits into and out of Illinois.[48]
4. A more robust system due to improved system reliability and improved resiliency during extreme weather events.[49]

309 **Q: Do you agree with the Joint Applicants' position on the thermal issues resolution in**
310 **Illinois identified in the MISO Future 1 models as one of the benefits of the Program?**
311 A: Yes, I agree with Mr. Davies's direct testimony that MISO found thermal issues, and the
312 Program resolved those issues in Illinois because of Iowa to Michigan (East-Central
313 Corridor, the northern corridor in the Program) and Northern Missouri Corridor (southern
314 corridor in the Program) transmission flows modeled in MISO Future 1 models.[50] Based
315 on the MTEP 21 LRTP Addendum, I verified the eleven thermal issues in Illinois identified
316 by MISO among the top 20 thermal issues listed in each Corridor.[51]

[51] Ameren Exhibit 3.3 at 55-56, 59-60.

Q: Were you able to map the eleven thermal issues identified by MISO in Illinois to the individual transmission line segments proposed by the Joint Applicants in the Program?

A: Based on Mr. Johnson's direct testimony, I was able to map 5 out of 11 thermal issues to the transmission line segments proposed by the Joint Applicants in the Program.[52] When asked to share the results of power flow analyses in a data request, the Joint Applicants shared a Portable Document Format (PDF) file summarizing the power flow analyses.[53] Additionally, the Joint Applicants shared a PDF file listing the monitored facilities owned by Ameren and non-Ameren companies.[54] Based on the results of the power flow analyses, I was able to map the remaining 6 thermal issues to "TO-LRTP projects."

Q: Do you agree with MISO's Long Range Transmission Planning assessment of the East-Central Corridor and Northern Missouri Corridor?

A: Yes, I agree in part with MISO's LRTP assessment of the East-Central Corridor and Northern Missouri Corridor. However, it is unclear whether MISO considered grid enhancing technologies in assessing the transfer capacity along these Corridors.

Q: Do you agree with the Joint Applicants' position on the system performance enhancement benefit of the Program?

A: I agree in part that the Program provides multiple paths for energy to flow on the Ameren Transmission System; however, I do not see any data in the testimony or MISO documents to support this theory. Mr. Davies states the Program "will enhance the Ameren Transmission System's performance."[55] To substantiate his claim, Mr. Davies does not provide any quantitative evidence. Mr. Davies implies the Program enhances the Ameren Transmission System's performance by creating "more paths for energy to flow" during "numerous contingencies including multiple outages" studied as part of the "NERC Transmission Planning Standards and the Ameren Transmission Planning Criteria and Guidelines."[56] Based on Mr. Davies' testimony alone, I cannot confirm the assertion.

Q: Do you agree with the Joint Applicants' position on the overall voltage profile enhancement benefit of the Program?

A: Not necessarily. I do not see data to support the theory in testimony or MISO documents, and did not analyze it independently. Therefore, I am 'unable to independently confirm Mr. Davies' assertion. Mr. Davies states that the "Program improves the overall voltage profile of the Ameren Transmission System" but does not provide any quantitative evidence to show how the Program improves the overall voltage profile of the Ameren Transmission System.

The voltage profile of a transmission line shows small changes in voltage along the line caused by power transfers from one end to the other.

[55] Ameren Exhibit 5.0 at 22:440-42.
[56] *Id.* at 22:443-50.

MISO found that voltage profiles will improve in Indiana ("Figure 6-14: Improved voltage profiles in Indiana and Increased transfer levels with the Iowa to Michigan Projects"), Michigan ("Figure 6-15: Improved voltage profiles in Michigan and Increased transfer levels with the Iowa to Michigan Projects") and Missouri ("Figure 6-16: Improved voltage profiles in Missouri and Increased transfer levels with the Iowa to Michigan Projects") but does not specifically call out improved voltage profiles in Illinois.[57]

Additionally, MISO explicitly states, "Transfer levels increase and voltage profiles improve in Indiana, Missouri, and Michigan with the IA – MI projects (Figures 6-14, 6-15, and 6-16)."[58] Hence, the Joint Applicants have not yet demonstrated that the Program improves the overall voltage profile of the Ameren Transmission System in Illinois.

Finally, Mr. Davies states the alleged improvement in the voltage profile "also allows for greater transfer limits into and out of Illinois, as MISO determined."[59] But, there is no evidence from the MTEP21 LRTP Addendum to support this. MISO calls out increased transfer levels in Indiana, Missouri and Michigan but not Illinois in this statement: "Transfer levels increase and voltage profiles improve in Indiana, Missouri, and Michigan with the IA – MI projects."[60] Hence, I cannot independently confirm that the Program allows for greater transfer limits into and out of Illinois.

[57] Ameren Exhibit 3.3 at 56-57.
[58] *Id.* at 56.
[59] Ameren Exhibit 5.0 at 23:451-53.
[60] Ameren Exhibit 3.3 at 56.

Q: Do you agree with the Joint Applicants' position that the Program provides a more robust system?

A: Under "other system related benefits," Mr. Davies states that the "Program creates a more robust system, which will improve system reliability and resiliency during extreme weather events."[61] Mr. Davies notes that "[i]ncreasingly frequent extreme weather events may challenge system reliability" and provides an explanation involving the February 2021 Arctic Event.[62] Mr. Davies refers to MISO's report titled, "The February Arctic Event, February 14-18, 2021, Event Details, Lessons Learned and Implications for MISO's Reliability Imperative."[63]

Mr. Davies specifically references MISO's statement that "[t]he challenges faced during this extreme weather event, including transmission emergencies and generator outages, are a stark reminder of the need to continue transforming to ensure the MISO Region is ready for the current and future challenges facing the industry."[64] He also states that "[e]xtreme weather events like the February 2021 cold weather emphasize not only the necessary steps but the urgency with which we must move."[65] I don't disagree with either MISO or the Joint Applicants that extreme weather events are a "stark reminder" that we must take necessary steps. However, the full context of MISO's February Arctic Event is relevant.

MISO's experience with the February 2021 cold weather event exposed the transmission problems in the South region. MISO had to declare two local transmission

[61] Ameren Exhibit 5.0 at 23:454-56.

[64] *Id*. at 5.
[65] *Id*. at4.

emergencies in east Texas, a transmission system emergency in Louisiana's Acadiana Area near east Texas, and ultimately a Maximum Emergency Event Step 5 in the South region, which involves dropping load when prior steps fail to restore normal transmission conditions. Importantly, these issues occurred in the South region, not in the Midwest region, which is the focus of the Tranche 1 Portfolio.[66]

Aside from a transmission system emergency in East St. Louis, Missouri, that led to a 130 MW emergency load reduction, the rest of the emergencies were declared in the South region. In total, MISO actions led to the following emergency load reductions in the South region: 1100 MW in east Texas, 1000 MW in Louisiana and 700 MW in Arkansas. In contrast, during the February 2021 Arctic Event that Mr. Davies referenced, MISO called for a 130 MW emergency load reduction in the Midwest Subregion and 2,800 MW emergency load reduction in the South Subregion.

Mr. Davies acknowledges that "the Program was not designed to address the specific circumstances of the February 2021 event."[67] While this may be true, it raises the question of whether the Program can enhance the overall resilience of the transmission system during extreme weather events. My concern is that even though transmission lines are robust under normal conditions, severe weather events like the 2021 Arctic event can damage high-voltage transmission infrastructure, such as towers, leading to extended outages and long restoration times.[68] Therefore, while the Program may not have been

[66] *Id*. unlabeled picture at 5.
[67] Ameren Exhibit 5.0 at 23:463-64.
[68] It took more than 3 months for 500-kV transmission tower repair work in Entergy due to Hurricane Laura in August 2020. See https://www.entergynewsroom.com/article/strongest-storm-since-1800s-ravages-transmission-equipment-in-louisiana-texas/ and https://cajunusa.com/what-we-do/entergy-500kv-transmission-line-repair/.

designed for such events, it is unclear whether it will provide the level of resilience necessary to address these types of challenges in the future.

Q: Do you agree with the Joint Applicants that MISO considered alternatives as part of the LRTP Tranche 1 plan?

A: I disagree in part and agree in part. I agree with the Joint Applicants that MISO considered alternatives as part of the LRTP Tranche 1, but all of these alternatives are transmission-oriented. It is my understanding that MISO did not consider grid enhancing technologies as alternatives in LRTP Tranche 1. Additionally, it appears that MISO studied alternatives located in Michigan, not in Illinois, for the East-Central Corridor.[69] Hence, I disagree with the Joint Applicants that MISO considered alternatives as part of the LRTP Tranche 1.

I am aware that MISO modeled Demand Response, Energy Efficiency and Distributed Generation, collectively referred to by MISO as "Distributed Energy Resources" during the model building for all Futures.[70] Specifically, in Local Resource Zone 4, which is Illinois, MISO has modeled 393 MW of distributed solar, which is part of the Distributed Energy Resources.[71]

Q: Out of the 6 transmission alternatives for the East-Central Corridor that MISO considered as part of the LRTP Tranche 1 plan, how many are based in Illinois?

A: None. Mr. Davies asserted in his direct testimony that "For MVPs 12 through 18 comprising the East-Central Corridor, 6 alternatives were evaluated."[72] Mr. Davies referred to MTEP21 LTRP Addendum, Page 43 where MISO stated, "[t]wo alternative solutions

[69] MTEP 21 LRTP Addendum, at 43.
[70] CUB-EDF Exhibit 1.03 at 41.
[71] *Id.* at 57.
[72] Ameren Exhibit 5.0 at 19:395-20:396.

were received during the alternative submittal period, Duck Lake to Weeds Lake and Hiple to Duck Lake (MISO Main Proposal). Four additional alternatives were also evaluated."[73] MISO provided a list of these 6 alternatives, but they are all located in Michigan, not Illinois.

Table 5 - MISO Alternatives to East-Central Corridor

MISO Alternative to East-Central Corridor	**Location**
Duck Lake to Weeds Lake	Michigan
Hiple to Duck Lake	Michigan
Argenta – Hiple	Michigan
Argenta – Duck-Lake	Michigan
Oneida to Madrid (double-circuit)	Michigan
Iowa to Indiana with Duck Lake Configuration	Michigan

When asked in a data request, "Are any of the 6 alternatives evaluated located in Illinois or entirely in Michigan?", the Joint Applicants responded that, "[i]t is the Joint Applicants' understanding that MISO studied the Multi-Value Projects comprising the LRTP Tranche 1 portfolio, and the portfolio, as a whole, including the impact of alternatives on the MISO transmission system on a regional basis, rather than on a state boundary basis."[74]

Q: Out of the 5 transmission alternatives for the Northern Missouri Corridor that MISO considered as part of the LRTP Tranche 1 plan, how many are based in Illinois?

A: None. Similar to the East-Central Corridor, MISO studied 5 alternatives in the Northern Missouri Corridor, but they appear to all be located in Missouri, not Illinois.

[73] MTEP 21 LRTP Addendum at 43.
[74] Joint Applicants' Response to CUB-EDF 1.13.

Zachary – Maywood – Thomas	Maywood, MO

450 **Q: Did MISO consider Grid Enhancing Technologies during the development of**
451 **"indicative roadmaps" in the first phase of the LRTP study?**

452 A: Mr. Dodd mentioned in his direct testimony that "MISO began with the first phase of the
453 LRTP study by developing indicative, or hypothesis, roadmaps of potential transmission
454 expansions throughout the region, including solutions that would be required to enable
455 Future 1 alone and Futures 1, 2, and 3 together."[75]

456 MISO did not consider Grid Enhancing Technologies during the development of
457 indicative roadmaps in the first phase of the LRTP study because MISO stated, "with such
458 a high percentage of facilities overloaded, including legacy EHV [Extra High Voltage] 345
459 kV facilities, Grid Enhancing Technologies would not be sufficient to solve the issues
460 identified in the LRTP Tranche 1 study over the long-run. Ultimately, Grid Enhancing
461 Technologies were not included in the indicative roadmap since such technologies typically
462 address localized needs or provide increased operational flexibility in the operating
463 horizon."[76]

464

[75] Ameren Exhibit 3.0 at 21:396-98.
[76] Response to CUB/EDF-MISO Data Request 1.5.

Q: Do you agree with MISO's explanation regarding why MISO did not consider Grid Enhancing Technologies in the first phase of the LRTP study?

A: No, I disagree. In MISO's RIIA study, which Mr. Dodd referenced, MISO acknowledges that if local and operational issues are not addressed, they become regional issues: "As power flows across longer distances, local planning and operational issues become regional challenges."[77] So, MISO should have considered Grid Enhancing Technologies to address these local planning and operational issues.

MISO looked at "Operating Reliability" as one of the focus areas.[78] MISO defined "Operating Reliability" as the "ability to withstand unanticipated component losses or disturbances."[79] One of the insights MISO developed in this Operating Reliability focus area was that "[o]n average Critical Clearing Time (CCT) improves as large generating units are replaced, but new local issues emerge."[80] So, MISO is aware of new local issues emerging when higher penetrations of renewables occur. Hence, MISO should have analyzed whether the Critical Clearing Times improved on average if Grid Enhancing Technologies addressed the new local issues.

Finally, MISO studied various levels of renewable penetrations in the RIIA study, which Mr. Dodd referenced. When renewable penetration was within the 10-20% range, MISO observed, "The **local** nature of renewable deployment causes outlet issues with the **local** and subregional transmission system. Transmission issues, seen through the lens of **local** transmission reliability and congestion, intensify but can be managed through

[77] Ameren Exhibit 3.1 at4.
[78] *Id*. 6.
[79] *Id.*
[80] *Id*. at 10.

continued incremental upgrades to the system since **local** cause-and-effect can be easily identified."[81] Since MISO stated that Grid Enhancing Technologies could address local needs and due to the local nature of renewable development, local transmission reliability and congestion is an issue that can be clearly addressed. Thus, there was a role for Grid Enhancing Technologies during the initial phase of LRTP study that MISO did not consider.

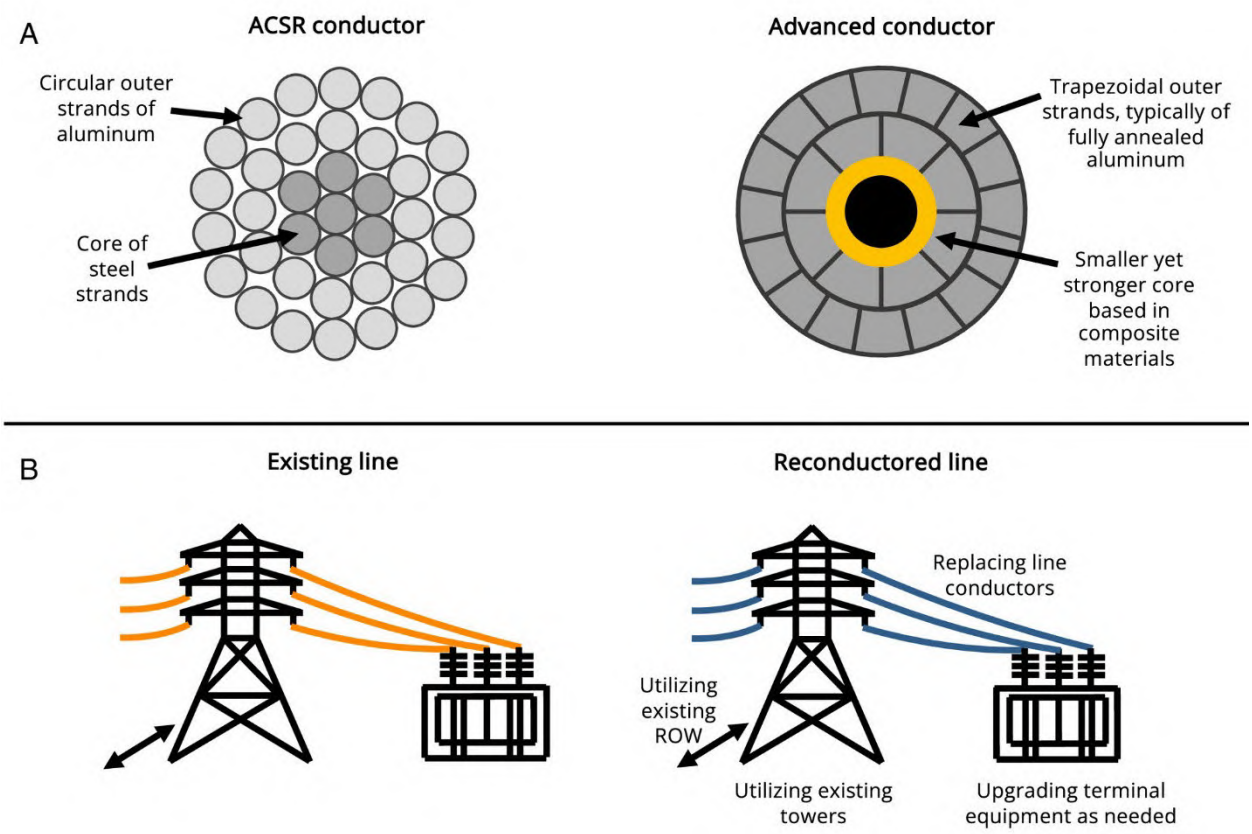
Q: Did the Joint Applicants consider alternatives to the Program?

A: It appears as if the Joint Applicants only considered and proposed advanced conductors as alternatives to the Program. Mr. Davies asserted in his direct testimony, "Each TO submits back to MISO a recommended set of projects concerning its transmission system that it believes must be undertaken to mitigate negative effects to the system."[82]

When asked in a data request, "Were Grid Enhancing Technologies (e.g., Dynamic Line Ratings, Advanced Powerflow Controllers, Topology Optimization, Reconductoring) part of this set of projects? If not, why not?", the Joint Applicants responded that "[u]ltimately, the transmission solutions were evaluated and selected by MISO as part of the LRTP Tranche 1 transmission expansion plan to facilitate the needs of the system, under the models built for Series 1 Futures... Other than utilizing an advanced conductor, Ameren Services Transmission Planning did not propose any solutions using GETS."[83] However, utilizing an advanced conductor is not the same as reconductoring because reconductoring is far more involved than replacing an existing conductor with an advanced conductor as shown in the graphic below.

[81] Id. at 13 (emphasis added).
[82] Ameren Exhibit 5.0 at 11:223-25.
[83] CUB-EDF Exhibit 1.02 at 3-4.

Figure 1 - Graphic illustrating the difference between Advanced Conductor and Reconductoring[84]



For example, the Joint Applicants are proposing to reconductor the existing 345 kV circuits at Ipava-Duck Creek-4573 345 kV and Duck Creek-Mapleridge-4573 345 kV (Program #2 Line Segment) with "bundled" 2-954 Cardinal ACSS 54/7 or "bundled" 2-795 Drake ACSS 26/7.[85] On the other hand, the Joint Applicants state, "[a]ll of the 345kV lines that will be built for the Program, and some of the 138kV lines that are being built or rebuilt, will use a high temperature, low sag advanced ACSS conductor to facilitate the required ratings of the Program."[86] Thus, the Joint Applicants have not presented evidence

[84] Accelerating transmission capacity expansion by using advanced conductors in existing right-of-way. Proceedings of the National Academy of Sciences PNAS, Vol. 121. No. 40. https://www.pnas.org/doi/10.1073/pnas.2411207121.
[85] Ameren Exhibit 7.0 at 8:146-52, 20:400-410.
[86] CUB-EDF Exhibit 1.02 at 18-19.

or analysis to demonstrate that they have considered reconductoring existing 138 kV transmission lines and other forms of Grid Enhancing Technologies as alternatives to the Program.

Q: Did the Joint Applicants study MVPs 11, 13, 14 and 15 individually or together?

A: The Joint Applicants state that they studied MISO MVPs 11, 13, 14 and 15 "together, as part of an integrated portfolio of projects, consistent with the MISO Tariff and FERC-recognized transmission planning practices."[87] This is relevant because the Joint Applicants did not evaluate if any of the grid enhancing technologies with the exception of reconductoring existing 345 kV transmission lines or battery energy storage systems can replace or enhance either one or more of the MISO MVPs 11, 13, 14 and 15.

Q: Did the Joint Applicants independently verify whether the transmission solutions developed by MISO in the LRTP Tranche 1 are cost-effective?

A: The Joint Applicants state that they have determined that the Program was an optimal solution, "Ameren Services Transmission Planning, on behalf of the Joint Applicants, in collaboration with MISO and other Transmission Owners, determined as part of mandated RTO transmission-planning processes that the Program was the optimal solution to increase transmission capacity in the MISO Midwest Subregion, including in Illinois, to support the clean energy transition and the significant renewable and distributed generation energy sources coming online, among other benefits."[88] Since the Joint Applicant's response states "optimal" not "cost-effective," it is not clear whether the Joint Applicants verified

[87] *Id*. at 7-8.
[88] *Id*. at 15-16.

independently whether the transmission solutions developed by MISO in the LRTP Tranche 1 are cost-effective.

Q: Did the Joint Applicants independently verify that the Program as designed by MISO represents the best combination of engineering feasibility, cost, efficiency, and mitigation of impacts to land use, residents, and the area surrounding the Program?

A: The Joint Applicants have not demonstrated that they independently verified that the Program as designed by MISO represents the best combination of engineering feasibility, cost and efficiency because some of the grid enhancing technologies were not evaluated. Additionally, it appears that the Joint Applicants proposed seven additional potential "add-on" projects to MISO that MISO did not accept.[89]

As mentioned earlier, the Joint Applicants state that the "Program was the optimal solution to increase transmission capacity in the MISO Midwest Subregion, including in Illinois, to support the clean energy transition and the significant renewable and distributed generation energy sources coming online, among other benefits."[90] It is not clear whether the Joint Applicants definition of "optimal solution" translates into the best combination of engineering feasibility, cost and efficiency.

The Joint Applicants state that "the Program makes use of existing transmission corridors where possible, which reduces the need to acquire additional new, or "greenfield," right-of-way. Using existing transmission corridors helps mitigate societal costs by reducing impacts on landowners and other stakeholders and promoting timelier implementation of transmission expansion. Additionally, co-locating portfolio facilities

[89] CUB-EDF Exhibit 1.05.
[90] CUB-EDF Exhibit 1.02 at 15-16

with existing transmission assets minimizes the environmental and historical use impacts of transmission infrastructure investments."[91] This response implies that by making use of existing transmission corridors where possible, the Joint Applicants have independently verified the mitigation of impacts to land use, residents and the area surrounding the Program. However, as I mention below, the Joint Applicants did not evaluate the use of grid enhancing technologies to mitigate impacts to land use with the exception of reconductoring existing 345 kV transmission lines.

Q: Do you agree with the Joint Applicants assertion that the Program is the "least-cost means of" providing adequate, reliable, and efficient service to Illinois customers?

A: Yes, I agree with a part of the Joint Applicants response explaining the "least-cost means of" assertion.[92] Mr. Davies states that the purpose of his direct testimony is "I, along with other Ameren witnesses, demonstrate why the Program is necessary to provide adequate, reliable, and efficient service to Illinois customers and is the least-cost means of doing so."[93]

When asked to provide references to support the "least-cost means of doing so" specific assertion, the Joint Applicants respond that it is their "general understanding that "least cost" in the context of the Commission's assessment of proposed transmission construction does not mean cheapest dollar cost, including short-term, solution. For example, as explained throughout the Joint Applicants' February 5, 2024 direct case filing, the Program makes use of existing transmission corridors where possible, which reduces the need to acquire additional new, or "greenfield," right-of-way. Using existing

[91] *Id*. at 11-12.
[92] *Id*.
[93] Ameren Exhibit 5.0 at 3:47-49.

577 transmission corridors helps mitigate societal costs by reducing impacts on landowners and
578 other stakeholders and promoting timelier implementation of transmission expansion.
579 Additionally, co-locating portfolio facilities with existing transmission assets minimizes
580 the environmental and historical use impacts of transmission infrastructure investments."[94]

581 This response indicates that the Joint Applicants considered the use of existing
582 transmission corridors where possible and those existing transmission corridors reduced
583 the impacts on landowners and other stakeholders thereby providing the least-cost means
584 of providing adequate, reliable and efficient service to Illinois customers. I don't disagree
585 with this part of the Joint Applicants response.

586 **Q: Do you have any other observations regarding the Joint Applicants' "least-cost means**
587 **of" assertion?**

588 A: Joint Applicants state, "co-locating portfolio facilities with existing transmission assets
589 minimizes the environmental and historical use impacts of transmission infrastructure
590 investments."[95] As I show below, co-locating grid enhancing technologies with existing
591 transmission assets also minimizes the environmental and historical use impacts of
592 transmission infrastructure investments.

593 **Q: How do the Joint Applicants define "service" to Illinois customers?**

594 A: The Joint Applicants assert that the "the Program is necessary to provide adequate, reliable,
595 and efficient service to customers and is the least-cost means of satisfying the service needs
596 of customers" and "is the least-cost means of satisfying that service need."[96] When asked
597 to define the "service needs of customers" and "service need", the Joint Applicants provide

[94] CUB-EDF Exhibit 1.02 at 11-12.
[95] *Id*.
[96] Ameren Exhibit 1.0 at 31:643, 660.

598 references to Mr. Schukar's direct testimony discussing the Section 8-406 and Section 8-
599 406(b) requirements.[97] I discuss my non-legal interpretation of Section 8-406(b)
600 requirements below.

601 The Joint Applicants also provide references to Mr. Schukar's direct testimony that
602 provides a response to the question, "How, specifically, does the Program ready the grid in
603 Illinois?"[98] Mr. Schukar's response implies that the Program satisfies the service needs of
604 the customers and is a least-cost means of satisfying that service need because it adds
605 "needed capacity to the Ameren Transmission System in Illinois" and "facilitate the State's
606 clean energy transition by promoting Illinois customer access to energy from more diverse
607 resources and permitting renewable generators in Illinois to more efficiently and effectively
608 bring their product to market."[99]

609 **Q: Do you agree with Mr. Schukar's assertion that the Program adds needed capacity to**
610 **the Ameren Transmission System in Illinois?**

611 A: Not necessarily. However, if the Joint Applicants had provided an evaluation of grid
612 enhancing technologies including reconductoring of existing 138 kV transmission lines and
613 battery energy storage systems, then it would be possible to quantify how much additional
614 capacity the Program adds to the Ameren Transmission System in Illinois.

615

616

617

[97] Joint Applicants Response to CUB/EDF-AMEREN 2.02.
[98] Ameren Exhibit 1.0 at 14:293.
[99] *Id*. at 294-99.

Q: Do you disagree with Mr. Schukar's assertion that the Program facilitates the State's clean energy transition by promoting Illinois customer access to energy from more diverse resources and permitting renewable generators in Illinois to more efficiently and effectively bring their product to market?

A: I agree with the first part of Mr. Schukar's assertion that the Program facilitates the State's clean energy transition by promoting Illinois customer access to energy from more diverse resources. It is the latter part of his assertion that is difficult to verify given the lack of detail and specificity in the Joint Applicants' presentation, specifically, whether the Program promotes Illinois customer access to energy from permitting renewable generators in Illinois to bring their product more efficiently and effectively to market. As I discuss below, grid enhancing technologies and battery energy storage systems have the capability to promote Illinois customer access to energy from renewable generators efficiently and effectively as well.

Q: How do you respond to the Joint Applicants assertion that compliance with the NERC reliability standards is mandatory and "these standards avoid the costs to customers of an unreliable or failed transmission system"?[100]

A: I agree with the Joint Applicants that compliance with the North American Electric Reliability Corporation's ("NERC") reliability standards is mandatory. I also agree that these standards avoid the costs to customers of an unreliable or failed transmission system. However, these standards do not eliminate any need or obligation to evaluate other alternatives to comply with and provide reliability to customers. Hence, the Joint Applicants are free to explore alternatives such as the grid enhancing technologies and

[100] CUB-EDF Exhibit 1.02 at 9-10.

battery energy storage systems that provide the same level of reliability as the transmission lines in the Program or assess the level of reliability some of these alternatives provide. The Joint Applicants' failure or decision not to sufficiently evaluate alternatives renders the application incomplete.

Q: How do the Joint Applicants respond to your question on whether the NERC Transmission Planning standard TPL-001-4 contains any requirements for cost-effective transmission planning?

A: The Joint Applicants do not directly address whether the NERC standard TPL-001-4 recently revised to TPL-001-5 contains any requirements for cost-effective transmission planning in their response.[101] The Joint Applicants state, "[g]iven the economic, societal, and other costs to customers of an unreliable grid, a system that is not studied or planned consistent with these objections as embodied in the NERC Standards and other established transmission planning standards and processes would not be cost-effective for customers."[102] The Joint Applicants response implies that if the system is not studied or planned then the system is not cost-effective. But this implication misses how the system is studied. For example, if the system is not studied or planned with grid enhancing technologies and battery energy storage systems, that does not imply that the system is not cost-effective. My point is, for cost-effective transmission planning, the system should be studied or planned with grid enhancing technologies and battery energy storage systems.

[101] CUB-EDF Exhibit 1.02 at 13-14.
[102] *Id*. at 9-10.

Q: Do you agree with the Joint Applicants that the Program is the least-cost means of satisfying the service needs of its customers as required by the Illinois Compiled Statutes ("ILCS") Section 8-406(b)?

A: Even though I am not a lawyer, I am regularly called on to understand how statutes and regulations apply to real-world situations involving public utility operations. Viewing the statute through that lens, it is my understanding that the Commission will examine whether the Joint Applicants have shown that a new transmission project is the least-cost means of satisfying the needs of its customers. In applying the statute to the instant proposal, I would look for evidence evaluating alternatives such as the grid enhancing technologies including reconductoring existing 138 kV transmission lines and battery energy storage system solution. The Joint Applicants have not yet provided sufficient evidence or evaluations. With such an evaluation, I could better determine that the materials they have provided would support a conclusion that the proposed Program is the least-cost means of satisfying the needs of the customers.

IV. GRID ENHANCING TECHNOLOGIES

Q: Please explain the potential of Grid Enhancing Technologies.

A: There is evidence that Grid Enhancing Technologies, or GETs, are quick-deployment and cost-effective tools that can complement existing transmission.[103,104] According to research from the Brattle Group, they can also be deployed on new transmission lines, like the Joint Applicants' Program, to make those lines more efficient and to "help alleviate some of the

[103] CUB-EDF Exhibit 1.06; CUB-EDF Exhibit 1.07.
[104] *See* CUB-EDF Exhibit 1.08 (WATT Coalition list of case studies and other grid enhancing technologies resources).

other project risks and uncertainties."[105] In either scenario, they can reduce costs for ratepayers, who get the benefits of added transmission capacity at a much lower price. That additional capacity also improves the reliability of the system as a whole by reducing the likelihood of an overload.

Q: What are Grid Enhancing Technologies?

A: The Working for Advanced Transmission Technologies ("WATT") Coalition has provided a definition that I think is a good way of encapsulating this term. "GETs are hardware and software that increase the capacity, efficiency and/or reliability of the transmission grid."[106] The four most commonly discussed GETs today are Dynamic Line Ratings, Advanced Power Flow Controllers, Reconductoring, and Topology Optimization. Out of these four technologies, Topology Optimization is a software solution. The remaining are hardware technologies. I describe each of these four technologies in detail below.

Q: Are Grid Enhancing Technologies cost-effective compared to transmission projects?

A: Grid Enhancing Technologies cost estimates are generally lower when compared to cost estimates for new transmission lines. Based on publicly available data, I estimate the costs of Dynamic Line Ratings, Advanced Power Flow Controllers, Reconductoring and Topology Optimization in the discussion below. I find that Grid Enhancing Technologies have the potential to lower the costs of the Program and that Joint Applicants should, therefore, consider them, either as alternatives or as part of the Program design.

[105] T. Bruce Tsuchida et al., "Building a Better Grid: How Grid-Enhancing Technologies Complement Transmission Buildouts," The Brattle Group (Apr. 20, 2023), *available at* https://watt-transmission.org/wp-content/uploads/2023/04/Building-a-Better-Grid-How-Grid-Enhancing-Technologies-Complement-Transmission-Buildouts.pdf.

[106] "Frequently Asked Questions about Grid Enhancing Technologies," WATT Coalition, https://watt-transmission.org/resources-2/faq/.

Q: Did the Joint Applicants estimate the costs of GETs for the Program?

A: Based on the information included in their Application and testimony, the Joint Applicants did not estimate the cost of using GETs in the Program area, either as an alternative to individual transmission line segments in their Program or as part of their Program. Accordingly, I must rely on estimated costs based on publicly available data for my testimony.

Q: Can Grid Enhancing Technologies accelerate the speed at which thermal issues identified in the MISO Future 1 models are resolved?

A: Yes. For example, DLRs rely on non-contact sensors – they do not need to be attached to a live wire.[107] They are installed on the transmission tower without the need for a transmission outage in a networked transmission system. This saves substantial time and cost because it means the system can continue running while the necessary equipment is installed, and DLR installation does not require approval from MISO. Additionally, identifying reconfiguration solutions by running the Topology Optimization software is a timely alternative to long-lead transmission equipment such as transformers. Likewise, unlike the 364-mile Right-of-Way ("ROW") acquisition and land rights needed for transmission lines in the Program, GETs do not require ROW and land rights.[108]

[107] Press Release, LineVision, Inc., "Introducing LineVision LUX™: The Industry's Only Non-Contact Sensor" (July 20, 2023) https://www.linevisioninc.com/news/introducing-linevision-lux-tm-the-industrys-only-non-contact-sensor.

[108] The number of miles of land rights needed for each Transmission Line Segment in Ameren Exhibit 10.0.

Table 7 - Total number of miles Land Rights are needed

Transmission Line Segments	Land Rights needed for # of miles
1. Iowa/Illinois border (from Skunk River in Iowa) to Ipava	65.45
2. Ipava to Mapleridge	40.3
3. Mapleridge to Tazewell	22.9

5. Radbourn to Plackett	44.5
6. Plackett (south) to Sidney	32.7
7. Plackett (north) to Crossbuck	21.1
8. Crossbuck to Illinois/Indiana border (to Morrison Ditch in Indiana)	28.3
9. Missouri/Illinois border (from Maywood in Missouri) to Meredosia	60.9
Total	364.35

Q: What is the average lead time for transmission utilities to procure Large Power Transformers?

A: According to a report from the U.S. Department of Energy, the average time it takes for utilities to receive new Large Power Transformers is more than two years now.[109] Based on the Joint Applicants' description, the Program will require Large Power Transformers, which may lead to delays. In contrast, I am not aware of any significant lead time for installing DLR sensors or conducting a Topology Optimization analysis. Hence, DLRs and Topology Optimization can accelerate the speed of resolving any transmission constraints or reliability problems.

[109] U.S. Dept. of Energy, "The Supply Chain Crisis Facing the Nation's Electric Grid" (Dec. 12, 2022) https://www.energy.gov/sites/default/files/2022-12/The%20Supply%20Chain%20Crisis%20Facing%20the%20Nations%20Electric%20Grid_12.12.22.pdf.

V. LRTP TRANCHE 1 LINK TO TRANCHE 2

Q: What should the the Joint Applicants do to Tranche 1 to demonstrate that they have minimized the overall costs of Tranche 1 or Tranche 2?

A: MISO states the "Tranche 2 portfolio focuses on creating a 765 kV transmission 'highway' within the MISO region to maximize value based on land use, line distances, transfer levels and costs."[110] MISO is proposing Tranche 2.1 Portfolio at an estimated cost of $21 Billion. In terms of the new Right-of-Way, MISO is proposing 2,100 miles of 345 kV and 1,900 miles of 765 kV transmission projects. MISO estimates that 70% of the proposed transmission lines in Tranche 2.1 are proposed on the new Right-of-Way.[111] In contrast, the Program requires 364 miles of Right-of-Way acquisition and land rights. Hence, the Joint Applicants should be looking at opportunities to minimize rework along Tranche 1 corridors either near or adjacent to MISO's proposed Tranche 2 corridors.

Q: Are there specific things that the Joint Applicants can do in the Tranche 1 corridors to minimize rework on the same transmission line corridor?

A: Yes. MISO is proposing new 345 kV and 765 kV transmission lines in Illinois in Tranche 2. Even though these proposed new transmission lines are not MISO Board approved, MISO labels them as "Near-Final Tranche 2.1."[112] Specifically, MISO is proposing three new transmission lines in Woodford County, which is immediately on the north border of right

[110] Slide 7, Tranche 2: Initial Draft Portfolio, LRTP Workshop, March 15, 2024 https://cdn.misoenergy.org/20240315%20LRTP%20Workshop%20Item%2002%20Tranche%202%20Anticipated%20Portfolio632013.pdf.
[111] Slide 2, LRTP Tranche 2.1 Portfolio Update, LRTP Workshop, September 10, 2024 https://cdn.misoenergy.org/20240910%20LRTP%20Workshop%20Item%2002%20Tranche%202.1%20Facilities%20Update646679.pdf.
[112] Slide 6, LRTP Tranche 2.1 Reliability & Economic Deep Dive (Central and East Region focus), LRTP Workshop, July 17, 2024 https://cdn.misoenergy.org/20240717%20LRTP%20Workshop%20Item%2002%20Reliability%20%20Economic%20Deep%20Dive638965.pdf.

above Tazewell and McLean Counties and east of Peoria County.[113] These three new transmission lines in Tranche 2.1 are:[114]

- LRTP-15 [MEC] Sub;T--[AMIL] WoodfordCo 765 kV
- LRTP-16 [AMIL] WoodfordCo--[CE] Collins 765 kV
- LRTP-19 [AMIL] WoodfordCo--[NIPS] Reynolds 765 kV.

There are "two new 345 kV greenfield transmission corridors to route the new 345 kV Program circuit (Tazewell-Radbourn-4537) from the Tazewell substation to the existing 138 kV Towerline-Huff transmission corridor."[115] These two new 345 kV greenfield transmission corridors are part of Tranche 1 line segment #4: Tazewell to Radbourn. Even if the Tranche 1 must be built in Tazewell and McLean Counties, there will be likely disruption to the same landowners twice with planned work in Woodford County for Tranche 2.

Q: Do Grid Enhancing Technologies play a role in minimizing the costs of Tranche 1 and Tranche 2?

A: Yes. As I discuss below, Grid Enhancing Technologies play a role in minimizing the costs of Tranche 1 by resolving thermal constraints, providing increased transfer capabilities, less lead time to deploy and no need for new Right-of-Way. GETs can play a similar role in minimizing the costs of Tranche 2.

[113] Ameren Exhibit 7.1.
[114] Slide 65, LRTP Tranche 2.1 Reliability & Economic Deep Dive (Central and East Region focus), LRTP Workshop, July 17, 2024.
[115] Ameren Exhibit 7.0 at 24:493-95.

Q: Is there a role for Grid Enhancing Technologies that could minimize landowner disruption?

A: Yes. As I discuss below, Grid Enhancing Technologies could minimize landowner disruption because they do not require acquisition of new Right-of-Way. These technologies can minimize work and re-work on the same route to minimize or avoid multiple disruptions.

Q: Is there a potential for Grid Enhancing Technologies to avoid re-work?

A: Yes. Re-work, meaning, redoing the work, which in this Program context would mean redoing construction of a new transmission line or redoing upgrading of an existing transmission line is avoided with the Grid Enhancing Technologies. Deploying GETs upfront on existing transmission lines ensures that if there is a need for a new transmission line or upgrades, the business case for that need is strong.

VI. DYNAMIC LINE RATINGS

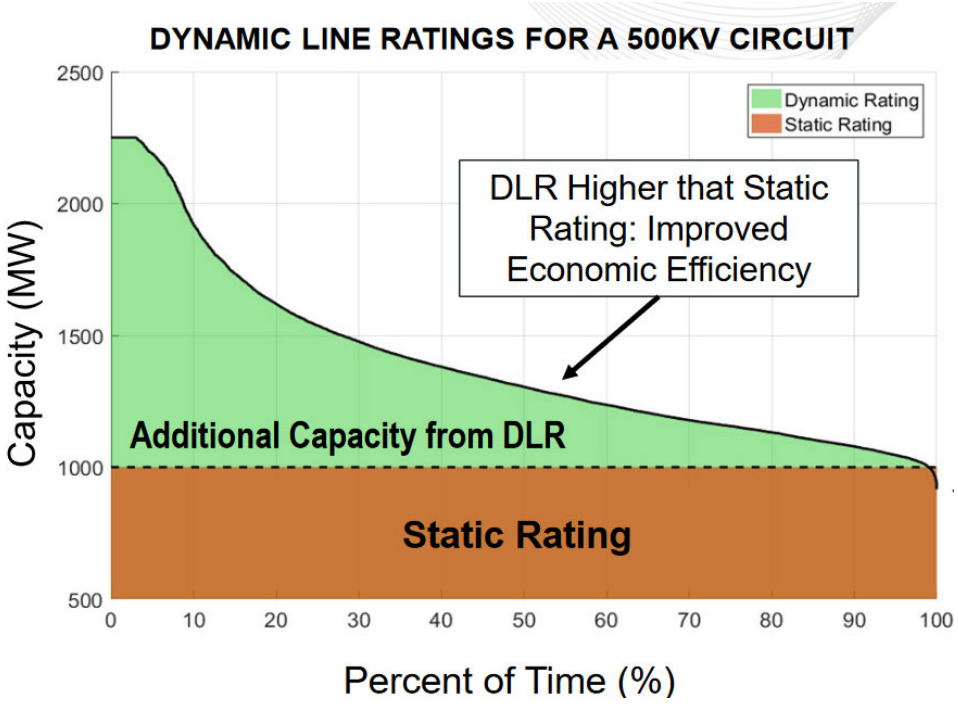
Q: What is Dynamic Line Rating?

A: A static line rating refers to a single power value, which is the maximum amount of power a line can carry that does not change during the course of the year because it does not account for variables such as wind speed, sunlight, and the resulting temperature. Seasonal ratings are a variation on static ratings, in which a single value is applied to different parts of the year; for example, a summer rating and a winter rating. Static ratings and seasonal ratings, based on conservative assumptions, leave excess, unused capacity on the transmission line.

In contrast, a dynamic line rating maximizes all the available transmission capacity. A dynamic line rating consists of multiple maximum power values that vary in real-time

according to weather conditions. For example, when wind blows, it lowers the temperature of the conductor, and the thermal rating is also lowered, allowing for more power transfer. On the other hand, when there is more sunlight, it increases the conductor temperature, leading to a higher rating, which results in less power transfer. The illustration below from PJM shows the additional capacity unlocked by DLR and the percentage of time that capacity is unlocked. The diagram demonstrates that for about 10% of the time, DLR can double the capacity of a 500 kV transmission line. For more than half the time, DLR adds more than 25% to capacity over the static rating.

Figure 2 - Dynamic Line Ratings for a 500 kV Circuit from PJM[116]



[116] Shaun Murphy, "Dynamic Line Ratings Overview," PJM, at 6 (March 30, 2021), *available at* https://www.pjm.com/-/media/committees-groups/committees/oc/2021/20210330-special/20210330-item-01-dynamic-line-ratings-overview.ashx.

Q: What are the estimated costs of DLRs?

A: Typical transmission costs are $3.6M per mile for a new single circuit 345 kV transmission line in Illinois.[117] However the typical cost of a sensor to install Dynamic Line Ratings, as an example, is only $22,727 per mile.[118] According to MISO Transmission Owners, DLRs can cost between $100,000 and $200,000 per transmission line, and each transmission line needs fifteen to thirty sensors.[119] Ameren Illinois Transmission System is composed of more than 5,000 circuit miles of 138 kV through 345 kV.[120] If the Joint Applicants install DLRs on the entire 5,000 miles, the total estimated cost of DLR is $113 million, which is less than the $114.5 million estimated cost paid by Illinois customers for the Program.

Table 8 - DLR Cost Estimates

# of Miles of Existing Tx Lines	200
Cost of installing DLR per Tx Line	$22,727
Cost of installing DLRs on 200 miles	$4,545,400
# of Miles of Tx Lines in the Program	380
Cost of installing DLRs on 380 miles	$8,636,260
Total cost of the Program for IL customers	$ 114,511,700
Cost of installing DLRs as a% of Total Cost	7.5%

[117] MISO, *Transmission Cost Estimate Guide*, at 38. (May 1, 2024), *available at* https://cdn.misoenergy.org/MISO%20Transmission%20Cost%20Estimation%20Guide%20for%20MTEP24337433.pdf.
[118] The cost of installing DLRs on 22-mile Cook-Olive 345 kV transmission line owned by AEP in 2017 was $500,000. Hence the $22,727 per mile DLR estimate ($500,000 divided by 22). *See* U.S. Dept. of Energy, *Dynamic Line Rating*, at 14 (June 2019), https://www.energy.gov/oe/articles/dynamic-line-rating-report-congress-june-2019.
[119] T. Bruce Tsuchida et al., *Unlocking the Queue with Grid Enhancing Technologies,* The Brattle Group at 12 (Feb. 1, 2021), *available at* https://watt-transmission.org/wp-content/uploads/2021/02/Brattle__Unlocking-the-Queue-with-Grid-Enhancing-Technologies__Final-Report_Public-Version.pdf90.pdf.
[120] Bruce Sheriff and George Justice, "2019 Summer Preparedness – Presentation to the Illinois Commerce Commission," Ameren Illinois Company, at 9 (June 26, 2019), https://icc.illinois.gov/api/web-management/documents/downloads/public/Amren.pdf.

If the Joint Applicants install DLRs on 200 miles of existing transmission lines, the estimated cost estimate is nearly $4.545M.[121,122] Including DLRs on the proposed 380 miles of 9 transmission line segments would cost $8.636M. Hence, the estimated cost of including DLR on the entire proposed transmission line segments in the Program Area is 7.5% of the cost paid by Illinois customers for the Program.

Q: Which Transmission Owners are already using DLRs?

A: The most mentioned DLR success story is PPL Electric, a transmission owner in Pennsylvania deploying $250,000 DLR solution instead of an estimated $50 million transmission line rebuild.[123] PPL Electric estimates that deploying DLRs eliminated nearly $23 million annually in congested generation costs. In addition to PPL Electric, multiple Transmission Owners are installing DLRs in multiple states. These utilities include Arizona Public Service, New York Power Authority, Xcel Energy in Colorado and Minnesota, National Grid and Avangrid in New York, Sacramento Municipal Utility District in California, and AES in Virginia.[124]

Q: Did the Joint Applicants analyze Dynamic Line Ratings as an alternative to or part of the Program?

A: No, it does not appear to be the case. The Joint Applicants state that they will implement Ambient Adjusted Ratings (AAR) "on all Ameren Transmission System transmission lines," which they claim will unlock much of the same capacity and reduce some of the

[121] See Table 11. 200 miles of existing transmission lines is an approximate value based on Ameren Exhibit 7.0. Adding all the existing miles found in the description of Mr. Johnson's direct testimony.
[122] DLR cost per mile of $22,727 times 200 miles = $4,545,400.
[123] David Quier, "DLR From the Utility Perspective," PPL Electric, at 3 (2023), *available at* https://www.mass.gov/doc/ma-eoeea-pop-up-forum-on-grid-enhancing-technologies-ppl-electric-utilities-presentation/download.
[124] *See* CUB-EDF Exhibit 1.09 (listing DLR deployments and pilot projects).

benefit of DLR.[125] They state "DLR provides limited benefit" during summer peak hours but noted that "DLR could still provide congestion relief and reliability benefit during construction and outage seasons."[126] Finally, they mentioned that "Ameren Services Transmission Planning is intending to have some DLRs active on our system within the next few years. During that study phase, Ameren Services Transmission Planning will be able to determine the need to add DLRs to facilitate the construction."[127]

Q: Do you agree with the Joint Applicants' discussion of Dynamic Line Ratings?

A: No, I do not. While implementing Ambient Adjusted Ratings can increase some transmission capacity, it does not maximize capacity like Dynamic Line Ratings. AAR relies on ambient temperature, which may or may not reflect real-time conditions. In contrast, DLR updates transmission line ratings in real-time based on actual conditions like wind speed and conductor temperature, providing more accurate and often higher capacity.

Dynamic Line Ratings ("DLRs") increase the transmission capacity of existing transmission line up to 44%.[128] By installing DLRs, the Joint Applicants could see a significant increase in transmission capacity of existing transmission lines. Increasing the capacity of existing lines improves reliability by reducing the likelihood of an overload. The Joint Applicants could have considered DLR as part of the project design in order to make the newly-built 345 kV lines more efficient. At a minimum, they should have

[125] CUB-EDF Exhibit 1.02 at 3-4.
[126] *Id.*
[127] *Id.*
[128] Shaun Murphy, "Dynamic Line Ratings Overview," PJM, at 4 (March 30, 2021), *available at* https://www.pjm.com/-/media/committees-groups/committees/oc/2021/20210330-special/20210330-item-01-dynamic-line-ratings-overview.ashx.

analyzed this issue so the Commission can have a complete record when evaluating the Joint Applicants' proposal.

Q: Can you explain how DLR could increase capacity on existing transmission lines in the Program?

A: As described above, static line ratings are based on conservative assumptions about weather. For a 345 kV conductor, the Joint Applicants indicate summer current ratings of 3070 A for normal conditions and 3500 A for emergency conditions.[129] These summer current ratings translate to an 1834 MVA rating for normal conditions and a 2091 MVA rating for emergency conditions, respectively.[130] A 44% increase in these ratings results in 2642 MVA and 3012 MVA. Similarly, DLRs could increase capacity on existing 138 kV and 161 kV transmission lines, as shown below.

Table 7 - Increased MVA Ratings with DLRs for Existing Transmission Lines

Without DLRs			With DLRs		
345 kV	Summer Rating (MVA)	Winter Rating (MVA)	345 kV	Summer Rating (MVA)	Winter Rating (MVA)
Normal	1834	2030	Normal	2642	2924
Emergency	2091	2249	Emergency	3012	3239
138 kV			138 kV		
Normal	376	486	Normal	541	700
Emergency	481	564	Emergency	693	812
161 kV			161 kV		
Normal	439	567	Normal	632	817
Emergency	561	658	Emergency	808	948

Q: Which specific transmission lines in the Program could benefit from DLRs?

A: The following existing transmission lines in the Program appear to benefit from DLRs:

[129] Ameren Exhibit 7.0 at 7:139-40.
[130] (345*3070*1.732)/1000 = 1834 MVA.

VII. ADVANCED POWER FLOW CONTROLLERS

Q: What are Advanced Power Flow Controllers?

A: Advanced Power Flow Controllers are power electronic devices that change the power flow on constrained transmission lines by varying the reactance, which is the property of a transmission line to oppose the change in current.

For example, when the energy flow increases on the 138 kV Paxton East-Gilman South-1505 line if temperature rises in summer, the reactance will be increased, which will push the increased energy to transmission lines connected to the 138 kV Paxton East-Gilman South-1505 line.[131] Simultaneously, reactance will be decreased on existing 138 kV transmission lines connected at the Existing Paxton East Substation and Existing Gilman South Substation. When the reactance is decreased, the energy flow increases on the existing 138 kV transmission lines connected at these Substations.

Hence, these Advanced Power Flow Controllers increase the reactance on a constrained line which pushes the Power Flow to less constrained lines where the reactance is decreased.[132] To put it simply, these Power Flow controllers are relieving the 138 kV Paxton East-Gilman South-1505 constrained line; for example, when temperature increases and sends the increased flow on other less-constrained transmission lines.

Q: What are the costs of Advanced Power Flow Controllers?

A: Advanced Power Flow Controllers typically cost less than new transmission lines. For example, in 2018, a wind developer was required to upgrade the transmission grid for

[131] One of the eleven thermal issues identified by MISO in Illinois. Source: Table 3.
[132] T. Bruce Tsuchida et al., *Unlocking the Queue with Grid Enhancing Technologies,* The Brattle Group, at 20 (Feb. 1, 2021), https://watt-transmission.org/wp-content/uploads/2021/02/Brattle__Unlocking-the-Queue-with-Grid-Enhancing-Technologies__Final-Report_Public-Version.pdf90.pdf.

882 $100M in 2018 in the PJM portion of Illinois. The proposed upgrades would have consisted
883 of a combination of new lines and reconductoring existing lines. Instead, the developer
884 used advanced Power Flow controllers to reduce the upgrade costs to $12M, almost 1/10th
885 of the transmission system upgrade cost.[133]

886 Based on a New York Power Authority press release which mentions $11.5 M for
887 costs and a news story that mentions the 86-mile length of 230-kV transmission lines, I
888 estimate that Advanced Power Flow Controller costs are $133,721 per mile.[134] Based on
889 the mileage of the thermal issues identified by MISO, I have estimated cost of installing
890 these Controllers would be $6.779 M.

891 ***Table 11 - Advanced Power Flow Controllers Cost Estimate***

Monitored Facility/Thermal Issue	# of Miles	APFC Cost Estimate
Morrison Ditch Sheldon South 138 kV Ckt. 1	5.3	$ 708,721
Gilman Paxton East 138 kV Ckt. 1	22	$ 2,941,862
Sheldon South Watseka 138 kV Ckt. 1 AMIL	11.1	$ 1,484,303
Gilman Watseka 138 kV Ckt. 1	10	$ 1,337,210
Herleman 3 – Quincy S. 138 kV Ckt. 73	2.3	$ 307,558
Total Cost Estimate		$ 6,779,655

892 As I have already noted, this is an approximation of costs. Since the Joint
893 Applicants did not include any evaluation of Advanced Power Flow Controllers in its
894 Application or initial testimony, actual costs for deployment in the Project Area are
895 unknown.

[133] Emily Pontecorvo, "There is a Stupidly Easy Way to Expand the Grid," Heatmap, Feb. 20, 2024, https://heatmap.news/climate/clean-energy-grid-reconductoring ("In 2018, the PJM grid operator determined that a wind farm expansion in Illinois was going to require $100 million of grid upgrades — including building new lines and **reconductoring** existing ones — ..The developer countered that the needed upgrades could be achieved through **power flow controls**, which could be installed for a cost of just $12 million in less than half the time. PJM approved the idea, and the project is currently underway.").

[134] "NYPA Approves $11.5 Million for Advanced Power Flow Control Project in Northern NY" Source: https://prod-www.nypa.gov/news/press-releases/2020/20200128-flow and "NY Commission Approves Rebuild of Moses-Adirondack Transmission Lines" Source: https://www.tdworld.com/overhead-transmission/article/20973404/ny-commission-approves-rebuild-of-moses-adirondack-transmission-lines.

Q: Did the Joint Applicants analyze Advanced Power Flow Controllers as an alternative to or part of the Program?

A: It appears as if the Joint Applicants did not consider or rely on Advanced Power Flow Controllers as an alternative to or part of the Program. The Joint Applicants state that "[w]hile they are not a part of long-term planning of a heavily interconnected the system, they can certainly assist with flow control during outages and contingencies."[135] Regarding the role of controllers in assisting during contingencies, as Mr. Davies explains in his direct testimony, each of the 6 alternatives studied by MISO solved fewer contingencies than the MISO's East-Central Corridor plan indicating the East-Central Corridor was a better alternative.[136] The Joint Applicants have not demonstrated that Advanced Power Flow Controllers solved fewer contingencies than the Program. This is the type of evidence I would expect the Joint Applicants to have included in their Application to ensure that the Commission has a complete evidentiary record.

Q: Do you agree with the Joint Applicants' that Advanced Power Flow Controllers are not a part of long-term planning?

A: I disagree. As I previously mentioned, these controllers help reduce flows on constrained transmission lines while increasing flows on less constrained ones, which directly addresses transmission constraints – a critical element of long-term planning. The Joint Applicants are treating long-term planning and outage planning separately. Outage planning involves seeking MISO's approval for transmission outages on existing transmission lines during Program construction.

[135] CUB-EDF Exhibit 1.02 at 3-4.
[136] Ameren Exhibit 5.0 at 20:396-98.

The Joint Applicants state that they are "looking at the benefit of a proactive purchase of a powerflow controller to cover equipment lead times being longer that outage planning."[137] By focusing only on the benefits of these controllers for outage planning, they may be overlooking the significant advantages these controllers could provide for long-term planning as well.

VIII. RECONDUCTORING

Q: What is reconductoring?

A: Reconductoring is another hardware grid enhancing technology solution. It is rewiring the existing conductor to increase the current carrying capability, called ampacity.[138] Replacing traditional aluminum-core steel-reinforced ("ACSR") conductors with advanced conductors can increase transmission capacity by up to 250%.[139] Reconductoring can be deployed on any transmission line if the existing line has a traditional ACSR conductor. The Joint Applicants mention that they will re-use the existing bundled 954 Rail ACSR 45/7 conductor for existing 138 kV or 161 kV transmission lines in the Program, but any new 138 kV or 161 kV transmission line will use new 954 T2 ("Twisted") Rail ACSR 45/7 conductor.[140]

The Joint Applicants are proposing to reconductor the existing 345 kV circuits at Ipava-Duck Creek-4573 345 kV and Duck Creek-Mapleridge-4573 345 kV (Program #2 Line

[137] *Id.*
[138] Liza Reed et al., "Expanding Transmission Capacity: Examples of Regulatory Paths for Five Alternative Strategies," 33 The Electricity. J. 6 (July 2020), *available at* https://www.sciencedirect.com/science/article/pii/S1040619020300622.
[139] Jeff St. John, *New Transmission Tech Can Easily Double Clean Energy Capacity. Will Utilities Buy It?*, Canary Media, Nov. 17, 2021, https://www.canarymedia.com/articles/transmission/new-transmission-tech-can-easily-double-clean-energy-capacity-will-utilities-buy-it ("[T]he new cables can increase electricity capacity by as much as 250 percent compared to traditional ACSR equipment, Huang said in a September interview.").
[140] Ameren Exhibit 7.0 at 8:146-52.

Segment) with "bundled" 2-954 Cardinal ACSS 54/7 or "bundled" 2-795 Drake ACSS 26/7.[141] Since the Joint Applicants are proposing to reconductor the existing 345 kV circuits, my discussion below focuses on existing 138 kV or 161 kV transmission lines for reconductoring.

Q: What are the estimated costs of reconductoring?

A: The Joint Applicants are in the best position to provide an estimate for reconductoring costs since they are proposing to reconductor the existing 345 kV circuits. However, similar to my analyses above, analysis by well-respected analysts exists, which provides additional information that should assist the Commission. In particular, the costs of reconductoring could be half of a new transmission line cost, according to the Department of Energy.[142] Another Department of Energy report suggests reconductoring costs could be in the range of $1-$8M per mile, depending on the voltage, which is quite a wide range, but at the higher end, would be in the same price range as new construction transmission lines.[143] A recent report from GridLab found that reconductoring with advanced conductors can double line capacity at half the price of new lines.[144]

[141] Ameren Exhibit 7.0 at 8:146-52, 20:400-410.
[142] U.S. Dept. of Energy, Advanced Transmission Technologies, at 26 (Dec. 2020), *available at* https://www.energy.gov/oe/articles/advanced-transmission-technologies-report ("A reconductoring project may cost up to half as much as a new transmission line and can be completed in a significantly shorter amount of time.").
[143] U.S. Dept. of Energy, Dynamic Line Rating, at 3 (June 2019), *available at* https://www.energy.gov/oe/articles/dynamic-line-rating-report-congress-june-2019 ("[L]ine reconductoring, which can be used in some situations to increase capacity on existing transmission right-of-way, can cost from $1 million to $8 million per mile depending on the voltage class of the line.").
[144] Emilia Chojkiewicz et al., "Reconductoring with Advanced Conductors Can Accelerate the Rapid Transmission Expansion Required for a Clean Grid," GridLab, at 3 (2024), *attached as CUB-EDF Exhibit 1.10*.

953 **Q: Why is reconductoring gaining traction at the U.S. Department of Energy?**

954 A: With reconductoring, there is no need for 364 miles of new Right-of-Way acquisition, as
955 the Joint Applicants' Program requires, and transmission losses are reduced.[145] These are
956 the two primary reasons reconductoring is gaining attention at the U.S. Department of
957 Energy. Reconductoring also does not require raising transmission towers, which results in
958 less steel, aluminum, and other materials usage for transmission structures.[146]

959 **Q: Why should the Joint Applicants consider Reconductoring when evaluating and**
960 **designing the Program?**

961 A: Reconductoring select 138 kV lines like those that MISO found have thermal issues could
962 provide additional capacity at a price per mile significantly less than the Joint Applicants'
963 Program. For example, taking the mid-value of $4M per mile reconductoring costs from
964 the Department of Energy studies discussed above, I estimate the cost of reconductoring
965 22 miles of existing 138 kV Paxton East-Gilman South-1505 line at $88 million, which
966 could provide 250% capacity increase along that path.

967 To be clear, I am not suggesting reconductoring all the 138 kV transmission lines
968 identified by MISO as thermal issues since that would not be cost-effective compared to
969 the Program costs paid by the Illinois customers.

[146] See "the total cost of reconductoring projects on a unit length basis is less than half of new-build projects due to the avoided cost of new ROW and structures" Accelerating transmission capacity expansion by using advanced conductors in existing right-of-way. Proceedings of the National Academy of Sciences PNAS, Vol. 121. No. 40. https://www.pnas.org/doi/10.1073/pnas.2411207121.

Table 8 - Reconductoring Cost Estimates

Monitored Facility/Thermal Issue	# of Miles	Cost Estimate
Morrison Ditch Sheldon South 138 kV Ckt. 1	5.3	$ 21,200,000
Gilman Paxton East 138 kV Ckt. 1	22	$ 88,000,000
Sheldon South Watseka 138 kV Ckt. 1	11.1	$ 44,400,000
Gilman Watseka 138 kV Ckt. 1	10	$ 40,000,000
Herleman 3 – Quincy S. 138 kV Ckt. 73	2.3	$ 9,200,000
Total Cost Estimate		$ 202,800,000

Since the Joint Applicants did not include any analysis of reconductoring for 138 kV or 161 kV transmission lines in their Application or testimony, it is difficult to compare these proposals directly to the Program. However, the foregoing discussion demonstrates the type of analysis the Joint Applicants would need to provide to ensure that the Commission has a complete record on which it can meaningfully evaluate the merits of the Joint Applicants' proposal. The reconductoring cost estimates provided here are examples of reconductoring existing thermal issues that were mentioned earlier in Table 4 and are illustrative only.

Q: Did the Joint Applicants consider or rely on Reconductoring existing 138 kV or 161 kV transmission lines when evaluating or designing the Program?

A: No, it does not appear so. As I mentioned above, the Joint Applicants are proposing reconductoring on existing 345 kV circuits.[147] Additionally, the Joint Applicants assert, "some of the 138kV lines that are being built or rebuilt, will use a high temperature, low sag advanced ACSS conductor to facilitate the required ratings of the Program."[148] However, it is unclear if the Joint Applicants have considered or relied on reconductoring

[147] Ameren Exhibit 7.0 at 8:146-52, 20:400-410.
[148] CUB-EDF Exhibit 1.02 at 18-19.

existing 138 kV or 161 kV circuits. The Joint Applicants' response to discovery did not address reconductoring.[149]

IX. TOPOLOGY OPTIMIZATION

Q: What is Topology Optimization?

A: Topology Optimization is a software solution that finds reconfiguration solutions when transmission lines are congested in real-time operations. It is the "Waze for the transmission grid."[150] Topology Optimization is operations-oriented software rather than a transmission planning software tool. According to the WATT Coalition, Topology Optimization reduces grid congestion in real-time "by opening and closing circuit breakers at substations."[151]

Q: Why should the Joint Applicants consider Topology Optimization when evaluating and designing the Program?

A: Topology Optimization can be a cost-effective way to improve the efficiency of the transmission system and reduce renewable energy curtailment risk. For example, the software company that MISO contracted for Topology Optimization, NewGrid, states that its software improves grid resilience and reliability and increased transfer, and can lead to congestion cost reductions of up to 50%.[152]

[149] *Id*. at 3-4.
[150] Pablo Ruiz and Jay Caspary, "SPP Transmission Topology Optimization Pilot: Efficient Congestion Management And Overload Mitigation Through System Reconfigurations" ESIG Spring Technical Workshop, at 2 (March 20, 2019), *available at* https://watt-transmission.org/wp-content/uploads/2019/03/spp-transmission-topology-optimization-pilot-efficient-congestion-management-and-overload-mitigation-through-system-reconfigurations-.pdf.
[151] Press Release, WATT Coalition, MISO Grid Optimization Process Will Reduce Congestion Costs, Improve Reliability and Renewable Delivery (July 17, 2023), https://watt-transmission.org/miso-grid-optimization-process-will-reduce-congestion-costs-improve-reliability-and-renewable-delivery/.
[152] Pablo Ruiz and Mitch Myhre, "Congestion Mitigation With Transmission Reconfigurations" (March 11, 2024), *available at* https://newgridinc.com/wp-content/uploads/2024/03/NewGrid_Congestion-Mitigation-with-Reconfigurations_OMS-MWG-TWG_20240311_FINAL_website.pdf.

Additionally, Mr. Dodd, in his direct testimony, establishes a direct relationship between increasing renewable penetration in the MISO Midwest Subregion and MISO's LRTP, resulting in Tranche 1 Portfolio, of which the Program is part.

First, Mr. Dodd stated the MISO's Renewable Integration Impact Assessment ("RIIA"), "assessed the effect on the MISO system of integrating increasingly higher levels of renewables."[153] He also stated, "the growth in renewables penetration causes different dispatch patterns relative to conventional generators, leading to several dynamic issues" implying higher renewables penetration could lead to renewable energy curtailments.[154]

Second, Mr. Dodd addressed why MISO "formulated the Reliability Imperative."[155] Because "MISO recognized as a result of the RIIA and other efforts, such as its annual Regional Resource Assessment (RRA)... that industry trends are driving members to make significant changes to their portfolios, including retirements of aging units and integration of increased levels of renewables."[156]

Third, Mr. Dodd discussed why MISO updated its Futures. He stated, "[i]n response to the need for transmission solutions that allow MISO members and states to reach their ambitious clean energy transition goals, MISO initiated a stakeholder process to update its Futures[.]"[157]

Finally, Mr. Dodd states that the "LRTP initiative component of the Reliability Imperative is MISO's transmission planning response."[158] To achieve increased renewable

[153] Ameren Exhibit 3.0 at 13:247-48.
[154] *Id*. at 14:268-70.
[155] *Id*. at 15:299.
[156] *Id*. at 15:294-97.
[157] *Id*. at 16:320-22.
[158] *Id*. at 20:376-77.

energy goals, MISO first conducted the RIIA study and then formulated the Reliability Imperative. LRTP is a component of the Reliability Imperative. The Joint Applicants Program is a result of the LRTP Tranche 1 Portfolio.

Hence, the Program provides increased penetration of renewable generation. While the Program may increase the penetration of renewable generation, using Topology Optimization as part of the Program Portfolio to address the renewable energy curtailment risk could find system reconfigurations that allow even more renewable generation and reduce renewable curtailments up to 50%. Hence, Topology Optimization software like that offered by NewGrid could help the Joint Applicants achieve some of the stated goals of the Program.

Q: What role does MISO play in deploying Topology Optimization Software?

A: After the MISO Board approved the Tranche 1 Portfolio in July 2022, MISO started a new process in July 2023 for market participants and transmission owners to identify transmission congestion patterns of interest.[159,160] The market participant must identify reconfiguration solutions, analyze them and submit to MISO and Transmission Owners such as the Applicants. MISO will then assess the reliability and economic impact and evaluate options. The final step in this process is MISO and Transmission Owners agreeing to implement the reconfiguration solution if real-time conditions warrant the need to implement this solution. The Topology Optimization software tool is not only deployed at MISO—other Independent System Operators such as Southwest Power Pool, Electric

[159] https://www.misoenergy.org/meet-miso/media-center/2022/miso-board-approves-$10.3-in-transmission-projects.
[160] MISO, "Process to Support Congestion Cost Reconfigurations in the MISO Footprint," (June 30, 2023), https://cdn.misoenergy.org/MISO%20Congestion%20Cost%20Reconfigurations%20Process629409.pdf.

Reliability Council of Texas, and ISO-New England have deployed the optimization tool to find reconfigurations.[161]

Q: Is transmission reconfiguration through topology optimization one of the recommendations by MISO's Independent Market Monitor?

A: Yes, MISO's Independent Market Monitor, Potomac Economics, recommended to MISO that "MISO should work with TOs to identify and deploy economic transmission reconfiguration options" in the 2021 State of the Market report.[162]

Q: What is the estimated cost of Topology Optimization?

A: Topology Optimization software vendor NewGrid provided an estimate for a pilot project between $1 Million and $2 Million. For the purposes of my testimony, I assumed a midpoint value of $1.5 Million for the estimated cost of Topology Optimization.[163] The Joint Applicants could provide a more accurate cost estimate by considering Topology Optimization during the planning stage for Programs like this one.

[161] *See* Pablo Ruiz et al., "Transmission Topology Optimization Case Studies in SPP and ERCOT," (June 24, 2020), *available at* https://www.ferc.gov/sites/default/files/2020-06/W3-1_Ruiz_et_al.pdf; Emily Hayes, "NewGrid to Bring Congestion Software to ISO-NE System," RTO Insider, Aug 31, 2021, https://www.rtoinsider.com/28538-newgrid-congestion-software-iso-ne-system/.

[163] "We estimate the pilot costs to be $1,000,000 to $2,000,000, depending on the scope, duration and the degree to which the NewGrid software would require to be integrated with other systems." https://arpa-e.energy.gov/sites/default/files/NewGrid.pdf?ref=ctvc.co.

Q: Did the Joint Applicants consider or rely on Topology Optimization software when evaluating or designing the Program?

A: It appears as if the Joint Applicants did not consider or rely on Topology Optimization software when evaluating or designing the Program. The Joint Applicants state that it "is not part of a long-term planning solution, however, can be used during outage planning."[164]

Q: Do you agree with the Joint Applicants that the Topology Optimization software solution is not part of a long-term planning solution?

A: I disagree. As I mentioned above, Mr. Dodd mentioned that higher renewable energy penetration leads to several dynamic issues.[165] If these dynamic issues occur in real-time operations, operators need guidance on how to respond, including how to reconfigure the transmission system. Topology Optimization software enables the identification of reconfiguration solutions to address these dynamic issues. Hence, Topology Optimization software should be considered part of a long-term planning solution that enables efficient real-time operations.

X. GRID ENHANCING TECHNOLOGIES COST COMPARISON

Q: Please show the comparison of estimated Grid Enhancing Technology costs.

A: As shown in the table below, with the exception of reconductoring, deploying Grid Enhancing Technologies in the Program Area would amount to a small fraction of the total Program costs paid by Illinois customers.

[164] CUB-EDF Exhibit 1.02 at 3-4.
[165] Ameren Exhibit 3.0 at 14:268-70.

Table 13 - Grid Enhancing Technology Cost Comparison

Grid Enhancing Technology	Estimated Costs	Estimated Benefit
Topology Optimization	Approx. $1,500,000	40% - 50% congestion cost savings[166]
Dynamic Line Ratings	Approx. $23,000 per mile	up to 44% increase in transmission capacity[167]
Advanced Power Flow Controller	Approx. $134,000 per mile	Situation Dependent
Reconductoring	Approx. $88,000,000 for 22-mile 138 kV Paxton East-Gilman South-1505 line	250% increase in transmission capacity[168]

Q: Would the GETs you analyzed provide the same benefits as the Program?

A: Because the Joint Applicants did not evaluate GETs either when considering alternatives or when designing the Program and provided limited data regarding the benefits of and need for the Program, it is difficult to say to what extent the GETs I analyzed may provide benefits equivalent to the Program. The GETs described above have a track record of increasing transmission capacity at a lower cost than new transmission lines. Based on this track record, it is reasonable to assume that GETs could cost-effectively provide some or all of the benefits of the Program, either as alternatives or as part of the Program design.

[166] Press Release, WATT Coalition, MISO Grid Optimization Process Will Reduce Congestion Costs, Improve Reliability and Renewable Delivery (July 17, 2023), https://watt-transmission.org/miso-grid-optimization-process-will-reduce-congestion-costs-improve-reliability-and-renewable-delivery/ (stating that NewGrid, Inc. found 40% congestion cost savings in one case study in MISO); Pablo Ruiz and Mitch Myhre, "Congestion Mitigation With Transmission Reconfigurations," at 10 (March 11, 2024), *available at* https://newgridinc.com/wp-content/uploads/2024/03/NewGrid_Congestion-Mitigation-with-Reconfigurations_OMS-MWG-TWG_20240311_FINAL_website.pdf (stating that congestion savings of 50% are achievable).

[167] *See* Shaun Murphy, "Dynamic Line Ratings Overview," PJM, at 4 (March 30, 2021), *available at* https://www.pjm.com/-/media/committees-groups/committees/oc/2021/20210330-special/20210330-item-01-dynamic-line-ratings-overview.ashx. (stating that capacity increases of up to 44% are possible with DLR); *see also* CUB-EDF Exhibit 1.09 (case studies from multiple utilities showing average added capacity of 9-36%).

[168] Jeff St. John, *New Transmission Tech Can Easily Double Clean Energy Capacity. Will Utilities Buy It?*, Canary Media, Nov. 17, 2021, https://www.canarymedia.com/articles/transmission/new-transmission-tech-can-easily-double-clean-energy-capacity-will-utilities-buy-it ("[T]he new cables can increase electricity capacity by as much as 250 percent compared to traditional ACSR equipment, Huang said in a September interview.").

The Joint Applicants should conduct this analysis and provide the information necessary to make an informed decision regarding the costs and benefits to Illinois' customers.

Q: Would the GETs you analyzed provide benefits not identified in the Program?

A: Yes. As I mentioned earlier, GETs can provide additional resiliency benefits that are not captured in the Program. For example, hundreds of transmission towers and conductors might need to be replaced if extensive damage occurs during a weather event. That might lead to a 3-week transmission outage as evidenced in the MISO South region during Hurricane Ida in August 2021 when "Hurricane Ida cut through a significant transmission corridor, severing all ties from MISO into much of Baton Rouge and all of New Orleans."[169] Since GETs are quick-deployment tools, the restoration time to redeploy GETs in the event of storm damage is less compared to traditional transmission equipment. This resiliency benefit of quickly restoring GETs is an example of a benefit not identified in the Program.

Q: How should the Commission approach resiliency within the context of GETs?

A: Within the context of GETs, the Commission must provide consideration for rapid recovery from disruptive outages due to weather events as an example. One framework to study the benefits of GETs in providing this resiliency attribute is the Resilience Trapezoid, which "highlights the return to normal operations after a disturbance in a baseline system compared to a more resilient system."[170] This Resilience Trapezoid illustrates that

[169] On August 29, 2021, Hurricane Ida, Category 4 "caused significant distribution damage compared to other recent storms in Louisiana" According to MISO, 228 transmission lines returned to service by September 21, 2021, nearly 3 weeks later. See slides 13-14, MISO Operations Report presentation at the Markets Committee of the Board of Directors December 7, 2021, https://cdn.misoenergy.org/20211207%20Markets%20Committee%20of%20the%20BOD%20Item%2005%20MISO%20Operations%20Report608173.pdf.

[170] Page 5, NARUC Energy Resilience Reference Guide Chapter Two: Developing a Shared Framework to Value Resilience Investments, February 2023. https://pubs.naruc.org/pub/458600D2-913F-CBF6-B8F3-BBF1A796F00E.

deploying GETs lead to a transmission system with a better "recovery" profile than a transmission system with traditional transmission solutions alone.

Q: Would the GETs you analyzed resolve the thermal issues in Illinois identified in the MISO Future 1 models?

A: Yes. The 40% increase in thermal ratings of the 138 kV transmission lines when DLRs are deployed can resolve the thermal issues identified by MISO in the Future 1 models. If DLR deployment does not quite address the percentage loading on those existing 138 kV transmission lines, studies and industry practices referenced above suggest either Advanced Power Flow Controllers or Topology Optimization could be effective in addressing the remaining thermal issues.

Q: Would the GETs you analyzed provide the system performance enhancement benefit of the Program?

A: Yes. The Joint Applicants state that the Program provides "more paths for energy to flow" implying the Program creates multiple transmission paths.[171] All of the GETs I have analyzed can create more paths for energy to flow. A 40% increase in the thermal ratings of existing transmission lines due to DLR deployment, placing Advanced Power Flow Controllers at or near the locations where MISO identified thermal issues, Reconductoring a specific transmission line and running Topology Optimization software—all of them have the potential to create more paths for energy to flow.

[171] Ameren Exhibit 5.0 at 22:444.

Q: Would the GETs you analyzed provide the overall voltage profile enhancement benefit of the Program?

A: Yes. Although DLRs do not directly increase voltage profiles because they primarily address thermal issues, not voltage issues, with increased ratings, DLRs provide greater transfer limits into and out of Illinois.[172] Since transfer limits into and out of Illinois are the primary benefit from voltage profile enhancement that the Joint Applicants are concerned about, DLRs would provide this benefit. Similarly, Advanced Power Flow Controllers and Topology Optimization have the potential to provide the overall benefit of voltage profile enhancement. Whether Reconductoring provides similar benefits is dependent on the location where voltage issues occur.

Q: Would the GETs you analyzed provide a more robust system?

A: Yes. GETs can lead to a more robust system. There should be an additional consideration of benefits not identified in the Program such as the resiliency benefit of quickly restoring GETs compared to transmission assets. With this additional consideration, it will be clear that a transmission system with GETs provides for a faster recovery time compared to a transmission system with transmission solutions alone.

Q: Would co-locating the GETs you analyzed with existing transmission assets minimize the environmental and historical use impacts of transmission infrastructure investments?

A: Yes. As I mentioned above, deploying GETs on existing transmission assets, meaning co-locating GETs with existing assets minimizes the environmental and historical use impacts of transmission infrastructure investments.

[172] *Id.* at 23.

XI. BATTERY ENERGY STORAGE SYSTEM

Q: Should the Joint Applicants consider a Battery Energy Storage System (BESS) when evaluating the need for the Program?

A: Yes. The Joint Applicants should consider a BESS when evaluating the need for the Program because increasing renewable energy penetration leads to instances when there is excess energy on the grid, and batteries can ideally charge with that excess energy and discharge when there is no renewable energy. MISO found in the RIIA study, which Mr. Dodd referenced that at 30-40% of renewable penetration, "[s]olutions include operational or market practices to reserve needed headroom in real-time or installing stand-alone resources like battery storage to respond when needed."[173] MISO called out battery storage as one of the methods to stabilize the grid after 30% renewable penetration.[174]

Q: Are you aware of other utilities in MISO using BESS to improve transmission reliability?

A: Yes. American Transmission Company is in the process of constructing a 2.5 MW lithium-ion battery project to improve reliability on its transmission system in Wisconsin.[175,176] The project has been classified as a transmission asset by MISO, which means costs will be recovered through transmission rates.

[173] Ameren Exhibit 3.1 at 16.
[174] *Id*. at 10.
[175] Bob McKee, "Deploying Energy Storage as Transmission Assets," American Transmission Co., at 7 (Jan. 11, 2022), *available at* https://icc.illinois.gov/api/web-management/documents/downloads/public/McKee_Bob_ATC_ICC_Session5_1-11-2022.pdf.
[176] American Transmission Company now lists the Waupaca Area Energy Storage Project as estimated to be in service in early 2024. https://www.atc10yearplan.com/summary-report/emerging-projects-update/.

Q: Did the Joint Applicants evaluate deploying a BESS as part of the Program?

A: No. The Joint Applicants did not provide this evaluation. The Joint Applicants state that MISO included storage as part of LRTP Tranche 1 models but do not specifically state whether they independently evaluated BESS as part of the Program.[177] In MISO's LRTP Tranche 1 models, I found only a 5 MW BESS in 2040 in Illinois.[178] Hence, it is unclear whether BESS was evaluated as part of the Program.

Q: What are the typical costs of BESS solutions?

A: The National Renewable Energy Laboratory ("NREL") Annual Technology Baseline ("ATB") 2024 update lists capital costs for a 4-hour utility-scale BESS is $252 per kWh for an advanced scenario, $310 per kWh for the moderate scenario and $402 for conservative scenario assumptions per kWh.[179] For the sake of my testimony, I have assumed the $402 per kWh cost estimate.

Q: Please show a comparison of estimated BESS costs in the Program Area.

A: Similar to the American Transmission Company, if the Joint Applicants install a 2.5 MW/10 MWh BESS at one of the locations in the Program Area, then the cost would be $4 million. If the BESS costs must be paid by Illinois customers alone, then the BESS could be rated up to 70 MW/280 MWh. However, if BESS qualifies as a regional project, then the BESS could be rated up to 564 MW/2256 MWh.

For the sake of this cost comparison, I assumed:

1. NREL conservative cost assumptions only.

[177] CUB-EDF Exhibit 1.02 at 18-19.
[178] LRTP Tranche 1 Detailed Business Case Analysis spreadsheet, B_Region_RRF_Capacity tab, available at https://www.misoenergy.org/planning/long-range-transmission-planning/, https://cdn.misoenergy.org/LRTP%20Tranche1%20Detailed%20Business%20Case%20Analysis625787.xlsx
[179] NREL ATB 2024 data is available here: https://atb.nrel.gov/electricity/2024/data

2. The BESS costs to Illinois customers will be 8.87% of the capital costs, similar to the Program costs.

3. A rating of 564 MW is chosen because 564 MVA is the winter emergency rating of a 138 kV transmission line in this Program.

4. BESS will discharge for four hours, which is standard among most grid-scale battery storage.

5. I did not assume transmission reservations are needed to charge the battery, so I did not include the costs of procuring transmission reservations.

Table 14 - BESS Costs Estimate

MW/MVA	Hours	Size (MWh)	Cost/kWh	Source	BESS Capital Cost	Costs to IL customers
2.5	4	10	$402	NREL	$4,020,000	$356,574
5	4	20	$402	NREL	$8,040,000	$713,148
70	4	280	$402	NREL	$112,560,000	$9,984,072
564	4	2256	$402	NREL	$906,912,000	$80,443,094

Q: Please state your conclusions from comparing various BESS alternatives.

A: BESS is a viable alternative for addressing higher percentages of renewable integration because it provides grid stability. However, the battery size is limited to lower than or equal to 564 MW/2256 MWh to keep BESS costs lower than the Program costs paid by Illinois customers.

XII. RECOMMENDATIONS

Q: Please provide an overview of your recommendations and conclusions.

A: ***First***, I generally agree that there is a need to invest in the Illinois transmission system to address the issues identified by MISO's Tranche 1 portfolio, in order to provide adequate, reliable, and efficient service through the least-cost means.

Second, the Joint Applicants should consider Grid Enhancing Technologies when evaluating least cost or cost-effective alternatives to the transmission line segments in the Central Illinois Grid Transformation Program. Dynamic Line Ratings, Advanced Power Flow Controllers, Reconductoring and Topology Optimization could all enhance transmission efficiency in the Program Area and present significant savings. Even if these technologies cannot serve as an alternative to transmission line segments in the Program, they could minimize the environmental and historical use impacts of transmission infrastructure investments and improve the overall resiliency of the Program design when co-located with the Program.

Third, the Joint Applicants should consider a Battery Energy Storage System when evaluating alternatives that provide grid stability to the transmission line segments in the Program. While my analysis determined one particular battery size is cost-effective to Illinois customers, the Joint Applicants should conduct an analysis to determine optimal battery size.

Q: Please provide a table summarizing the alternatives to consider when evaluating the Program's needs.

A: The Table below includes both the GETs solutions and the BESS option:

Table 15 - Summary of Estimated Costs of Alternatives for Evaluation

Alternative	Estimated Costs	Estimated Benefit
Topology Optimization	Approx. $1,500,000	40% - 50% congestion cost savings.
Dynamic Line Ratings	Approx. $23,000 per mile	up to 44% increase in transmission capacity.
Advanced Power Flow Controller	Approx. $134,000 per mile	Situation Dependent.
Reconductoring	Approx. $88,000,000 for 22-mile 138 kV Paxton East-Gilman South-1505 line	250% increase in transmission capacity.
BESS	Approx. $80,443,094	Grid stability.

Q: Does this conclude your testimony?

A: Yes, it does.

4. Rate Impacts of Improved System Utilization
5. Principles for Measuring System Utilization
6. Conclusion

Technical Appendix

Section 1: **Summary**

Background

The purpose of this study is to assess an emerging opportunity to reduce electricity rates by improving the utilization of the US power system.

The affordability challenge: Several factors are driving electricity rate increases, including the growing cost of maintaining and expanding an aging transmission and distribution grid. At the same time, electricity demand is rising, driven by growth in data center development, electrification, and manufacturing.

The utilization solution: Because the power system is built to serve infrequent spikes in demand, less than half of its capacity is used throughout the year. If new electricity demand can be added to the existing power system where and when there is spare capacity, the system's fixed costs will be shared by more customers, putting downward pressure on rates.

Making it happen: The urgent need to improve system utilization is coinciding with the emergence of efficient, flexible, distributed energy technologies such as batteries, electric vehicles, smart thermostats, and other devices that reduce electricity demand at times when the power system is constrained. Encouraging their adoption offers direct financial savings to participating customers and can reduce electricity rates for all.

ANALYSIS OVERVIEW

We define a representative utility system and quantify the rate impacts of load growth with and without a focus on improved utilization.

The utility: An illustrative mid-sized (3,000 MW peak demand) utility experiencing 1,000 MW of load growth (33% increase), half of which is transmission-connected (e.g., data center) and the rest of which is distribution-connected (e.g., EVs, heat pumps).

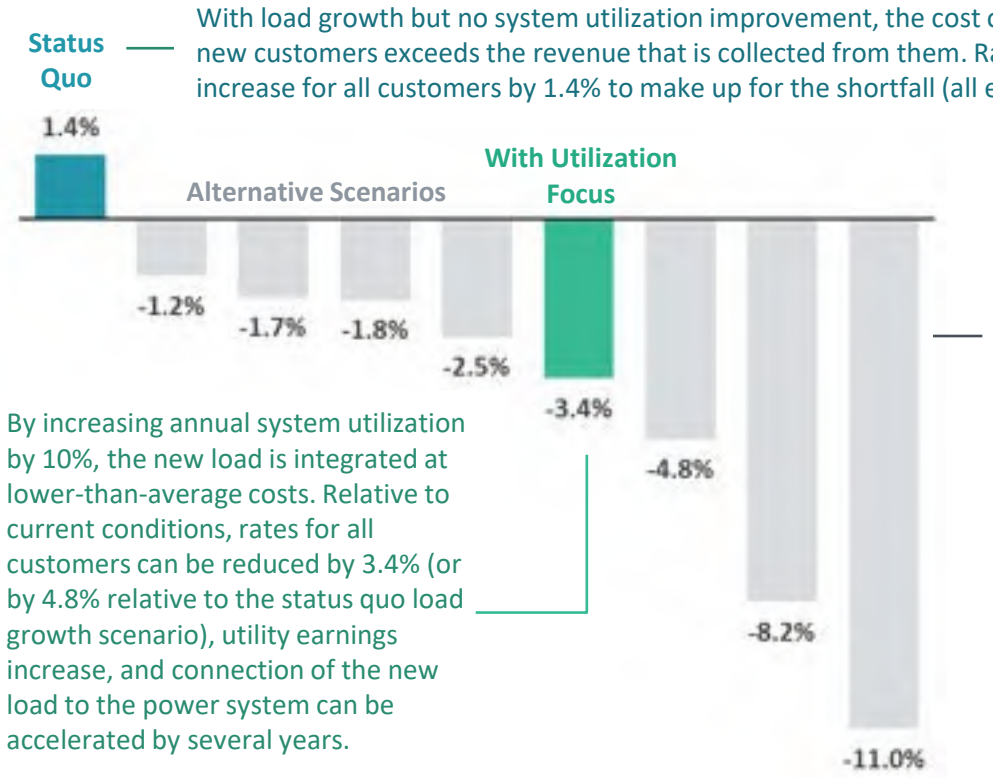
Status quo approach: New generation, transmission, and distribution infrastructure are built to serve the new load. Costs not recovered from the new load are made up through a rate increase for all customers.

Approach with utilization focus: Peak demand reductions from the new load and from existing customers reduce the amount of supporting infrastructure that must be built. New revenue lessens the cost-recovery burden for existing customers.

The Impacts of Improved System Utilization: An Illustrative Example

In this illustrative analysis, improving system utilization can reduce customer bills and accelerate the connection of new load while still allowing utility earnings to grow relative to current levels, all else equal.

All-in Average Rate Impact Due to Load Growth
For various characterizations of the power system



Note: Impacts are shown in nominal terms.

INTERPRETING THE RESULTS

Proof-of-concept. The analysis is a plausible illustration of the benefits of improved system utilization; it is not a comprehensive analysis of all possible utility or market conditions. Tailored, jurisdiction-specific analysis is needed to understand the opportunities for any given system.

Other rate impacts. This study focuses only on the rate impacts associated with load growth and improved system utilization. It does not analyze other factors that could independently drive rate changes, such as the replacement of aging transmission and distribution (T&D) infrastructure or fluctuations in natural gas prices.

Rate design. The "status quo" analysis assumes existing rates are insufficient to fully recover incremental cost from new load. In practice, rate design can also be an effective tool for mitigating cost shifts from new loads to existing customers.

Policy implications. This paper quantifies the impact of increased system utilization but does not propose specific policies or programs in this area.

National Implications

At a national scale, improving system utilization can be a win for consumers, utilities, and new loads.

Benefits to Consumers

Analysts project that annual US electricity sales will increase by 20–30% over the next five years. Scaling this study's utility-level findings to that level of national load growth indicates that **US consumers could save $110 to $170 billion over 10 years** on their electricity bills due to system utilization improvements. Participants in programs or rates that incentivize peak demand reductions will experience **additional savings through enrollment incentives**.

Benefits to Utilities

Improving system utilization is a strategy for efficient load growth. In our analysis, a focus on improving system utilization lessens but does not eliminate the need to invest in new generation, transmission, and distribution capacity. As a result, utility earnings will still grow relative to current levels, and margins could increase with the introduction of new regulatory incentives. This focus on efficient growth will allow utilities to **focus capital deployment on the most critical infrastructure projects while also being a key enabler of economic development**.

Benefits to New Loads

Cost-effective solutions for improving system utilization allow new customers to connect to the grid **without shifting costs to other consumers**, addressing an escalating policy concern. These solutions also **mitigate the stranded asset risk of overbuilding the power system** if new load does not materialize at the level or pace forecasted, as efficiency, flexibility, and DERs can be scaled to match load growth more effectively than larger resources. Lastly, distributed resources can be brought online more quickly than other options, **accelerating speed-to-market.**

Ensuring Beneficial Outcomes

System utilization is a simple concept, but thoughtful attention to key details can help ensure the beneficial outcomes identified in this study are realized.

$$\text{System Utilization (\%)} = \frac{\text{Total energy delivered or produced on system over a given time period}}{\text{Available system capacity over the same time period}}$$

Utilization measurement should account for differences in the characteristics of generation, transmission, and distribution planning and operations.

Generation capacity should reflect expected availability of the generators during peak ("effective load carrying capability" or "unforced capacity"), as this appropriately accounts for energy-limited resources and planned outages.

Transmission capacity can be represented by the firm transfer capability of a given transmission zone; transmission utilization naturally will be lower than generation utilization due to more stringent transmission reliability planning considerations.

Distribution capacity can be calculated as the loading limits of all components at a given level of the network (e.g., feeders). Given the varied and local nature of constraints across the distribution system, an additional metric that quantifies the *share* of the system that is constrained could provide a useful complementary perspective to a systemwide average metric.

EXAMPLE PRINCIPLES TO ENSURE BENEFICIAL OUTCOMES

- **System Fundamentals:** Account for fundamental factors that drive differences in utilization across systems (e.g., customer mix, climate, distribution system configuration, generation mix).
- **Interaction with Rates:** Carefully consider the rate paid by new load when estimating the price impacts of improved utilization. Rate design and cost allocation methods will influence the extent to which rates are reduced for existing customers.
- **Cost-Effectiveness:** Improved system utilization is not a goal on its own; it is a mechanism through which to reduce electricity rates. Ensure that the methods used to improve utilization are less costly than investments in conventional infrastructure.
- **Diminishing Returns:** Take into account levels at which higher system utilization could produce diminishing benefits or even additional costs. For example, the distribution system needs times of reduced load for electrical equipment to cool, which can reduce wear and associated long-term maintenance costs.
- **Reporting:** Consider grid security considerations that may require T&D utilization to be reported at aggregate levels or subject to confidentiality agreements.

Note: See Section 5 for further details and discussion of additional principles.

Section 2: **Introduction**

New Challenges

After years of stable rates and reliable service, the US power sector needs solutions to new challenges.

Rates are increasing, creating affordability concerns.

During the years between 2015 to 2020, the average US retail electricity rate increased only by 0.4% per year in nominal terms. In following five years, the average rate has increased by 5.6% per year. In some states (e.g., California), rate increases exceeded 12% per year over the same period. The increases are broadly expected to persist or even accelerate, with tightening reserve margins, aging grid infrastructure, rising transmission and distribution equipment costs, and a need for improved resilience against extreme weather events all applying continued upward pressure on rates.

The power system is increasingly constrained.

On the bulk power system, the rapid emergence of energy-intensive data centers has led to growing concerns about system reliability. On the distribution system, the continued rise in adoption of technologies such as electric vehicles has been slowed in part by capacity bottlenecks. In both cases, this rapid demand growth is putting pressure on grid operators to make new infrastructure investments, which introduces the risk of further price increases but also an opportunity to reduce prices if more power can be sold over the existing grid.

This study explores the opportunity to reverse these trends toward reduced affordability and reliability by improving the overall utilization of the power system.

> "Over the past few years, millions of Americans have seen their electricity bills skyrocket."
>
> *Washington Post*, January 15, 2026

> "Discontent over rising power bills has become a hot political issue that is expected to spill into the 2026 midterm elections."
>
> *Wall Street Journal,* December 29, 2025

> "Concern about rising electricity rates has emerged as a leading economic and political issue. Rising electricity prices played a big role in recent elections, including statewide races in Georgia, New Jersey and Virginia."
>
> *New York Times,* December 16, 2025

The Opportunity: Improve Power System Utilization

Making better use of the existing power system can put downward pressure on rates.

The power system is built to serve peak demand. However, electricity demand is near its peak in only a very limited number of hours per year. As a result, capacity across the entire power system often remains unused.

By adding load when and where there is spare capacity, the fixed costs of the generation, transmission, and distribution systems can be recovered across a broader base of electricity sales, and everyone will pay less for their electricity consumption as a result.

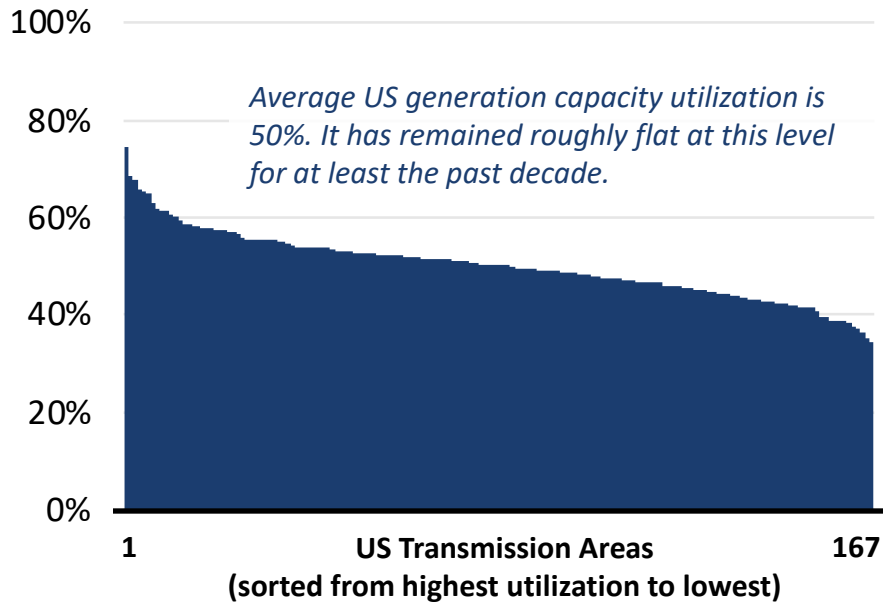
In other words, improving system utilization means the cost of the grid is shared by more customers. We carpool for the same reason—sharing resources reduces costs for everyone.

Two conditions enable improvements in system utilization: (1) load growth[1], which comes from connecting new customers to the power grid, and (2) an ability to make the load growth happen when and where there is spare capacity.

The current environment of rapidly growing electricity demand, coupled with the widespread emergence of flexible, distributed, intelligent energy technologies, has created ideal conditions for improving system utilization.

[1] In the absence of load growth, improving system utilization may enable the retirement of older, inefficient assets. However, this economic benefit is generally smaller than avoiding capital investment in new assets.

US Generation Capacity Utilization, by Transmission Area
2022–2024 Average



Note: System utilization is represented here as a region's average annual electricity demand divided by its peak demand plus an illustrative planning reserve margin of 15%. The figure shows average annual utilization factors from 2022–2024 for 167 US transmission areas, which are roughly consistent with utility or ISO zonal boundaries. Transmission area load data sourced from FERC Form 714, as compiled by Hitachi Velocity Suite.

Purpose of This Report

The purpose of this report is to provide decision-makers with an understanding of the extent to which improved system utilization can reduce electricity rates for all customers.

The remainder of the report is organized around three topics:

- A description of how improved system utilization can—and has—put downward pressure on rates, along with the tools available to achieve this outcome.
- A quantitative illustration of the rate impacts of load growth with and without improved system utilization. The analysis considers improvements in the utilization of generation, transmission, and distribution systems.
- A description of system utilization metrics, including important considerations when developing new programs or policies aimed at improving system utilization. These considerations will increase the likelihood of beneficial rate outcomes.

HOW TO USE THIS REPORT

Proof-of-Concept. The report includes an illustration of the benefits of improved system utilization, but not a comprehensive analysis of all utility conditions. It is intended to serve as the foundation for additional state- or utility-specific system utilization analysis, because each system and market has unique characteristics.

Scenario-Based Analysis. The modeled load growth, system costs, and rate impacts in this study are not a forecast of what will happen in the future, but instead reflect a plausible scenario through which the impact of system utilization on rates can be explored. Whether improved system utilization leads to lower nominal rates or otherwise slows the pace of rate growth will depend on various factors driving rate changes on the utility system.

Not a Policy Proposal. This paper quantifies the impact of increased system utilization, but does not propose specific policy mechanisms that could encourage increased utilization.

Section 3: **How It Works**

Converting Utilization Improvements into Downward Rate Pressure

Improvements in system utilization enable capital-efficient load growth, which puts downward pressure on rates.

Headroom

Create or identify spare capacity on power system

Prior studies identified 200 GW of cost-effective national potential in demand flexibility alone (roughly 20% of US peak demand). The potential is significantly higher when considering additional sources of flexibility, such as distributed storage and data center flexibility. Innovation in regulatory models may be needed to align utility incentives with this opportunity.

Load

Add load with efficient/limited investment in power system

Analysts project annual US electricity demand could increase by 25% (1,000 TWh/yr) over the next five years, driven primarily by data centers, electrification, and manufacturing. However, the forecast is uncertain. Distributed energy resources (DERs) can be scaled to match load growth more effectively than larger resources, managing the risk of overbuild and stranded assets.

Sales

Recover portion of costs of existing power system from new load

At a national average rate of 14 cents/kWh, 1,000 TWh/year of new annual electricity sales would amount to $140 billion/year in new energy revenue. A significant portion of that would pay for the existing generation, transmission, and distribution systems.

Rates

Reduce portion of existing power system paid for by existing customers

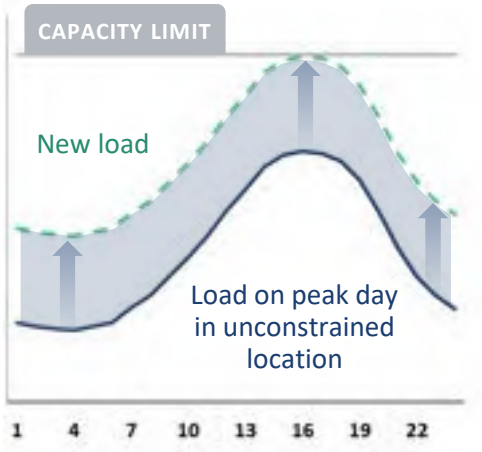
As the new load pays for a portion of the existing power system, the cost burden for other customers is reduced. As is shown later in this report, a capital-efficient approach to accommodating new load puts downward pressure on rates while still providing utilities with growth opportunities relative to current levels.

The Three Ways to Improve System Utilization

System utilization can be improved by adding new load when and where there is spare capacity. System headroom can be created through flexibility, efficiency, and other cost-effective capacity solutions.

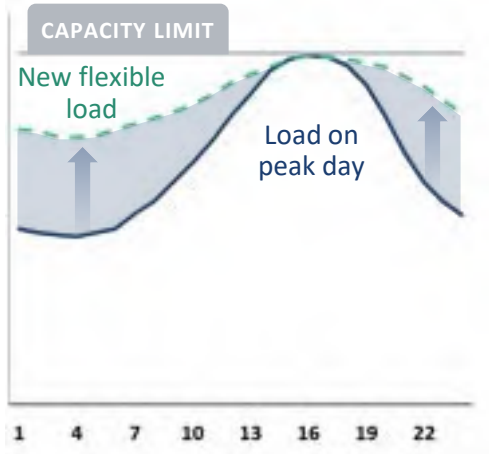
1

Add new load in **locations** where sufficient headroom already exists on the system.



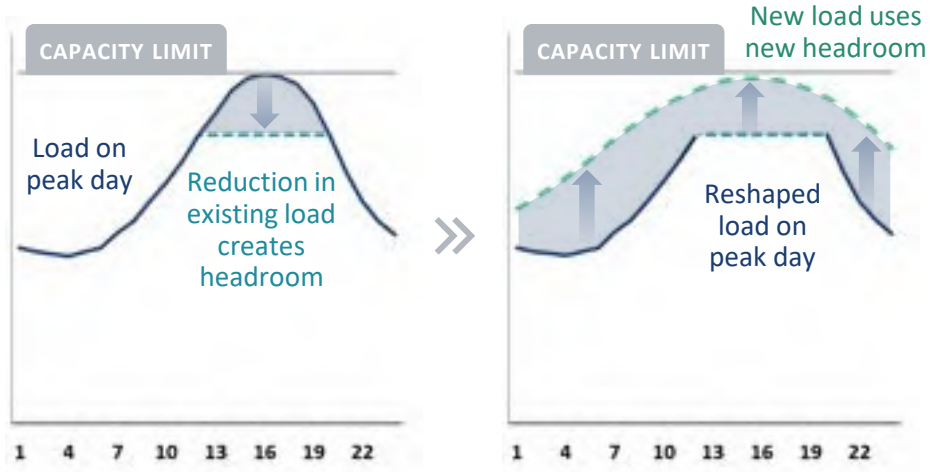
2

Add new load at **times** when there is spare capacity. This is possible if the new customers are flexible and/or can self-supply during peak conditions.



3

Incentivize technologies and behavioral changes that reduce peak demand of existing load. This creates new headroom on the system, which can then accommodate the addition of new load.



Note: These are highly simplified conceptual illustrations. The nuances of how improved system utilization would put downward pressure on rates are discussed in more detail throughout this report.

Tools for Improving System Utilization

Many options for improving system utilization are commercially available and can be deployed at scale. Both new and existing customers can contribute to utilization improvements.

Batteries

Batteries can charge from the grid at times when there is spare capacity, and discharge to the grid to create headroom during peak hours. New models are emerging to facilitate the deployment and operation of batteries across the distribution system as a grid asset. If the batteries are located on the customer's site, they can additionally provide valuable services to the customer, such as backup power and bill management.

California has developed more than 700 MW of dispatchable behind-the-meter residential battery capacity in under three years. Green Mountain Power's residential battery program is now the utility's largest peaking resource. Rocky Mountain Power has fully incorporated its battery program into the company's central unit dispatch system.

HVAC Controls

HVAC controls allow heating and cooling to be reduced during a limited number of hours per year when demand for electricity is highest. Roughly 10% of US households now have a smart thermostat, and other control technologies exist as well, including emerging options such as battery-paired heat pumps.

This concept also extends to water heating. Currently, roughly 9,700 MW of residential HVAC and water heating electricity demand can be controlled through utility demand response programs, and there is the potential to increase this capability several-fold.

EV Charging Controls

EV charging controls can shift electric vehicle charging load to hours when there is excess system capacity (e.g., overnight hours). Time-of-use (TOU) rates for home charging have reached high levels of adoption among EV owners, with some utilities exceeding 40% participation in voluntary EV TOU rates.

As EV adoption grows, actively managed charging will allow utilities to more precisely manage load. Vehicle-to-grid is an emerging capability with significant potential that would allow EV batteries to be more fully utilized to serve system demand during a select number of high-value events by exporting output to the grid.

Tools for Improving System Utilization (cont'd)

Smart Panels

Smart panels are an emerging technology to manage customer demand through circuit-level monitoring and control. They can disconnect specific circuits within a home when needed to manage the home's total demand and can potentially act as a gateway to metering and/or controlling devices within the home.

PG&E has developed a smart panel-enabled virtual power plant to shape home energy demand during up to 100 peak event hours. This premise-level control has the potential to improve downstream utilization of the distribution system at the grid's edge.

Time-varying Rates

Time-varying rates provide customers with a financial incentive to shift consumption to off-peak hours. Today, nearly 80% of residential customers are offered a time-of-use (TOU) rate by their utility. Some utilities, such as the California investor-owned utilities, Long Island Power Authority (LIPA) in New York, and Xcel Energy in Colorado have defaulted their customers to TOU rates.

TOU rates offer a static price signal that can be paired with event-based Critical Peak Pricing (CPP), which offers an additional (higher) rate on a limited number of days. These rates increase customer response and lead to greater demand reduction during stress events.

Flexible Interconnection Policies

Flexible interconnection policies are agreements between the utility and the customer to operate the customer's load within prescribed limits. These limits, sometimes referred to as "operating envelopes," are defined by the utility based on available distribution system capacity. Operating envelopes may be fixed at the time of interconnection or time-varying based on real-time available capacity ("dynamic operating envelope").

Some US utilities such as ComEd are exploring how flexible interconnections avoid or defer local distribution system upgrades that may otherwise be needed to support new load or DER connection.

Targeted Energy Efficiency

Targeted energy efficiency focuses efficiency investments on locations and end uses where they provide the greatest grid value, such as constrained feeders or peak-driven substations. Advanced analytics and hosting capacity studies increasingly enable utilities to identify locations for targeted efficiency that can create new headroom and be integrated into non-wires alternative (NWA) procurements and distribution planning processes.

Tools for Improving System Utilization (cont'd)

Grid-Enhancing Technologies

Grid-enhancing technologies (GETs) increase the usable capacity of existing transmission and distribution assets through advanced monitoring, control, and power flow optimization. Technologies such as dynamic line ratings, power flow controllers, and advanced conductors can often be deployed more quickly and at lower cost than traditional infrastructure upgrades, making them well-suited for near-term capacity needs.

Utilities across the US are piloting GETs to unlock incremental capacity and improve system utilization during peak conditions. For example, PPL realized 15% to 17% capacity increases through dynamic line ratings.

Data Center Flexibility

Data center flexibility can directly reduce the power system impact of large loads through operational adjustments or the use of on-site generation. In Texas, for example, Senate Bill 6 requires large loads with on-site generation to be available to curtail load during firm load shed events. Google has signed contracts with utilities to provide flexibility in return for accelerated interconnection.

Emerging aggregation models, such as the Bring Your Own Distributed Capacity (BYODC) model, credit data centers for supporting enrollments of residential and C&I customers in utility demand response and energy efficiency programs to offset grid impacts.

Improved System Planning

Improved system planning can surgically align investments and operations with demand growth. Proactive planning that anticipates load additions and electrification trends, supported by better load forecasting, helps utilities target upgrades to the highest-value constraints rather than overbuilding capacity. Integrated distribution planning that coordinates distribution needs with transmission and resource plans can unlock non-wires alternatives, optimize feeder and substation usage, and reduce redundant spending.

Emerging Evidence of the Benefits

Several recent analyses have found that load growth can enable downward pressure on rates.

RELEVANT STUDIES

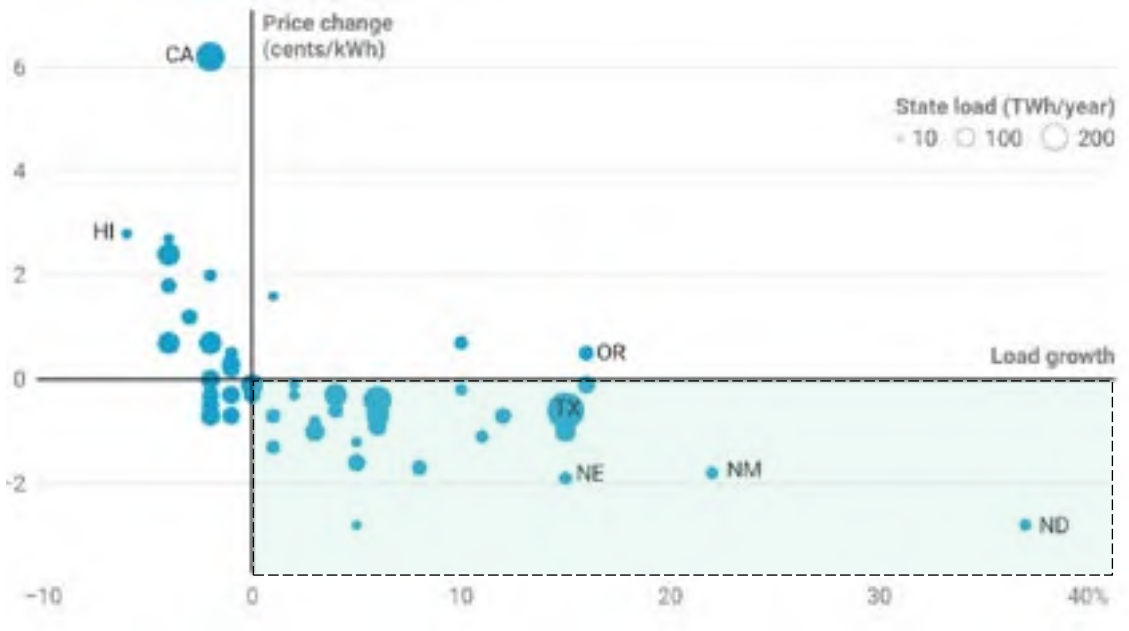
LBNL-Brattle 2025 study shows that historical load growth is associated with retail electricity price decreases.

RFF 2025 study provides empirical evidence showing that higher electricity demand reduces prices if the marginal generation cost is lower than the average cost.

Stanford 2025 study shows significant transmission headroom in the West; targeted load growth boosts grid utilization, lowers per-customer costs, and enables cost-effective system modernization.

UT Austin 2017 study attributes the 1960–1980 decline in utility network and administration costs to increasing energy consumption.

The Historical Relationship Between Load Growth and Retail Electricity Rates, by State (2019–2024)



24 states experienced load growth and declining inflation-adjusted retail electricity rates between 2019 and 2024

Source: Wiser, R. et al., "Factors Influencing Recent Trends in Retail Electricity Prices in the United States," prepared by LBNL and The Brattle Group, October 2025.

Notes: Price change is in cents/kWh, inflation adjusted to 2024$. Load growth is in percentage terms from 2019 to 2024. The source of the underlying data is EIA, created with Datawrapper.

Illustrating the Potential Rate Impact of Load Growth

The figures below provide a simplified, hypothetical illustration of how load growth could decrease or increase rates.

Hypothetical Illustration of **Rate Decrease** with Flexibility

Rate Impact of New Load:

-0.4 ¢/kWh (3% decrease in 14 ¢/kWh rate)

$$=\frac{\text{Cost of infrastructure and energy to serve new load: } \mathbf{\$350M/yr} + \text{Ratepayer cost of creating headroom through flexibility, etc.: } \mathbf{\$30M/yr} - \text{Revenue from new load: } \mathbf{\$450M/yr}}{\text{Sales to new customers: } \mathbf{5 \text{ million MWh/yr}} + \text{Sales to existing customers: } \mathbf{13 \text{ million MWh/yr}}}$$

Revenue from new load exceeds the incremental cost of serving the new load through a combination of investment in conventional infrastructure and new initiatives to create headroom (e.g., DERs, flexibility, advanced planning). Rates decrease on average as a result.

Hypothetical Illustration of **Rate Increase** without Flexibility

Rate Impact of New Load:

+0.3 ¢/kWh (2% increase in 14 ¢/kWh rate)

$$=\frac{\text{Cost of infrastructure and energy to serve new load: } \mathbf{\$500M/yr} + \text{Ratepayer cost of creating headroom through flexibility, etc.: } \mathbf{\$0} - \text{Revenue from new load: } \mathbf{\$450M/yr}}{\text{Sales to new customers: } \mathbf{5 \text{ million MWh/yr}} + \text{Sales to existing customers: } \mathbf{13 \text{ million MWh/yr}}}$$

The incremental cost of serving new load entirely from investment in conventional infrastructure exceeds the revenue generated by the new load. Rates increase for existing customers to recover the shortfall.

Note: These are simple illustrative values which differ from the more detailed analysis presented throughout this report. Utility-specific analysis should take into account ratemaking factors which could influence this outcome such as class cost allocation methods and the presence or absence of decoupling.

Section 4:
The Rate Impacts of Improved System Utilization

Section Overview

Our study provides an indicative analysis of the potential rate impacts of load growth.

Load growth could put upward or downward pressure on rates. A focus on improving system utilization increases the likelihood that load growth will contribute to beneficial rate outcomes.

In this section of the report, we estimate the impact of load growth on rates for an illustrative utility system. First, we describe the methods we use to develop this estimate. Then, we report the findings for a base case as well as seven sensitivity cases.

We conclude by extrapolating the findings to provide an indication of the bill savings that could be achieved if the scope of improving system utilization becomes a national initiative.

RATE IMPACT ANALYSIS CAVEATS

This study focuses only on the rate impacts associated with load growth and improved system utilization. It does not analyze other factors that could independently drive rate changes, such as replacement of aging T&D infrastructure or fluctuations in natural gas prices, for example.

We assume new load pays rates based on embedded costs; we do not consider the role that tariff design or other interventions can play in further mitigating adverse rate impacts for existing customers.

For simplicity, we assume all load growth occurs in the same year that capacity solutions are developed.

Approach Overview

We analyze the rate impacts of adding load to an illustrative utility system for two scenarios: one scenario focuses on improving system utilization, and the other scenario does not.

1

Define illustrative characteristics of utility system and new load

The illustrative utility has load characteristics that are broadly representative of a mid-sized U.S. investor-owned utility (e.g., 3,000 MW of peak demand and 43% generation capacity utilization).

The utility's costs also broadly align with national averages. The utility's average all-in retail rate is 14 cents/kWh. The utility's marginal capacity costs are 30% higher than its embedded (average) costs, reflecting current inflationary trends.

We assume 1,000 MW of total new load will connect to the utility's system in the near term: half will connect at the transmission level (e.g., data center), and half will connect at the distribution level (e.g., transportation electrification).

2

Calculate rate impact of adding load *without* improving system utilization (status quo)

Under the status quo scenario, we assume the new load growth will be served entirely through investment in traditional infrastructure. Specifically, 1,000 MW of additional generation and transmission capacity and 500 MW of distribution capacity will be developed to serve the new load.

The retail rate charged to the new load is strictly based on the utility's embedded costs, and therefore does not fully recover the higher incremental cost associated with the newly developed infrastructure.

Any costs that are not recovered from the new load are assumed to be collected through a uniform rate increase for all customers (new and existing).

3

Calculate rate impact of adding load *with* focus on improving system utilization

With a focus on improving system utilization, we consider a case in which the new load is accommodated on the power system with reduced investment in new infrastructure.

Half of the new transmission-level load is assumed to connect without imposing material new capacity costs on the system (e.g., through load flexibility during peak hours and/or self-supply from on-site generation).

Additionally, a 500 MW portfolio of distributed energy resources (demand flexibility, batteries, energy efficiency, EV managed charging, etc.) is developed at an average net cost of $50/kW-yr. The capacity contribution of the portfolio is derated to reflect that it offsets only a portion of the generation, transmission, and distribution infrastructure necessary to reliably serve the new load.

Note: See appendix for additional detail on modeling assumptions

The Impact of Improved System Utilization

Relative to current levels, load growth with a 10% improvement in system utilization reduces rates by 3.4%, increases utility earnings by 23%, and accelerates the connection of new load by several years.

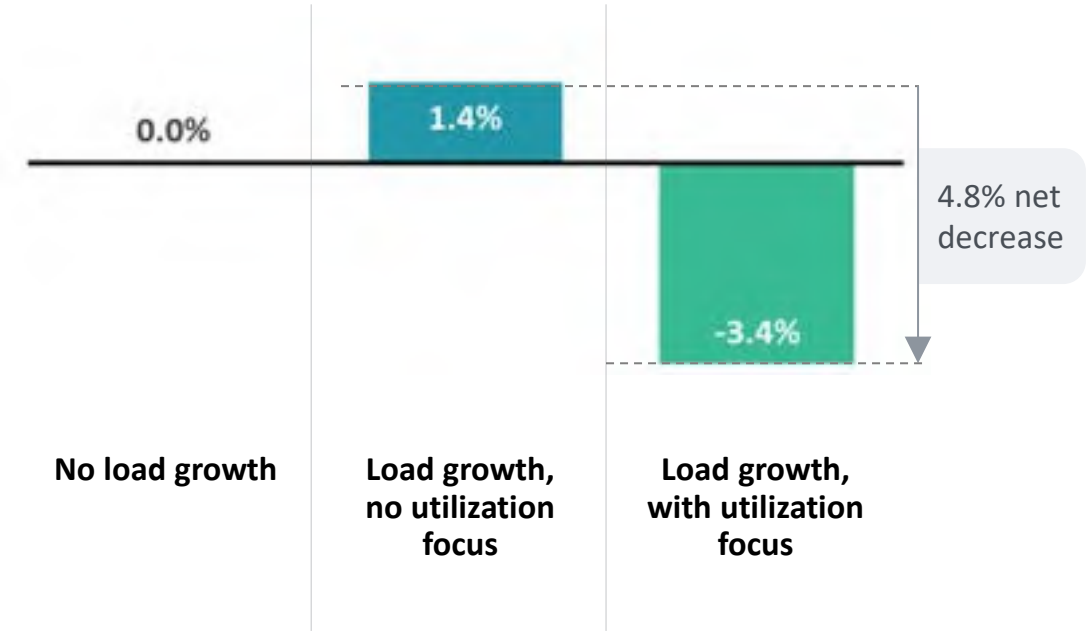
	BASELINE: No Load Growth	SCENARIO 1: Load Growth, no Utilization Focus (Status Quo)	SCENARIO 2: Load Growth, with Utilization Focus	Discussion
System Utilization	**43%**	**44%** (+1% from Base)	**53%** (+10% from Base)	Utilization increases slightly by building traditional infrastructure to accommodate customers with higher-than-average load factors, but meaningful utilization improvements require flexibility and efficiency, including through the deployment of distributed energy resources.
Average All-in Rate	**14.0 cents/kWh**	**14.2 cents/kWh** (+1.4%)	**13.5 cents/kWh** (-3.4%)	By reducing the amount of infrastructure that is needed to serve new load, flexibility and efficiency allow the cost of the grid to be shared by more customers. The result is a 3.4% rate reduction relative to a scenario without load growth, and a 4.8% rate reduction relative to a scenario in which load growth is served entirely through a capacity buildout.
Utility Earnings, Return on Equity	**$317M/yr, 9.8% ROE**	**$435M/yr** (+37%), **9.8% ROE** (+0 bps)	**$390M/yr** (+23%), **10.1% ROE** (+26 bps)	Improving system utilization lessens but does not eliminate the need to invest in new infrastructure. As a result, earnings will still grow relative to current levels, while focusing capital investment on the most critical infrastructure projects. Mechanisms that allow utility shareholders to share the benefit of net cost savings further enhance this outcome and can increase ROE.
Time to Connect New Load	N/A	**5 to 10 years**	**1 to 5 years**	The lead time to develop new utility-scale generation is over half a decade due to supply chain bottlenecks and interconnection delays. Flexibility, distributed energy resources, and other options for improving system utilization do not face the same barriers to scaling quickly.

Notes: Totals may not exactly sum due to rounding. System utilization is represented here as average hourly energy sales divided by installed generating capacity. See next section for further discussion of ways to measure utilization at each level of the system (generation, transmission, and distribution). The utility earnings estimate assumes a vertically integrated utility and a regulatory mechanism through which cost savings are shared between customers and shareholders. 10 basis points (bps) represent 0.1% of return on equity (ROE). See appendix for further detail. Rate impacts are shown in nominal terms.

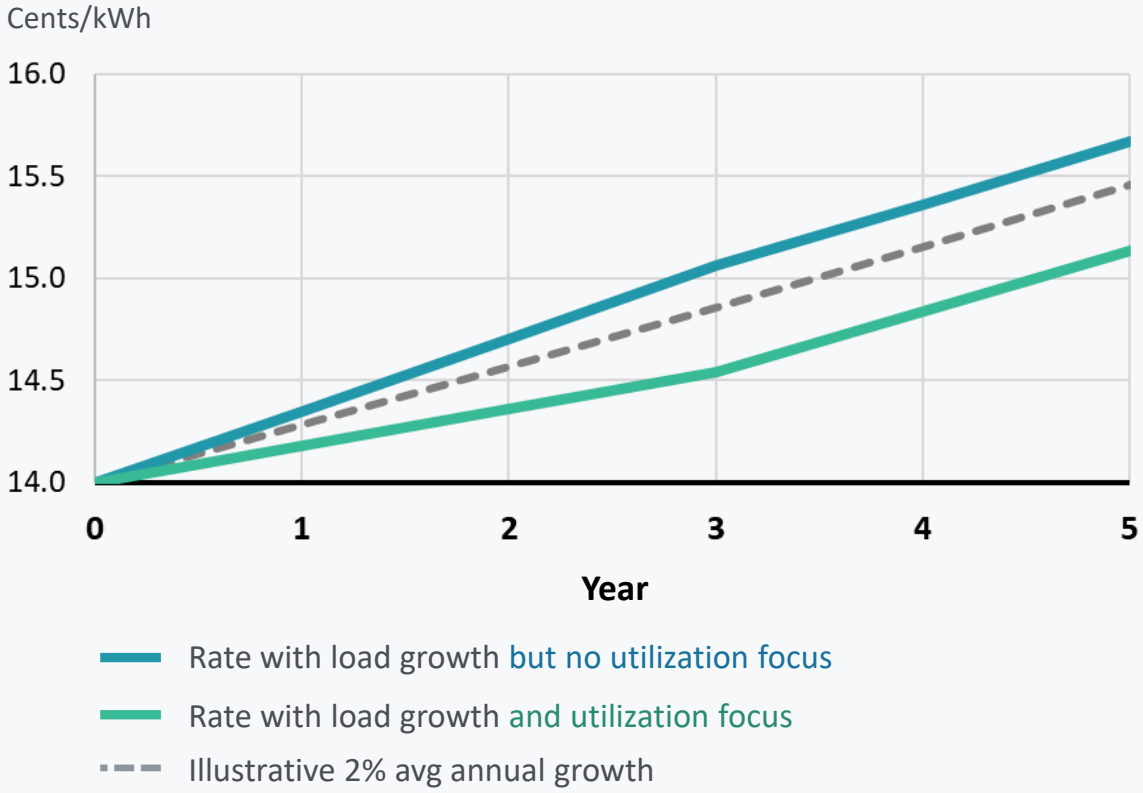
Annual Rate Impacts

Many factors may drive rates up in the future. Improving system utilization makes power cheaper and can dampen rate increases that may result from other inflationary price pressures.

Total Rate Impact of Load Growth
With and without focus on system utilization



5-year Trajectory of Average All-in Rate
Assuming illustrative 2%/year nominal baseline growth



Note: Figure based on illustrative assumption that rate impacts of load growth phasing in over three-year period. With less baseline rate inflation, improved system utilization could produce nominal decreases in rates. Values are shown in nominal terms.

Alternative Scenarios

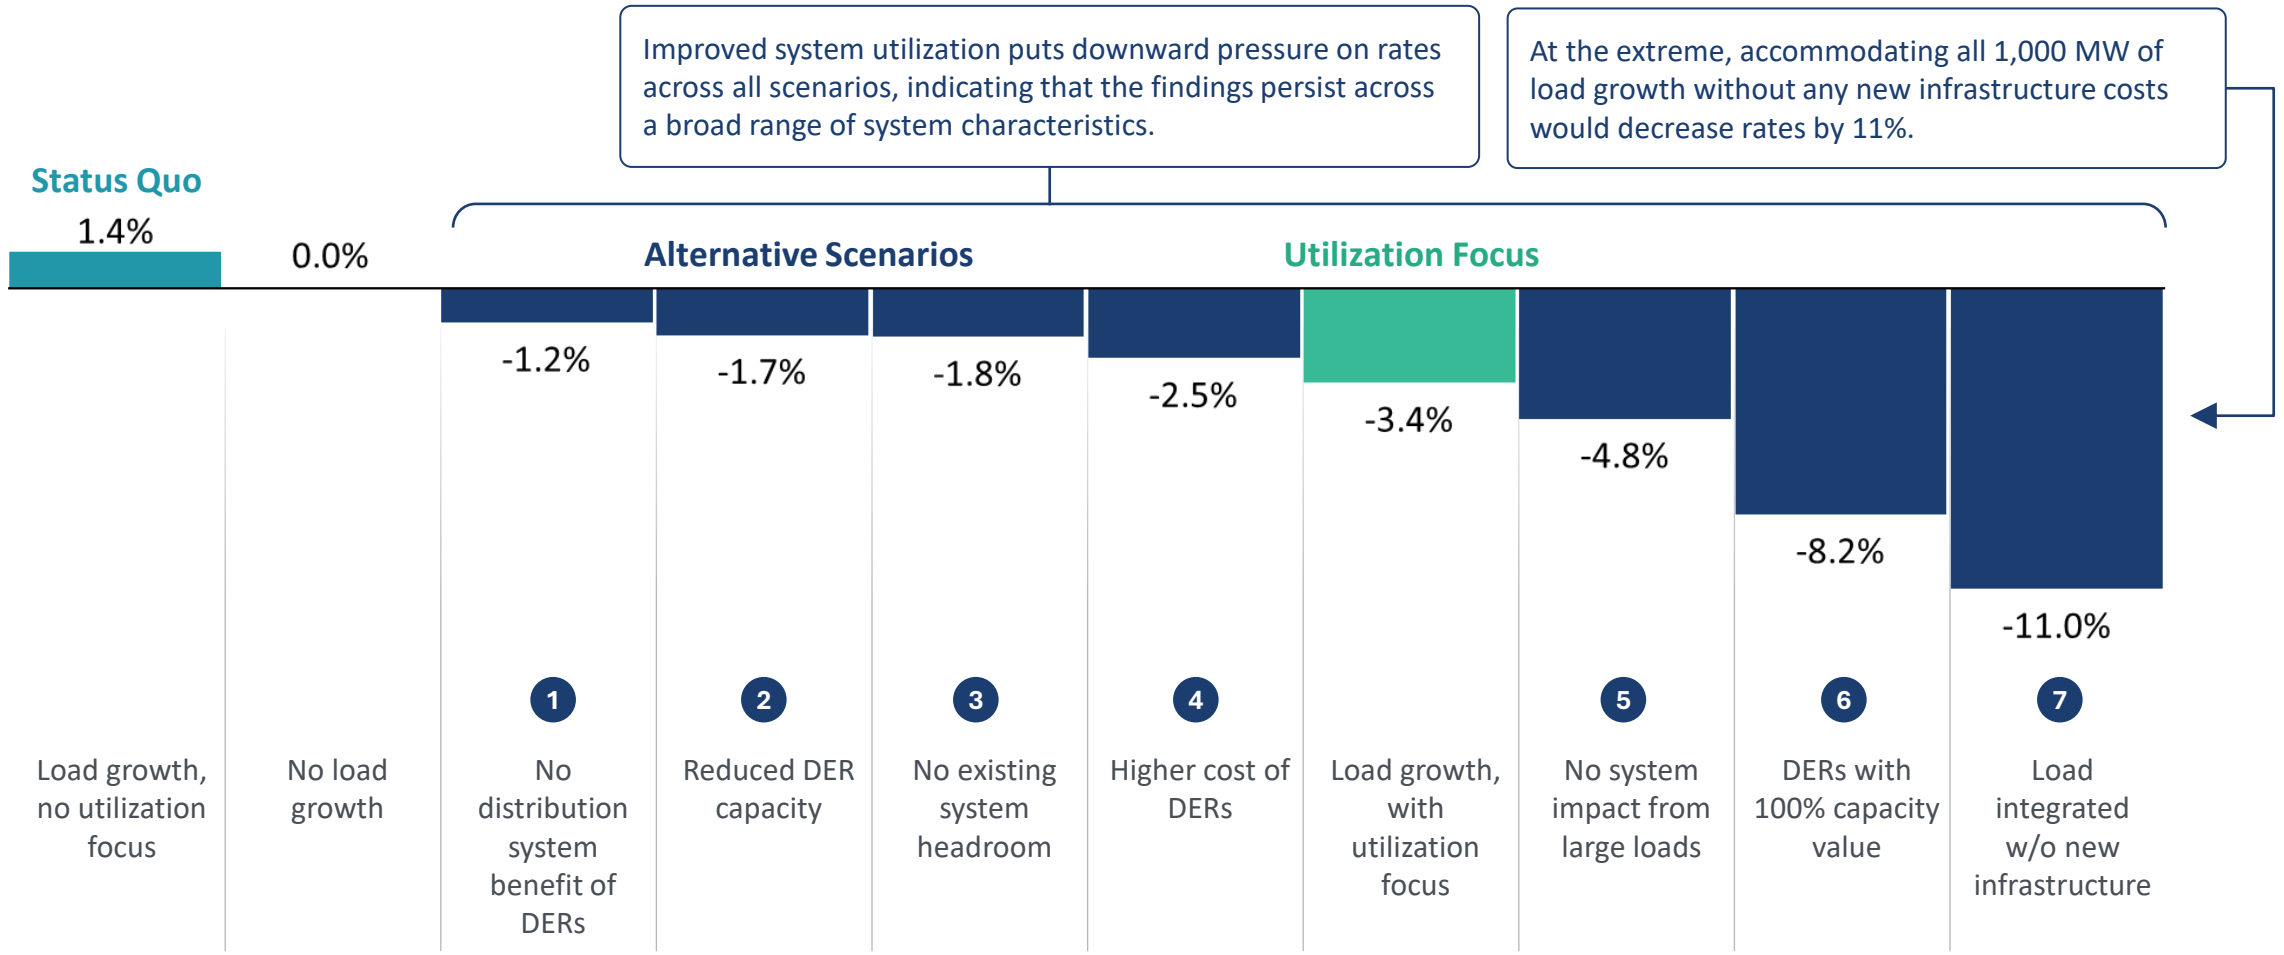
We analyze seven alternative scenarios to test the strength of the findings.

Alternative Scenarios	Base Assumption	Alternative Scenario Assumption	Impact of Alternative Assumption on Rate, Relative to Base
1. No distribution system benefit of DERs	DERs have 40% distribution capacity credit (i.e., 1 MW of DER capacity creates 0.4 MW of distribution system headroom)	DERs are used exclusively to provide bulk system capacity and do not create headroom on the distribution system	
2. Reduced DER capacity	DER portfolio has 500 MW of capacity	DER portfolio has 250 MW of capacity	
3. No existing system headroom	50 MW of bulk system headroom and 100 MW of distribution system headroom, beyond standard reliability reserve margin	No existing system headroom to accommodate new load growth	
4. Higher cost of DERs	DERs provide capacity at average cost of $50/kW-year (cost of nameplate capacity, before availability derate)	DERs provide capacity at an average cost of $100/kW-yr	
5. No system impact from large loads	Half of 500 MW of new transmission-connected load served without new infrastructure (e.g., through self-supply)	None of 500 MW of new transmission-connected load requires new infrastructure (e.g., due to bring-your-own-capacity mandate)	
6. DERs with 100% capacity value	Capacity value of DERs is 90% for generation, 25% for transmission, and 40% for distribution	Capacity value of DERs is 100% for generation, transmission, and distribution (i.e., highly flexible and optimally-sited portfolio)	
7. Load integrated w/o new infrastructure	Infrastructure investment, flexibility, or DERs are needed to accommodate load growth	Extreme case in which all load growth is accommodated without new infrastructure costs	

Scenario Analysis Results

The downward rate impact of improved system utilization is robust across a range of system conditions.

Rate Impact of Load Growth Across Scenarios



National Implications

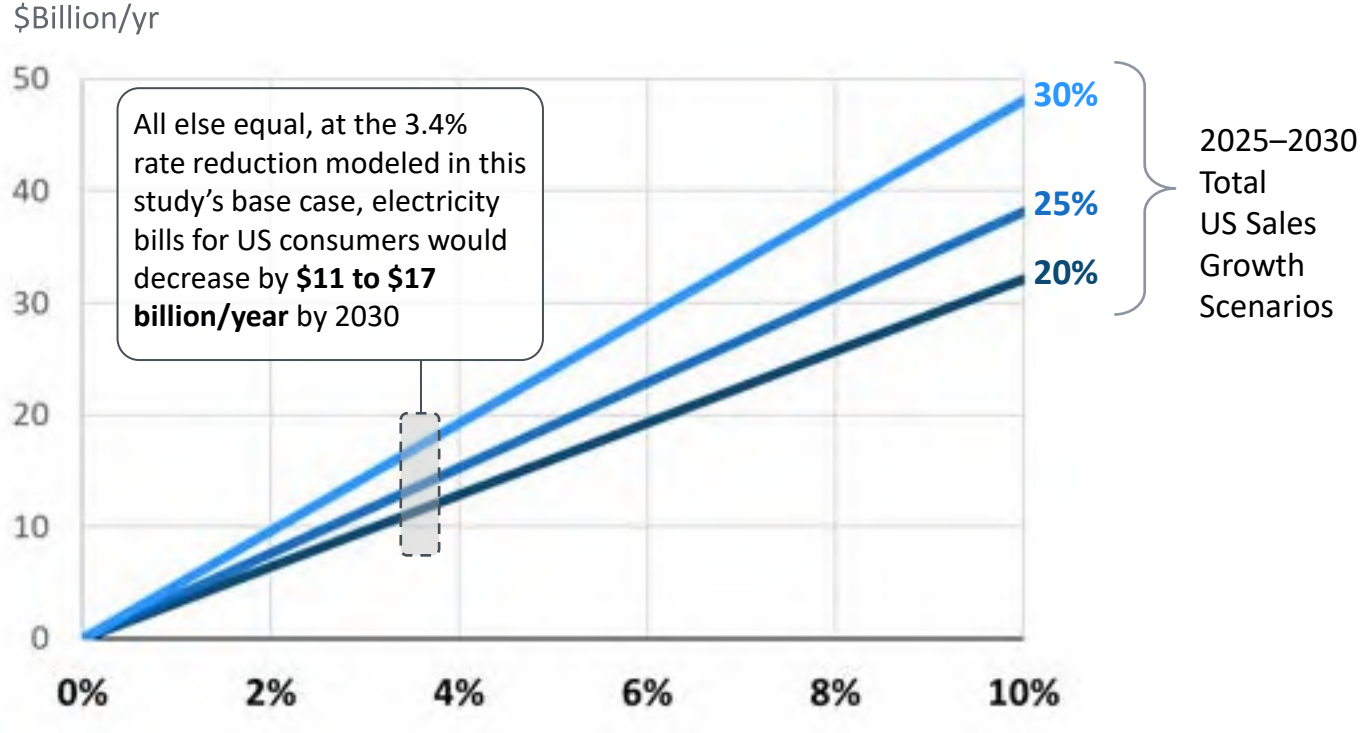
At a national scale, consumers could save hundreds of billions of dollars over the next decade due to system utilization improvements.

Extrapolating the findings of our illustrative utility analysis to the national level provides an indication of the total reduction in electricity bills that could be experienced by existing consumers due to improvements in system utilization.

Between 2025 and 2030, analysts forecast that annual electricity sales in the US could increase by between 20% and 30%. Scaling the results of our base-case analysis to that level of load growth suggests annual consumer electricity bill savings of $11 billion to $17 billion per year by 2030, all else equal. Over a 10-year period, the savings would amount to $110 billion to $170 billion.

If downward pressure on rates exceeds the finding in our base case (as shown in some alternative scenarios), the bill savings could be significantly higher, approaching $500 billion over 10 years if a 10% rate reduction is achieved.

Reduction in National Annual Electricity Bill Due to Improved System Utilization
For Range of Achieved Rate Reductions and Electricity Sales Growth, by 2030



Note: Values are shown in nominal terms.

Applicability of Findings in Organized Wholesale Markets

System utilization improvements can be beneficial in both vertically integrated and restructured states.

Vertically Integrated Utilities

Vertically integrated utilities own generation, transmission, and distribution. Examples are Southern Company and Duke Energy. In some cases, vertically integrated utilities may also participate in wholesale markets (e.g., Dominion in PJM, utilities in MISO).

Improvements in system utilization impact the rates of vertically integrated utilities as described throughout this report. The utility sets rates to recover its embedded (historical average) costs. If new customers can be served at a lower cost, rates can be reduced for all customers across the generation, transmission, and distribution systems, and the utility earns its revenue requirement.

A benefit of the vertically integrated utility structure in this context is that the utilities have more flexibility in how they recover costs from customers (e.g., by directly assigning costs to new customers and by being insulated from price volatility of wholesale capacity markets).

Distribution Utilities in Restructured States

Distribution utilities own only the distribution system, but still often provide supply (energy) to customers by procuring it through bilateral contracts or purchases from the wholesale energy and capacity markets (e.g., most utilities in PJM, New York, and New England).

Distribution utilities can use system utilization improvements to directly reduce distribution rates, which can account for a third or more of a residential customer's bill. By being located at the edge of the grid, DERs are well suited to provide this benefit.

Additionally, when distribution utilities are the customer's energy providers, they pay for generation and transmission capacity based on their contribution to the broader system's peak demand. Reducing forecasted peak demand is an opportunity to further mitigate rate increases, though when the pace of load growth significantly exceeds supply (e.g., in PJM), capacity prices may remain elevated.

Section 5:
Principles for Measuring System Utilization

Section Overview

An essential first step in improving system utilization is to appropriately measure it.

The concept of improving system utilization is fundamentally simple: increase the use of existing power system assets. However, appropriately measuring system utilization—and developing new programs and policies that aim to improve it—are complex issues.

In this section, we first discuss methods for measuring system utilization, including important differences between generation and network utilization, and data sources.

We then provide an overview of several important issues that decision-makers will need to consider to increase the likelihood that new initiatives targeting system utilization will provide beneficial rate outcomes for all customers.

Background

Fundamentally, utilization is a comparison of energy to system capacity over a given period of time.

$$\text{System Utilization (\%)} = \frac{\text{Total energy delivered or produced on system over a given time period}}{\text{Available system capacity over the same time period}}$$

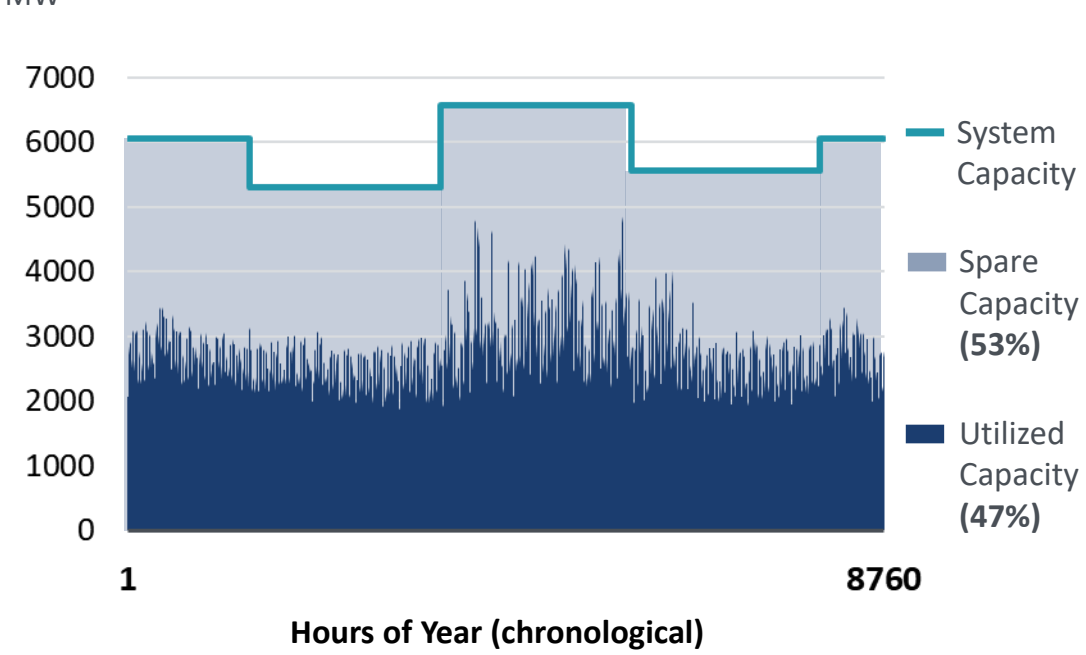
Generation utilization example:

A utility has 6,500 MW of generating capacity during the four summer months, and between 5,000 and 6,000 MW of generating capacity during the other eight months. The utility's average capacity over the year is 6,000 MW. The utility's fleet of generators produces 24.7 million MWh of energy over the year.

The utilization of the utility's generation fleet is:

$$47\% = \frac{24.7 \text{ million MWh}}{6{,}000 \text{ MW capacity} \times 8{,}760 \text{ hours per year}}$$

Illustrative Hourly Output from Generation Fleet Over a Year



Notes: System capacity differs by season based on variation in resource availability such as renewable generation and thermal planned and maintenance outages. We show illustrative seasonal derates driven by thermal planned outages in a system primarily reliant on thermal rated capacity.

Measuring System Utilization: Generation, Transmission, and Distribution

	Generation	Transmission	Distribution
Example Opportunity	Alleviate load growth-related resource adequacy challenges during peak hours by reducing system peak demand through demand response, time-varying rates, and peak-targeted energy efficiency.	Use grid-enhancing technologies such as dynamic line ratings to increase utilization of existing transmission capacity, or use distributed batteries to relieve peak congestion on a constrained transmission corridor.	Use flexible interconnection policies to accommodate the addition of new electric vehicle load or leverage smart panels or flexible heat pumps to add load without exceeding loading limits on the secondary distribution system.
Example Utilization Metric	For the entire generation fleet, calculate annual generator output divided by total installed "unforced capacity." At the fleet level, this appropriately accounts for energy-limited resources and planned outages due to maintenance. Capacity can vary over the applicable time period to reflect changes in availability.	For a given transmission zone, calculate annual total transmission flows and divide by the zone's firm transfer capacity. Using firm transfer capacity as the denominator reflects the reliably available capability reserved for firm service, while still allowing non-firm transfers to use remaining headroom and increase measured utilization.	Across all feeders in a distribution system, calculate a load-weighted average of each feeder's utilization, where feeder utilization is defined as metered load on the feeder divided by the feeder's loading limit. Using customer meter-level load implicitly accounts for line losses on the feeder, reductions in which could show up as higher measured utilization.
Key Considerations	Note that total output of the generation fleet may differ from the utility's load due to imports/exports and renewables curtailments. Measuring utilization over a multi-year period helps to normalize for weather-related variation in demand. Planning reserve margins will necessarily limit achievable utilization.	Transmission utilization will naturally be lower than generation utilization; transmission planning for N-1 contingencies (i.e., the loss of any single component) generally results in a higher level of capacity redundancy than at the generation level.	As a secondary metric, an assessment of the portion of the distribution system facing capacity constraints (e.g., number of feeders) will provide additional perspective on utilization improvement opportunities relative to the systemwide average described above.

Note: In the above examples, the measure of capacity (i.e., the denominator) would be multiplied by 8,760 hours of the year to produce a utilization metric between 0% and 100%.

Ensuring Beneficial Outcomes

As decision-makers develop policies or programs aimed at improving system utilization, the following considerations will increase the likelihood that the outcome reduces rates for all customers.

System Fundamentals. Certain fundamental factors outside a utility's control will influence the system's utilization level. For example, large industrial customers tend to have higher load factors than residential customers; a utility with a larger industrial base may naturally have higher system utilization as a result. Policies encouraging improvements in system utilization should take these utility-specific conditions into account. In other words, the focus of new utilization initiatives should be on incremental improvement from existing levels, rather than attainment of a single utilization value that is considered to be "universal" across all utility territories.

Interaction with Rates. The rate paid by new load will influence the extent to which improved utilization reduces rates for existing customers. Higher rates for new loads, relative to the cost of serving that new load, will improve the outcome for other customers. Relatedly, cost allocation is an important consideration in the ratemaking process; new methods may need to be developed to ensure the benefits of improved system utilization are realized by all customers and not restricted to specific customer classes.

Cost-Effectiveness. Improved system utilization is not an end in itself; it is valuable to the extent that it helps lower total system costs and, ultimately, customer rates. Regulators, therefore, need to ensure that strategies used to raise utilization—such as deploying DERs—are more cost-effective than conventional grid investments that would otherwise be required. In other words, initiatives aimed at improving operational efficiency should be evaluated not only on whether they increase utilization, but also on whether they deliver net cost savings and improve overall cost efficiency.

Diminishing Returns. There are levels at which higher system utilization could produce diminishing benefits or even additional costs. For example, the distribution system benefits from times of reduced load for electrical equipment to cool. Further, some excess system capacity is needed to allow equipment to be taken offline for maintenance or to prepare for extreme weather conditions. Goals for improving system utilization should take these limits into account.

Reporting. Aggregate generator data is typically available from utility resource plans, ISO/RTO annual capacity reports, or public sources such as the US EIA's Form 860 and Form 923. However, grid security considerations may prevent detailed transmission and distribution data from being reported publicly. It may be necessary for system operators to report utilization metrics at aggregated levels, potentially subject to confidential review by regulatory commissions. Utilities increasingly are publishing hosting capacity data with this information for the distribution system.

Ensuring Beneficial Outcomes (cont'd)

Timescale. System utilization can be measured over different periods of time (e.g., seasonal versus annual). Annual measurement generally is an effective time period to use, because it captures seasonal differences in utilization. Measuring over several years is a transparent alternative to weather normalization.

Applicable System. Utilization should be measured separately for generation assets, the transmission system, and the distribution system. Decision-makers will need to decide whether to focus on all or a subset of these, depending on cost drivers and market structure.

Geographic Granularity. Measuring utilization for the system as a whole is important to account for utilization improvements that result from connecting new load in locations with existing headroom. As a secondary consideration, utilization could be measured for specific constrained zones/locations in order to identify location-specific opportunities or locations that have already reached high levels of utilization. Data availability will influence the level of geographic granularity that is possible.

Business Model Innovation. Maximizing opportunities to improve system utilization may require regulatory or business model innovation, because traditional utility incentives are tied to capital investment, not to getting more value from existing assets. Updating performance incentives, cost-recovery rules, and planning requirements can reward utilities for least-cost outcomes, enable third-party participation where efficient, and ensure benefits are shared with customers through lower long-run costs and rates.

Weather Effects. Year-to-year fluctuations in weather will drive changes in load patterns and, therefore, cause variability in measurements of system utilization. System utilization could be measured on a weather-normalized basis to address this variation, though weather normalization techniques are not always transparent. Reporting system utilization as an average over several recent years of weather conditions could be a pragmatic alternative.

Interaction with Decarbonization Goals. Improving utilization of the generation system means increasing production from the existing fleet of generators. Policymakers should be aware of and weigh the trade-offs of improved affordability relative to decarbonization goals, if higher utilization contributes to increased output from carbon-emitting resources. Conversely, system utilization improvements can enable achievement of decarbonization goals if the distributed resources deployed to facilitate the improvements are sources of clean energy (e.g., solar-plus-storage or energy efficiency measures). Improved system utilization can also accelerate the adoption of electrification measures by relieving distribution system bottlenecks.

Improving grid utilization is a meaningful opportunity to enhance affordability and reliability. Achieving these benefits will require thoughtful, system-specific goals that account for reliability needs, applicable regulatory structures, policy requirements, and local conditions. This balanced approach will ensure that the utilization improvements complement strategic infrastructure investment, directing capital where it delivers the greatest long-term value.

Section 6: **Conclusion**

Moving Forward

This study is the beginning, not the end, of the discussion on the benefits of improved system utilization.

Our study has highlighted the potential for load growth to be an energy affordability solution, rather than a problem. Specifically, the study has shown that improvements in system utilization through load growth can put downward pressure on rates for consumers, while accelerating the connection of new load and reducing financial risk. Work remains to ensure initiatives in this area achieve the desired energy affordability outcomes. We recommend the following next steps.

1

Data Collection

Measuring system utilization requires assembling the right data. Generation utilization metrics are often available from public sources, but transmission and distribution capacity ratings and limits are frequently confidential. To fill these gaps, regulators and analysts should work with utilities and system operators to establish clear data definitions, confidentiality protections, and data-sharing processes.

2

System Characterization

Setting utilization targets requires an accurate characterization of the system in question. Utilities differ in key drivers of utilization—such as customer mix, climate, infrastructure age and condition, and network topology. Regulators and utilities should document these factors up front and design utilization initiatives and benchmarks that reflect local constraints and operating realities, rather than applying one-size-fits-all targets.

3

Potential Assessment

Improving system utilization requires identifying the options that are feasible and cost-effective for a specific utility. The best opportunities will vary; some systems may benefit most from targeted energy efficiency, while others may find greater value in distributed batteries or load flexibility, for example. Developing a “supply curve” of utilization-improvement options, ranked by cost and potential impact, helps regulators and utilities design informed, least-cost initiatives.

4

Implementation Plan

Market, regulatory, and technical barriers can limit how effectively utilization tools deliver value. Alongside evaluating cost-effectiveness, utilities, regulators, and service providers should assess near-term feasibility by identifying the specific barriers that constrain deployment or operations. Where benefits justify it, they should pursue targeted reforms, such as rule changes or interconnection/process improvements, to remove barriers and unlock longer-term, system-wide optimization.

Technical Appendix

Modeling Assumptions: Illustrative Utility

	Base Assumption	Support for Assumption
Peak Demand	3,000 MW	Representative of mid-sized investor-owned utility (e.g., AES Indiana's system peak is 2,750 MW; Idaho Power's peak is about 3,900 MW)
Annual Load Factor (Avg demand / peak demand)	50%	Representative of many utilities (e.g., Georgia Power, Puget Sound Energy)
Planning Reserve Margin	15%	Generally consistent with standard utility planning practices. Represents capacity target above peak demand, to ensure reliability during abnormal load conditions.
Existing System Headroom	50 MW at transmission level 100 MW at distribution level	Illustrative assumption. Represents utility system that is modestly overbuilt relative to its target planning level.
All-in Average Rate	14 cents/kWh	Representative of typical average retail rate for US utility (e.g., ComEd, Arizona Public Service). Represents an average across all customer classes.
Embedded Costs	Share of total revenue requirement: Energy = 25%, generation capacity = 15%, transmission = 15%, distribution = 40%, other = 5%	Illustrative assumption that broadly aligns with cost breakdown reported by EIA.
Marginal Costs	Capacity costs are 30% higher than embedded costs.	Illustrative assumption to reflect current inflationary environment.
Financial Metrics	ROE = 9.8%, WACC = 7.1%, equity ratio = 50%	Broadly representative of U.S. investor-owned utilities.

Modeling Assumptions: Case Without Focus on Utilization

	Base Assumption	Support for Assumption
Peak Demand of New Load	500 MW transmission-connected 500 MW distribution-connected	500 MW is larger than most existing data centers, but smaller than announced AI training facilities, which can reach 1 GW. 500 MW of distribution-connected load could represent natural load growth as well as impact of transportation and building electrification.
Annual Load Factor of New Load	70% for transmission-level load 40% for distribution-level load	70% represents the relatively high load factor of large customers such as data centers. 40% is representative of the load factor of a fleet of light-duty electric vehicles.
Retail Rate Paid by New Load	Based on embedded costs. Energy charged on volumetric basis, capacity charged on peak demand basis. Transmission-connected load is not charged for distribution. Any costs that are not recovered from the new load are assumed to be collected through a uniform rate increase for all customers (new and existing).	Illustrative assumption.
Flexibility Assumptions	New load is inflexible. All new load beyond the modest amount of existing system headroom is served with development of new generation, transmission, and distribution capacity.	Illustrative assumption.

Modeling Assumptions: Case with Focus on Utilization

	Base Assumption	Support for Assumption
Characteristics of New Load	Same as case without focus on utilization (see prior page)	N/A
Flexibility of Transmission-Connected Load	250 MW out of 500 MW can be served without new infrastructure investment	Representative of a portion of the new load being flexible during peak hours or being served through on-site generation.
Distribution-Connected Flexibility	500 MW of DERs (e.g., generation, storage, flexibility, efficiency) deployed at distribution level	Represents 12.5% of the utility's system peak demand. Many DSM potential studies have shown that this level of deployment is achievable, and some US utilities already have built peak reduction portfolios of this scale.
Cost of Distribution-Connected Flexibility	$50/kW-yr	The net cost of achieving peak demand reductions through demand-side initiatives varies by measure. $50/kW-yr is reflective of costs to the utility that could incorporate buy-downs from hyperscalers, or partial customer funding of devices that provide both grid and private value, for example. As a result, the utility pays only a fraction of total technology costs.
Capacity Impact of Flexible Resources	Capacity credit: 90% for generation capacity, 25% for transmission capacity, 40% for distribution capacity.	High generation-level capacity credit is consistent with recent PJM ELCC values for demand response. Lower transmission-level capacity credit reflects that the majority of transmission system investment is not driven by peak demand growth or otherwise avoidable with distributed resources. Moderate distribution capacity value assumes DERs are operated to "stack" distribution and bulk system value, with some geographically-targeted deployment to constrained locations of the grid.
Energy Impact of DERs	44,000 MWh/yr of energy savings (equivalent to year-round savings at 1% of 500 MW peak impact)	Accounts for the possibility that a portion of the DERs will reduce peak by reducing overall energy consumption. This effect is accounted for when quantifying the rate impact, because it offsets some of the downward pressure otherwise achieved through load growth.
Shared Savings Model	10% of net avoided cost attributable to distributed flexibility and efficiency is returned to utility shareholders.	A utility shared savings model allows utilities to retain a portion of cost savings achieved through activities that improve utilization and reduce costs, aligning shareholder incentives with least-cost solutions while still delivering the majority of benefits to customers.

PREPARED FOR
WATT (Working for Advanced Transmission Technologies) Coalition

FEBRUARY 1, 2021

Brattle

Disclaimer

- This report was prepared for the WATT (Working for Advanced Transmission Technologies) Coalition with support from GridLab, EDF Renewables North America, NextEra Energy Resources, and Duke Energy Renewables. The WATT Coalition includes Ampacimon, Lindsey Manufacturing, LineVision, NewGrid, Smart Wires, and WindSim. All results and any errors are the responsibility of the authors and do not represent the opinion of The Brattle Group (Brattle) or its clients.
- The analyses that we provide here are necessarily based on assumptions with respect to conditions that may exist or events that may occur in the future. Most of these assumptions are based on publicly-available industry data. Brattle and their clients are aware that there is no guarantee that the assumptions and methodologies used will prove to be correct or that the forecasts will match actual results of operations. Our analysis, and the assumptions used, are also dependent upon future events that are not within our control or the control of any other person, and do not account for certain regulatory uncertainties. Actual future results may differ, perhaps materially, from those indicated. Brattle does not make, nor intends to make, nor should anyone infer, any representation with respect to the likelihood of any future outcome, can not, and does not, accept liability for losses suffered, whether direct or consequential, arising out of any reliance on our analysis. While the analysis that Brattle is providing may assist WATT Coalition members and others in rendering informed views of how advanced transmission technologies could help integrate additional amounts of renewable resources, it is not meant to be a substitute for the exercise of their own business judgments.
- This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Issue at Hand - 1/2

Increasing renewable resources (often associated with carbon reduction) is a common goal.

- Many private entities including utilities, corporations, and academic institutes.
- Across jurisdictions from federal, state, to local (e.g., cities) levels.
- Increasing renewable projects provide jobs and other local benefits, and help boost the economy out from the current COVID-associated downturn.

Service Territories of Utilities With Announced Carbon Reduction Goals

Docket No. 20260020-EI
Report-Grid-Enhancing Technologies
Exhibit DC-12, Page 4 of 73

Issue at Hand - 2/2

What are the roadblocks to integrating more renewables?

- Utilities and system operators have good understandings of the variability of renewable resources.
  - Wind became SPP's leading resource in 2020.
- Transmission availability is a major limiting factor.
  - Many renewable projects are locked up in the Generation Interconnection Queue.
  - There is a timing gap: renewables are developed (in months to years) much faster than transmission (in years to sometimes decades).
  - Utility-scale renewables are usually more cost efficient (on a $/MWh basis) compared to distributed resources.

Can Grid-Enhancing Technologies (GETs) help integrate more renewables?

- GETs quickly and cost-effectively help maximize the capability of the existing transmission system

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Study Overview - 1/2

Goal: Analyze how much additional renewables can be added to the grid using Grid-Enhancing Technologies (GETs):

- GETs enhance transmission operations and planning.
- GETs complement building new transmission—they can bridge the timing gap until permanent expansion solutions can be put in place.
- While there are various types of GETs, this study focuses on the combined impact of the following three technologies:
  - **Advanced Power Flow Control**: Injects voltage in series with a facility to increase or decrease effective reactance, thereby pushing power off overloaded facilities or pulling power on to under-utilized facilities.
  - **Dynamic Line Ratings (DLR)**: Adjusts thermal ratings based on actual weather conditions including, at a minimum, ambient temperature and wind, in conjunction with real-time monitoring of resulting line behavior.
  - **Topology Optimization**: Automatically finds reconfiguration to re-route flow around congested or overloaded facilities while meeting reliability criteria.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Study Overview - 2/2

Goal: Analyze how much additional renewables can be added to the grid using Grid-Enhancing Technologies (GETs):

- Use the Southwest Power Pool (SPP) grid (focused on Kansas and Oklahoma, looking at 2025) as an illustrative case study.
  - SPP Generation Interconnection Queue* (GI Queue) shows ~9 GW of renewable resources with an Interconnection Agreement (IA) executed in Kansas and Oklahoma.
  - SPP Integrated Transmission Planning (ITP) Reports** show high congestion.
- Results metrics for the **combined** (not for individual) three GETs include:
  - Renewables added (capacity [GW] and energy [GWh]).
  - Economic benefits (production costs, investments, jobs, etc.)
  - Carbon emissions reduction.

SPP figure from http://opsportal.spp.org/Images/SPPMap.gif
* SPP GI Queue as of September 28, 2020
** 2019 Integrated Transmission Planning (available at: https://spp.org/Documents/60937/2019%20ITP%20Report_v1.0.pdf) and Q3 2020 Quarterly Project Tracking Report (available at: https://www.spp.org/documents/62710/q3%202020%20qpt%20report%20draft.pdf)

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

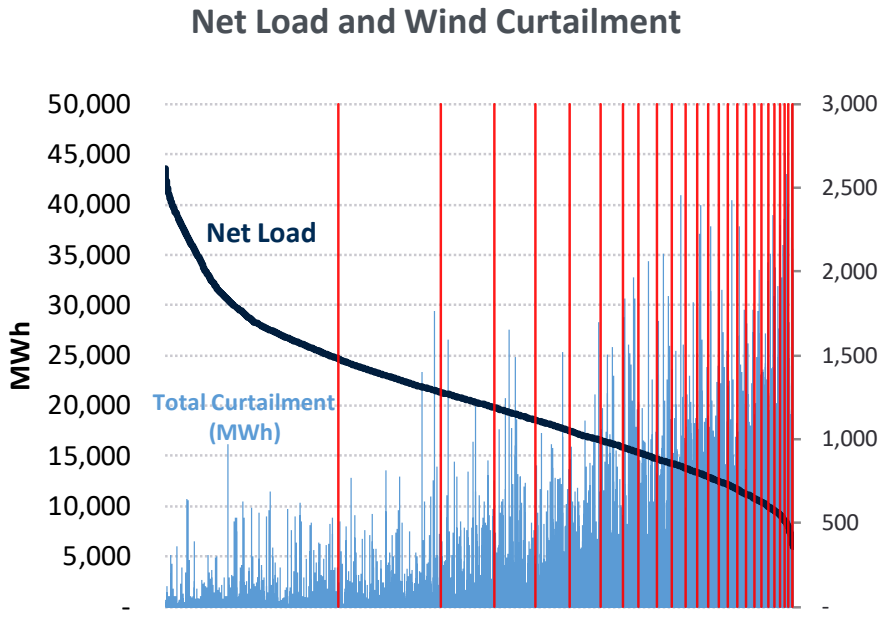
Study Approach - 1/2

Study purpose

- Quantify the benefits of **the three GETs combined** for integrating renewable resources (largely wind) using SPP as a test bed.

Analysis approach

- Select 24 representative historical power flow snapshots of SPP operations (2019 – 2020) that together reasonably represent a full year.
- Modify the snapshots to reflect new transmission upgrades, renewable projects from the GI queue, announced retirements, load change, etc.
- Find the maximum renewables amount (GW and GWh) that can be integrated under a business as usual scenario (Base Case) and then with GETs (With GETs Case), sequentially in the order of DLR, Topology Optimization, and Advanced Power Flow Control, by simulating the entire SPP system using the 24 power flow cases.
- Assess benefits of GETs including economic values (production costs, jobs, local benefits etc.) and carbon emissions reduction.



Areas between red line indicates the bins from which snapshots were selected, blue bars indicate curtailment of renewables. Each bin contains equal amounts of curtailment.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Study Approach - 2/2

Study purpose

- Quantify the benefits of **the three GETs combined** for integrating renewable resources (largely wind) using SPP as a test bed.

Finding the maximum amount of renewables that can be integrated

- Analysis is performed separately for the Base Case and With GETs Case for all 24 snapshots.
- Analysis is done using an iterative process:
  - Determine feasible reduction in thermal unit generation to accommodate additional renewable resources.
  - Dispatch wind and solar to their max output by running Security Constrained Optimal Power Flow (SCOPF).
  - Iteratively solve SCOPF (i.e., solve SCOPF, take out renewable projects with high curtailments, then resolve SCOPF, and repeat).
- Analysis assumes a 5% curtailment threshold for viability assessment (i.e., projects are viable if analysis indicates annual curtailments to be less than 5%).
  - Curtailment occurs largely for two reasons—transmission congestion (which the GETs will help solve) and minimum generation constraints of other generation resources.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Docket No. 20260020-EI
Report-Grid-Enhancing Technologies
Exhibit DC-12, Page 9 of 73

Study Results - 1/5

GETs enable more than twice the amount of additional new renewables to be integrated.

- Potential Renewables Considered: 9,430 MW
  - Based on queue projects with IA executed.
- Integrated Renewables (without further transmission upgrades)
  - Base Case: 2,580 MW
  - With GETs Case: 5,250 MW
  - Delta (With GETs Case – Base Case): 2,670 MW

RENEWABLE POTENTIAL ASSUMED FOR KANSAS AND OKLAHOMA

State	Wind	Solar	Total
Kansas	3,410	120	3,530
Oklahoma	5,760	140	5,900
Total	9,170	260	9,430

[Rounded to the nearest 10 MW]

~1.5 times the amount of wind SPP integrated in 2019 (1.8 GW).

ADDITIONAL RENEWABLES INTEGRATED

State	Base Case			With GETs Case			Delta (GETs - Base)		
	Wind	Solar	Total	Wind	Solar	Total	Wind	Solar	Total
Kansas	1,710	0	1,710	1,910	0	1,910	200	0	200
Oklahoma	770	100	870	3,200	140	3,340	2,430	40	2,470
Total	2,480	100	2,580	5,110	140	5,250	2,630	40	2,670

X2

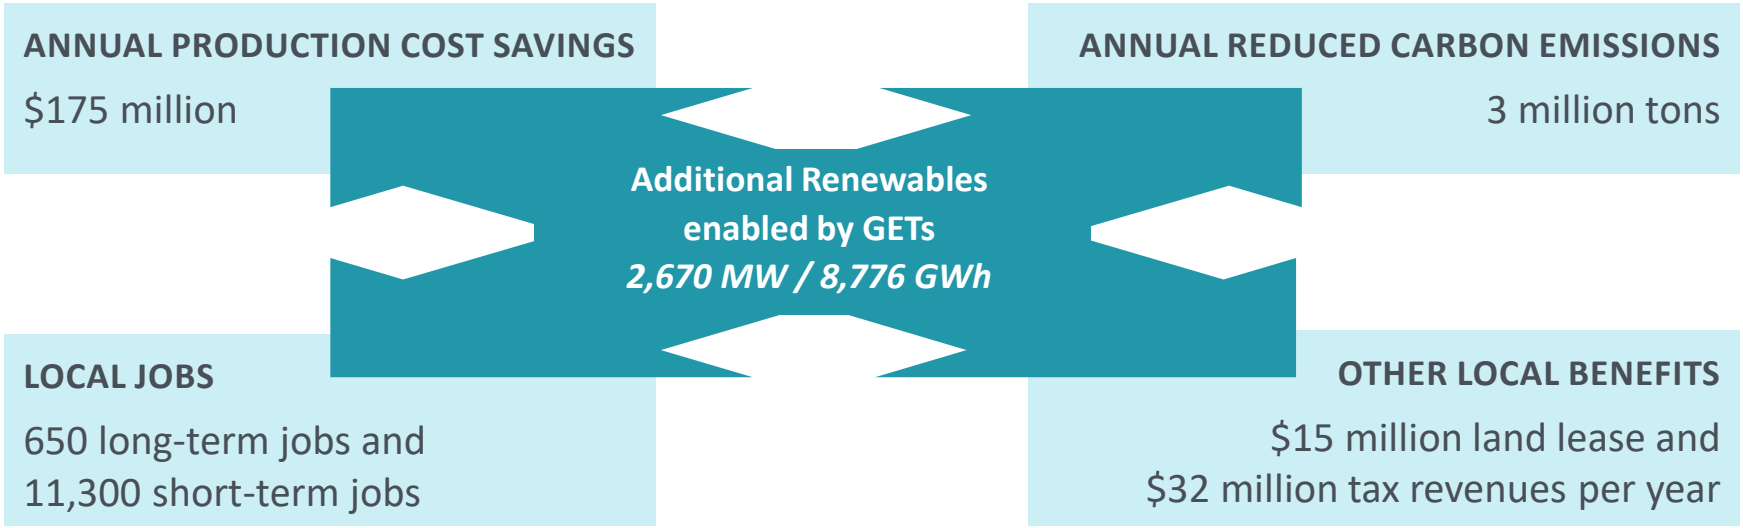
[Rounded to the nearest 10 MW]

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Study Results - 2/5

GETs enable more than twice the amount of additional new renewables to be integrated.

- Additional renewables enabled by GETs: **2,670 MW / 8,776 GWh**.
  - 2,630 MW of **new wind** is assumed to produce over 8,640 GWh of energy per year.
  - 40 MW of **new solar** is assumed to produce about 60 GWh of energy per year.
  - GETs lower curtailment of **existing wind** by over 76,000 MWh per year.
- GETs installation cost is about $90 million.
  - Annual O&M costs is estimated to be around $10 million.
- GETs benefits (other than the value of additional renewables) include:



This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Study Results - 3/5

GETs enable more than twice the amount of additional new renewables to be integrated.

- Estimated annual production cost savings: **$175 million**.
  - Pay-back for GETs investment (~$90 million) is about half a year.
  - $175 million conservatively assumes $20/MWh savings for 8,776 GWh of energy.
  - $20/MWh is at the lower end of the generation cost of a new natural gas-fueled combined cycle plant or coal plant and lower than average 2019 LMP (both day-ahead and real-time).
- Estimated job benefits associated with the increased renewables (2,670 MW):
  - Over 11,300 direct short-term jobs (largely construction of renewables).
  - Over 650 direct long-term jobs for operation and maintenance of the renewable resources.
- Estimated carbon emissions reduction: **Over 3 million tons per year.**
  - Conservatively assumes the renewables replace carbon emissions from natural gas-fueled combined cycle plants.
  - Less efficient resources with higher heat rates and emission rates are more likely to be replaced.
- Other estimated benefits include:
  - Local benefits estimated to be over $32 million annual tax revenues and $15 million land lease revenues (based on literature research).

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Study Results - 4/5

Key benefits of GETs for Kansas and Oklahoma

- Enable more than **twice** the amount of additional new renewables to be integrated.
  - This is 1.5x the amount of wind SPP integrated in 2019.
- Estimated annual production cost savings: $175 million.
  - Payback for GETs investment is about 0.5 years.
- Estimated carbon emissions reduction: Over 3 million tons per year.
- Over 11,300 direct short-term and 650 direct long-term jobs.
- Over $32 million annual tax revenues and $15 million land lease revenues.

Potential Nation-Wide Benefits

Extrapolating these results to a nation-wide level* indicate GETs to provide **annual benefits** in the range of:

- Over **$5 billion** (~$5.3 billion) in production cost savings.
- **$90 million tons** of reduced carbon emission (more than enough to offset **ALL NEW** automobiles sold in the U.S. a year).
- About **$1.5 billion** in local benefits (local taxes and land lease revenues).
- More than 330,000 short-term (only for first year) and nearly 20,000 long-term jobs.
- Investment cost is $2.7 billion (only for first year). Ongoing costs would be around $300 million per year.

* EIA shows 2019 generation in Kansas and Oklahoma combined (136 TWh) was about 1/30 of the nationwide generation from utility-scale resources (4,100 TWh). EIA data, available at: https://www.eia.gov/electricity/state/kansas/, https://www.eia.gov/electricity/state/oklahoma/, and https://www.eia.gov/electricity/annual/html/epa_01_01.html

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Study Results - 5/5

GETs utilized in this study include:

- **Hardware solutions**: DLR on 56 lines and Advanced Power Flow Control on 8 locations.

Hardware Solutions by Voltage Level	345	230	161	138	115	69	Total
DLR*	10	3	11	22	3	7	56
Advanced Power Flow Control	3	0	4	1	0	0	8

- **Software solutions**: 204 unique Topology Optimization reconfigurations, averaging 13 per snapshot.**

Software Solutions by Voltage Level	345	230	161	138	115	69	Total
Lines	20	10	31	75	4	30	170
Substations	4	0	1	1	0	0	6
Transformers (high voltage terminal)	10	1	4	13	0	0	28

- Estimated costs for implementing the above GETs: ~$90 million.
  - Initial investment costs is estimated to be around $90 million.***
  - Ongoing costs of around $10 million per year.***

* Every DLR installation requires 15 to 30 sensors.

** Average actions represent the average number of actions that remain per case, not actions per hour. Based on other studies the average number of actions per hour is expected to be smaller, typically less than the number of topology changes due to planned outages.

*** Costs can vary project by project, and also on how the GETs service is provided—for example, Topology Optimization can be provided as a software subscription service to reduce the initial cost. We also assume utilities can incorporate these technologies without large costs.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Study Scope and Purpose

Study purpose

- Analyze how much additional renewables can be added to the grid using three GETs:
  - Advanced Power Flow Control
  - Dynamic Line Ratings (DLR)
  - Topology Optimization

Study scope

- Use the Southwest Power Pool (SPP) grid with the focus on **Kansas and Oklahoma** looking at 2025 as an illustrative case study.
  - SPP Generation Interconnection Queue* shows ~9 GW of renewable resources with Interconnection Agreements executed.
  - SPP Integrated Transmission Planning (ITP) reports** shows high congestion.
- Results metrics for the **combined** (not for individual)*** GETs include:
  - Renewables added (capacity [GW] and energy [GWh]).
  - Economic benefits (production costs, jobs, local benefits, etc.)
  - Carbon emissions reduction.

* SPP GI Queue as of September 28, 2020.

** 2019 Integrated Transmission Planning (available at: https://spp.org/Documents/60937/2019%20ITP%20Report_v1.0.pdf) and Q3 2020 Quarterly Project Tracking Report (available at: https://www.spp.org/documents/62710/q3%202020%20qpt%20report%20draft.pdf)

*** This is because the order of analysis matters—being the first GETs to be analyzed will likely show more benefits than being the last.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

GETs – Introduction

Traditional thinking treated transmission as if it is fixed and cannot be operated dynamically.

- Transmission has a fixed capacity, much like roads or railways do (e.g., the number of cars or trains that can go through at any given time).
- Advancements in maps and GPS technology have allowed for safer, easier and more efficient driving on the same roads and railways.
- Are there similar technologies that allow for such innovation in transmission **operations** (and planning)?

GETs enhance transmission operations and planning.

- GETs considered in this study: DLR, Topology Optimization, and Advanced Power Flow Control.
- These technologies have matured over the past several decades, are commercially proven and **actively operating** on grids around the world.
- They **focus on operational improvements** and have a much lower cost and faster implementation than traditional transmission technologies.
  - Similar to the comparison between building a road to reduce congestion (long-term investment) and having a good map/GPS system to avoid congested roads (operational improvements).

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Dynamic Line Ratings - 1/2

Historical practice was largely based on Static Line Ratings (SLR).

- Maximum operating temperature for a given line is pre-determined.
  - Uses conservative assumptions, such as low wind, high temperature, high solar irradiance, etc., to accommodate most conditions.
  - It is similar to setting highway speed limit based on snowy road conditions.
  - Recently more transmission operators have adopted ambient adjusted rating (AAR).

DLR enhances AAR further and utilize real-time data.

- Commonalities between SLR, AAR, and DLR.
  - Minimum allowable electrical clearance is the same.
- Differences between SLR, AAR, and DLR.
  - SLR applies uniform weather conditions to all lines and is generally lower than AAR and DLR that applies line-specific conditions.
  - AAR requires line-specific data and ambient temperature, but has a ≥ 15% risk of exceeding electrical clearance limitations (as commonly implemented in the U.S.)*
  - DLR requires line-specific data in conjunction with real-time monitoring of ambient temperature, wind and conductor position, and can provide forecasts for operations planning.*

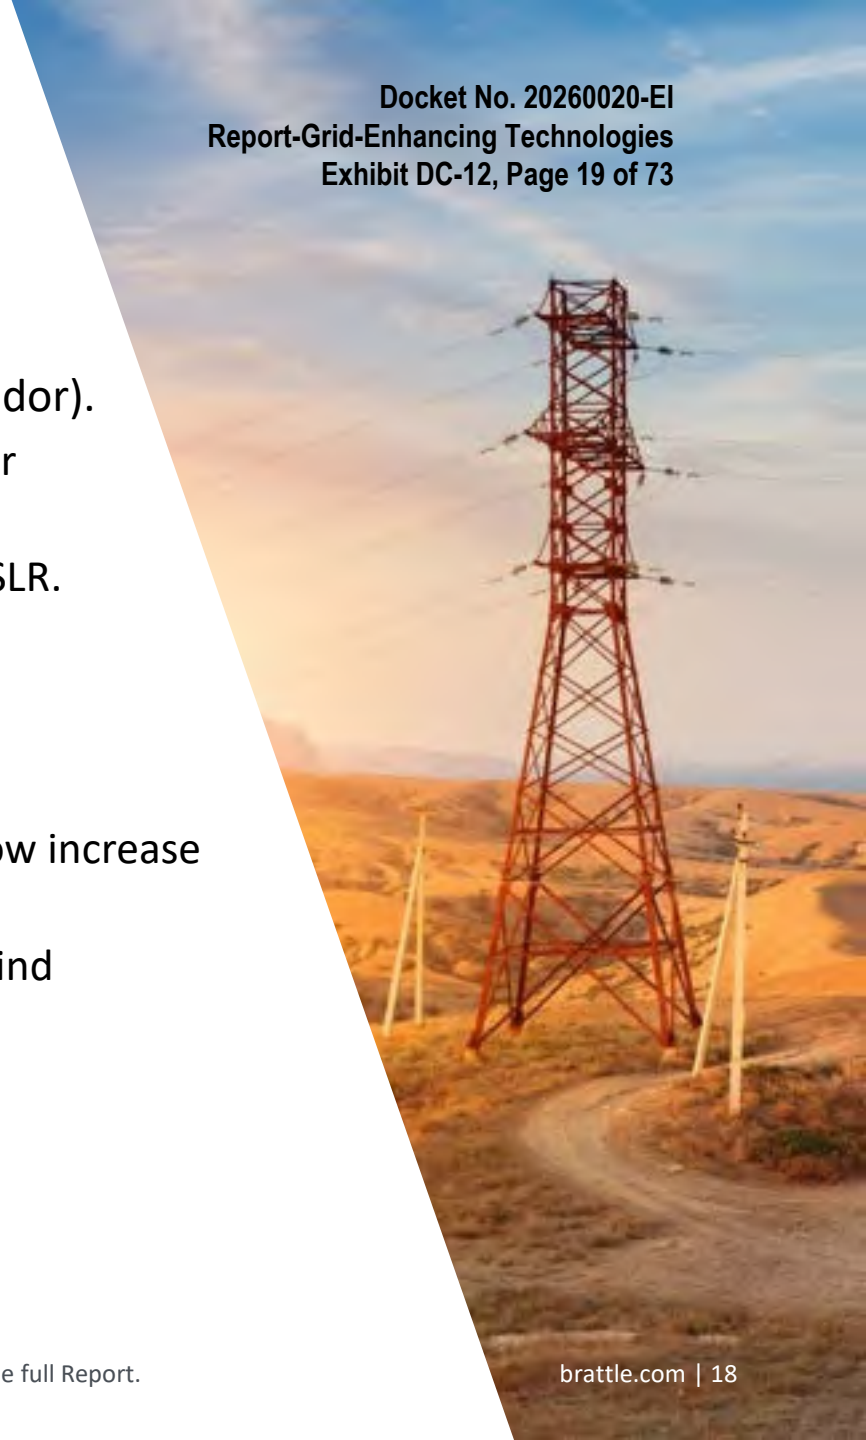
* Post-Technical Conference Comments of the WATT Coalition, November 2019, available at: https://watttransmission.files.wordpress.com/2019/11/post-technical-conference-of-the-watt-coalition.pdf, pp 2-5.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Dynamic Line Ratings - 2/2

DLR adjust limits based on ambient conditions.

- Thermal ratings use real-time measurements the line location (along line corridor).
  - Line temperature, line sagging, ambient conditions (temperature, humidity, solar irradiance, wind, precipitation etc.).
  - DOE/ONCOR study indicates DLR transfer capability to be 5 to 25% higher than SLR.
- Accumulation of real-time data can be used for future calibration.
  - DLR is variable and requires a forecast for operations planning.
- High wind leads to higher cooling and allows for increased flow.
  - High degree of overlap between wind production and DLR-induced allowable flow increase has been observed.
  - European studies indicate DLR contributes to approximately 15% reduction in wind curtailments in some areas.



This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Advanced Power Flow Control - 1/2

Phase Shifting Transformers (PSTs)* and Flexible Alternating Current Transmission Systems (FACTS) devices help the operator control flow through a given path.

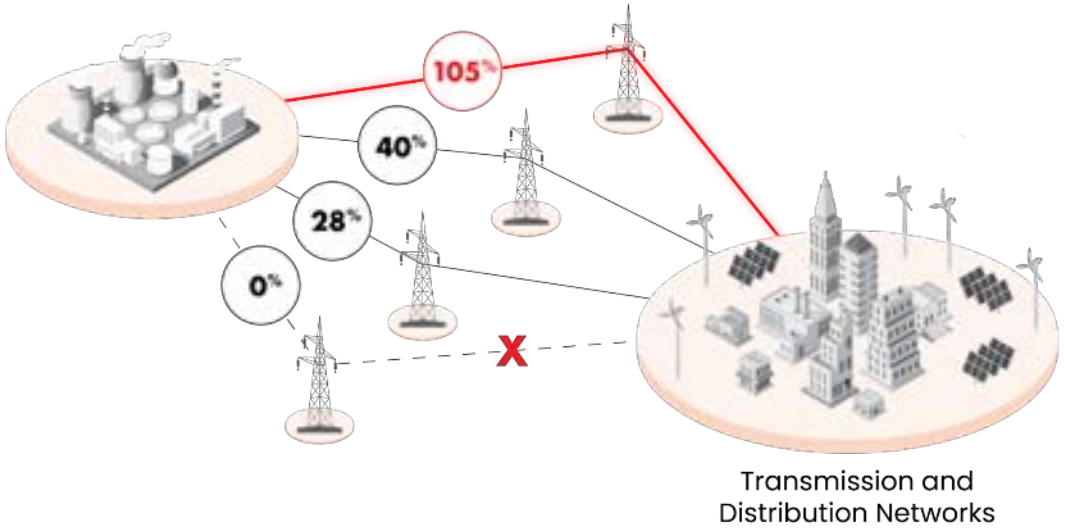
- These devices are widely accepted in the industry.
  - The largest drawback is the cost—for example, a recently-installed PAR* between Michigan and Ontario has an annual carrying cost of over $10 million.
- FACTS devices are power-electronic-based static devices that allow for flexible and dynamic control of flow on transmission lines or the voltage of the system.
  - Some FACTS devices alter the reactance of a line to control the flow (i.e., increasing the reactance will push away flows while decreasing the reactance will pull in more flow to the line).
  - FACTs devices typically cost less than PARs, can be manufactured and installed in a shorter time, are scalable, and in many cases, are available in mobile form that can be easily deployed (or redeployed, as needed) while providing flexible layout options.

* Phase Shifting Transformers are also called Phase Angle Regulators (PARs).

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Advanced Power Flow Control - 2/2

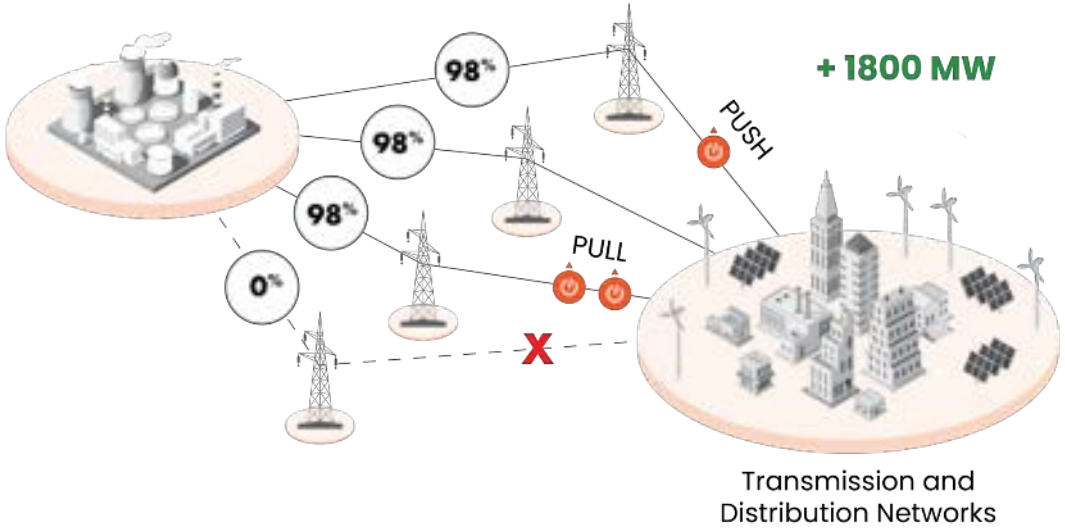
Before FACTS Device*



Traditional solutions include:

1. Redispatch generation
2. Reconductor constraining element
3. Install PSTs/Series Capacitor/Series Reactor
4. Construct a new parallel circuit

After FACTS Device



Power can be **PUSHED** and **PULLED** to alternate lines with spare capacity—leading to maximum utilization (typically obtained by a number of small applications on more than one circuit.)

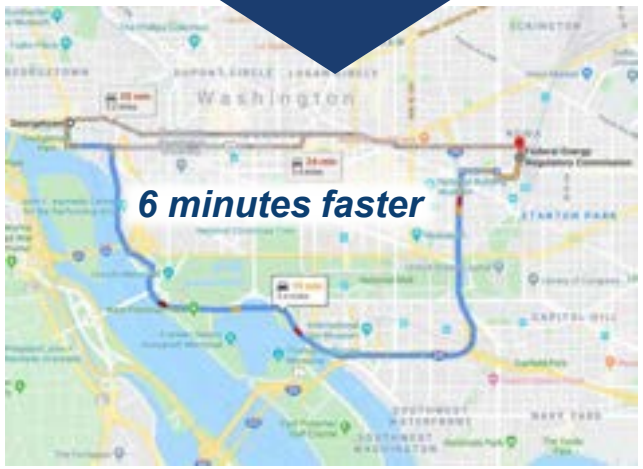
* Illustrative example from Smart Wires, https://www.smartwires.com/smartvalve/

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Topology Optimization - 1/2

Topology Optimization is analogous to Waze: "Arrive to destination reliably, with minimum delay even when there are events on the road" by re-routing.

- Re-routing is achieved by grid reconfigurations: switching circuit breakers open or close.
  - Analogous to temporarily diverting traffic away from congested roads to make traffic smoother.
  - Similar effect as advanced flow control devices, using existing equipment.
- Reconfiguring the grid in operations is feasible today.
  - Circuit breakers are capable of high duty cycles and extremely reliable—some breakers are switched very frequently today, e.g., those connecting generating units with daily start and stop operations.
  - Switching infrastructure is already in place—most breakers are controlled remotely over SCADA by the TO.
  - Low cost: usually $10-$100 per switching cycle.



Road closure picture from https://www.islandecho.co.uk/plea-motorists-heed-road

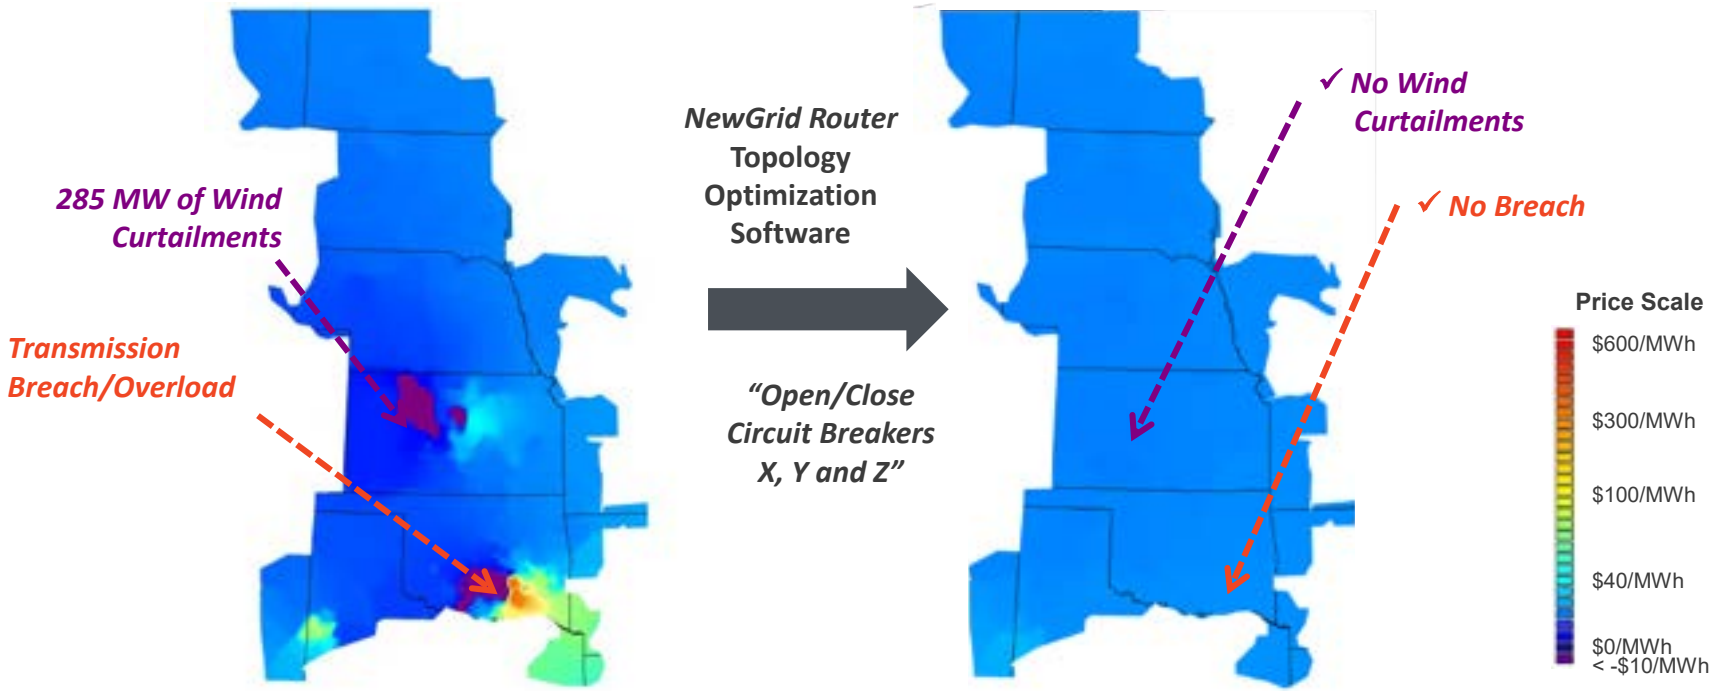
This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Topology Optimization - 2/2

Topology Optimization software technology automatically finds reconfigurations to route flow around congested elements ("Waze for the transmission grid").

SPP Historical Case
(March 10, 2018 20:10 CST,
38% Wind Penetration)

With Reconfigurations
(3 actions, 1 per constraint in
Historical Case)



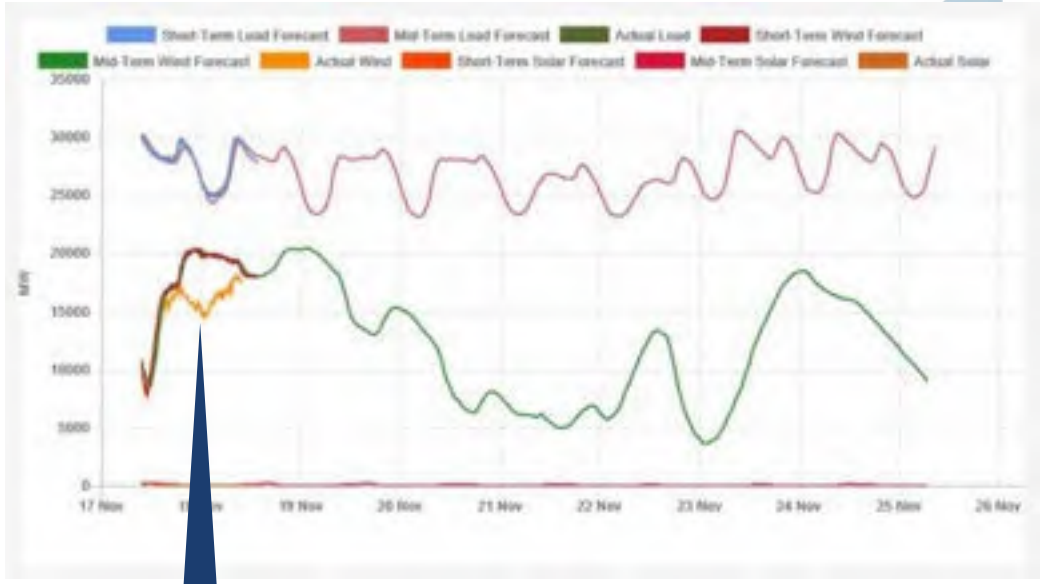
This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

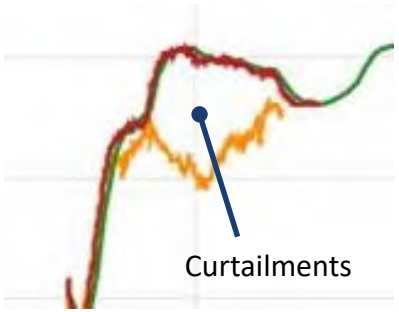
Why GETs?

GETs enhance transmission operations and planning.

- GETs **focus on operational improvements** and can be implemented quicker and at a lower cost than traditional transmission technologies.
  - Similar to the comparison between building a road to reduce congestion (long-term investment) and having a good map/GPS system to avoid congested roads (operational improvements).
- SPP operations data shows renewable curtailments likely caused by transmission congestion (indicated by transmission shadow prices).

SPP REAL-TIME MARKET DATA SNAPSHOT
FROM NOVEMBER 18, 2020





Actual wind production (shown in yellow) is lower than forecasts. Wind (and load) forecasts for both the short- and mid-term trend are over each other, indicating that the reduced wind production is likely due to curtailments.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Study Objective, Approach, and Steps

Overall study objective

- Quantify the combined benefits of three GETs for integrating renewables:
  - For a future year 2025.
  - For a select area within SPP.
  - Using 24 representative snapshots (power flow cases) to represent a full year.

Analysis approach and steps

Step 1: **Identify preferred area** for analysis.

Step 2: **Select 24 representative snapshots** from SPP operational power flow cases.

Step 3: **Modify the snapshots** to reflect new transmission upgrades, renewable plants from the generation interconnection queue, announced retirements, etc.

Step 4: **Find the maximum amount of renewables** that can be integrated under a business as usual scenario (Base Case) and then with GETs (With GETs Case) in the order of DLR, Topology Optimization, Advanced Power Flow Control. This will be done by solving the power flow cases (for the entire SPP footprint) prepared in Step 3, with and without GETs.

Step 5: **Assess benefits** including economic values (production cost savings, job creation, local benefits, etc.) and carbon emissions reduction.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 1: Identify Preferred Areas - 1/4

Step 1: Identify preferred area for analysis.

- GETs focuses on transmission operation.
  - These technology options are particularly helpful in increasing renewable penetration when transmission congestion is curtailing renewables (or preventing interconnection).
  - More renewables (largely wind in SPP) will likely to higher transmission congestion.
- Therefore, the preferred areas would be:
  - Areas with transmission constraints identified in SPP transmission studies.
    - Preferred areas to be identified by studying the SPP Integrated Transmission Planning (ITP) Assessment Report and quarterly updates.
  - Areas with significant generation resource changes (large amounts of new renewable projects and retirements of existing resources).
    - Preferred areas to be identified by studying the SPP GI Queue.

SPP figure from http://opsportal.spp.org/Images/SPPMap.gif

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 1: Identify Preferred Areas - 2/4

Based on the observations from the ITP report and GI queue, **Kansas and Oklahoma** are selected as the focus areas.

- Selection criteria for new renewables projects are set to those where Interconnection agreement has been fully executed.*
  - GI queue status of IA Fully Executed/On Schedule or IA Fully Executed/Suspended.
- This approach will include over 9,400 MW of renewable projects:

RENEWABLE POTENTIAL ASSUMED FOR KANSAS AND OKLAHOMA

State	Wind	Solar	Total
Kansas	3,410	120	3,530
Oklahoma	5,760	140	5,900
Total	9,170	260	9,430

[Rounded to the nearest 10 MW]

WIND SITING PLANS FROM 2019 ITP

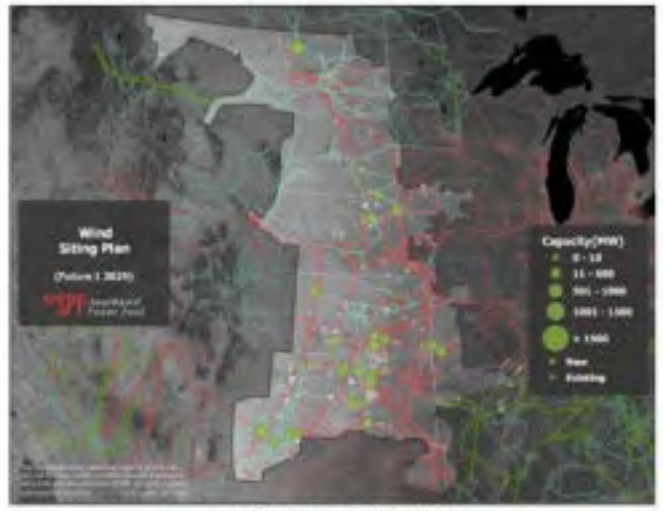

Figure 2.19: 2029 Future 1 Wind Siting Plan

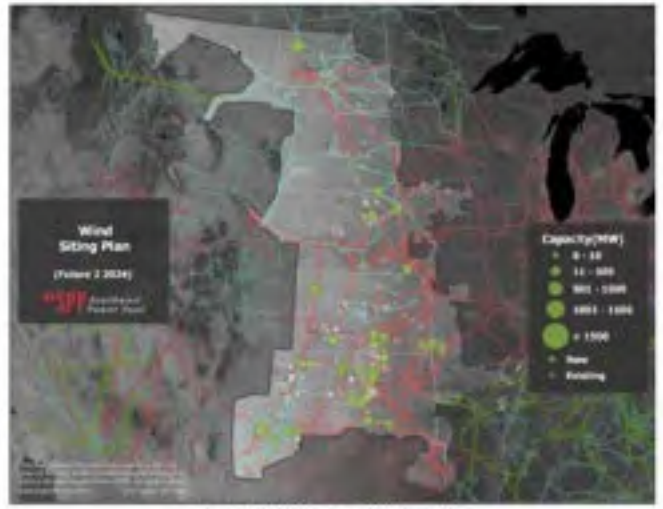

Figure 2.20: 2024 Future 2 Wind Siting Plan

* The 2010 SPP Wind Integration Study uses a similar approach.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 1: Identify Preferred Areas - 3/4

SPP identifies two target areas in its 2019 Integrated Transmission Planning (ITP) Assessment Report as areas that needed additional analysis and could benefit from closer attention.

4.1.1.1 Southeast Kansas/Southwest Missouri Target Area (Target Area 1)

Southeast Kansas/Southwest Missouri was identified as Target Area 1, requiring additional analysis for several reasons. The area has been the site of historic and projected congestion on the EHV system and has had unresolved transmission limits identified in multiple studies, most recently in the 2018 ITPNT. By defining this corridor as a target area in the 2019 ITP, SPP is able to address the TWG's direction to provide a path forward for the area to properly evaluate and resolve the issues present in day-to-day operations and in the planning horizon.

4.1.1.2 Central/Eastern Oklahoma Target Area (Target Area 2)

Central/Eastern Oklahoma was identified as Target Area 2 due to heavy congestion and parallel system correlation with Target Area 1. Additional analysis was unnecessary for Target Area 2 because system issues in this area were only related to congestion and underlying voltage stability concerns. The main point of congestion in Target Area 2 is related to the Cleveland 345/138 kV station west of Tulsa, Oklahoma. The renewable forecast in the 2019 ITP drives increased bulk transfers across central Oklahoma. EHV contingencies in the area shift congestion mostly to the lower-voltage system.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 1: Identify Preferred Areas - 4/4

SPP's GI Queue shows significant renewable additions and material retirements of existing generation resources for Kansas and Oklahoma.

KS/OK

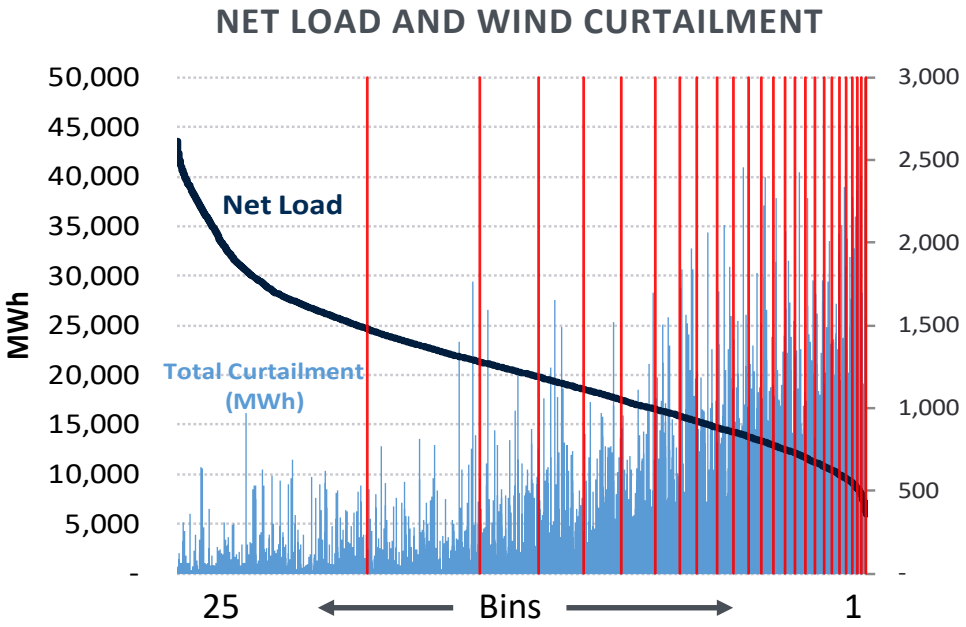
Planned Capacity Source: SPP GI Queue accessed September 28, 2020

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 2: Identify 24 Snapshots - 1/5

Step 2: Select 24 representative snapshots from SPP operational power flow cases.

- The 24 snapshots should represent varying conditions over a full year.
  - This is an alternative approach to performing production simulation type analyses.
  - This approach may reflect historical operational conditions better than production simulations.
- Create 25 bins (numbered 1 through 25) using historical data (one full year).
  - Sort all hours in the year by decreasing net load.
  - Create 25 bins (separated by red lines in the chart to contain about 1/25th of the total (annual) curtailment observed.
  - Curtailment is higher in hours where net load (shown as the thick black line in the chart to the right) is lower.
  - Analysis will be for 24 bins, excluding the first bin (bin 25) with minimal average curtailment.
- Select appropriate snapshots to represent each bin.

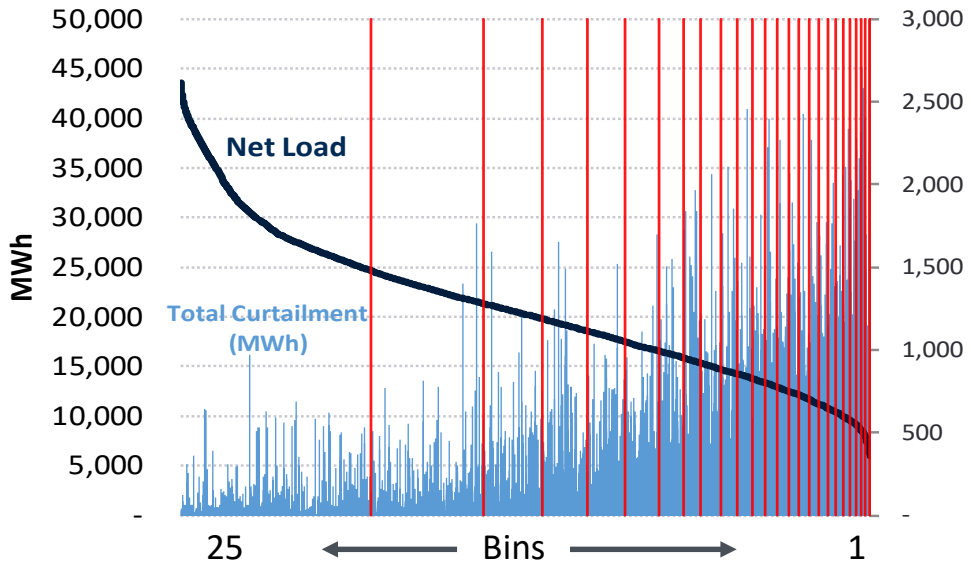


This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 2: Identify 24 Snapshots - 2/5

25 bins (numbered 1 through 25) created using historical data (one full year).

- Each bin (separated by red lines in the chart to the below) contains approximately 1/25th of the total (annual) curtailment observed.



Areas between red line indicates the bins from which snapshots were selected, blue bars indicate curtailment of renewables. Each bin contains equal amounts of curtailment.

To be analyzed

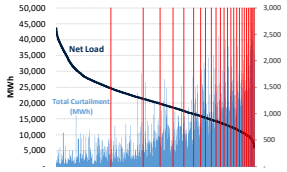
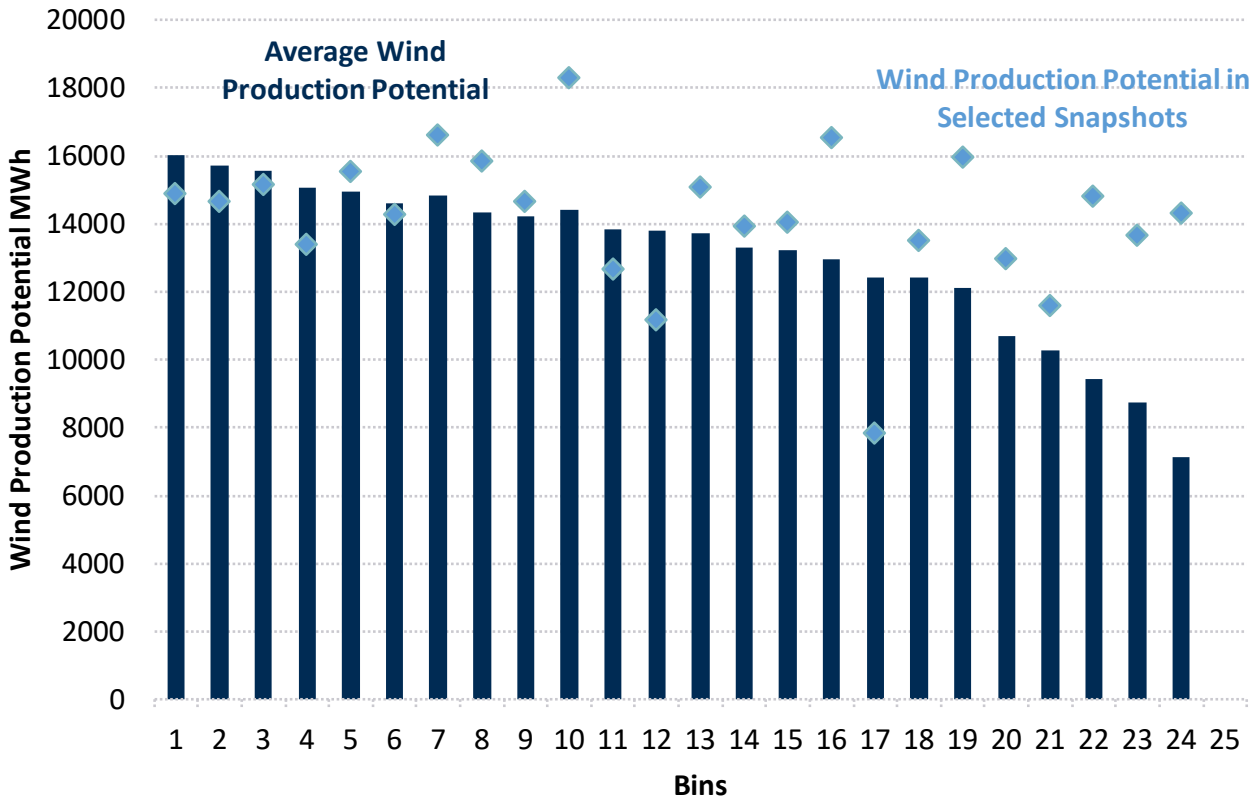
Step 2: Identify 24 Snapshots - 4/5

Select a representative hour from each bin to obtain 24 snapshots that span the conditions where wind curtailment occurs.

- Average wind production potential in sample: 14.3 GW.
  - Sample wind production potential ranges from 7.9 GW to 18.3 GW.



Bin	Date	Time*
1	April 12, 2020	Early Morning
2	September 28, 2020	Early Morning
3	June 1, 2020	Early Morning
4	September 21, 2020	Early Morning
5	June 13, 2020	Early Morning
6	September 9, 2020	Early Morning
7	March 8, 2020	Mid Day
8	January 9, 2020	Early Morning
9	November 11, 2019	Late Afternoon
10	January 8, 2020	Late Afternoon
11	April 18, 2020	Early Morning
12	September 10, 2020	Early Morning
13	December 7, 2019	Late Afternoon
14	April 16, 2020	Late Afternoon
15	March 4, 2020	Late Night
16	December 19, 2019	Late Afternoon
17	May 10, 2020	Late Night
18	November 15, 2019	Late Afternoon
19	December 11, 2019	Late Afternoon
20	November 16, 2019	Mid Day
21	August 13, 2020	Early Morning
22	September 6, 2020	Mid Day
23	August 20, 2020	Late Night
24	June 26, 2020	Late Night

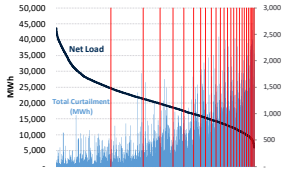


This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 2: Identify 24 Snapshots - 5/5

Select a representative hour from each bin to obtain 24 snapshots that span the conditions where wind curtailment occurs.

- Average capacity factor: 63.2% (annual SPP CF 41.5%).
- Average curtailment in sample: 2.8%.



Bin	Date	Time*
1	April 12, 2020	Early Morning
2	September 28, 2020	Early Morning
3	June 1, 2020	Early Morning
4	September 21, 2020	Early Morning
5	June 13, 2020	Early Morning
6	September 9, 2020	Early Morning
7	March 8, 2020	Mid Day
8	January 9, 2020	Early Morning
9	November 11, 2019	Late Afternoon
10	January 8, 2020	Late Afternoon

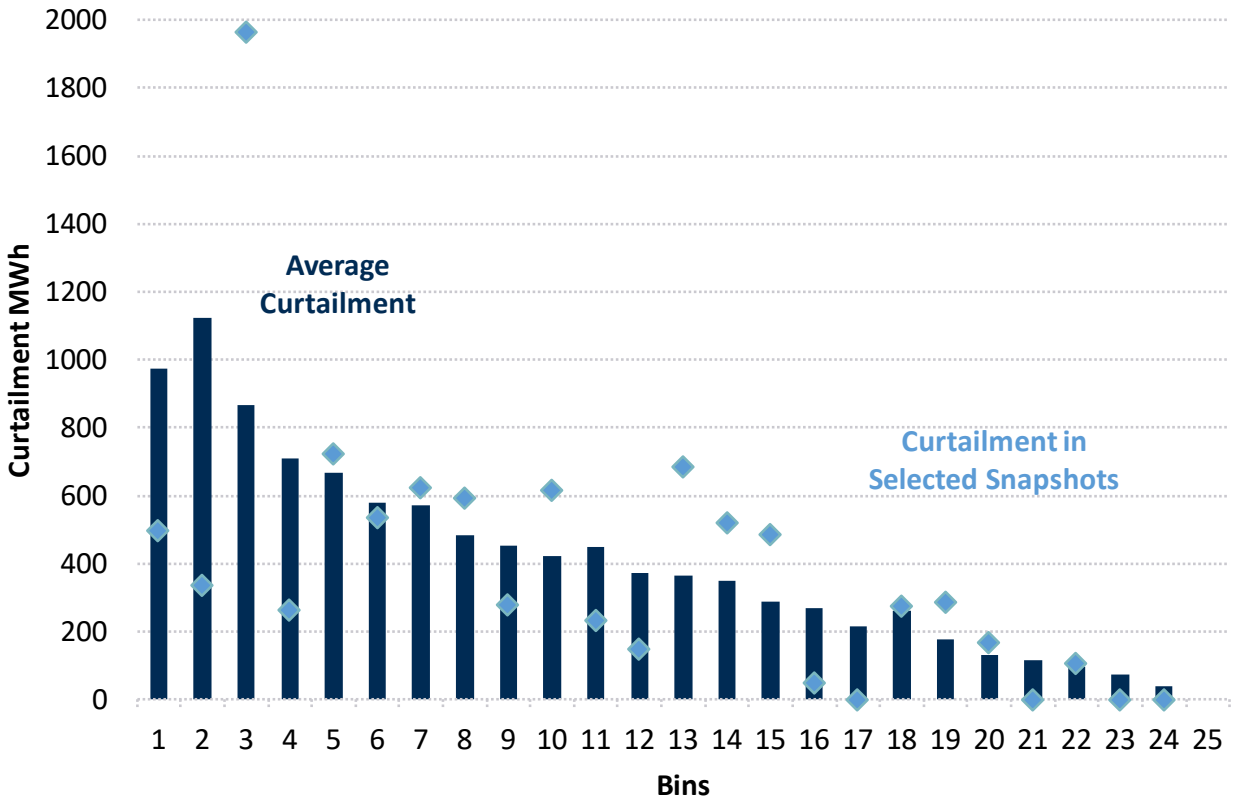
14	April 16, 2020	Late Afternoon
15	March 4, 2020	Late Night
16	December 19, 2019	Late Afternoon
17	May 10, 2020	Late Night
18	November 15, 2019	Late Afternoon
19	December 11, 2019	Late Afternoon
20	November 16, 2019	Mid Day
21	August 13, 2020	Early Morning
22	September 6, 2020	Mid Day
23	August 20, 2020	Late Night
24	June 26, 2020	Late Night

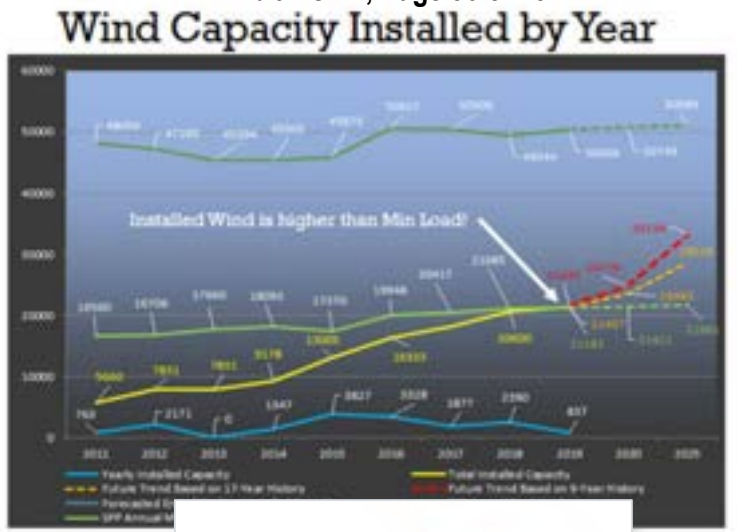


This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 3: Modify the 24 Snapshots - 1/2

Step 3: Modify the snapshots from SPP to reflect new transmission upgrades, wind and solar units from the generation interconnection queue, announced retirements, load changes, etc., to model 2025.

- Generation
  - Add/retire announced thermal generation.
  - Add new wind and solar units from interconnection queue. Assume added units' max potential output based on capacity factor from nearby units of the same type (this will be done by snapshot).
  - Adjust wind/solar dispatch to reverse curtailment by observing historical data on LMPs to identify units that may have been be curtailed (e.g., LMP less than -$20/MWh).
  - For assumed curtailments, estimate what the non-curtailed dispatch might have been using nearby wind/solar units.
- Load
  - Adjust load to 2025 level.
  - Remove portion of Lubbock load that is scheduled to transfer to ERCOT.*
  - Keep imports/exports with neighboring areas constant.



* LP&L Exit Study, available at https://www.spp.org/documents/52338/2017-lpl%20exit%20study%20-%2020170630_final.pdf

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Docket No. 20260020-EI
Report-Grid-Enhancing Technologies
Exhibit DC-12, Page 37 of 73

Step 3: Modify the 24 Snapshots - 2/2

Step 3: Modify the snapshots from SPP to reflect new transmission upgrades, wind and solar units from the generation interconnection queue, announced retirements, load changes, etc., to model 2025.

- Transmission
  - Adjust transmission constraint limits by comparing binding constraints against historical data (and adjust as necessary.)
  - Add new transmission projects. Transmission projects that are planned to be in service by 2025 are selected from SPP's Integrated Transmission Planning (ITP) reports (See appendix for the list of projects.)
  - Identify outages in snapshots that correspond to capital projects, and put them back in service.
  - Setup single-element contingencies in SPP and neighboring areas (Mid-American, Associated Electric, Entergy etc.).

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 4: Find Max Renewables - 1/3

Step 4: Find the maximum amount of renewables that can be integrated under a business as usual scenario (Base Case) and then with GETs.

- Dispatch wind and solar to their max output by running Security Constrained Optimal Power Flow (SCOPF).
  - Adjust output of non-renewable units. For fossil-fuel thermal units:
    - If capacity is < 100 MW, allow the unit to shut down.
    - If capacity is >= 100 MW, assume the unit's min-gen is 30% of max-capacity.
    - For night time snapshots, allow natural gas-fueled combined cycle units and simple cycle units to shut down as needed.
    - Leave nuclear units and units outside of SPP operating as is (i.e., no redispatch).
  - Set priority order for different generator units by unit type.
    - Prioritize wind and solar over other units, and prioritize existing wind/solar over new wind/solar.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 4: Find Max Renewables - 2/3

Step 4: Find the maximum amount of renewables that can be integrated under a business as usual scenario (Base Case) and then with GETs (With GETs Case). This will be performed by solving the power flow cases for the entire SPP footprint.

- Without GETs implemented (Business as Usual).
  - Assess curtailment without GETs.
  - Solve SCOPF (i.e., run contingency analysis to get violations, add interfaces to represent violations and re-run OPF, repeat these steps until no new violations are identified.) In doing so, enforce 69 kV and higher constraints within SPP, and 100 kV and higher constraints for external regions.
  - Save power flow case as Base Case.
  - Tally curtailment by comparing dispatch with limits for all wind and solar units. For new renewable projects (9,430 MW-worth from GI Queue), assume 5% curtailment thresholds for viability assessment (i.e., projects are considered viable if analysis indicates annual curtailments to be less than 5%). This will be an iterative process (i.e., run SCOPF, take out renewable projects with high curtailments, then resolve SCOPF, and repeat).

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Docket No. 20260020-EI
Report-Grid-Enhancing Technologies
Exhibit DC-12, Page 40 of 73

Step 4: Find Max Renewables - 3/3

Step 4: Find the maximum amount of renewables that can be integrated under a business as usual scenario and then with GETs (in the order of DLR, Topology Optimization, and Advanced Power Flow Control). This will be performed by solving the power flow cases for the entire SPP footprint.

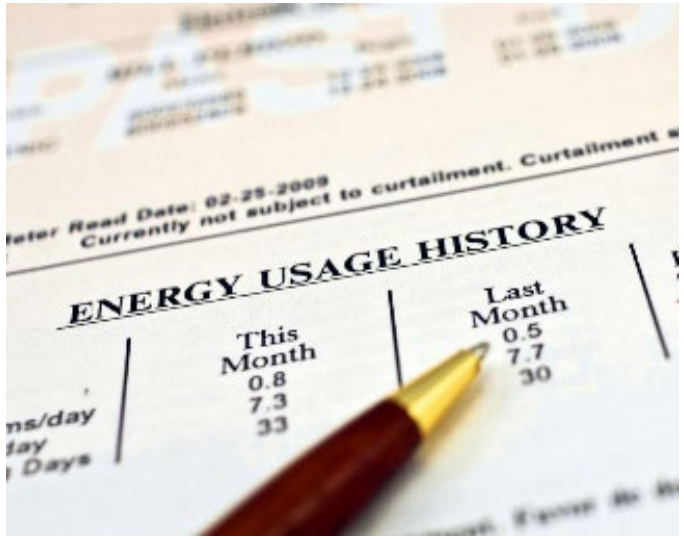
- With GETs implemented (repeat the analysis from the previous slide).
  - Perform DLR analysis on Base Case and save power flow case as DLR Case.
  - Perform Topology Optimization analysis on DLR Case, save power flow case as TC Case.
  - Perform Flow Control analysis on TC Case, save power flow case as FC Case.
  - Revisit FC Case to identify additional DLR and/or Topology Optimization opportunities.
  - Tally curtailment by comparing dispatch with limits for all wind and solar units. Apply the same 5% threshold to assess project viability.
- Results will be for the **combined benefits**, rather than individual GETs.
  - The order of GETs implemented in the analysis will likely change the benefits reaped by the individual technologies (i.e., being the first technology to be added would likely show larger benefits than being last).

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 5: Assess Benefits - 1/3

Step 5: Assess benefits including economic values (production cost savings, job creation, local benefits, etc.) and carbon emissions reduction.

- Calculate production costs benefits and carbon emission benefits utilizing SPP market data where applicable.
- Review public studies on the economic impacts to estimate “per unit” benefits, and apply to the findings.
- GETs Vendors provide economic impacts associated with their respective technology installments.
  - Cost data for both initial investment, and ongoing operational costs once installed, provided by GETs vendors.



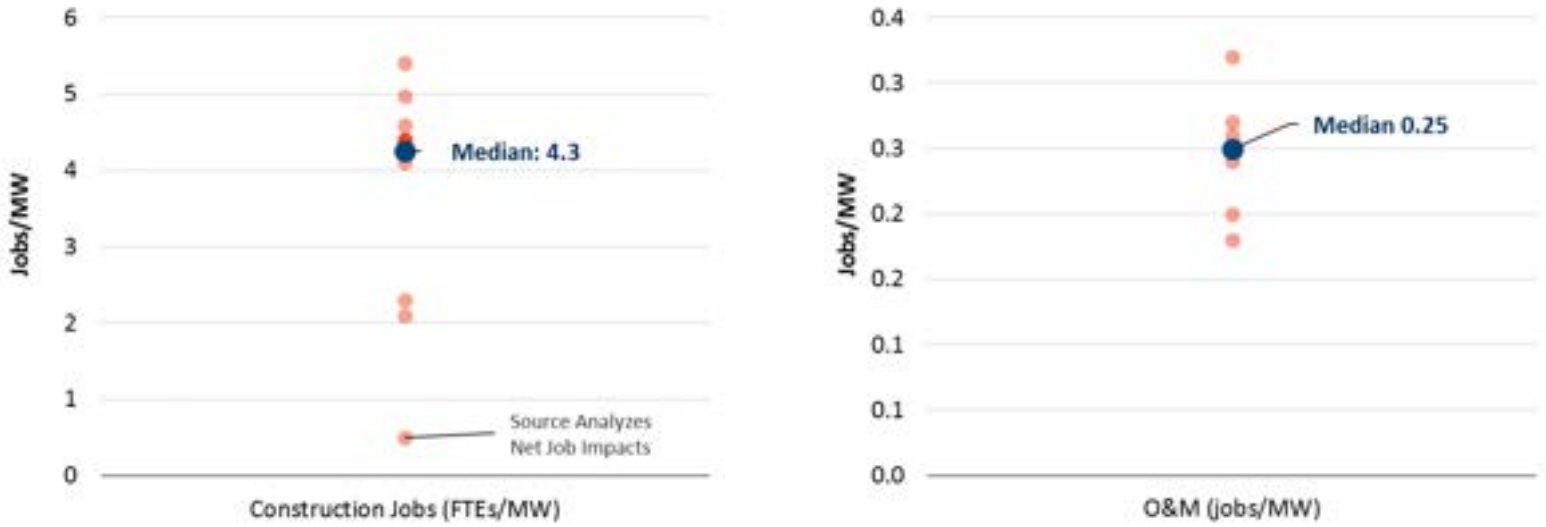
This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 5: Assess Benefits - 2/3

Adding more renewables produces jobs.

- Review of various public reports (14)* to assess job impacts through wind investments.
  - Direct, indirect, and induced jobs are included.
  - Data generally reflects short term jobs (e.g., construction jobs) rather than long term O&M jobs.
  - Impacts are at the state level (or smaller geographical areas).

COMPARISON OF JOB IMPACTS ACROSS STUDIES



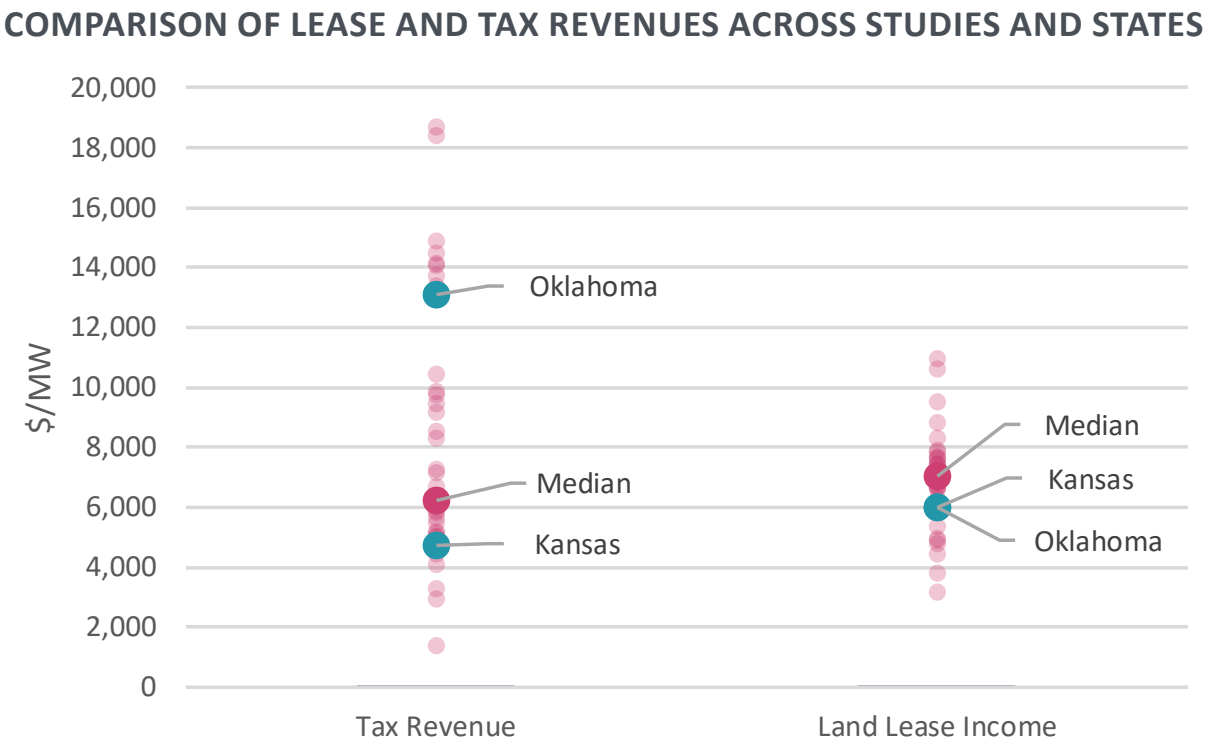
* See Appendix-B for list of reports reviewed.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Step 5: Assess Benefits - 3/3

Adding more renewables produces additional local benefits.

- Review of various public reports (7)* to assess land lease and tax revenues from wind development.



* See Appendix-B for list of reports reviewed.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Table of Contents

- Study Scope and Purpose
- Introduction to GETs
  - Dynamic Line Ratings
  - Advanced Power Flow Control
  - Topology Optimization
  - Why GETs Technologies?

Section 2: Study Scope and Analysis Approach

- Approach and Steps
  - Step 1: Identify Preferred Areas
  - Step 2: Identify 24 Snapshots
  - Step 3: Modify the 24 Snapshots
  - Step 4: Find the Maximum Amount of Renewables
  - Step 5: Assess Benefits

Section 3: Study Results

- System Assumptions for 2025
- Renewables under Base Case (business as usual)
- Renewables with GETs
- Benefits Analysis

Appendix

- A. Glossary
- B. Detailed Assumptions and Data

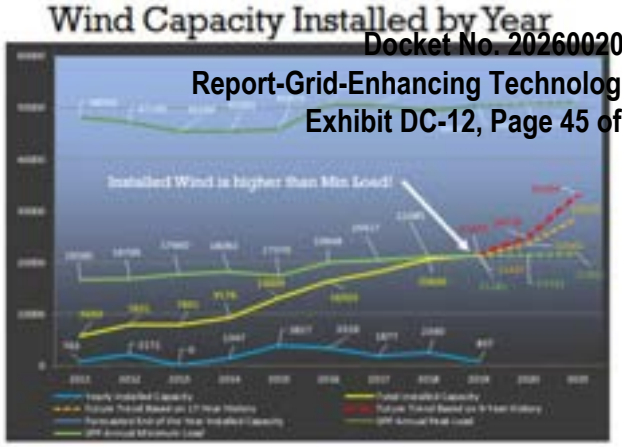
This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

System Assumptions for 2025

Study focus area: Kansas and Oklahoma.

- Load Change
  - SPP estimates 240 MW load growth between 2020 and 2025.
  - Approximately 470 MW (summer peak) of Lubbock load estimated to transfer to ERCOT in 2021.
    - Load connected to the Xcel Energy system by four 230 kV nodes (LP-Milwakee, LP-Southeast, LP-Holly, and LP-Wadswrth) is scheduled to transfer. Roughly 180 MW will remain in SPP.
- Over 9,400 MW of potential renewable projects.
  - Projects in the SPP GI queue projects with IA executed.
- Over 70 new transmission projects added.
  - Based on status from ITP Assessment reports.

Detail data are included in the Appendix.



POTENTIAL RENEWABLE PROJECTS

State	Wind	Solar	Total
Kansas	3,410	120	3,530
Oklahoma	5,760	140	5,900
Total	9,170	260	9,430

[Rounded to the nearest 10 MW]

TRANSMISSION PROJECTS

Voltage Level	Project Counts
230 KV and Above	16
169 kV and 138 kV	27
115 kV	16
69 kV	14
Total	73

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Renewables Under Base Case

Study focus area: Kansas and Oklahoma.

- Base Case (business as usual) allows for over 2,500 MW of new renewables to be integrated.
  - Retirements of existing thermal resources contribute.
  - While limited, load growth also contributes.
  - Lubbock load departure works against integrating more renewables.

ADDITIONAL RENEWABLES INTEGRATED – BASE CASE

State	Potential (MW)			Base Case (MW)			Realization (%)		
	Wind	Solar	Total	Wind	Solar	Total	Wind	Solar	Total
Kansas	3,410	120	3,530	1,710	0	1,710	50%	0%	48%
Oklahoma	5,760	140	5,900	770	100	870	13%	71%	15%
Total	9,170	260	9,430	2,480	100	2,580	27%	38%	27%

[Rounded to the nearest 10 MW]

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Docket No. 20260020-EI
Report-Grid-Enhancing Technologies
Exhibit DC-12, Page 47 of 73

Renewables Under With GETs Case - 1/3

GETs utilized in this study include:

- **Hardware solutions**: DLR on 56 lines and Advanced Power Flow Control on 8 locations.

Hardware Solutions by Voltage Level	345	230	161	138	115	69	Total
DLR*	10	3	11	22	3	7	56
Advanced Power Flow Control	3	0	4	1	0	0	8

- **Software solutions**: 204 unique Topology Optimization reconfigurations, averaging 13 per snapshot.**

Software Solutions by Voltage Level	345	230	161	138	115	69	Total
Lines	20	10	31	75	4	30	170
Substations	4	0	1	1	0	0	6
Transformers (high voltage terminal)	10	1	4	13	0	0	28

- Estimated costs for implementing the above GETs: ~$90 million.
  - Initial investment costs is estimated to be around $90 million.***
  - Ongoing costs of around $10 million per year.***

* Every DLR installation requires 15 to 30 sensors.

** Average actions represent the average number of actions that remain per case, not actions per hour. Based on other studies the average number of actions per hour is expected to be smaller, typically less than the number of topology changes due to planned outages.

*** Costs can vary project by project, and also on how the GETs service is provided—for example, Topology Optimization can be provided as a software subscription service to reduce the initial cost. We also assume utilities can incorporate these technologies without large costs.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Renewables Under With GETs Case - 2/3

Study focus area: Kansas and Oklahoma.

- GETs allow for **over 5,200 MW** of new renewables to be integrated.
  - This is **more than twice the amount** of renewables integrated in the Base Case.

ADDITIONAL RENEWABLES INTEGRATED – WITH GETS CASE

State	Potential (MW)			With GETs Case (MW)			Realization (%)		
	Wind	Solar	Total	Wind	Solar	Total	Wind	Solar	Total
Kansas	3,410	120	3,530	1,910	0	1,910	56%	0%	54%
Oklahoma	5,760	140	5,900	3,200	140	3,340	56%	100%	57%
Total	9,170	260	9,430	5,110	140	5,250	56%	54%	56%

[Rounded to the nearest 10 MW]

- Curtailment levels of existing renewables (wind) are also reduced.
  - Existing wind curtailment reduced by over 76,000 MWh.
  - No change for solar.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Renewables Under With GETs Case - 3/3

GETs enable more than twice the amount of additional new renewables to be integrated.

- Potential Renewables Considered: 9,430 MW
  - Based on queue projects with IA executed.
- Integrated Renewables (without further transmission upgrades)
  - Base Case: 2,580 MW
  - With GETs Case: 5,250 MW
  - Delta (With GETs Case – Base Case): 2,670 MW

RENEWABLE POTENTIAL ASSUMED FOR KANSAS AND OKLAHOMA

State	Wind	Solar	Total
Kansas	3,410	120	3,530
Oklahoma	5,760	140	5,900
Total	9,170	260	9,430

[Rounded to the nearest 10 MW]

~1.5 times the amount of wind SPP integrated in 2019 (1.8 GW).

ADDITIONAL RENEWABLES INTEGRATED

State	Base Case			With GETs Case			Delta (GETs - Base)		
	Wind	Solar	Total	Wind	Solar	Total	Wind	Solar	Total
Kansas	1,710	0	1,710	1,910	0	1,910	200	0	200
Oklahoma	770	100	870	3,200	140	3,340	2,430	40	2,470
Total	2,480	100	2,580	5,110	140	5,250	2,630	40	2,670

X2

[Rounded to the nearest 10 MW]

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Benefits of Increased Renewables - 1/7

GETs enable more than twice the amount of additional renewables to be integrated.

- 2,670 MW = 5,250 MW (With GETs Case) – 2,580 MW (Base Case)
- 2,670 MW = 2,630 MW (Wind) + 40 MW (Solar)
- GETs investment cost is around $90 million.

SUMMARY OF BENEFITS OF INCREMENTAL 2,670 MW OF RENEWABLES - 1/2

Annual Renewables Benefits			Notes
Additional Generation	New Wind	8,640 GWh	Wind assumes 37.5% capacity factor, solar assumes 18.0% capacity facto, see slide 51.
	New Solar	60 GWh	
	Total	8,700 GWh	
Reduction in Curtailment from Existing Wind		76 GWh	
Total Increase in Renewable Generation		8,776 GWh	
Annual Production Costs Savings		$175 million	Assumes $20/MWh is avoided, see slide 52.
Annual Carbon Reduction		3 million tons	Assumes Combined Cycle Plant (350g per kWh), see slides 53 & 54.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Docket No. 20260020-EI
Report-Grid-Enhancing Technologies
Exhibit DC-12, Page 51 of 73

Benefits of Increased Renewables - 2/7

GETs enable more than twice the amount of additional renewables to be integrated.

- 2,670 MW = 5,250 MW (With GETs Case) – 2,580 MW (Base Case)
- 2,670 MW = 2,630 MW (Wind) + 40 MW (Solar)
- GETs investment cost is around $90 million.

SUMMARY OF BENEFITS OF INCREMENTAL 2,670 MW OF RENEWABLES - 2/2

Renewables Benefits			Notes
Direct Jobs from Renewables	Short-term (Construction etc)	Over 11,300 person-year	See slide 55.
	Long-term (O&M etc)	Over 650 person-year	
Estimated Local Tax Revenues (Annual)		$32 million	
Estimated Land Lease Revenues (Annual)		$15 million	

- There are additional job benefits associated with the installation and operations of GETs.
  - 50 to 60 long-term jobs.
  - 20 to 30 short-term jobs (for installation).

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Benefits of Increased Renewables - 3/7

GETs enable additional new renewables by: 2,670 MW / 8,776 GWh.

- 2,630 MW of Wind is assumed to produce over 8,640 GWh of energy per year.
  - Assumes 37.5% capacity factor for wind.
  - 2019 SPP State of the Market Report* shows wind producing roughly 74,000 GWh of power and SPP having 22,482 MW of wind at the end of 2019.
  - These figures conservatively suggest the realized average capacity factor of wind is 37.5% (after accounting for outages and curtailments).
  - In reality newer wind plants show higher capacity factors. SPP State of the Market Report shows real time capacity factors for wind in 2019 to be 39.4%.
- 40 MW of Solar is assumed to produce about 60 GWh of energy per year.
  - Assuming 18% capacity factor for solar.
- Curtailment of existing wind is reduced by more than 76 GWh a year.
  - Total increase in renewables generation enabled by GETs is 8,776 GWh.

* 2019 SPP State of the Market Report, available at: https://www.spp.org/documents/62150/2019%20annual%20state%20of%20the%20market%20report.pdf

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Benefits of Increased Renewables - 4/7

GETs enable additional 8,776 GWh of generation from renewables.

- Estimated annual production cost savings: **Over $175 million**.
  - Conservatively assumes $20/MWh savings for 8,776 GWh of energy.
  - Generation cost of a new natural gas-fueled combined cycle plants would be in the $20/MWh to $25/MWh range (assuming $2.5-3.0/MMBtu fuel cost and 7,000 Btu/kWh heat rate plus VOM).
  - Generation cost of coal plants would be in the $20/MWh to $25/MWh range (assuming $2/MMBtu fuel cost and 10,000 Btu/kWh heat rate plus VOM).
  - LMPs can be used as an indicator for the marginal cost of power. The SPP State of the Market Report shows 2019 day-ahead prices averaged around $22/MWh and real-time prices averaged around $21/MWh. 2018 average was $25/MWh for both.
  - This value does **NOT** include any Production Tax Credit-driven savings.
  - Pay-back for GETs investment ($90 million) is about half a year.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Benefits of Increased Renewables - 5/7

GETs enable additional 8,776 GWh of generation from renewables.

- Estimated carbon emissions reduction: **Over 3 million tons per year**.
  - Conservatively assumes the additional new renewables replace carbon emissions from natural gas-fueled combined cycle plants (with emission estimated to be 350g per kWh, or 0.8 pound per kWh).
  - Less efficient resources with higher heat rates and emission rates are more likely to be replaced. The average coal plant produces approximately twice the amount of carbon emissions, compared to a combined cycle plant. An average natural gas-fueled simple cycle gas turbine (a.k.a. peakers) produces approximately 20% to 30% more carbon emissions, compared to a combined cycle plant.
  - Additional benefits include **reduced water usage**. By enabling twice the amount of renewables to be integrated, reduction in water usage for power production is doubled.

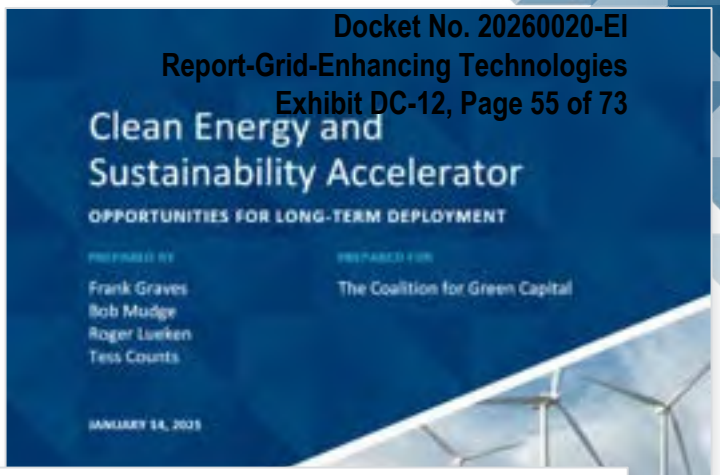
This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Benefits of Increased Renewables - 6/7

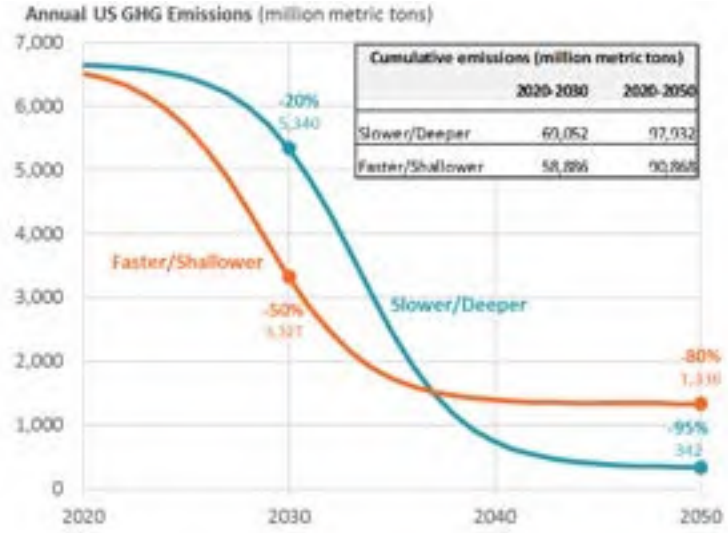
Docket No. 20260020-EI
Report-Grid-Enhancing Technologies
Exhibit DC-12, Page 55 of 73

GETs, through enabling more renewables, is estimated to reduce carbon emission by over 3 million tons per year.

- Cumulative greenhouse gas (GHG) in the atmosphere is what causes warming, not the rate at which they are emitted in any given year (and they persist in the atmosphere for decades or longer).
  - Therefore, early reductions in GHG emissions are in many ways more important than eventual depth of reductions, because of the cumulative and persistent nature of GHGs in the atmosphere.
  - A recent whitepaper published by Brattle* illustrates how earlier adoption can lead to lower cumulative GHG emission (through 2050).
- Utilizing GETs could set an example for early adoption of existing technology to curb GHG emission.



ILLUSTRATIVE EXAMPLE OF BENEFITS OF ACCELERATING DECARBONIZATION



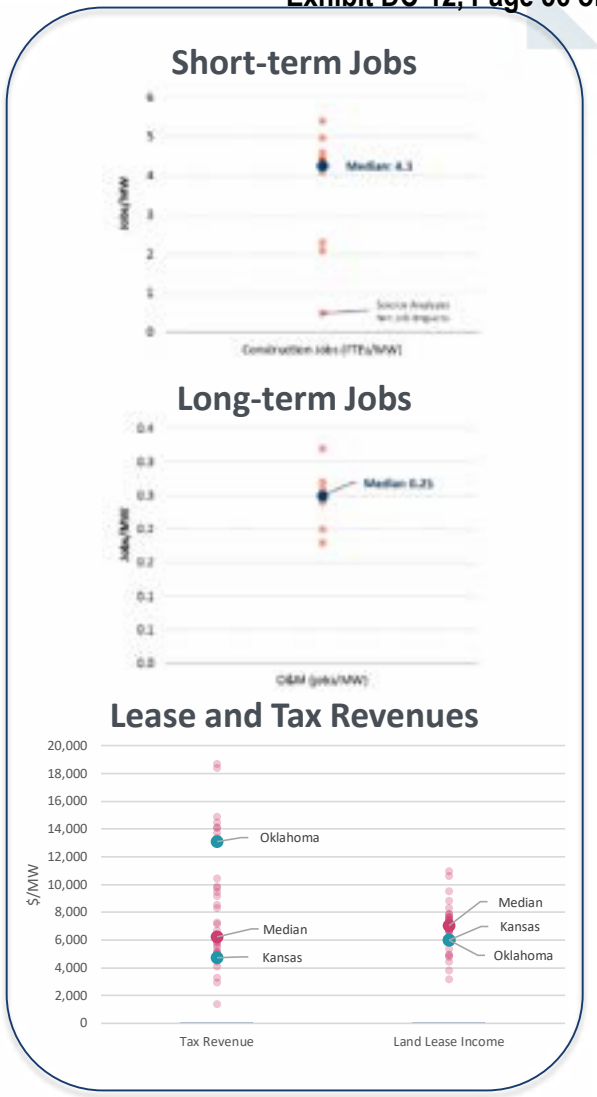
* Clean Energy and Sustainability Accelerator, available at: https://brattlefiles.blob.core.windows.net/files/20809_clean_energy_and_sustainability_accelerator.pdf

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Benefits of Increased Renewables - 7/7

The additional 2,670 MW (2,430 in Oklahoma and 200 MW in Kansas) of renewables enabled by GETs will provide jobs and other local benefits.

- Over 11,300 direct short-term jobs (largely construction of renewables).
  - Assumes 4.3 jobs (person-year) / MW for wind and 1.3 jobs (person-year) / MW for solar.
- Over 650 direct long-term jobs for operation and maintenance of the renewable resources.
  - Assumes 0.25 jobs (person-year) / MW for wind and 0.005 jobs (person-year) / MW for solar.
- Other estimated local benefits include over $32 million annual tax revenues and $15 million land lease revenues.
  - Tax revenues assumes $13,000/MW for the 2,430 MW in Oklahoma and $4,700/MW for the 200 MW in Kansas.
  - Land lease revenues assumes $5,900/MW for both Kansas and Oklahoma.



Docket No. 20260020-EI
Report-Grid-Enhancing Technologies
Exhibit DC-12, Page 57 of 73

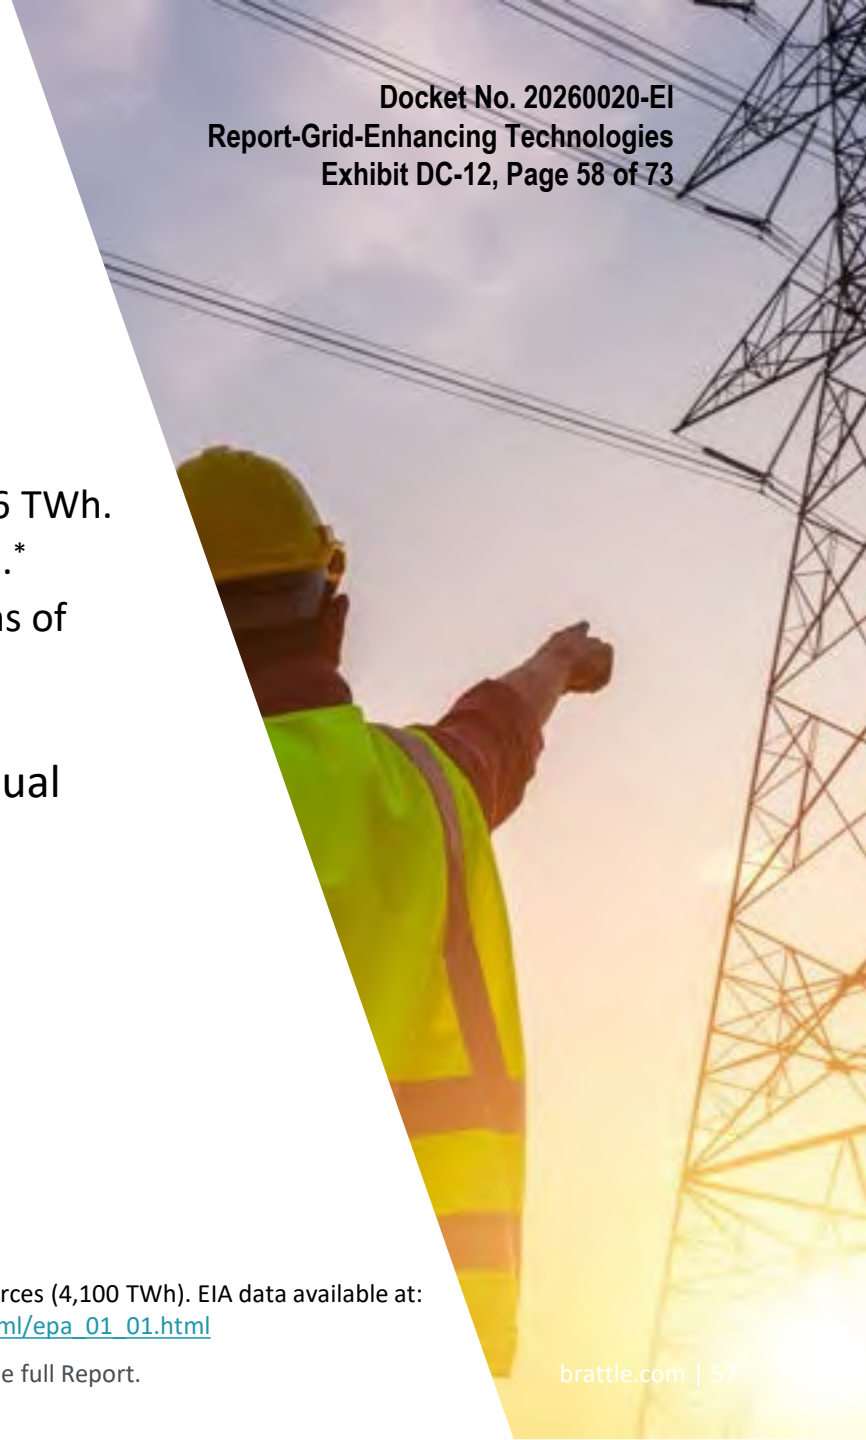
Summary of Benefits - 1/2

Key benefits of GETs for Kansas and Oklahoma

- Enable more than **twice** the amount of additional new renewables to be integrated.
  - This is 1.5x the amount of wind SPP integrated in 2019.
- Estimated annual production cost savings: **$175 million**.
  - This suggests the payback for GETs investment is about 0.5 years.
- Estimated carbon emissions reduction: **Over 3 million tons per year**.
- Other benefits include:
  - Over 11,300 direct short-term jobs (largely construction of renewables).
  - Over 650 direct long-term jobs for operation and maintenance of the renewable resources.
  - Over $32 million annual tax revenues.
  - Over $15 million land lease revenues.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Summary of Benefits - 2/2



Potential nation-wide benefits of GETs

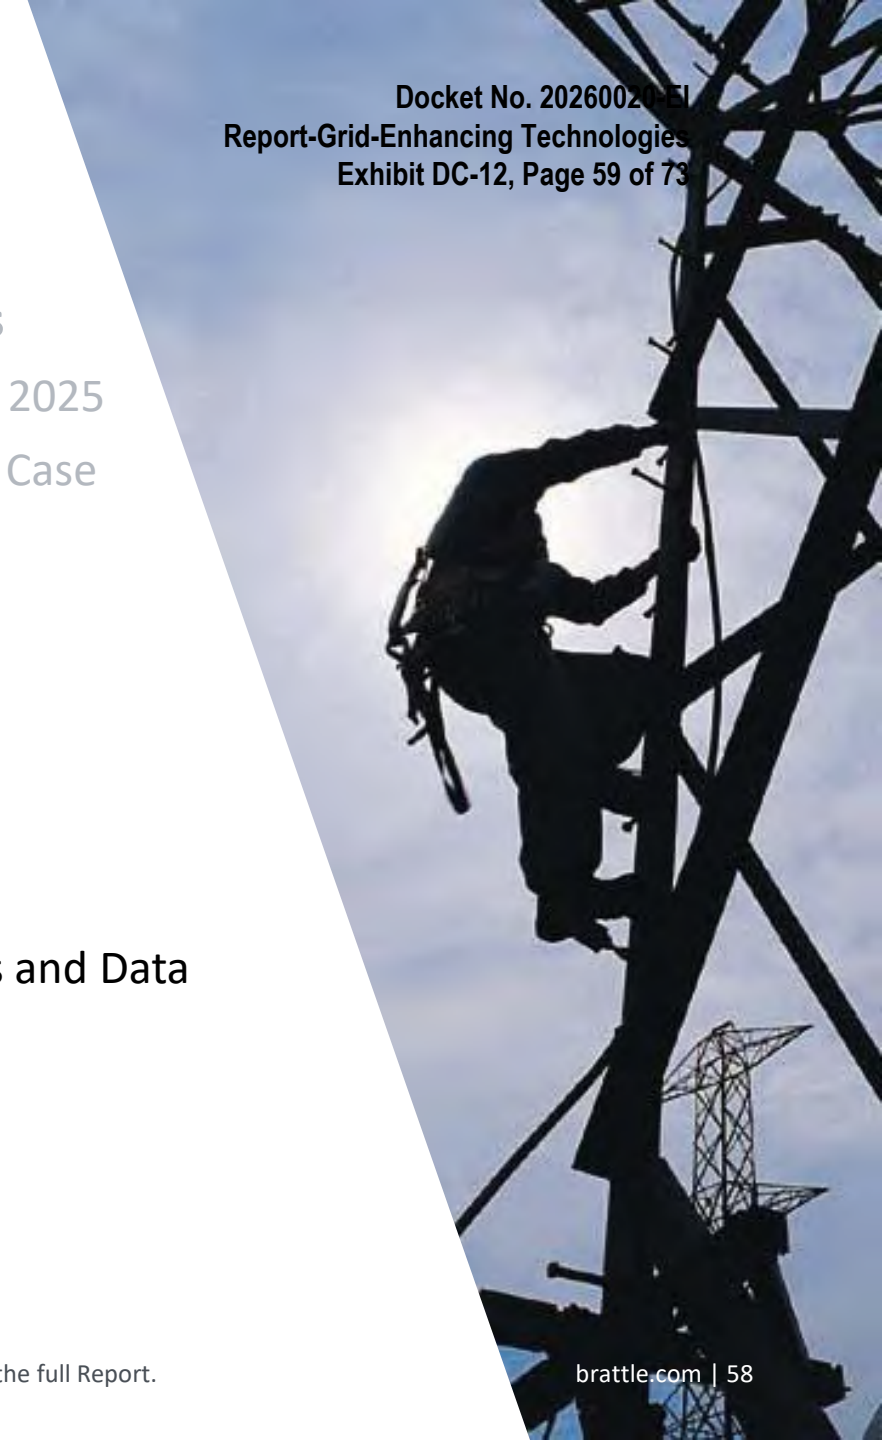
- Scaling Kansas and Oklahoma to nationwide:
  - 2019 generation in Kansas and Oklahoma combined was about 136 TWh.*
  - 8,700 GWh from the GETs enabled new renewable generation equates to 6.4% of 136 TWh.
  - The nationwide generation from utility-scale resources in 2019 was about 4,100 TWh.*
  - 6.4% of 4,100 TWh would equate to 260 TWh worth of clean power, or 90 million tons of carbon reduction assuming wind replaces natural gas burning CCs – the most clean conventional fossil-fuel based power generation technology.
- Extrapolating these results to a nation-wide level indicate GETs to provide annual benefits in the range of:
  - Over **$5 billion** (~$5.3 billion) in production cost savings.
  - **$90 million tons** of reduced carbon emission.
    - More than enough to offset **all new automobiles** sold in the U.S. in a year.
  - About **$1.5 billion** in local benefits (local taxes and land lease revenues).
  - More than 330,000 short-term (only for first year) and nearly 20,000 long-term jobs.
  - Investment cost is $2.7 billion (only for first year).
  - Ongoing costs would be around $300 million per year.

* EIA shows 2019 generation in Kansas and Oklahoma combined (136 TWh) was about 1/30 of the nationwide generation from utility-scale resources (4,100 TWh). EIA data available at: https://www.eia.gov/electricity/state/kansas/, https://www.eia.gov/electricity/state/oklahoma/, and https://www.eia.gov/electricity/annual/html/epa_01_01.html

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

APPENDIX

Table of Contents



Section 1: Introduction to GETs

- Study Scope and Purpose
- Introduction to GETs
  - Dynamic Line Ratings
  - Advanced Power Flow Control
  - Topology Optimization
  - Why GETs Technologies?

Section 2: Study Scope and Analysis Approach

- Approach and Steps
  - Step 1: Identify Preferred Areas
  - Step 2: Identify 24 Snapshots
  - Step 3: Modify the 24 Snapshots
  - Step 4: Find the Maximum Amount of Renewables
  - Step 5: Assess Benefits

Section 3: Study Results

- System Assumptions for 2025
- Renewables under Base Case (business as usual)
- Renewables with GETs
- Benefits Analysis

Appendix

- A. Glossary
- B. Detailed Assumptions and Data

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Glossary

AAR	Ambient Adjusted Ratings
DLR	Dynamic Line Ratings
FACTS	Flexible Alternating Current Transmission Systems
GETs	Grid-Enhancing Technologies
GHG	Greenhouse Gas
GI Queue	Generation Interconnection Queue
IA	Interconnection Agreement
ITP	Integrated Transmission Planning
LMP	Locational Marginal Price
PARs	Phase Angle Regulators
PSTs	Phase Shifting Transformers
SCOPF	Security Constrained Optimal Power Flow
SLR	Static Line Ratings
SPP	Southwest Power Pool

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Potential Renewables from SPP GI Queue

Potential renewable generation projects selected from SPP's GI Queue.

List of Transmission Projects - 1/4

Transmission projects that are planned to be in service by 2025 are selected from SPP's 2019 Integrated Transmission Planning (ITP) Assessment Report.

PLANNED TRANSMISSION PROJECTS FROM 2019 ITP FOR 2020-2025 (230 KV AND HIGHER)

Project Name	Project Type	Owner	Project Status	In-Service Date
Multi - Gentleman - Cherry Co. - Holt Co. 345 kV	Regional Reliability	NPPD	Delay - Mitigation	6/1/2022
XFR - Thedford 345/115 kV	High Priority	NPPD	Delay - Mitigation	5/1/2021
XFR - Wolfforth 230/115 kV Ckt 1 Transformer	Regional Reliability	SPS	On Schedule < 4	4/15/2021
Sub - Amarillo South 230 kV Terminal Upgrades	Regional Reliability	SPS	On Schedule < 4	4/1/2020
XFR - Sundown 230/115 kV Transformer	Regional Reliability	SPS	Delay - Mitigation	12/15/2020
Multi - Tuco - Yoakum 345/230 kV Ckt 1	Regional Reliability	SPS	Delay - Mitigation	6/1/2020
Sub - Nichols - 230 kV	Regional Reliability	SPS	Delay - Mitigation	5/15/2020
Multi - Sheldon - Monolith 115 kV	Regional Reliability	NPPD	Delay - Mitigation	1/1/2021
XFR - Lawrence Hill 230/115kV	Regional Reliability	WR	Delay - Mitigation	6/1/2021
XFR - McDowell 230/115 kV Ckt 1	Regional Reliability	SPS	Delay - Mitigation	5/28/2021
Multi - China Draw - Road Runner 345 kV	Regional Reliability	SPS	Delay - Mitigation	11/15/2021
Line - Eddy County - Kiowa 345 kV New Line	Regional Reliability	SPS	On Schedule < 4	11/15/2020
Multi - S1361	Regional Reliability	OPPD	On Schedule < 4	6/1/2021
Multi - Cimarron - Northwest - Mathewson 345kV	Economic	OGE	On Schedule < 4	7/1/2020
Multi - Neset - New Town 230 kV	Regional Reliability	BEPC	Re-evaluation	12/31/2022
Sub - Neosho 345 kV	Sponsored Upgrade	WR	On Schedule < 4	7/1/2020

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

List of Transmission Projects - 2/4

Transmission projects that are planned to be in service by 2025 are selected from SPP's 2019 Integrated Transmission Planning (ITP) Assessment Report.

PLANNED TRANSMISSION PROJECTS FROM 2019 ITP FOR 2020-2025 (138 KV AND 169 KV)

Project Name	Project Type	Owner	Project Status	In-Service Date
Line - Cedar Grove - South Shreveport 138 kV	Transmission Service	AEP	On Schedule < 4	6/1/2020
Line - Keystone Dam - Wekiwa 138 kV Ckt 1 Rebuild	Regional Reliability	AEP	On Schedule < 4	6/1/2021
Line - Lincoln - Meeker 138 kV Ckt 1 New Line	Regional Reliability	OGE	Delay - Mitigation	7/31/2020
Multi - Driftwood 138/69 kV Substation and Transformer	Regional Reliability	WFEC	Delay - Mitigation	4/1/2022
Multi - DeGrasse - Knob Hill 138 kV New Line and DeGrasse 345/138 kV	Regional Reliability	WFEC	Delay - Mitigation	12/1/2024
Sub - Cleo Junction 138 kV Terminal Upgrades	Regional Reliability	WFEC	Delay - Mitigation	5/31/2023
Line - Crosstown - Blue Valley 161 kV New Line	Regional Reliability	KCPL	Re-evaluation	6/30/2023
Sub - Tupelo - Tupelo Tap 138 kV Terminal Upgrades	Economic	WFEC	Delay - Mitigation	12/31/2020
XFR - Creswell 138/69/13.2 kV Transformers	Regional Reliability	WR	On Schedule < 4	6/1/2021
Multi - Park Community - Sunshine 138 kV	Regional Reliability	WFEC	Delay - Mitigation	5/31/2021
Line - Cogar - OU SW 138 kV	Regional Reliability	WFEC	Delay - Mitigation	3/1/2024
Sub - Westmoore 138 kV	Regional Reliability	OGE	On Schedule < 4	12/31/2020
Sub - Santa Fe 138 kV	Regional Reliability	OGE	Re-evaluation	6/1/2021
Sub - Riverside Station 138 kV	Regional Reliability	AEP	Delay - Mitigation	11/1/2022
Sub - Southwestern Station 138 kV	Regional Reliability	AEP	Delay - Mitigation	11/1/2022
Sub - Moore 13.8 kV Breaker	Regional Reliability	NPPD	On Schedule < 4	6/1/2021
Sub - Craig 161 kV	Regional Reliability	KCPL	On Schedule < 4	12/31/2021
Sub - Leeds 161 kV	Regional Reliability	KCPL	On Schedule < 4	12/31/2020
Sub - Southtown 161 kV	Regional Reliability	KCPL	On Schedule < 4	12/31/2021
Sub - Mooreland 138/69 kV Breakers	Regional Reliability	WFEC	On Schedule < 4	5/1/2022
Line - Tulsa SE - S Hudson 138kV Ckt 1	Regional Reliability	AEP	Delay - Mitigation	11/1/2021
Line - Tulsa SE - 21st Street Tap 138kV Ckt 1	Regional Reliability	AEP	Delay - Mitigation	11/1/2021
Line - East Kingfisher - Kingfisher 138kV	Economic	WFEC	On Schedule < 4	1/1/2021
Line - Neosho - Riverton 161 kV	Transmission Service	EDE	NTC-C Project Estimate	10/1/2023
XFR - Pryor Junction 138/115	Regional Reliability	AEP	Delay - Mitigation	11/30/2021
Line - Anadarko - Gracemont 138kV	Economic	WFEC	On Schedule < 4	1/1/2021
Jayhawk Wind 161/69kV Transformer	Sponsored Upgrade	Apex		12/31/2021

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

List of Transmission Projects - 3/4

Transmission projects that are planned to be in service by 2025 are selected from SPP's 2019 Integrated Transmission Planning (ITP) Assessment Report.

PLANNED TRANSMISSION PROJECTS FROM 2019 ITP FOR 2020-2025 (115 KV)

Project Name	Project Type	Owner	Project Status	In-Service Date
Line - Northwest - Rolling Hills 115 kV Ckt 1	Regional Reliability	SPS	On Schedule < 4	5/15/2021
Line - Ainsworth - Ainsworth Wind 115 kV Ckt 1 Rebuild	Regional Reliability	NPPD	On Schedule < 4	6/1/2020
Sub - Carlsbad - Pecos 115 kV Terminal Upgrades	Regional Reliability	SPS	On Schedule < 4	6/1/2021
Carlisle - Murphy 115kV Terminal Upgrades	Regional Reliability	SPS	On Schedule < 4	6/1/2022
Sub - Carlsbad Interchange 115 kV	Regional Reliability	SPS	On Schedule < 4	6/1/2021
Sub - Hale Cty Interchange 115 kV	Regional Reliability	SPS	On Schedule < 4	6/1/2021
Sub - Denver City Interchange 115 kV North	Regional Reliability	SPS	On Schedule < 4	6/1/2021
Sub - Canaday 115 kV	Regional Reliability	NPPD	On Schedule < 4	6/1/2021
Sub - Hastings 115 kV	Regional Reliability	NPPD	On Schedule < 4	6/1/2021
Multi - Marshall County - Smittyville - Baileyville - South Seneca 115 kV	Regional Reliability	WR	Delay - Mitigation	6/1/2023
Sub - Firth 115kV	Regional Reliability	NPPD	Delay - Mitigation	6/1/2023
Sub - Amoco - Sundown 115 kV	Economic	SPS	On Schedule < 4	6/1/2020
Line - Hansford - Spearman 115kV	Economic	SPS	On Schedule < 4	1/1/2021
Multi-Hobbs Interchange-Millen 115kV	Regional Reliability	SPS	On Schedule < 4	6/1/2022
Sub - Denver City Interchange South 115 kV	Regional Reliability	SPS	On Schedule < 4	6/1/2021
Line - Aberdeen City - Aberdeen Industrial Park 115 kV	Sponsored Upgrade	NWE	On Schedule < 4	12/31/2021

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

List of Transmission Projects - 4/4

Transmission projects that are planned to be in service by 2025 are selected from SPP's 2019 Integrated Transmission Planning (ITP) Assessment Report.

PLANNED TRANSMISSION PROJECTS FROM 2019 ITP FOR 2020-2025 (69 KV AND LOWER)

Project Name	Project Type	Owner	Project Status	In-Service Date
Line - Elmore - Paoli 69 kV Rebuild	Regional Reliability	WFEC	Delay - Mitigation	3/1/2022
Line - Sara Road - Sunshine Canyon 69 kV Ckt 1 Rebuild	Regional Reliability	WFEC	Delay - Mitigation	12/31/2019
Device - S964 69 kV Cap Bank	Regional Reliability	OPPD	On Schedule < 4	6/1/2020
Line - Atoka - Atoka Pump - Pittsburg - Savanna - Army Ammo - McAlester City	Zonal Reliability	AEP	Delay - Mitigation	11/20/2020
Line - City of Winfield - Oak 69 kV Reconductor	Regional Reliability	KPP	On Schedule < 4	12/30/2020
Device - Dover SW 69 kV Cap Bank	Regional Reliability	WFEC	Delay - Mitigation	9/1/2023
Device - Cherokee SW 69 kV Cap Bank	Regional Reliability	WFEC	Delay - Mitigation	8/1/2023
Device - Clear Creek Tap 69 kV Cap Bank	Regional Reliability	WFEC	Delay - Mitigation	12/1/2020
Sub - Washita 69 kV	Regional Reliability	WFEC	On Schedule < 4	6/1/2021
Device- Gypsum 69 kV Capacitor Bank	Regional Reliability	WFEC	On Schedule < 4	6/1/2021
Sub - Cleo Corner - Cleo Junction 69kV	Regional Reliability	OGE	On Schedule < 4	6/1/2022
SUB - Marietta - Rocky Point 69 kV	Regional Reliability	WFEC	On Schedule < 4	12/1/2021
SUB - Forest Hill 69 kV Terminal Upgrades	Regional Reliability	OGE	On Schedule < 4	1/1/2021
DPNS-2019-March-1011 Shell Rock and Bauman Substation	Regional Reliability	CBPC	NTC - Commitment	6/1/2020

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Review of Public Reports - 1/2

Adding more renewables produces jobs.

- Various (14) public reports were reviewed to estimating the jobs and other economic benefits of wind development (out of 11 had useful information).

11 STUDIES ON THE ECONOMIC BENEFITS OF WIND DEVELOPMENT

Study	Region
Aldieri et. al, Wind Power and Job Creation, 2019	U.S. and other countries
AWEA, Wind Powers America Annual Report, 2019	Nationwide
Brattle, Job and Economic Benefits of Transmission and Wind Generation Investments in the SPP Region, 2010	SPP
EIG, Statewide Economic Impact of Wind Energy Development in Oklahoma, 2014	Oklahoma
NREL, Economic Impacts from Wind Energy in Colorado Case Study, 2019	Rush Creek Wind Farm, Colorado
NREL, Economic Development Impact of 1,000 MW of Wind Energy in Texas, 2011	Texas
NREL, Economic Impacts from Indiana's First 1,000 MW of Wind Power, 2014	Indiana
NREL, Estimated Economic Impacts of Utility Scale Win Power in Iowa, 2013	Iowa
NREL, Jobs and Economic Development from New Transmission and Generation in Wyoming, 2011	Wyoming
UC Berkeley, Job Impacts of California's Existing and Proposed RPS, 2015	California
USDA, Ex-Post Analysis of Economic Impacts from Wind Power Development in U.S. Counties, 2012	Great Plains and Rocky Mountains

Note: Three additional studies reviewed (whose data was not directly applicable to the analysis) are: NREL, Analysis of the Renewable Energy Projects Supported by 1603 Treasury Grant Program, 2012; NYSERDA, New York Clean Energy Industry Report, 2019; and NREL, Counting Jobs and Economic Impacts From Distributed Wind in the United States, 2014.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

Review of Public Reports - 2/2

Adding more renewables produces additional local benefits.

- Various (7) public reports were reviewed specifically to estimate the other economic benefits (tax and lease revenue) of wind development.

7 STUDIES ON THE ECONOMIC BENEFITS OF WIND DEVELOPMENT

Study	Region
EIG, Statewide Economic Impact of Wind Energy Development in Oklahoma, 2014	Oklahoma
NREL, Economic Impacts from Wind Energy in Colorado Case Study, 2019	Rush Creek Wind Farm, Colorado
NREL, Economic Development Impact of 1,000 MW of Wind Energy in Texas, 2011	Texas
NREL, Economic Impacts from Indiana's First 1,000 MW of Wind Power, 2014	Indiana
NREL, Estimated Economic Impacts of Utility Scale Win Power in Iowa, 2013	Iowa
NREL, Jobs and Economic Development from New Transmission and Generation in Wyoming, 2011	Wyoming
Wind Powers America Annual Report, 2019	USA state-level data

Note: The WPA annual report contained data for each state. All other sources report values from a single project.

This Report may be redistributed. If only a portion of Report is redistributed, the redistributed portion(s) must be accompanied by a citation to the full Report.

About Brattle

The Brattle Group answers complex economic, finance, and regulatory questions for corporations, law firms, and governments around the world. We are distinguished by the clarity of our insights and the credibility of our experts, which include leading international academics and industry specialists. Brattle has over 400 talented professionals across three continents. For more information, please visit **brattle.com**.

Our Services	Our People	Our Insights
Research and Consulting	Renowned Experts	Thoughtful Analysis
Litigation and Support	Global Teams	Exceptional Quality
